The mixed aneuriſm, produced by a laceration of the outer and a diſtenſion of the inner coat of the artery, is rare, and exhibits no external ſymptoms by which it can be diſtinguiſhed from the true aneuriſm. This, however, makes no difference; for we endeavour to remove it, like a true aneuriſm, by compreſſion; and when this either does not ſucceed, or cannot be applied, the operation is performed in the ſame manner as in the true aneuriſm. The ſecond ſpecies of the mixed aneuriſm is more frequent. This conſiſts at firſt of a true aneuriſm, in which the ſac, by occaſion of violent motion, concuſſion, a bruiſe, or even ſpontaneouſly, in conſequence merely of too great diſtenſion, has burſt, and produced an effuſion of blood, which ſurrounds the true aneuriſm. The change of a true into a mixed aneuriſm may in general be eaſily diſcovered. The ſwelling, which before was circumſcribed, ſuddenly ſpreads; the ſtrong pulſation, which before was diſtinctly perceptible in the tumour, ſuddenly grows weak and indiſtinct, or even becomes altogether imperceptible; and the tumour, which formerly was ſoft, ſuddenly becomes hard to the touch. The mixed aneuriſm, on account of the continual effuſion of blood, and the increaſe of the falſe aneuriſm, generally requires that the operation ſhould be ſpeedily performed. The moſt common mode of doing this (perhaps not the moſt eligible) we have already deſcribed; but it is a fact worthy of notice, that the Greeks were acquainted with the practice lately recommended, of tying and dividing the trunk of the artery high above the tumour, as will appear from the following extract (Ætii Tetr. iv. Serm. iv. cap. 10.) "At vero quod in cubiti cavitate fit aneuriſma, hoc modo per chirurgiam aggredimur: Primum arteria ſuperne ab ala ad cubitum per internam brachii parte ſimplicem ſectionem, tribus aut quatuor digitis infra alam, per longitudinem facimus, ubi maximè ad tactum arteria occurrit; atque ea paulatim denudata, deinceps incumbentia corpuſcula ſenſim excoriamus ac ſeparamus, *et ipſam arteriam cæco uncino attractam duobus fili vinculis probe adſtringimus, mediamque inter duo vincula diffecamus*; et ſectionem polline thuris explemus, ac linamentis inditis congruas deligationes adhibemus." Afterwards we are directed to open the aneuriſmal tumour at the bend of the elbow, and when the blood has been evacuated, to tie the artery twice, and divide it again. If the ancients had only omitted the latter part of their operation, they would abſolutely have left nothing to be diſcovered by the moderns. What a ſtriking example of the bold manner in which our forefathers have acted without being guided by the lights of anatomy and phyſiology! But there are two or three paſſages in Galen, Celſus, and Hippocrates, from which we may ſuſpect that even Ætius himſelf was not the inventor of this operation of tying the trunk of an artery, &c. See alſo Paul. Ægin. lib. vi. cap. 37.

The operation of tying the large trunk of an artery, above the aneuriſm, ſeems to have been regarded by Dr. Wm. Hunter as "a propoſal which a modern ſurgeon would think of with horror" (Med. Obſ. & Inq. vol. i. p. 335.); and Mr. Bromfeild calls it a "moſt extravagant propoſition." (Chir. Obſer. vol. i. p. 306.) But we are now fully convinced, by the evidence of incontrovertible facts, that this operation "may be done with a fair proſpect of preſerving the limb." Mr. Bromfeild relates, that he "once ſaw an attempt of this kind in a true aneuriſm, ſituated in the ham;" on which, however, he makes "no further remark, than that the patient died," and that he believes "the embarraſſments which occurred, as well as accidents in the operation, will deter the operator from making a ſecond attempt." We have reaſon to ſuppoſe that moſt of the caſes of aneuriſm on record, in which patients recovered, after long enduring compreſſion upon the artery, have in reality been caſes where the veſſel was totally *obliterated* by the preſſure; although the opinion of ſurgeons has uſually been, that the orifice of the artery had previouſly coaleſced and healed like a common wound, ſtill allowing the blood to circulate as before. Caſes are likewiſe recorded in which a ſpontaneous cure of aneuriſm has been effected; and in theſe we may alſo conclude, that the veſſels were obliterated as completely as they would have been by a ligature in the modern operation.

In the former part of this article we ſaid, that a popliteal aneuriſm was one of thoſe which occurred the moſt frequently. And its ſituation being ſuch as to afford a full command of the veſſel affected, this ſpecies of the diſeaſe has obtained a conſiderable degree of attention among ſurgeons, in hopes of their ſaving the limb as well as the life of the patient. After having made various trials, it is aſcertained that the collateral branches of the femoral artery, of thoſe of the profunda femoris, inoſculating with the arteries of the leg, are generally ſufficient to keep up the circulation in the lower extremity; and that the inoſculating blood veſſels of the arm, in like manner, will dilate and nouriſh the limb when the humeral artery has been tied; ſo that in moſt aneuriſms of the extremities, we have a very conſiderable chance of preſerving both the member and the life of the patient.

Paulus Ægineta, and after him the Arabian phyſicians, uſed to make two ligatures, one above and the other below the aneuriſm; after which they let out the coagulated blood found within the tumour, and healed up the wound according to the common principles of ſurgery. But Guillemeau, one of the diſciples of Ambroſe Paré, pointed out a more ſimple operation in the caſe of an aneuriſm at the bend of the arm: he laid bare the tumour, paſſed one ligature under the artery above the diſeaſed part, then emptied the ſac, and cloſed the wound. He directs the ſame plan to be adopted in other caſes of aneuriſm: "Si en quelque autre partie exterieure, il ſe preſente au chirurgien pareil aneuriſme, il peut ſeurement decouvrir le corps de l'artere vers ſa racine et partie ſuperieure, et la lier de meſme façon, ſans autre ceremonie." (Les Oper. de Chir. liv. x. c. vi.)

In the year 1714, M. Anel, of Paris, publiſhed an improvement on Guillemeau's method; which conſiſted in making a longitudinal inciſion over the aneuriſm, without wounding it, then making a ſingle ligature upon the veſſel, cloſe above the tumour, and leaving the reſt to nature. It is almoſt needleſs to mention, that in all theſe operations the ſurgeon applied a tourniquet upon the affected limb, ſo as to obtain an entire command of the artery. By little and little Anel found the tumour diſappear, until the whole was abſorbed. This practice did not meet the approbation of ſurgeons in general, although it was often followed by Heiſter and ſome few later operators. Indeed that author thinks it doubtful "whether or no this method will ſucceed ſo as to ſave the limb in wounds of the large crural artery;" Syſtem of Surgery, part ii. ſect. 1. chap. xiii. § 22.) and it has therefore been reſerved for our contemporaries, to determine the point by actual experiment. We do not wonder, however, at the doubt expreſſed by Heiſter, as he frankly confeſſes, that "he cannot conceive in what manner the blood is circulated through the lower parts of a limb, after this operation." How would he then have been ſurpriſed to learn, that it is even poſſible for a patient to recover of his limb,

limb, when the inguinal, or the ſubclavian artery, has been ſurrounded by a ligature!

During the month of June, 1785, M. Deſſault, of Paris, performed the following operation for a popliteal aneuriſm (See Journ. de Medecine, tome lxv. p. 452—471. Encycl. Methodique, Particle Aneuriſm, p. 135, and Sabatier de la Med. Operatoire, tome iii. p. 275): he made an inciſion about two inches above the aneuriſmal tumour in the patient's ham; and, when he had expoſed the artery, he ſeparated it from the adjacent nerve, and paſſed a ligature around it, leaving the aneuriſm untouched. The wound was dreſſed in a ſimple manner, with a looſe ligature caſt around the former one, as an additional ſecurity againſt future bleeding. The ſymptoms for the firſt ſix days were mild, and promiſed a favourable event; but M. Deſſault thought it prudent to tie the ſecond ligature faſt, on the ſixth day after the operation. The ſwelling diminiſhed rapidly; the ligatures fell off on the eighteenth day, and there was a plentiful diſcharge of bloody matter on the day following, which cauſed nearly the entire diſappearance of the aneuriſm. In ſhort, the external opening was ſoon healed, and the cure ſeemed complete; which, unfortunately, the patient died of another complaint.

During the month of December, in the ſame year, an operation, ſomewhat ſimilar to that of Deſſault, was performed by Mr. John Hunter. (See Lond. Med. Journal, vol. vii. p. 391. and Tranſact. of a Society for the Improv. of Med. and Chir. Know. vol. i. p. 138.) Mr. Hunter's patient was a coachman, 45 years of age: he was admitted into St. George's hoſpital with a popliteal aneuriſm, which he had firſt perceived three years previouſly to his admiſſion, and had obſerved it gradually increaſe during the whole of that period. It was ſo large as to diſtend the two ham-ſtrings laterally, and make a very conſiderable riſing between them; the pulſation was very diſtinct, and to be felt on every ſide of the tumour. The leg and foot of that ſide were ſo ſwelled as to be much thicker than the other, and were of a mottled brown colour; the ſwelling was not of the œdematous kind, but felt firm and brawny, probably from the extravaſation of coagulable lymph; the leg retained its natural ſhape, excepting that it was larger. Previouſly to performing the operation, a tourniquet was applied upon the upper part of the thigh, but not tightened, that the parts might be left as much in their natural ſituation as poſſible.

The operation was begun by making an inciſion on the anterior and inner part of the thigh, rather below its middle, which inciſion was continued obliquely acroſs the inner edge of the ſartorius muſcle, and made large, to give room for the better performing of whatever might be thought neceſſary in the courſe of the operation. The faſcia which covers the artery was then laid bare about three inches in length, after which the artery itſelf was plainly felt. A ſlight inciſion, about an inch long, was then made through this faſcia, along the ſide of the veſſel, and the faſcia diſſected off; by this means the artery was expoſed. Having diſengaged the artery from its lateral connections by the knife, and from the other adhering parts by the help of a thin ſpatula, a double ligature was paſſed behind it, by means of an eyed probe. The doubling of the ligature brought through by the probe, was cut ſo as to form two ſeparate ligatures. The artery was now tied by both theſe ligatures, but ſo ſlightly, as only to compreſs the ſides together. A ſimilar application of ligature was made a little lower. The reaſon for having four ligatures, was to compreſs ſuch a length of artery as might make up for the want of tightneſs, it being wiſhed to avoid great preſſure on the veſſel at any one part. The ends of the ligature were carried directly out at the wound, the ſides of which were now brought together, and ſupported by a ſticking plaſter and a linen roller, that they might unite by the firſt intention.

The limb was found, ſome hours after the operation, not only to retain its natural heat, but even to be warmer than the other leg. The ſecond day after the operation, the brawny firmneſs of the leg was conſiderably diminiſhed, it was become ſoft, looſe, and a good deal ſmaller, and the aneuriſmal tumour had loſt more than one third of its ſize.

Nothing could ſhew more plainly the action of the abſorbents, than the change the leg had undergone in ſo ſhort a time; the diminution of the tumour probably ariſing from the ſtaid blood which it contained having paſſed into collateral branches, or into the tibial artery.

The fourth day, on the removal of the dreſſings, the edges of the wound were found united through its whole length, excepting where prevented by the ligatures; there was neither pain nor tumefaction in the part; but the aneuriſmal tumour was the ſame as on the ſecond day.

On the ninth day after the operation there was a conſiderable diſcharge of blood from the part where the ligatures paſſed out; a tourniquet was therefore applied on the artery above, which ſtopped the bleeding; and, although the tourniquet was taken off a few hours after, no blood followed. The head of a roller was then placed upon the wound, in the direction of the artery, and over that the tourniquet, which was not, however, tightened more than was thought ſufficient to take off the impetus of the blood in that portion of the artery.

On the tenth day appearances were much the ſame, only that between the compreſs and the knee there appeared a little fullneſs, like beginning inflammation. On the eleventh day this was gone off, and on the fifteenth ſome of the ligatures came away, followed by a ſmall diſcharge of matter, the tumour in the ham being leſſened. On the ſeventeenth day the parts ſurrounding the aneuriſmal tumour were more reduced and pliable, ſo that it was diſtinctly to be felt.

About the latter end of January, 1786, ſix weeks after the operation, the patient went out of the hoſpital, the tumour at that time being ſomewhat leſſened, and rather firmer to the feel. He was ordered to come to the hoſpital once every week, and, in the mean time, to make ſome degree of preſſure, by application of a compreſs and bandage, with a view to excite the abſorbents to action, which in moſt caſes has a good effect.

About the middle of February the tumour had decreaſed, and was become ſtill firmer. March the 8th, the wound, which had cicatrized, broke out again, and the patient was taken into the hoſpital. About the 8th of April, ſome of the remaining thread of the ligature came away, and an inflammation appeared upon the upper part of the thigh. In the middle of May, a ſmall abſceſs broke at ſome diſtance from the old cicatrix, at which opening ſome matter was diſcharged, but no pieces of ligature were obſerved. Several ſmall threads were, at different times, diſcharged from the old ſore, and the ſwelling ſubſided; but the thigh ſoon ſwelled again to a greater ſize than before, attended with conſiderable pain. In the beginning of July, a piece of ligature, about one inch in length, came away, after which the ſwelling went off entirely, and he left the hoſpital the 8th of July, at which time there remained no appearance of tumour in the ham, he being in every reſpect well.

After leaving the hoſpital, the man returned to his uſual occupation of driving a hackney-coach; and being, from the nature of his employment, much expoſed to cold, in March, 1787, he was ſeized with a fever of the remittent kind, which carried him off. He had not made any com-

plaint

plaint of the limb on which the operation had been performed, from the time of his leaving the hoſpital.

He died on the 1ſt of April 1787, fifteen months after the operation; and leave was procured, with ſome trouble and conſiderable expence, to examine the limb, ſeven days after death, at which time it was entirely free from putrefaction.

The cicatrix on the anterior part of the thigh was ſcarcely diſcernible, but the parts under it felt hard. The ham had no appearance of tumour, and was to the eye exactly like that of the other limb; there was, however, a ſolid tumour perceptible to the touch, filling up the hollow between the two angles of the thigh bone.

The femoral artery and vein were taken out above the giving off the branch called profunda, and a little below the diviſion into the arteriæ tibiales and interoſſeæ. The arteries and veins that were pervious being injected, the whole was carefully diſſected.

The femoral artery was impervious from its giving off the arteria profunda as low as the part included in the ligature, and at that part there was an oſſification for about an inch and an half along the courſe of the artery, of an oval form, the rim of which was ſolid, becoming thinner towards the centre, and not bony, but ligamentous. Below this part the femoral artery was pervious down to the aneuriſmal ſac, and contained blood, but did not communicate with the ſac itſelf, having become impervious juſt at the entrance.

What remained of the aneuriſmal ſac was ſomewhat larger than an hen's egg, but more oblong, and a little flattened, extending along the artery below for ſome way; the blood preſſing with greater force in that direction, and diſtending that part ſo as, in ſome meaſure, to give the appearance of a ſeparate bag. The ſac was perfectly circumſcribed, not having the ſmalleſt remains of the lower orifice into the popliteal artery: whether this aroſe from the artery being preſſed upon by the inferior portion of the ſac, as appears to be the caſe in common, or was in conſequence of the ſac contracting after the operation, I will not pretend to determine; but it contained a ſolid coagulum of blood, which adhered to its internal ſurface. A ſection made of this coagulum, appeared to be compoſed of concentric lamellæ, uniform in colour and conſiſtence.

The popliteal artery, a little way below the aneuriſmal ſac, was joined by a ſmall branch, very much contracted, which muſt have ariſen either from the profunda, or the trunk of the femoral artery. About two inches below the ſac, the popliteal gave off, or divided into, the tibiales.

The profunda was of the uſual ſize, but a good deal oſſified, for ſome length after leaving the femoral artery; the two tibials, where they go off from the popliteal, were in the ſame ſtate.

The trunk of the femoral vein, where it paſſed along the ſide of the tumour, muſt have been obliterated; for at this part it appeared to ſend off three equal-ſized branches, paſſing over different parts of the aneuriſmal ſac: theſe muſt have been dilated branches, none of them having the courſe which the trunk of the vein ſhould have purſued.

Theſe appearances throw ſome light upon the changes which took place in the limb after the operation. The ligature upon the femoral artery impeded the paſſage of the blood into the ſac ſo much, as to allow its contents to coagulate, and render the opening into it from the artery impervious. By this a ſtop was only put to the increaſe of the tumour, its reduction to the ſize met with in the dead body, muſt have been the effect of abſorption.

The concluſion to be drawn from the above account, appears a very important one, *viz.* that ſimply taking off the force of the circulation from the aneuriſmal artery, is ſufficient to effect a cure of the diſeaſe, or at leaſt to put a ſtop to its progreſs, and leave the parts in a ſituation from which the actions of the animal œconomy are capable of reſtoring them to a natural ſtate.

We have given the hiſtory of this caſe at full length, becauſe the method adopted by Mr. Hunter has been ſince followed, with ſome ſlight variations, in almoſt every part of Europe. There is no reaſon, we believe, for ſuſpecting that Mr. Hunter took the hint of this operation from any of his predeceſſors: but, as Mr. Home has ſtated, this practice was the reſult of an opinion entertained by Mr. Hunter that the artery in aneuriſmal caſes is generally diſeaſed ſome way above the ſac, and therefore that the common cauſe of failure aroſe from tying an unſound artery, not diſpoſed to coaleſce before the ſeparation of the ligature.

The femoral and popliteal arteries are portions of the ſame trunk, preſenting themſelves on different ſides of the thigh, and are readily come at in either ſituation; but where the artery is paſſing from the one ſide to the other, it is more buried in the ſurrounding parts, and cannot be expoſed without ſome difficulty. In performing the operation for the popliteal aneuriſm, eſpecially when the tumour is large, the ligature was commonly applied on the artery at that part where it emerges from the muſcles. This mode of performing the operation will be found inadequate, if the diſeaſe of the artery extends above the ſac; for if the artery ſhould afterwards give way, there will not be a ſufficient length of veſſel remaining, to allow of its being again ſecured in the ham. To follow the artery up through the inſertion of the triceps muſcle, to get at a portion of it where it is ſound, becomes a very diſagreeable part of the operation: and to make an inciſion upon the fore-part of the thigh, to get at and ſecure the femoral artery would be breaking new ground; a thing to be avoided, if poſſible, in all operations.

Mr. Hunter, from having made theſe obſervations, was led to propoſe, that in this operation the artery ſhould be taken up in the anterior part of the thigh, at ſome diſtance from the diſeaſed part, ſo as to diminiſh the riſk of hæmorrhage, and to admit of the artery being more readily ſecured, ſhould any ſuch accident happen. The force of the circulation being thus taken off from the aneuriſmal ſac, the progreſs of the diſeaſe would be ſtopped: and he thought it probable, that if the parts were left to themſelves, the ſac, with its contents, might be abſorbed, and the whole of the tumour removed; which would render any opening into the ſac unneceſſary.

Numerous trials have lately been made in the different public hoſpitals which confirm the truth of Mr. Hunter's reaſoning. He had ſeveral opportunities of performing this operation before he died, and generally with perfect ſucceſs: but reiterated experience has ſhewn that it is beſt to ſecure the artery with only one ſtrong ligature, without ſeparating the veſſel from its attachments. Some attempts have been made, both in London and Paris, to improve on this method, by giving a greater latitude for preſſure on the artery, (either by the interpoſition of extraneous ſubſtances between the ligature and the veſſel, or by employing a broad piece of tape;) but ſuch attempts have been always attended with manifeſt diſadvantages. The only conſiderable deviation from Mr. Hunter's mode, which we think deſerves particular attention, is that of making two firm ligatures, about an inch diſtant from each other, and then dividing the artery between them; after the manner recommended by Ætius, thirteen centuries ago, for brachial aneuriſms.

In comparing this procedure with that which has formerly been had recourſe to in popliteal aneuriſms, every

perſon muſt be ſtruck with its decided ſuperiority. The operation is in itſelf ſimple; it requires but a ſhort time in the performance, and produces little, if any, affection of the conſtitution; but its advantages are more clearly ſeen by contraſting it with the common mode of operating for the popliteal aneuriſm. This is, by expoſing the ſac in the ham through its whole extent, laying it open, ſcooping out the blood, ſearching for the two orifices leading into it, and taking up the artery with a ligature both above and below the ſac. When this operation is over, there remains a large deep ſeated ſore, compoſed of parts not perfectly in a natural ſtate, and in a moſt diſadvantageous ſituation; which ſore is to ſuppurate, granulate, and heal; a proceſs that is not ſoon performed, and which muſt leave a ſtiff knee for ſome time afterwards. Yet this is conſidering the operation in the moſt favourable view, ſince there is always a riſk, from the artery being diſeaſed ſo cloſe to the ſac, of the patient dying from a ſecondary bleeding; and when that does not happen, there is ſtill ſome danger of not being able to ſupport the conſtitution during the healing of a large ſore, under circumſtances ſo very unfavourable.

It muſt not be diſſembled, however, that there are ſometimes very embarraſſing circumſtances attending the new operation, and that patients are not always free from the danger of hæmorrhage, even ſo late as the third or fourth week after the ligature of the artery. 1ſt. We can never be certain, in caſes of ſpontaneous aneuriſm, that the veſſel is not diſeaſed along its courſe, above the part on which the ligature was made. 2dly. We have no poſitive ſecurity againſt the occurrence of an ulceration juſt under the ligature, from which a fatal bleeding may at any time enſue. 3dly. We cannot always effect an adheſion of the ſides of the artery, ſo as to produce a perfect obliteration of its cavity, by any means within our power. Beſides which, the firſt ſurgeons may poſſibly fail in their endeavours to include the naked veſſel within a ligature; and at length may be compelled to make a freſh incision, or to amputate the patient's limb, in order to ſave his life. But, with all theſe diſadvantages, ſome of which indeed muſt apply to any kind of operation for aneuriſm, we are fully perſuaded that Mr. Hunter's plan is, on the whole, the moſt eligible and ſucceſsful. It therefore cannot but ſtrike us with ſurprize to find Mr. Benjamin Bell, in the laſt edition of his ſurgery (vol. iii. 1801.), declaring it to be doubtful "whether this operation, or that of amputating the limb *at the upper part of the thigh* will fall to be preferred." It only remains for us now to point out ſome of the principal rules to be obſerved, in caſes where this operation is indicated.

No ſkill or precaution can avert the ill conſequences which may enſue from a diſpoſition in the trunk of an artery to form aneuriſms: the objection, therefore, againſt tying the artery in this caſe, is not greater than it would be againſt amputating the limb "at its upper part." If an aneuriſm have formed ſpontaneouſly, the chance of recovery is not equal to that in which the diſeaſe aroſe from an accidental cauſe; but ſtill, we conceive, the ſpontaneity of the complaint is not alone a ſufficient objection againſt the method we are recommending. Suppoſe, then, we have determined on performing the operation; it is firſt neceſſary to reduce the quantum of blood in the vaſcular ſyſtem, if the patient be plethoric and young. He ſhould alſo be prepared, by giving him a few doſes of laxative medicine, and by a previous courſe of abſtemiouſneſs, eſpecially if there be any tendency to an inflammatory diatheſis. All things being in readineſs for the operation, let a tourniquet be placed on the limb; or let an aſſiſtant compreſs the artery in the beſt poſſible manner, where a tourniquet cannot be applied with advantage. Make your firſt inciſion through the ſkin and adipoſe ſubſtance; diſſect ſteadily and cautiouſly down to the trunk of the veſſel you are ſeeking for; clear away with the ſcalpel, or with your finger, all the cellular membrane which lies looſely in your way; open the faſcial covering peculiar to the artery; then ſeparate the vein and nerve accompanying it, without unneceſſarily tearing the veſſels from their ſurrounding attachments; and paſs a moderate ſized common ligature around the artery, with a ſufficient degree of tightneſs to ſtop the circulation entirely.

Theſe are the ordinary ſteps of this operation. But it is probably the ſafeſt way to make a ſecond ligature, about an inch below the former, and then to cut between them, as was practiſed by the ancients, ſo that the divided extremities of the artery may retire into the adjacent muſcular ſubſtance. This method has been approved by ſome of our beſt ſurgeons, and ſeemed to leſſen the danger of a ſecondary hæmorrhage. In addition, however, to this ſecurity, a new mode of faſtening the ligatures has been propoſed and practiſed at Guy's hoſpital (ſee Med. & Phyſ. Journal for July, 1802.) "An eyed probe, armed with a double ligature, having a curved needle at each end, was conveyed under the femoral artery, and the probe cut away. The ligature neareſt the groin was firſt tied; the other was ſeparated an inch from the firſt, and tied alſo; then the needles were paſſed through the coats of the artery cloſe to each ligature, and between them; the thread they carried was tied into the knot of the ligature which had been already ſecured around the veſſel; and thus a barrier was formed in the artery, beyond which the ligature could not paſs. The wound was united by the firſt intention, except where the ligature projected: one of the threads ſeparated on the 14th, the other on the 15th day." This mode of ſecuring the ligatures was found to be ſo effectual, that Mr. Aſtley Cooper was unable, in an experiment made on a dead ſubject, to remove the thread from its ſituation, even by injecting water into the artery with all his force. The ſuggeſtion was originally given to him by Mr. Cline, jun. and was put in practice in conſequence of two caſes having occurred, one to Mr. Cline (the father), and one to Mr. Cooper, in which the ligature ſlipped off the divided extremity of the blood veſſel, after an operation for aneuriſm.

We have directed the artery to be tied alone; and not to be wantonly *detached* from the circumjacent cellular membrane, which gives ſupport to the vaſa vaſorum nouriſhing the artery. For the ſame reaſon, we highly diſapprove of all compreſſes, pads or inſtruments propoſed to be laid in contact with the veſſel; as theſe, we are of opinion, contribute to produce inflammation and ulceration of the artery, with all their dreadful conſequences. The wound ſhould be cloſed with adheſive plaſters as accurately as poſſible, the ligatures hanging out, and a ſoft roller then paſſed over the limb for its further ſupport. By this ſimple method, we have found the operation extremely ſucceſsful; and there is but little comparative hazard of a ſecondary bleeding. Nay, it is even certain that ligatures may be made with complete ſucceſs upon the great artery of the thigh, above Poupart's ligament; and of the arm above the axilla. (See the caſes publiſhed by Mr. Keate, Mr. John Bell, and Mr. Abernethy.)

Other methods have been recommended by ingenious men in caſes of aneuriſm; ſuch as that of Mr. Lambert (Med. Obſ. and Inq. vol. ii. p. 360.), who propoſes to ſtitch the artery by means of the hare-lip ſuture, a plan which has been once imitated, without ſucceſs, by Mr. John Bell; and likewiſe a contrivance of Mr. Deſchamps (La Médecine eclairée, tome iii. p. 67.), for compreſſing the arterial tube,

tube, without ſurrounding it with a ligature. But, in our opinion, theſe methods promiſe to be leſs uſeful than they ſeem to be ingenious, and have not been generally approved by medical practitioners.

We have mentioned the *mixed* aneuriſm as a diſtinct ſpecies of this diſeaſe, becauſe it is noticed as ſuch by reſpectable authors. Dr. Monro, ſenior, we believe, was the firſt who deſcribed it (Edinb. Med. Eſſays and Obſerv. vol. ii. xvi.), and afterwards Dr. Wm. Hunter (Med. Obſ. and Inquiries, vol. i. xxvi.); but the diſtinction is not well eſtabliſhed, and is of very little practical importance. A much more valuable diſtinction has been introduced by Dr. Hunter, between common aneuriſms and thoſe which ſometimes ariſe from bleeding: the latter has been denominated VARICOSE *aneuriſm*, or with more propriety the *aneuriſmal* VARIX; and it ariſes from an artery having been wounded through a vein, ſo that a communication or anaſtomoſis is afterwards kept up between theſe two veſſels, which cloſely unite by a lateral adheſion. This varicoſe tumour is not near ſo dangerous as the true or the ſpurious aneuriſm; for the veins alone become much dilated, and it can ſcarcely ever be neceſſary to have recourſe to the ligature. Since Dr. Hunter publiſhed his account of this diſorder, its true nature has been aſcertained by the obſervations of various practitioners.

The aneuriſmal varix was firſt deſcribed by that anatomiſt with ſome degree of diffidence; but in a ſubſequent memoir, Dr. Hunter communicated to the world a further hiſtory of this curious diſeaſe, in the following terms:

"If ever this caſe happens, we are to ſuppoſe, that in the operation of bleeding the lancet is plunged into the artery through both ſides of the vein, and that there will be three wounds made in theſe veſſels, *viz.* two in the vein and one in the artery; and theſe will be nearly oppoſite to one another, and to the wound in the ſkin. This is what all ſurgeons know has often happened in bleeding; and the injury done the artery is commonly known by the jerking impetuoſity of the ſtream whilſt it flows from the vein, and by the difficulty of ſtopping it when a ſufficient quantity of it is drawn.

"In the next place we muſt ſuppoſe, that the wound of the ſkin, and of the adjacent or upper ſide of the vein, heal up as uſual; but that the wound of the artery, and of the adjacent or underſide of the vein, remain open (as the wound of the artery does in a ſpurious aneuriſm), and by that means the blood is thrown from the trunk of the artery directly into the trunk of the vein. Extraordinary as this ſuppoſition may appear, in reality it differs from the common ſpurious aneuriſm in one circumſtance only, *viz.* the wound remaining open in the ſide of the vein as well as in the ſide of the artery. But this one circumſtance will occaſion a great deal of difference in the ſymptoms, in the tendency of the complaint, and in the proper method of treating it; upon which account the knowledge of ſuch a caſe will be of importance in ſurgery.

"It will differ in its ſymptoms from the common ſpurious aneuriſm principally thus. The vein will be dilated or become varicoſe, and it will have a pulſatile jarring motion, on account of the ſtream from the artery. It will make a hiſſing noiſe, which will be found to correſpond with the pulſe, for the ſame reaſon. The blood of the tumour will be altogether, or almoſt entirely fluid, becauſe kept in conſtant motion. The artery, I apprehend, will become larger in the arm, and ſmaller at the wriſt, than it was in the natural ſtate; which will be found out by comparing the ſize and the pulſe of the artery in both arms at theſe different places: the reaſon of which I ſhall ſpeak of hereafter. And the effects of ligatures and of preſſure upon the veſſels, above the elbow and below it, will be what every perſon may readily conceive, who underſtands any thing of the nature of arteries and veins in the living body.

"The natural tendency of ſuch a complaint will be very different from that of the ſpurious aneuriſm. The one is growing worſe every hour, becauſe of the reſiſtance to the arterial blood; and if not remedied by ſurgery muſt at laſt burſt. The other in a ſhort time comes to a nearly permanent ſtate, and, if not diſturbed, produces no miſchief, becauſe there is no conſiderable reſiſtance to the blood that is forced out of the artery.

"The proper treatment muſt therefore be very different in theſe two caſes; the ſpurious aneuriſm requiring chirurgical aſſiſtance as much perhaps as any diſeaſe whatever; whereas, in the other caſe, I preſume it will be beſt to do nothing.

"If ſuch caſes do happen, they will, no doubt, be found to differ among themſelves in many little circumſtances, and particularly in the ſhape, &c. of the tumefied parts. Thus the dilatation of the veins may be in one only, or in ſeveral, and may extend lower or higher in one caſe than in another, &c. according to the manner of branching, and to the ſtate of the *valves* in different arms: and the dilatation of the veins may alſo vary on account of the ſize of the artery that is wounded, and of the ſize of the orifice in the artery, and in the vein.

"Another difference in ſuch caſes will ariſe from the different manner in which the orifice of the artery may be united or continued with the orifice of the vein. In one caſe, the trunk of the vein may keep cloſe to the trunk of the artery, and the very thin *ſtratum* of cellular membrane between them, may, by means of a little inflammation, and coagulation of the blood among its filaments, as it were, ſolder the two orifices of theſe veſſels together, ſo that there ſhall be nothing like a canal going from one to the other; and then the whole tumefaction will be more regular and more evidently a dilatation of the veins only. In other inſtances the blood that ruſhes from the wounded artery, meeting with ſome difficulty of admiſſion and paſſage through the vein, may dilate the cellular membrane between the artery and vein, into a bag, as in a common ſpurious aneuriſm, and ſo make a ſort of canal between theſe two veſſels. The trunk of the vein will then be removed to ſome diſtance from the trunk of the artery, and the bag will be ſituated chiefly upon the underſide of the vein. The bag may put on an irregular form, from the cellular membrane being more looſe and yielding at one place than at another, and from being unequally bound down by the *faſcia* of the *biceps* muſcle. And if the bag be very large, eſpecially if it be of an irregular figure, no doubt coagulations of blood may be formed, as in the common ſpurious aneuriſm."

As no ſurgical operation is required in this caſe, or but very rarely indeed, we need not dwell further on the ſubject of aneuriſmal VARIX. The diſeaſe has, in different inſtances, continued during the ſpace of twenty or thirty years without getting worſe, or demanding eſpecial attention. See VARIX and VARICOCELE.

ANEWOLONDANE, in *Geography*, a ſmall iſland of the Indian ſea, near the coaſt of Ceylon.

ANFANT, a town of Perſia, 30 miles north-weſt of Zareng.

ANFELDTHYDE, or ANFEALTHYLE, in *Law*, a ſimple accuſation; for the Saxons had two ſorts of accuſation, *viz. ſimplex* and *triplex*. That was called ſingle, when the oath of the criminal, and of two more, were ſufficient to diſcharge him: but his own oath, and the oaths of five more, were required to free him *a triplice accuſatione*.

ANFOSSI, *Paſquale*, of Naples, in *Biography*. See PASQUALE ANFOSSI.

ANGADD, a barren defert of Africa, in the kingdom of Algiers, 28 leagues long, and 18 wide, formerly the weft part of the province of Tremecen, in the road to Fez: it contains a few villages inhabited by Arabs, the chief of which were Guagida, Tenzegezet, and Zezil.

ANGALA-DIAN, in *Natural Hiftory*, a name given by Buffon to a fpecies of certhia, called lotenia by Gmelin. See CERTHIA LOTENIA.

ANGAMALA, a town of the Eaft Indies, in Malabar, on the river Aicota.

ANGARA, a river of Ruffia, which rifes in the lake Baikal, and runs into the Eniffey, not far from Eniffeifk.

ANGARAEZ, a province of South America, in the empire of Peru, fubject to the archbifhop of Lima, 20 leagues north-weft by weft of the city of Guamanga. It abounds in all kinds of grain and fruits, befides vaft droves of cattle both for labour and fuftenance.

ANGARI, or ANGARII, in *Antiquity*, denote public couriers, appointed for the carrying of meffages.

Αγγαροι is derived from a word, which, in the Perfian language, fignifies a fervice rendered by compulfion. Hence the Greeks borrowed their verb αγγαρευω, *compellere*, or *cogere*, and the Latins *angariare*.

The ancient Perfians, Budæus obferves, had their αγγαρειον δρομημα, which was a fet of couriers on horfeback, poffed at certain ftages or diftances, always in readinefs to receive the difpatches from one, and forward them to another with wonderful celerity, anfwering to what the moderns call poffs, q. d. *pofiti*, as being poffed at certain places or ftages. This invention of couriers is afcribed to Cyrus. As the Perfian empire, after its laft conquefts, was of a vaft extent, and Cyrus required that all his governors of provinces, and the chief commanders of his troops fhould write to him, and give an exact account of every thing that paffed in their feveral diftricts or armies: in order to render that correfpondence the more fure and expeditious, and to put himfelf into a condition of receiving fpeedy intelligence of all occurrences and affairs, and of fending his orders with expedition, he caufed poft-houfes to be built, and meffengers to be appointed in every province. Having computed how far a good horfe, with an active rider, could go in a day, without injury, he had ftables built at equal diftances from each other, and furnifhed them with horfes, and grooms to take care of them. At each of thefe places he appointed likewife a poft-mafter to receive the packets from the couriers as they arrived, and to give them to others, and to take the horfes that performed their refpective ftages, and to find freth ones. Thus the courier went continually night and day with extraordinary fpeed; nor did either rain or fnow, heat or cold, or any inclemency of the feafon interrupt his progrefs. Herodotus (lib. viii. c. 18.) fpeaks of the fame fort of couriers in the reign of Xerxes. The fuperintendency of the poffs became a confiderable employment; Darius, the laft king of the ancient Perfians, enjoyed it before he came to the crown. Xenophon takes notice, that this eftablifhment fubfifted in his time; and this perfectly agrees with what is related in the book of Eftber concerning the edict publifhed by Ahafuerus in favour of the Jews; which edict was carried through that vaft empire with a rapidity that would have been impoffible without thefe poffs erected by Cyrus. See POST.

The *angari* were alfo called by the Perfians *aftandæ*; by the Greeks ημεροδρομοι, on account of the long journies they made in one day, which, according to Suidas, amounted not to lefs than 1500 ftadia.

ANGARI is alfo applied figuratively to porters, and others employed in laborious offices, as bearing burdens.

ANGARI, in *Geography*, a fmall river of Abyffinia, which gives name to a diftrict in the province of Siri, not far from HAUZA. It rifes in a plain near Montefegla, and joins the Bowiha.

ANGARIA is ufed, in a general fenfe, for any burden, or incumbrance, forcibly impofed on perfons.

Some define *angariæ* by perfonal fervices, which a party is compelled to difcharge in his own perfon, or to ferve at his own expence; or fuch fervices impofed on lands whereby a perfon is obliged to work for another, either with his horfe, his afs, or the like.

ANGARIA, in the *Civil Law*, denotes a duty required of the fubjects to furnifh out horfes and carriages for conveying of corn for the foldiers, and fuch things as belonged to the *fifcus*.

This duty goes by the name of *curfus publicus*, *angariæ*, *parangariæ*, *tranflatio*, and *avectio*. The horfes ufed in this fervice are particularly called *paraveredi*, and *equi curfuales*.

Angariæ are generally underftood as exclufive of fhips; though, on fome occafions, thefe were preffed into the fervice for tranfporting provifions and the like.

Angariæ differ from *parangariæ*, in this, that the former are confined to public or main roads, the latter to oblique or crofs roads.

In the Book of Feuds, the performance of angariæ and parangariæ are ranked in the number of royal fervices. Lib. ii. tit. 56.

The clergy were exempted from this fervice by two laws of Conftantius; but he revoked this privilege in 360. The privilege was reftored in 382, and confirmed by Honorius in 412; but was taken away again in 440. Bingh. Orig. Eccleſiæ, lib. v. c. 3. § 10.

ANGARIA, is alfo ufed, in *Ancient Military Writers*, for a guard of foldiers poffed in any place for the fecurity of it. Veget. lib. i. c. 3. lib. ii. c. 19. lib. iii. c. 8.

ANGARKA, in *Geography*, a river of Siberia, in the country of the Tfchuktikes, which falls into the great river of Anuy.

ANGARO PORTO lies on the coaft of Brafil, and is one of thofe good harbours and bays for which the coaft between Point Negro, near Rio Grande, and Point Lucena, near Dou or Dulu, otherwife called Trieſte-watering river, is famous.

ANGAXOS *Iſland*, or ANGOXAS, lies on the eaftern coaft of Africa, in S. lat. 16° 30′, E. long. 38° 35′.

ANGAZYA, or ANGAZIZA, one of the Comorro iflands, lying between the north end of Madagafcar and the coaft of Zanquebar. It is inhabited by Moors, who trade with various parts of the continent, and all the iflands to the eaftward, in cattle, fruits, and the other commodities of the ifland, exchanging them for calicoes, and other cotton cloths, for their own wear. Their bread is chiefly made of the kernel of the cocoa-nut, boiled or broiled, and fpread over with honey; their drink is palm wine, or a juice extracted from the fugar-cane, and fuffered to ferment, or the milk of the cocoa-nut. They never allow their women to be feen by ftrangers without permiffion from the fultan. Their houfes are built of ftone and lime, made of calcined oyfter-fhells, with which the walls and roofs are elegantly plaiftered, and the roofs and windows are covered with palm leaves, ferving as a defence againft the rain and the fun. The ifland is under the government of ten lords, the conftitution being an ariftocracy. S. lat. 17°. E. long. 58° 10′.

ANGE, ST. or ANGELO *Cape*, lies in the Morea, and has its fouth-eaft point projecting confiderably into the fea. N. lat. 36° 27′. E. long. 33° 33′.

ANGE,

ANGE, DE ST. JOSEPH, his true name was La Broſſe, in *Biography*, a Carmelite monk, born at Toulouſe, was ſent to Iſpahan as a miſſionary. After reſiding ſeveral years in Perſia, he returned to Europe, and was made provincial of his order in Languedoc. Having acquired a knowledge of the Perſian language, he publiſhed, in 1681, Pharmacopœia Perſica, ea idiomata Perſica in Latinum tranſlata, 8vo. and, in 1684, Gazophylacium Linguæ Perſarum, a Treaſury of the Perſian Language, fol. at Amſterdam. This work is in great eſteem, containing, beſides an explanation of Perſian words and terms, many entertaining hiſtorical anecdotes and obſervations.

ANGEIOGRAPHIA, compounded of αγγειον, *vas, veſſel*, and γραφω, *ſcribo, I deſcribe*; the knowledge or deſcription of all kinds of ancient inſtruments, veſſels, and utenſils, both domeſtic, military, and nautical.

Angeiography alſo includes the conſideration of the WEIGHTS, MEASURES, &c. uſed by the ſeveral nations.

ANGEIOLOGY, in *Anatomy*, derived from αγγειον, *a veſſel*, and λογος, *a diſcourſe*, the hiſtory or deſcription of the veſſels of the body, which are thoſe concerned in the circulation of the blood, and in abſorption. See ARTERIES, VEINS, and ABSORBING VESSELS. The eſſential ſtructure of veſſels is the ſame in all. They are compoſed of thin ſkins or membranes, the inner part of which has a highly poliſhed and ſecreting ſurface, allowing the contained fluids to glide along it without impediment, whilſt the outer ſurface is rough and cellular, by which the veſſel is connected to the ſurrounding parts. This eſſential part of the veſſel is ſtrong and unyielding, preventing it from rupture, and preſerving it of an unvarying circular figure.

ANGEIOTOMY, formed of αγγειον, *veſſel*, and τεμνω, *ſeco, I cut*, in *Surgery*, is uſed by ſome to denote an artificial ſection of the veſſels, as in bleeding.

In this ſenſe angeiotomy may be divided into PHLEBOTOMY and ARTERIOTOMY.

ANGEL, a ſpiritual intelligent ſubſtance, the firſt in rank and dignity among created beings.

The word *angel*, αγγελος, is not properly a denomination of nature but of office; denoting as much as *nuncius, meſſenger*, a perſon employed to carry one's orders, or declare his will. Thus it is St. Paul repreſents angels, Heb. i. 14. where he calls them *miniſtering ſpirits*; and yet cuſtom has prevailed ſo much, that angel is now commonly taken for the denomination of a particular order of ſpiritual beings, of great underſtanding and power, ſuperior to the ſouls or ſpirits of men. Some of theſe are ſpoken of in Scripture in ſuch a manner, as plainly to ſignify that they are real beings, of a ſpiritual nature, of high power, perfection, dignity, and happineſs. Others of them are diſtinguiſhed as not having kept their firſt ſtation (Jude vi.). Theſe are repreſented as evil ſpirits, enemies of God, and intent on miſchief. The devil as the head of them, and thoſe as his angels, are repreſented as the rulers of the darkneſs of this world, or ſpiritual wickedneſſes or wicked ſpirits, τα πνευματικα της πονηριας εν τοις επουρανιοις, (Epheſ. vi. 12. Locke's Paraphr.) which may not be unfitly rendered, the ſpiritual managers of oppoſition to the kingdom of God.

The exiſtence of angels is ſuppoſed in all religions, though it is incapable of being proved *a priori*. Indeed, the ancient Sadducees are repreſented as denying all ſpirits; and yet the Samaritans and Caraites, who are reputed Sadducees, openly allow them: witneſs Abuſaid, the author of an Arabic verſion of the Pentateuch; and Aaron, a Caraite Jew, in his comment on the Pentateuch; both extant in manuſcript in the king of France's library.

In the Alcoran we find frequent mention of angels. The Muſſulmen believe them of different orders or degrees, and to be deſtined for different employments both in heaven and on earth. They attribute exceedingly great power to the angel Gabriel, as to be able to deſcend in the ſpace of an hour from heaven to earth; to overturn a mountain with a ſingle feather of his wing, &c. The angel Aſrael, they ſuppoſe, is appointed to take the ſouls of ſuch as die; and another angel, named Eſraphil, they ſay, ſtands with a trumpet ready in his mouth to proclaim the day of judgment.

The heathen philoſophers and poets were alſo agreed as to the exiſtence of intelligent beings, ſuperior to man; as is ſhewn by St. Cyprian in his treatiſe of the vanity of idols, from the teſtimonies of Plato, Socrates, Triſmegiſtus, &c. They were acknowledged under different appellations; the Greeks calling them dæmons, and the Romans genii, or lares; and Epicurus ſeems to have been the only one among the old philoſophers who abſolutely rejected them.

Authors are not ſo unanimous about the nature as about the exiſtence of angels. Clemens Alexandrinus believed they had bodies; which was alſo the opinion of Origen, Cæſarius, Tertullian, and ſeveral others. Athanaſius, St. Baſil, St. Gregory Nicene, St. Cyril, St. Chryſoſtom, &c. hold them to be mere ſpirits. It has been the more current opinion, eſpecially in later times, that they are ſubſtances entirely ſpiritual, that can, at any time, aſſume bodies, and appear in human or other ſhapes.

Eccleſiaſtical writers make an HIERARCHY of nine orders of angels. Others have diſtributed angels into nine orders, according to the names by which they are called in Scripture, and reduced theſe orders into three hierarchies; to the firſt of which belong ſeraphim, cherubim, and thenes; to the ſecond, dominions, virtues, and powers; and to the third, principalities, archangels, and angels. The Jews reckon four orders or companies of angels, each headed by an archangel; the firſt order being that of Michael, the ſecond of Gabriel, the third of Uriel, and the fourth of Raphael. But though the Jews believe them to be but four, yet it ſeems, from ſome intimation in Scripture, that there were ſeven. Rev. iv. v. viii. 2.

By the ancient councils men are forbidden to frame or give particular names to angels; the only names owned by the church are Michael, Gabriel, and Raphael, to which is ſometimes added Uriel. Du-Cange.

Before the Babyloniſh captivity, the Jews did not know the name of any angel; at leaſt we find none mentioned in the books written before this event. Calmet. Dict. Bib. Authors are divided as to the time of the creation of angels; ſome will have it to have been before the creation of our world, or even before all ages, that is from eternity; this is Origen's opinion, who, according to Leontius, held that all ſpirits, angels, devils, and even human ſouls, were from eternity.

Others hold angels to have been created before the world, yet not from eternity; of which opinion are Nazianzen, and others. Others again maintain that they were created at the ſame time with our world, but on what day is diſputed. Theodoret and Epiphanius fix their date from the firſt day.

Good *angels* are called *angels of light*, and *guardian angels*; and thoſe on the contrary, who are the *devil's* miniſters, *angels of darkneſs*, and *fallen angels*.

That angels are divine meſſengers employed on particular occaſions for executing the divine will, has been a very prevalent opinion; but what is their ſphere of action, and how far it extends, it is not eaſy to determine. Amongſt the Jews it ſeems to have been a firm belief and tradition, that every man had a tutelary or guardian angel from his

birth; and our Saviour ſeems to refer to this opinion in Matth. xviii. 10. The heathens were alſo of the ſame perſuaſion, and thought it a crime to neglect the admonitions of ſo divine a guide. Socrates publicly confeſſed himſelf to be under the direction of Sufet, an angel or daemon, as did alſo Plotinus and others; on this tutelar genius of each perſon, they believed his happineſs and good fortune depended. The ancient Perſians ſo firmly believed the miniſtry of angels, and their ſuperintendence over human affairs, that they gave their names to their months, and the days of their months, and aſſigned them diſtinct offices and provinces; and it is from them the Jews acknowledge that they have received the names of the months and angels, which they brought with them when they returned from the Babyloniſh captivity: after which we find they alſo aſſigned charges to the angels, and, in particular, the patronage of empires and nations; Michael being the prince of the Jews, as Raphael is ſuppoſed to have been of the Perſians. Hyde Rel. Vet. Perſ. c. 19 and 20.

As to the fallen angels, it is not known at what time and for what offence they incurred the diſpleaſure of the Almighty, and plunged themſelves into an abyſs of wickedneſs and miſery. The time in which this event took place is generally imagined to have preceded the creation of the world; and ſome have accounted for it by the ſuppoſition, that the angels, being informed of God's purpoſe to create man after his own image, and to dignify his nature by Chriſt aſſuming it, and thinking their glory to be thus eclipſed, envied the happineſs of man, and ſo revolted; and with this opinion that of the Mahometans has ſome affinity, who are taught that the devil, who was once one of thoſe angels who are neareſt to God's preſence, and named Azazil, forfeited Paradiſe for refuſing to worſhip or pay homage to Adam at the command of God. But whatever was the occaſion, or the mode by which it was manifeſted, pride ſeems to have been the leading ſin of the angels, and it ultimately terminated in rebellion and apoſtacy. Of theſe fallen angels there is ſuppoſed to have been a great number; and it is apprehended that there was ſome kind of gradation or ſubordination among them; one being conſidered as their prince, and called by ſeveral names, Belzebub, Satan, or Sammach, by the Jews; Aharimian by the Perſians; and Eblis by the Mahometans.

The Scripture uſes the term angel to denote other beings, or agents, beſides thoſe ſpirits that occupy a rank and dignity ſuperior to man. Accordingly it has been a concurrent opinion of the Hebrew and Samaritan ſchools, that the word angel does not only mean a ſpirit, but ſometimes alſo all ſorts of powers or inſtruments which God is pleaſed to uſe, and by means of which he acts. So that the elements of the world, fire, air, winds, and ſtorms, in particular viſion, and, in the language of Scripture, are called "angels of the Lord, which do his will." In this ſenſe is to be underſtood the expreſſion of the Pſalmiſt (Pſ. civ. 4.), who maketh his angels ſpirits, his miniſters a flame of fire," *i. e.* who maketh winds his angels, and lightnings his meſſengers. Moreover the Scriptures call a dream, a viſion, a voice from heaven, a plague, a burning wind, "Angels of God:" and whatſoever God is pleaſed to do by them is ſaid to be done by an "Angel of the Lord." For whatever declares God's will, or performs his pleaſure, is "his angel." In the New Teſtament we find mention of an angel, by which God puniſhed the blaſphemous pride of Herod. Acts, xii. 23. We find another mention of an angel moving at certain ſeaſons the pool of Bethesda. John, v. 4. In the Old Teſtament we have alſo mention of an angel deſtroying the numerous army of Sennacherib. 2 Kings, xix. 35. The puniſhment inflicted on David for his ſin in numbering the people, is deſcribed (1 Chron. xxi. 15.), by God's ſending an angel to Jeruſalem to deſtroy it, &c. Daniel alſo aſcribes his deliverance in the lion's den to an angel. Dan. vi. 22. By the angel, in Acts, xii. 23. interpreters have underſtood the extraordinary diſtemper which proved fatal to him. In the caſe of David the peſtilence inflicted upon Iſrael was the angel of God. See 2 Sam. xxiv. 15, 16. Thus the deſcent of the angel at the pool of Bethesda (John, v. 4.) may ſignify the extraordinary motion of the waters, which was the ſign of the miraculous virtue that attended them: although ſome interpreters conceive that the angel, in this caſe, was an officer or meſſenger deputed from the temple to ſtir the pool, and that the warm entrails caſt into it communicated the healing virtue to the waters. The angel of the Lord which went out and ſmote the camp of the Aſſyrians, ſeems to be explained by the promiſe of the prophet Iſaiah. 2 Kings, xii. 6, 7. In the account of Daniel's preſervation, "God ſent his angel," ſeems immediately explained in this ſenſe; "and hath ſhut the lions' mouths, that they have not hurt me." Dan. vi. 22. The effect was ſtopping the mouths of the lions; and in what way ſoever this was produced, under God's ſpecial direction and influence it may be ſaid to be done by his angel, though a ſeparate ſpirit had no concern at all in it. Thus alſo the Schechinah, or material ſymbol of glory, and the oracle from thence, may in this ſenſe be called the angel of the Lord, and it is ſo called in Scripture; and though the true God himſelf was the only ſpirit, or intelligent agent, who acted and manifeſted himſelf on the occaſion.

According to the opinion of thoſe who maintain the fall of angels, they are repreſented as being caſt out of heaven, abandoned to iniquity, and making it their buſineſs to ſeduce mankind, and taking pleaſure in doing them all kinds of injury. Others, however, among whom we may reckon Dr. Prieſtley, conſider the fall of angels as very problematical; and though it cannot be ſaid that the thing is abſolutely impoſſible, yet they conceive that it ſeems, upon the face of it, to be very improbable. Beſides, if ſuch exalted beings as theſe are ſuppoſed to have ſinned, and to have thereby become obnoxious to the divine diſpleaſure, what end, they aſk, could it anſwer to them to be ſo aſſiduous in ſeducing mankind? Indeed, upon the ſuppoſition that their exiſtence and torments were to be everlaſting, it may be conceived to give them a kind of gloomy ſatisfaction to have "brethren in iniquity," for their companions in their ſufferings. Prieſtley's Inſtitutes, vol. ii. p. 433. Bekker, of Amſterdam, maintains, that the word tranſlated "angels" in Jude, v. 6. and alſo 2 Pet. ii. 4. ſhould be "meſſengers;" adding, that here is no reference to fallen angels, but to the hiſtory of the perſons ſent out by Moſes to ſpy out, and make report of the land of Canaan; and to their falſe and wicked account, ſo as to diſcourage their countrymen from obeying the divine command.

Angel is more particularly applied to a perſon who ſuſtained any particular character or commiſſion. Accordingly there was an officer of the Synagogue, among the Jews, ſays Prideaux (Conn. vol. ii. 513.), who officiated in offering up the public prayers to God for the whole congregation, and who, as the mouth of the congregation, delegated as its repreſentative, meſſenger, or angel, ſpeaks to God in prayer for them, was therefore in the Hebrew language called "Sheliach Zibbor;" that is, "the angel of the church." He was alſo, according to Dr. Lightfoot, called פקיד, or *epiſcopus*, becauſe he overlooked the reader of the law.

In the Apocalypſe, the denomination *angel* is alſo given to

to the paſtors of ſeveral churches: who are called the *angel* of the church of Epheſus, the *angel* of the church of Smyrna, &c. This name, according to Prideaux (*ubi ſupra*), was borrowed from the ſynagogue. For as the Sheliach Zibbor, in the Jewiſh ſynagogue, was the prime miniſter to offer up the prayers of the people to God, he was alſo the biſhop who preſided over the church, the prime miniſter to offer up the prayers of the people to God in the church of Chriſt. Du-Cange adds, that the ſame name was anciently given to certain popes and biſhops, by reaſon of their ſingular ſanctity, &c.

Angel is alſo uſed, in *Commerce*, for an ancient gold coin ſtruck in England; ſo called, from the figure of an angel impreſſed upon it. It weighed 4 pennyweights, and was 23½ carats fine.

Its value in 1 Hen. VI. was 6*s*. 8*d*., in 1 Hen VIII. 7*s*. 6*d*., in 34 Hen. VIII. 8*s*. in 6 Edw. VI. it was 10*s*., in 2 Eliz, it was 10*s*. and in 23 Eliz. the ſame. And the *half angel*, or, as it was ſometimes called, the *angelot*, was the moiety of this; and the *quarter angelot* proportionable.

The angel now ſubſiſts no otherwiſe than as a money of account, denoting 10*s*.

The French have alſo had their *angels*, *demi-angels*, and *angelots*; but they are now diſuſed.

Angel-*fiſh*, in *Ichthyology*, the Engliſh name of the ſqualus ſquatina of Linnæus; the French call it *ange*. See Squatina.

Angel, or Angles *Road*, in *Geography*, lies on the ſtarboard ſide of Milford Haven, within the rocks, in the mid-channel of the haven to the eaſt.

ANGELA, or Onguela, a town of Africa, in the kingdom of Barca, ſituate towards Egypt. Its territory, though moſtly deſert, hath good water, and produces dates.

ANGELIC, or Angelical, ſomething belonging to, or that partakes of the nature of *angels*.

We ſay an *angelical* life, &c. St. Thomas is ſtyled the *Angelical Doctor*. The *angelical* ſalutation is called by the Romaniſts *Ave Maria*; ſometimes ſimply *angelus*.

Angelic *garment*, Angelica *veſtis*, among our *Anceſtors*, was a monkiſh garment which laymen put on a little before their death, that they might have the benefit of the prayers of the monks.

It was from them called *angelical*, becauſe they were called *angeli*, who by theſe prayers *animæ ſaluti ſuccurrebant*. Hence, where we read the phraſe *monachus ad ſuccurrendum* in our old books, it muſt be underſtood of one who had put on the habit when he was at the point of death.

ANGELICA, in *Botany*, a genus of the *pentandria digynia* claſs and order, and of the natural order of *umbellatæ*, or *umbelliferæ*. Its characters are, that the *calyx* has an univerſal umbel, manifold, and roundiſh, and partial, when flowering, exactly globular; the univerſal involucre three or five-leaved, ſmall; partial, eight-leaved, and ſmall; proper, perianth five-toothed, ſcarcely obſervable; the *corolla* univerſal uniform, floſcules all fertile; partial, petals five-equal, lanceolate, flattiſh, incurved, and caducous; the *ſtamina* have ſimple filaments, larger than the corolla, and ſimple anthers: the piſtillum has a germ, inferior ſtyles reflex, and ſtigmas obtuſe, no *pericarpium*; fruit roundiſh, angular, ſolid, and bipartile; *ſeeds* two, ovate, flat on one ſide, and margined; convex on the other, ſcored with three lines. Martyn enumerates ſix, and Gmelin ſeven ſpecies. 1. A. *archangelica*, ang. ſativa of Miller, garden angelica, with the odd leaflet of the leaves lobed. The root is thick, fleſhy, and reſinous; the ſtalk is erect, about the height of five feet, ramous, hollow, round, ſmooth, and furrowed; the leaves are ternate and pinnated, leaflets are ovate-lanceolate, acute, gaſhed, and acutely ſerrated, ſmooth, ſubdecurrent, with the odd one tripartite; the petiole at the baſe is membranaceous, nervous, very much dilated and ventricoſe; the umbels globoſe and multiradiate; the umbellules denſe and hemiſpherical; the involucres conſiſting of a few linear deciduous leaflets; the involucella ſuboctophyllous, linear-lanceolate and ſhort; the calyx ſmall, the petals ovate, inflex, and whitiſh-green; the fruit elliptic-roundiſh, compreſſed, and acutely ribbed. It is a native of the northern parts of Europe, and was cultivated here in 1568. With us it is found at Broadmoore, about ſeven miles north-weſt from Birmingham, is biennial, and flowers in September. In a cultivated ſtate, ſays Withering, this is ſuppoſed to be the garden angelica, which is uſed in ſome diſtilled waters, and candied by the confectioners.

Mr. Miller makes a diſtinct ſpecies of the angelica, which grows naturally in Hungary, and ſome parts of Germany; about twice the ſize of the common ſort, with much larger leaves, more deeply ſawed on the edges, with the umbels much larger, and the flowers yellow. 2. A. *ſylveſtris*, water A. or wild A. with leaflets equal, ovate-lanceolate and ſerrate; the ſtem erect, about four feet high, round, ſmooth, and folioſe; the leaves bipinnate, and ſubglaucous, with leaflets ovate, diſtinct, acutely ſerrated, and ſerratures mucronate; the umbels hemiſpheric and multiradiate; the umbellules denſe; the involucres ſubdiphyllous, and very narrow, and ſometimes none; the involucels polyphyllous and ſetaceous; the calyx ſcarce viſible; the petals ovate, inflex, and fleſhy, and the fruit ſmall: it is perennial, found in moiſt woods and hedges, and by the ſides of rivers, and flowers in July. 3. A. *verticillaris*, with leaves very much divaricate, leaflets ovate and ſerrate, and ſtem verticelled, with peduncles; a native of Italy and Sileſia, introduced in 1774 by M. Richard. 4. A. *atropurpurea*, purple A. with the outermoſt pair of leaves coadjoined, and the terminal leaf petioled; a native of North America, and cultivated by Mr. Miller in 1759. 5. A. *lucida*, ſhining A. with leaflets equal, ovate, and gaſh-ſerrate; a native of Canada, flowers in June, and the ſeeds ripen in Auguſt. 6. A. *Razulii*, panax alpina, &c. of Bocc. with leaves bipinnate, leaflets lanceolate, ſerrate, and decurrent; a native of the Apennines and Piedmonteſe mountains, found on the former by M. Raſouls, an apothecary at Perpignan, whence its trivial name. 7. A. *lobata*, with the inferior leaves biternate; the leaflets petiolate, ovate, and ſerrate; the ſuperior ternate. 8. A. *integrifolia*, with the leaflets entire and petiolate. Martyn's Miller. Gmelin. Willdenow. Smith. Flor Brit.

Culture. All the ſorts may be increaſed by ſeeds. The common angelica delights in a moiſt ſoil, in which the ſeeds ſhould be ſown ſoon after they are ripe; and when the plants are about ſix inches high, they ſhould be tranſplanted at a large diſtance, about three feet aſunder, on the ſides of ditches or pools of water. In the ſecond year they will flower, and their ſtems may be cut down in May, and heads will be put out from the ſides of the roots, and thus they may be continued for three or four years; but if they had been permitted to ſeed, their roots would periſh ſoon after. If they are permitted to ſeed, they laſt but two years.

Dietetic and medical uſes. The ſtalks of garden angelica were formerly blanched, and eaten as celery. The young ſhoots are in great eſteem among the Laplanders. In Norway bread is ſometimes made of the roots. The gardeners near London, who have ditches of water in their gardens, propagate great quantities of this plant, which they ſell to the confectioners, who make a ſweet-meat with the tender

ſtalks

ſtalks cut in May. Bohemia and Spain are ſuppoſed to produce the beſt: the college of London formerly directed the roots brought from Spain only to be kept in the ſhops. Linnæus, however, aſſures us, that the plant proves moſt vigorous on its native northern mountains, and gives a decided preference to the root dug here either early in the Spring, or late in the Autumn. The roots of angelica are one of the principal aromatics of European growth, though not much regarded in the preſent practice. They have a fragrant agreeable ſmell, and a bitteriſh pungent taſte; on being chewed they are firſt ſweetiſh, afterwards acrid, and leave a glowing heat in the mouth and fauces, which continues for ſome time. The ſtalk, leaves, and ſeeds appear to poſſeſs the ſame qualities, though in an inferior degree. Dr. Lewis ſays, that on wounding the freſh root early in the Spring, it yields, from the inner part of the bark, an unctuous, yelloviſh, odorous juice, which, gently exſiccated, retains its fragrance, and proves an elegant, aromatic, gummy reſin. Rectified ſpirit extracts the whole of the virtues of the root; water but very little; and, in diſtillation with the latter, a ſmall portion of very pungent eſſential oil may be obtained. The Laplanders extol the utility of angelica, not only as food but as medicine. For coughs, hoarſeneſs, and other diſorders of the breaſt, they eat the ſtalks roaſted in hot aſhes; they alſo boil the tender flowers in dairy milk till it attains the conſiſtence of an extract; and they uſe this to promote perſpiration in catarrhal fevers, and to ſtrengthen the ſtomach in diarrhæa, &c. According to the explanations of Sir John Pringle, the herb is antiſeptic, but the efficacy of the leaves is ſoon loſt by drying them. The ſeeds alſo, which come neareſt to the roots, can ſcarce be kept till the Spring after they are gathered, without the loſs of their vegetative power, as well as a diminution of their medicinal virtue. Theſe are the only part of the plant which is ordered by the London College, and that only in compound ſpirit of aniſeed. The aromatic quality of the root is more conſiderable than that of any other part; but as many other ſimples ſurpaſs angelica in aromatic and carminative powers, it is ſeldom employed in the preſent practice. All the parts of the wild angelica are ſimilar in quality to thoſe of the former ſpecies, but rather weaker, and the former may be more eaſily procured. Cows, goats, and ſwine eat it, but horſes refuſe it. Lewis. Murray. Woodville.

ANGELICA. See ÆGOPODIUM, CHÆROPHYLLUM, CICUTA, LASERPITIUM, SELINUM, and SMYRNIUM.

ANGELICA *rue*. See ARABIA.

ANGELICA *water* is one of the compound waters of the ſhops; thus called from the *angelica* root, which is the chief ingredient in the compoſition, and the moſt active part of that plant. Neumann.

ANGELICA *grana*, a technical name given to Anderſon's Scots pills.

ANGELICA was alſo a celebrated dance among the ancient Greeks, performed at their feaſts.

It was thus called, from ἀγγελος, *nuncius*, *meſſenger*, becauſe, as Pollux aſſures us, the dancers were dreſſed in the habit of meſſengers.

ANGELICI, an ancient order of knights, inſtituted in 1191, by Iſaacus Angelus Flavius Comnenus, emperor of Conſtantinople.

They were divided into three claſſes, but all under the direction of one grand maſter. The firſt were called *torquati*, from a collar which they wore, and theſe were fifty in number. The ſecond were called the *knights of juſtice*, and were eccleſiaſtics. And the third were called *knights ſervitors*.

Juſtiniani will have this order to have been inſtituted in the year 313, by Conſtantine; and ſuppoſes the occaſion thereof to have been the appearance of an angel to that emperor, with the ſign of a croſs, and theſe words, *In hoc ſigno vinces*; but that there was ſuch a thing as any military order in thoſe days, is a mere fable.

ANGELICI, in *Eccleſiaſtical Hiſtory*, were alſo a ſect of ancient Chriſtians. St. Auguſtin ſuppoſes them thus called from their yielding an extravagant worſhip to angels, and ſuch as tended to IDOLATRY; though Epiphanius derives the name from their holding, that the world was created by angels.

ANGELINA *zanoni acoſtæ*, in *Botany*. This is a tree of vaſt ſize, ſometimes above ſixteen feet thick, growing on rocky and ſandy places in Malabar, in the Eaſt Indies. It bears ripe fruit in December, and continues bearing for a whole century.

The dried leaves heated, are ſaid to alleviate pains and ſtiffneſs in the joints, and diſcuſs an intumeſcence of the *teſtes* occaſioned by a contuſion, or any external violence; as alſo an *hydrocele*, or *pneumatocele*. It is efficacious likewiſe in ſome venereal complaints, and hæmorrhoidal fluxes.

ANGELIO, PETER, in *Biography*, a modern Latin poet, was born in 1517, at Barga, a caſtle of Tuſcany, and hence uſually called Bargæus. Having made a great proficiency in Latin and Greek at the early age of ten years, he was prevented from purſuing his ſtudies by the loſs of his parent, and obliged to enter into the army. Afterwards, however, he renewed his application to literature, and ſtudied law under Alciatus, at Bologna. But he was obliged to leave this place on account of ſome ſatirical verſes which he wrote, and to go to Venice, where he was employed by William Pellicier, the French ambaſſador, in correcting the Greek MSS. which were copied for his ſovereign Francis I. In 1542 he removed to Conſtantinople, where his life was brought into danger by his zeal for the honour of his own nation, which urged him to kill a Frenchman who ſpoke diſreſpectfully of it. From hence he eſcaped firſt to Genoa, and then to Milan; and from Milan he removed to Reggio, in Lombardy, and accepted an invitation to become public preceptor of Greek in that place. After a reſidence here of three years, he was invited by Coſmo I. duke of Florence, to a profeſſorſhip, firſt of belles lettres, and afterwards of the ethics and politics of Ariſtotle, in the univerſity of Piſa, where he continued 17 years. During his abode in this place, he defended it, with the aid of the ſcholars of the univerſity, againſt an attack of Peter Strozzi, in the war of Sienna. In 1575 he was invited to Rome by the Cardinal Ferdinand de Medici, who entertained him liberally at his court, and recompenſed him for the dedication of his poems, with a donation of 2000 gold florins. His latter days he ſpent at Piſa, living at eaſe on the munificence of his ſovereign; and he died there in 1596. His works in Italian and Latin, both proſe and verſe, are numerous; but to his Latin performances he chiefly owes his reputation. In five books of miſcellaneous Latin poems, he has happily imitated the ſtyle of Catullus. His "Cynegeticon," or Chace, in ſix books, firſt printed in 1568, and ſaid to be the labour of 20 years, is reckoned one of the beſt ſpecimens of modern Latinity, and highly commended by Lombin, De Thou, and Poſſevin. His "Syrias," an epic poem in 12 books, on the expedition of Godfrey of Bouillon to the Holy Land, was compoſed in his old age, and though it poſſeſſes elegance, it wants the majeſty required for ſuch a theme.

ANGELITÆ, *Angelites*, in *Eccleſiaſtical Hiſtory*, certain Chriſtians, thus denominated from *Angelium*, the name of a place in Alexandria, where their firſt aſſemblies were held.

The

The *Angelites* appear to have been the same with what are otherwise called *Severites*, sometimes *Theodosiani* and *Damianistæ*, from the names of their leaders: sometimes also *Tabellionistæ*.

They made their first appearance in the time of the emperor Anastasius, and pope Symmachus, about the year of Christ 494.

The distinguishing tenets of the angelitæ were, that the several persons of the Trinity had no distinct essence, substance, or deity, but only a subsistence or deity in common, or indivisible among them.

ANGELL, in *Geography*, a river of North Wales, which runs into the Dovey.

ANGELN. See ANGLEN.

ANGELLO, *Port of*, is an harbour on the South Sea coast, in the middle between St. Pedro and Capolita; a broad open bay with good anchorage, but bad landing; and the Spaniards reckon it as good a harbour as Guatulis.

ANGELO, ST. a small but strong town of Italy, in the Capitanata. There are several other towns and castles of the same name in Italy, particularly the castle of St. Angelo at Rome. N. lat. 41° 43'. E long. 15° 56'.

ANGELO *Monte, St.* a small port in N. lat. 41° 42', and E. long. 16° 11', within Cape Vestice on the west side of the gulf of Venice, is so called from a high mountain within the cape, and the first land made after entering the gulf.

ANGELO *Rio, St.* lies on the coast of Brasil, to the northwest from Cape St. Augustine, and is a large opening, without depth of water, blocked up with shoals, and rendered useless for navigation.

ANGELO BUONARÒTI, MICHAEL, a celebrated painter, was born in the territory of Arezzo, in Tuscany, in 1474, and educated at Florence, where, pursuing the bent of his natural genius for sculpture and painting, in opposition to the remonstrance of his parents, he became, at the age of 14, the disciple of Dominico Ghirlandaio, who has gained great reputation by the artists which his school produced. Michael Angelo soon became superior to his instructor; and such was his uncommon merit, that Lorenzo de Medici took him into his service, and employed him in founding an academy at Florence for painting and sculpture; and also in executing several noble works, particularly in statuary, which gained him universal applause. By the death of his patron, and the disturbances which happened at Florence, he was obliged to quit the city; but he soon returned, and finished that incomparable figure of David with his sling, out of a large block of marble, which is deemed his master piece, and worthy of the hand of an antique artist. The distinguishing excellence of this great master was sculpture; and he was the first painter who communicated to the artists of Italy a taste for what is grand and elevated, and enabled them to abandon the dry, stiff manner of Perugino and others. Although he cannot be commended for his colouring, yet the grandeur, elevation, and sublimity of his ideas, the exquisite taste of his design, and the justness of some of his expressions, established his fame, notwithstanding many imperfections which have been imputed to him as a painter. He wanted elegance in the contours of his figures, and purity of outline; his attitudes are not always beautiful or pleasing; and he was, as Fresnoy observes, bold even to rashness, in which he often succeeded.

His acquaintance with anatomy qualified him for shewing every limb and joint of the human body, and the insertion, as well as the power of every muscle, with great precision; but in consequence of his anatomical skill, he was apt to give too great a strength and swell to the muscular parts. However, it is said, that Raphael himself derived improvement from observing the grand ideas of Buonaroti, though he far excelled him in elegant simplicity, grace, and nature.

The most capital performances of this extraordinary genius are "The Crucifixion," and "The Last Judgment," which is the ornament of the chapel of Sixtus V. in the Vatican. This picture employed him eight years; and as every muscle and limb are distinctly and curiously marked, the figures are entirely naked. This circumstance induced Biagio of Cesenna, the pope's master of ceremonies, to observe, that such an exhibition of naked figures was more suitable to a brothel than a chapel. But Michael Angelo revenged himself for this sarcasm, by painting the portrait of Biagio exceedingly like, representing him as a dæmon, with ass's ears, encircled with a large serpent, and placing him in hell. The pope frequently intreated Buonaroti to deliver his master of the ceremonies from this place of torment; but he made this excuse, that he might have been released if he had only been in purgatory, but as he was in hell there was no redemption for him.

A late judicious traveller, having viewed that famous composition with a most critical attention, and proportionable admiration, says, that while he stood before it his blood was chilled, and he felt as if all he saw was real; and the very sound of the painted trumpet seemed to pierce his ears. The composition, however, though grand, is not without perceptible faults. The faces express passions of the strongest kind, and communicate them to the beholders; but the bodies are of too gross an appearance. Indeed the face of our Saviour possesses a dignity, which language cannot describe; it has an astonishing mixture of divine sweetness and severity, which could only be happily expressed by the pencil of Angelo. M. Angelo discontinued painting in the 75th year of his age; and as he died at Rome in the 90th year of his age, A. D. 1563, he was splendidly interred in that city at the expence of Cosmo, duke of Tuscany; but by order of this prince, his remains were secretly conveyed to Florence, and deposited, with great funeral pomp, in a magnificent monument, enriched with three marble statues, representing Painting, Sculpture, and Architecture. Pilkington's Dict. Keysler's Travels, vol. ii. p. 150.

Sir Joshua Reynolds, in the spirited and masterly sketch which he has given of the character of M. Angelo in his "Discourse delivered to the Students of the Royal Academy," Dec. 10, 1790, describes him "as the exalted founder and father of modern art, of which he was not only the inventor, but which he, by the divine energy of his own mind, carried at once to its highest point of possible perfection." "M. Angelo (says this excellent artist and judge of merit,) possessed the poetical part of the art to a most eminent degree; and his mechanical excellence invigorated and emboldened his mind to carry painting into the regions of poetry, and to emulate that art in its most adventurous flights. M. Angelo equally possessed both the mechanical and poetical qualifications; yet of the former there were certainly great examples to be found in ancient sculpture, and particularly in the fragment known by the name of the Torso of Michael Angelo; but of that grandeur of character, air, and attitude, which he threw into all his figures, and which so well corresponds with the grandeur of his outline, there was no example; they could therefore proceed only from the most poetical and sublime imagination." "Were I now to begin the world again," says the ingenious president of the Royal Academy, "however unequal I feel myself to that attempt, I would tread in the steps of that great master: to kiss the hem of his garment, to catch the slightest of his perfections, would be glory and distinction enough

enough for an ambitious man. I feel a ſelf-congratulation in knowing myſelf capable of ſuch ſenſations as he intended to excite. I reflect, not without vanity, that theſe diſcourſes bear teſtimony of my admiration of that truly divine man; and I ſhould deſire that the laſt words which I ſhou'd pronounce in this academy, and from this place, might be the name of Michael Angelo."

Angelo Amerigi Da Caravaggio, Michael, was born at the village of Caravaggio, in the Milaneſe, in 1569, and became the author of that ſtyle in which he painted, which was ſtrong, and had a powerful effect, by the bold oppoſition of his lights and ſhadows. His ſtyle of painting was ſo new, and ſo ſurpriſing, that moſt of his contemporaries, ſuch as Domenichino, Guido, and Guercino, ſtudied to imitate it. His chief excellence conſiſted in colouring, but his attitudes are ill choſen, his figures inelegantly diſpoſed, and his compoſitions manifeſt no fixed idea of grace or grandeur; nevertheleſs, ſome of his pictures are truly fine, and admirably finiſhed with great mellowneſs of pencil. At firſt he painted fruit and flowers; but he afterwards devoted his whole attention to hiſtorical compoſitions and portraits. In the church of St. Martin, at Naples, there is a capital picture by Caravaggio, repreſenting "Peter's denial of his Maſter," with figures at half length, and large as life. The maſter-piece of all his works, viz. "The Intombing of Chriſt," is now in the Louvre at Paris. He died in 1609, aged 40. Pilkington.

Angelo, Michael, called De Campidoglio, was born at Rome in 1610, and diſtinguiſhed by the appellation Campidoglio, from an office which he held in the capitol at Rome. He was the diſciple of Fioravanti, and peculiarly excelled in painting fruit and flowers. He died at the age of 60.

Angelo Cerquozzi, Michael, called Di Battaglia, was born in 1600, and denominated Di Battaglia from the excellence of his ſtyle in painting battles. He alſo painted fruit with ſuch taſte as rendered his performances, in this way, famous through Europe. He poſſeſſed ſo lively an imagination, and ſo ready a pencil, that he never ſketched his deſigns, but merely marked them on the canvas as his fancy directed, and gradually retouched them, till he gave them their utmoſt perfection. He lived to the age of 60 years.

Angelo Colonna, Michael, was born at Ravenna in 1600, and ſtudied architectural painting under Girolamo Carti, called Dentone, in which branch of his profeſſion he arrived at a conſiderable degree of eminence. In concurrence with Curti he enriched a great number of chapels and convents with various works. Philip IV. invited him to the court of Spain, where he was reſpected and encouraged; and he was alſo highly eſteemed at the courts of Modena, Florence, Paris, and Parma. His principal works are grand compoſitions in the churches and convents of Italy, and in the palaces of the nobility. Pilkington.

ANGELOLATRIA, from *αγγελος, angel*, and *λατρευω, I worſhip*, the ſuperſtitious worſhip or adoration of angels.

ANGELOLOGIA, from *αγγελος* and *λογος, diſcourſe*, the doctrine or ſcience of angels, their nature, office, &c. Gerhard has publiſhed a ſacred Angelologia, Muſæus an apoſtolical Angelologia.

Some uſe the term Angeloſophia in a ſenſe much the ſame. A. Varennius has given an Angeloſophia.

ANGELOGRAPHIA, from *αγγελος* and *γραφω, I deſcribe*, a deſcription of angels, their orders, names, diſcipline, &c. This amounts to much the ſame with what others call angelologia. Caſmannus and Manitius have publiſhed Angelographies.

ANGELONI, Francis, in *Biography*, an hiſtorian and antiquary of the 17th century, illuſtrated the Roman hiſtory by medals, in a work publiſhed at Rome, in folio, in 1685, and entitled "Hiſtoire Auguſte par les Medailles depuis Julius Cæſar juſq'a Conſtantin le Grand." He alſo wrote a "Hiſtory of Terni," his native country, printed in 4to. at Rome, in 1649; where he died in 1652. Nouv. Dict. Hiſt.

ANGELOS, Los, in *Geography*. See Tlascala.

Angelos, Puebla de los, or the *city of angels*, a town of Mexico, and new capital of the province of Los Angelos or Tlaſcala, ſupplies the place of the ancient city of Tlaſcala, which is now dwindled to a poor inconſiderable village, and ſituated not far from it. It lies in N. lat. 19° 30′, and W. long. 99° 10′, on the river Zacatula, in a fine valley, about 25 leagues to the eaſtward of Mexico. In the middle is a beautiful ſpacious ſquare, from whence run the principal ſtreets in a direct line, which are croſſed by others at right angles. One ſide is almoſt entirely occupied by the magnificent front of the cathedral, and the other three conſiſt of arcades, under which are the ſhops of tradeſmen. The city is the ſee of a biſhop, ſuffragan to the archbiſhop of Mexico. The number of inhabitants is computed at 60,000. In the town there are a mint, and glaſs-houſe, and a manufacture of excellent ſalt; and the adjacent valley produces vines and all ſorts of European fruits. In the neighbourhood are ſeveral kinds of mineral waters.

ANGELOT, an ancient Engliſh gold coin, ſtruck at Paris while under ſubjection to the Engliſh. It was thus called from the figure of an angel ſupporting the ſcutcheon of the arms of England and France. There was another coin of the ſame denomination ſtruck under Philip de Valois.

Angelot is alſo uſed, in *Commerce*, to denote a ſmall, fat, rich ſort of cheeſe, brought from Normandy.

Skinner ſuppoſes it to have been thus called, from the name of the perſon who firſt made it up in that form, and perhaps ſtamped it with his own name. Menage takes it to have been denominated from the reſemblance it bears to the Engliſh coin called *angelot*. It is made chiefly in the Pays de Bray, whence it is alſo denominated *angelot de Bray*. It is commonly made in vats, either ſquare or ſhaped like a heart.

ANGELUS, in the *Church Hiſtory* of France, denotes a prayer to the Holy Virgin, beginning with this word, inſtituted by John XXII. in the year 1326, and to be recited every day, morning, noon, and night. Lewis XI. eſtabliſhed in France the practice of repeating it at noon; and he obtained from the pope an indulgence of 300 days for all the faithful who, at three o'clock, ſhould rehearſe three times on their knees an Ave Maria for the preſervation of the king and kingdom. They began, toward the cloſe of the year 1330, to uſe the angelus in an evening before they put out their fires; this prayer they entitled the pardon, on account of the indulgences attached to it.

ANGELY (L'), in *Geography*, a town of Germany, in the circle of Weſtphalia and biſhopric of Liege, four miles ſouth-weſt of Charleroy.

ANGEN, a ſmall town of Lower Auſtria, belonging to the count of Peltzburg.

ANGER. Hutcheſon defines anger, a propenſity to occaſion evil to another, ariſing upon an apprehenſion of an injury done by him; or, as archdeacon Paley defines it, anger is the pain we ſuffer upon the receipt of an injury or affront, with the uſual effects of that pain upon ourſelves.

Anger is either deliberative or inſtinctive; and the latter kind is raſh and ungovernable, becauſe it operates blindly without affording time for deliberation or fore-ſight. Biſhop Butler (ſermon viii.) very juſtly obſerves, that anger is far from

from being a ſelfiſh paſſion, ſince it is naturally excited by injuries offered to others, as well as to ourſelves; and was deſigned by the Author of Nature not only to excite us to act vigorouſly in defending ourſelves from evil, but to intereſt us in the defence or reſcue of the injured and helpleſs, and to raiſe us above the fear of the proud and mighty oppreſſor. "Be ye angry, and ſin not," is a ſcripture caution; and this ſuppoſes that all anger is not ſinful, becauſe ſome degree of it, and, upon ſome occaſions, is inevitable. It becomes ſinful, however, when it is conceived upon ſlight and inadequate provocations, and when it continues long. The cautions and precepts relating to anger evidently ſuppoſe, that this paſſion is within our power; and this power conſiſts in ſo mollifying our minds by habits of juſt reflection, as to be leſs irritated by impreſſions of injury, and to be ſooner pacified. Such reflections as the following, as they conduce to this purpoſe, may be conſidered as the ſedatives of anger, *viz.* the poſſibility of miſtaking the motives from which the conduct that offends us proceeded; how often *our* offences have been the effect of inadvertency, when they are conſtrued into indications of malice; the inducement which prompted our adverſary to act as he did, and how powerfully the ſame inducement has, at one time or other, operated upon ourſelves; that he is ſuffering perhaps under a contrition, which he is aſhamed, or wants opportunity, to confeſs; and how ungenerous it is to triumph by coldneſs or inſult over a ſpirit already humbled in ſecret; that the returns of kindneſs are ſweet, and that there is neither honour, nor virtue, nor uſe, in reſiſting them—for ſome perſons think themſelves bound to cheriſh and keep alive their indignation, when they find it dying away of itſelf. We may remember that others have their paſſions, their prejudices, their favourite aims, their fears, their cautions, their intereſts, their ſudden impulſes, their varieties of apprehenſion, as well as we: we may recollect what hath ſometimes paſſed in our own minds, when we have got on the wrong ſide of a quarrel, and imagine the ſame to be paſſing in our adverſary's mind now; when we became ſenſible of our miſbehaviour, what palliations we perceived in it, and expected others to perceive; how we were affected by the kindneſs, and felt the ſuperiority of a generous reception and ready forgiveneſs; how perſecution revived our ſpirits with our enmity, and ſeemed to juſtify the conduct in ourſelves, which we before blamed. Add to this, the indecency of extravagant anger; how it renders us, whilſt it laſts, the ſcorn and ſport of all about us, of which it leaves us, when it ceaſes, ſenſible and aſhamed; the inconveniences and irretrievable miſconduct into which our iraſcibility has ſometimes betrayed us; the friendſhips it has loſt us; the diſtreſſes and embarraſſments in which we have been involved by it; and the ſore repentance which on one account or other it always coſts us.

But the reflection calculated above all others to allay that haughtineſs of temper which is ever finding out provocations, and which renders anger ſo impetuous, is that which the Goſpel propoſes, namely, that we ourſelves are, or ſhortly ſhall be, ſuppliants for mercy and pardon at the judgment-ſeat of God. Imagine our ſecret ſins diſcloſed and brought to light; imagine us thus humbled and expoſed; trembling under the hand of God; caſting ourſelves on his compaſſion; crying out for mercy—imagine ſuch a creature to talk of ſatisfaction and revenge; refuſing to be intreated, diſdaining to forgive; extreme to mark and to reſent what is done amiſs; imagine this, and you can hardly bring to yourſelf an inſtance of more impious and unnatural arrogance. Paley's Philoſ. vol. ii. chap. vii. p. 261, &c.

Phyſicians and naturaliſts relate ſome very extraordinary effects of this paſſion. Borrichius cured a woman of an inveterate tertian ague, by putting the patient into a violent fit of anger. The ſame paſſion has been excited with ſalutary influence in paralytic, gouty, and even dumb perſons; and theſe laſt have, in ſome caſes, recovered the uſe of ſpeech. Etmuller, among other inſtances of ſingular cures wrought by anger, mentions a perſon, who, being afflicted with the gout, was provoked by his phyſician to a great degree, and thus cured. In ſome caſes this paſſion, unduly excited, has proved mortal. Valentinian the Firſt, Wenceſlaus, Matthius Corvinus king of Hungary, and others, have fallen ſacrifices to it. Inſtances might alſo be mentioned in which it has produced the epilepſy, jaundice, cholera morbus, diarrhœa, &c.

Anger, indeed, is of ſuch a nature, that it quickly throws the whole nervous ſyſtem into preternatural commotions by a violent ſtricture of the nervous and muſcular parts: and ſurpriſingly augments not only the *ſyſtole* of the heart, and of its contiguous veſſels, but alſo the tone of the fibrous parts in the whole body. It is alſo certain, that this paſſion, by the ſpaſmodic ſtricture it produces in the parts, exerts its power principally on the ſtomach and inteſtines, which are highly nervous and membranous parts; whence the ſymptoms are more dangerous, in proportion to the greater conſent of the ſtomach and inteſtines with the other nervous parts, and almoſt with the whole body.

The unhappy influence of anger likewiſe, on the biliary and hepatic ducts, is very ſurpriſing; ſince by an intenſe conſtriction of theſe, the liver is not only rendered ſcirrhous, but ſtones alſo are often generated in the gall-bladder, and biliary ducts; theſe accidents have ſcarcely any other origin than an obſtruction of the free motion and efflux of the bile, by means of this violent ſtricture. From ſuch a ſtricture of theſe ducts likewiſe proceeds the jaundice, which in proceſs of time lays a foundation for calculous concretions in the gall-bladder. Laſtly, by increaſing the motion of the fluid, or the ſpaſms of the fibrous parts by means of anger, a larger quantity of blood is propelled with an *impetus*, to certain parts; whence it happens, that they are too much diſtended, and the orifices of the veins diſtributed there, opened. It is evident from experience that anger has a great tendency to excite enormous hæmorrhages, either from the noſe, the aperture of the pulmonary artery, the veins of the arms; or in women from the uterus; eſpecially in thoſe previouſly accuſtomed and diſpoſed to ſuch evacuations.

For the influence of this paſſion on the perſpiration and urine of human bodies, ſee PERSPIRATION, &c.

ANGER, in *Geography*, a town of Germany, in the duchy of Stiria, 12 miles north-north-eaſt of Graz.

ANGER is alſo a town of Germany, in the archduchy of Auſtria, eight miles ſouth of St. Polren.

ANGERAP, a river of Pruſſia, which runs into the Pregel, near Georgenburg.

ANGERBACH, a river of Germany, which runs into the Havel, near Potzdam.

ANGERBURG, a modern, well-built, and flouriſhing town of Pruſſia, in a government of the ſame name. It is defended by a ſtrong caſtle built in 1335 upon the bank of a lake, which is the ſource of the river Angerap. This lake, ſeven German miles long, and one and a half broad, is of great ſervice to the town, and abounds with eels. In 1725 an arch-preſbytery was founded here, which has 12 churches under its juriſdiction. The beſt Pruſſian manna is produced in the environs of Angerburg.

ANGERMANLAND, or ANGERMANNIA, a province of Sweden, bounded on the north by Bothnia and Lapland,

on the east by the gulf of Bothnia, on the south by Medelpad, and on the west by Jamtland and Hafjendalen. Its extent is about 150 Swedish miles in length, and 16 in breadth. It abounds with forests and mountains; amongst the latter of which is the high mountain called Skula, the most considerable. The soil, however, is fruitful, and in some parts produces excellent corn. The district on the south side of Angermanland river yields rye, peas, linseed, flax, and good hay; and the low lands afford good pasture for cattle. There are also several iron works, and lakes abounding with fish. This province maintains 6 ships for the royal navy, and consists of a lieutenant-judicature, and two vogteys. It is the residence of the superintendent of this diocese, which is the first in rank, and divided into two provostships. The superintendency or bishoprick consists of the provinces of Angermanland, Medelpad, Jamtland, Hafjendalen, and the whole government of West Bothnia, Kremilapmark excepted, which belongs to the diocese of Abo. The province is divided into the north and south parts.

ANGERMANLAND *River*, is one of the largest rivers in the whole kingdom of Sweden, being about a league in breadth at its entrance the gulf of Bothnia, and navigable for small vessels several Swedish miles into the continent. The salmon-fishery in this river affords extraordinary profits to the country.

ANGERMUND, a town of the duchy of Courland, in the district of Pilten, 16 miles north-east of Pilten.

ANGERMUND is also a town and prefecturate of Berg, in Westphalia, situate on the rivulet of Anger.

ANGERMUND, NEW, a town of Germany, in the circle of Upper Saxony, and uckermark of Brandenburg; 36 miles north-east from Berlin. N. lat. 53° 1′. E. long. 14° 1′.

ANGERN, a small place, with a church and iron-works, in the prefecture of Tuckum, and duchy of Courland.

ANGERO, a town of Italy, in the kingdom of Naples, and Principato Citra; 11 miles west north-west from Salerno.

ANGERONA, in *Mythology*, a pagan deity of the Romans, similar to the Harpocrates of the Egyptians, and the Sigalion of the Greeks, supplicated by them for relief under the quinzy or angina. This deity is denominated by Pliny the "Goddess of Silence and Calmness of Mind," because she banished all uneasiness and melancholy. She is represented with her mouth closed, and a finger applied to it, to denote patience, and the suppression of complaint. Her statue was set up in the temple of the goddess Volupia, and was intended a moral allegory, intimating that patience under affliction led to subsequent and certain pleasure.

ANGERONALIA, in *Antiquity*, solemn feasts held by the Romans, the 21st of December, in honour of Angerona, or Angeronia, the goddess of patience and silence.

Festus and Julius Modestus, quoted by Macrobius, Saturn. lib. i. cap. 10. derive the name from *angina, squinancy*; and suppose the goddess to have been thus denominated, because she presided over that disease. Others suppose it formed from *anger, grief, pain*; to intimate that she gave relief to those afflicted therewith. Others deduce it from *ango, I press, I close*; as being reputed the goddess of silence, &c.

ANGEROT, in *Geography*, a small town of Westphalia, in the duchy of Berg, situated near the fall of the Anger into the Rhine, nine miles north from Dusseldorp.

ANGERS, anciently *Juliomagus* and *Andegavium*, a city of France, and capital of the department of the Mayne and Loire, situate on the Mayne, and divided by it into two parts, communicating with each other by two bridges. Before the revolution it was the capital of Anjou and the see of a bishop, suffragan to the archbishop of Tours: its university was founded by St. Lewis in 1246, by whom also its castle, seated on a steep rock, was built; and its academy of the belles lettres in 1685. The first walls of this city were built by John, king of England, who was count of Anjou in 1214, but destroyed by Louis VIII. and rebuilt by his son, in their present form, in 1232; the city has 16 parishes, and several religious houses; the cathedral is venerable for its age, and beautiful with regard to its structure; the houses are covered with the black slate procured from the quarries of Angers, and hence Angers is called "The Black City." The manufacture of Angers before the revolution consisted of camblets, serges, and mixed stuffs, and it carried on a considerable trade in other commodities. Its population is estimated at 300,000 inhabitants. It is distant 22 leagues west from Tours, 18 north-east from Nantes, and 67 south-west from Paris. N. lat. 47° 28′ 8″. W. long. 0° 33′ 52″.

ANGERVILLE, a small town of France, in the department of the Seine and Oise, and chief place of a canton, in the district of Etampes, and four leagues distant from it.

ANGERVILLE is also a town of France, in the department of the Lower Seine, and chief place of a canton, in the district of Montivilliers, and two and a half leagues north-east from it.

ANGETENAR, in the *Arabian Astronomy*, denotes a fixed star of the fourth magnitude, in the body of Cetus, or the whale.

ANGHIERA, in Latin ANGLIERA, in *Geography*, a town of Italy, in the duchy of Milan, and capital of a county of the same name, established by the emperor Wenceslaus in 1397, and situate at the foot of the Alps. It is well peopled, and has a good trade, and the adjacent country is fertile. It is directly opposite to Aroua, and separated from it by the lake called Lago Magiore. N. lat. 45° 18′. E. long. 8° 19′.

ANGIGLOSSII, from ἀγχω, *constringo*, and γλωσσα, *lingua*, denote those who speak with difficulty, hesitation, or even stammering.

ANGILDUM, in our *Old Writers*, denotes a simple gild, that is, the simple value of the man, or other thing.

The word is compounded of the Saxon, *an, one*, and *gild, payment, price*, or *compensation*.

In this sense, *angildum* stands contradistinguished from *twigildum, a double compensation*; *trigildum, a triple compensation*.

ANGINA, in *Medicine*, an inflammation about the muscles of the *larynx* or *pharynx*, attended with an acute fever, difficulty of swallowing, and danger of suffocation.

The word is derived immediately from the Latin *ango, I vex*, formed of ἀγχω, *suffoco, strangulo*. See CYNANCHE.

ANGINA *lini*, in *Botany*, a name used by some of the later Greek writers, to express what the more ancient writers of this nation called *linozostis*, and the Latins *epilinum*; this was the *cuscuta* or *dodder* growing on the flax, as that on the thyme was called *epithymum*. It was called *angina lini*, the *quinzy* of flax, from its choaking that plant.

ANGINA *pectoris*, in *Medicine*, a name given to a disease, dangerous and not extremely rare, first described by Dr. W. Heberden, and so called from the seat of the disorder, and the sense of strangling and anxiety with which it is attended. The doctor's account of it is in the second volume of the London Medic. Transf. p. 59. &c. See also Medic. and Phil. Comment. vol. ii. p. 95. The patient, while walking, especially if soon after eating, is affected with a painful sensation in his breast; at first, it is removed by his standing still, but afterwards it does not go off so suddenly: it comes

on

on in bed, obliges the patient to get up, and continues for an hour and more; ſometimes, though rarely, it attacks the patient ſtanding or ſitting ſtill. It is brought on by trivial accidents, coughing, &c. or any ſlight diſturbance. In ſome it is worſe in Winter, in others in Summer. The pulſe, ſometimes at leaſt, is not diſturbed. People affected with it often die ſuddenly, but ſome continue ſubject to it for upwards of 20 years. The patient commonly refers the *ſeat* of his complaint to the ſternum, or to a line running acroſs the middle of the ſternum; and a pain in the middle of the left arm ſometimes accompanies it.

The *cauſe* of this diſtreſſing malady was not underſtood till lately, it being often ſuppoſed a ſpaſmodic affection, or a caries of the ſternum; but it is now believed to be an oſſification of the coronary arteries which ſupply the muſcular ſubſtance of the heart with blood. This change of ſtructure renders the heart unequal to the taſk of circulating the unuſual quantity of blood thrown upon it by bodily exertions or paſſions of the mind; and hence it is that theſe are the exciting cauſes of the diſtreſs, in the early ſtages of the diſeaſe.

The *prognoſis* muſt generally be unfavourable; but ſeveral means may be employed to diminiſh the ſufferings of the patient, or to poſtpone the fatal iſſue of the diſeaſe. Theſe are temperance in eating and drinking, and abſtinence from violent exerciſe and paſſions. As angina pectoris commonly attacks perſons diſpoſed to *obeſity* and *plethora*, theſe ſtates ſhould be avoided by a ſuitable regimen, and occaſional bleeding and purging. The circulation ſhould alſo be kept as equable as poſſible in every part of the ſyſtem, by warm clothing, and avoiding the cauſes of local congeſtion. Wine, or other cordials, taken at bed-time, prevent or weaken night-fits, but opium is the moſt effectual relief; ten, fifteen, or twenty drops of the Thebaic tincture, taken at bed-time, may be ſafely continued as long as requiſite.

This diſeaſe has been accurately deſcribed, and ſuitable preventives or remedies propoſed, by Dr. Fothergill. Med. Obſ. and Inq. vol. v. p. 233. 252.; and Dr. C. H. Parry, of Bath, has publiſhed an "Inquiry into the Symptoms and Cauſes of the Syncope Anginoſa, commonly called Angina pectoris," 8vo. 1799. This work contains every thing then known on the ſubject.

ANGIOLELLO, John Maria, in *Biography*, an hiſtorian, of the 16th century, was a native of Vicenza, and followed the young ſultan Muſtapha, to whom he was a ſlave, in 1573, into Perſia, in the dreadful war carried on by Mahomet II. at the head of nearly 200,000 men. As an eye-witneſs of the events of this war, he wrote "A Hiſtory of Mahomet II." in the Italian and Turkiſh languages, dedicated to the ſultan, freely written, and yet well received and liberally rewarded. A work, "Of the Life and Actions of the King of Perſia," was printed at Venice, under the name of this writer in 1553; and he alſo wrote, in Italian, "A Relation of the Life and Actions of Uſſun Caſſan." Gen. Dict.

ANGIOPTERIS, in *Botany*. See Onoclea.

ANGIOSPERMIA, a term uſed by Linnæus, to expreſs the ſecond order of the *didynamiæ* plants, which have their ſeeds not lodged naked within the cup as in the *gymnoſpermia*, but incloſed in a capſule, and adhering to a receptacle in the middle of a pericarp. The claſs of *didynamia* contains the labiated and perſonated plants. The angioſpermia are the perſonated, the others the labiated kind. In this order many of the corollas are perſonate, or labiate, with the lips cloſed; ſome, however, have bell-ſhaped, wheel-ſhaped, or triangular corollas.

To have ſeeds incloſed in a pericarp is common to all, and hence the name of the order *angioſpermia*. In moſt of the genera the calyxes are quinqueſid; in ſome, however, they are biſid; one triſid, in many quadriſid, and in two multiſid. This order, in Gmelin's edition of Linnæus, contains 87 genera. See Didynamia.

ANGITAS, in *Ancient Geography*, a river of Thrace, which runs from the north-eaſt, and diſcharges itſelf into the Strymon, above Amphipolis.

ANGITIÆ Lucus, or Nemus, a foreſt of Italy, ſituate near the Lacus Fucinus. Pliny calls the inhabitants Lucenſes. Angitia was the ſiſter of Medea and Circe, and was regarded as a goddeſs, becauſe ſhe preſcribed antidotes againſt poiſon and the bites of ſerpents. The name was probably derived from anguis, a ſerpent, a ſpecies of animals which abounded in this place. This foreſt is mentioned by Virgil (Æn. viii. v. 659.), and by Silius Italicus (lib. viii. v. 498.), and was ſituated in the country of the Marſi.

ANGITULA, a ſmall river of Italy in Brutium, which diſcharged itſelf into the Thermaic gulf, near Nepita.

ANGLE, Angulus, in *Geometry*, the aperture or mutual inclination of two lines, meeting in a point.

Such is the angle BAC (*Plate* II. *Geometry*, *fig.* 15.) formed by the lines AB and AC, meeting in the point A.—The lines AB, and AC, are called the legs or the ſides of the angle; and the point of interſection, the vertex or angular point.

Angles are ſometimes denoted by a ſingle letter affixed to the vertex, or angular point, as A; and ſometimes, when ſeveral angles have the ſame vertex, by three letters, that of the vertex being in the middle, as BAC.

The meaſure of an angle, by which its quantity or magnitude is expreſſed, is an arc, DE, deſcribed from its vertex A, with any radius at pleaſure between its legs, AC and AB; and the meaſure of the angle depends merely on the inclination of the lines by which it is formed, and not on the length of the radius, or the extent of the arc that bounds it.

Hence angles are diſtinguiſhed by the ratio of the arcs which they thus ſubtend to the circumference of the whole circle.—And thus an angle is ſaid to be of ſo many degrees, as are the degrees of the arc DE, by which it is meaſured.

Hence alſo, ſince ſimilar arcs AB and DE, (*fig.* 16.) have the ſame ratio to their reſpective circumferences; and the circumferences contain each the ſame number of degrees; the arcs AB and DE, which are the meaſures of the two angles ACB, and DCE, are equal; and therefore the angles themſelves muſt be likewiſe equal. Hence, again, as the quantity of an angle is eſtimated by the ratio of the arc ſubtended by it to the periphery, it is of no importance what radius that arc is deſcribed with; but the meaſures of equal angles are always either equal arcs, or ſimilar ones; and contrarily.

It follows, therefore, that the quantity of the angles remains ſtill the ſame, though the legs be either produced or diminiſhed.—And thus in ſimilar triangles, and in ſimilar figures, the homologous or correſponding angles are alſo equal.

The *taking or meaſuring of angles* is an operation of great uſe and extent in ſurveying, navigation, geography, aſtronomy, &c. The inſtruments chiefly uſed for this purpoſe are quadrants, ſextants, octants, theodolites, circumferentors, &c.

Mr. Hadley has invented a new and excellent inſtrument for taking angles, uſeful where the motion of the object, or any circumſtance cauſing unſteadineſs in the common inſtruments, renders the obſervations difficult or uncertain. Phil. Tranſ. N° 420, and N° 425. Mr. Dollond has likewiſe contrived

contrived an inſtrument for meaſuring ſmall angles. Phil. Tranſ. vol. xlvii. N° 74. See HADLEY'S QUADRANT and MICROMETER.

ANGLE, *to meaſure the quantity of an.*—1. On paper. Apply the centre of a protractor to the vertex of the angle C (*Plate* I. *Surveying, fig.* 1.), ſo that the radius CB may coincide with one of the legs: the degree ſhewn in the arc, by the other leg of the angle, will give the angle required. To do the ſame with a line of chords, ſee SECTOR. See GONIOMETRY.

2. On the ground.—Place a ſurveying inſtrument, *e. gr.* a ſemi-circle (*fig.* 2.), in ſuch a manner as that a radius thereof CG may lie over one leg of the angle, and the centre C over the vertex. The firſt is obtained by looking through the ſights F and G, towards a mark fixed at the end of the leg; and the latter, by letting fall a plumbet from the centre of the inſtrument. Then, the moveable index HI being turned this way and that, till through its ſights you diſcover a mark placed at the extreme of the other leg of the angle; the degree it cuts in the limb of the inſtrument ſhews the quantity of the angle.

To take the angle with a QUADRANT, THEODOLITE, PLAIN TABLE, CIRCUMFERENTOR, COMPASS, &c. See the ſeveral articles.

To plot or lay down any given angle, *i. e.* the quantity of the angle being given, to deſcribe it on paper. See PLOTTING and PROTRACTOR.

To biſect a given angle, as HIK (*Plate* I. *Geometry, fig.* 17.), from the centre I, with any radius at pleaſure, deſcribe an arc LM. From L and M, with an aperture greater than half LM, ſtrike two arcs mutually interſecting each other in N. Then drawing the right line IN, we have HIN =NIK.

To triſect an angle, ſee TRISECTION.

Pappus, in his Mathematical Collections, lib. iv. treats of angular ſections, and more particularly of triſections.

ANGLES are of various kinds and denominations.

With regard to the form of their legs, they are divided into *rectilinear, curvilinear,* and *mixed.*

ANGLE, *rectilinear,* or *right lined,* is that whoſe legs are both right lines: as BAC (*Plate* I. *Geometry, fig.* 15.).

ANGLE, *curvilinear,* is that whoſe legs are both of them curves.

ANGLE, *mixt,* or *mixtilinear,* is that, one of whoſe ſides is a right line, and the other a curve.

With regard to their magnitude, *angles* are again divided into *right, acute, obtuſe,* and *oblique.*

ANGLE, *right,* is that formed by a line falling perpendicularly on another; or that which ſubtends an arc of 90 degrees. Such is the *angle* KLM (*fig.* 18.)

The meaſure of a right angle, therefore, is a quadrant of a circle; and conſequently all right angles are equal to each other.

ANGLE, *acute,* is that which is leſs than a right angle, or than 90°—as AEC (*fig.* 19.).

ANGLE, *obtuſe,* is that greater than a right angle, or whoſe meaſure exceeds 90°—as AED.

ANGLE, *oblique,* is a common name both for acute and obtuſe angles.

With regard to their ſituation in reſpect of each other, *angles* are divided into *contiguous, adjacent, vertical, alternate* and *oppoſite.*

ANGLES, *contiguous,* are ſuch as have the ſame vertex, and one leg common to both.—Such are FGH and HGI (*fig.* 20.).

ANGLE, *adjacent,* is that made by producing one of the legs of another angle. Such is the angle AEC (*fig.* 19.), made by producing a leg, ED, of the angle AED, to C. Two *adjacent angles, x* and *y,* or any other number of angles made at the ſame point E, over the ſame right line CD, are together equal to two right ones; and conſequently to 180°. And hence one of two adjacent angles being given, the other is likewiſe given; as being the ſupplement of the former to 180°.

Hence alſo, to meaſure an inacceſſible angle in a field, take an adjacent acceſſible angle, and ſubtract that from 180°, the remainder is the angle required.

Again, all the angles *x, y, o,* E, &c. made round a given point E, are equal to four right ones; and therefore all make 360°.

ANGLES, *vertical,* or *oppoſite,* are thoſe whoſe legs are continuations of each other. Such are the angles *o* and *x,* (*fig.* 19.).

If a right line AB, cut another, CD, in E, the vertical angles, *x* and *o,* as alſo *y* and E, are equal. And hence, if it be required to meaſure, in a field, or any other place, an inacceſſible angle, *x;* and the other vertical angle, *o,* be acceſſible; this latter may be taken in lieu of the former.

ANGLE, *alternate* See ALTERNATE.

ANGLES, *external,* are the angles of any right-lined figure made without it, by producing all the ſides.

All the external angles of any figure, taken together, are equal to four right angles; and the external angle of a triangle is equal to both the internal and oppoſite ones.

ANGLES, *internal,* are the angles made by the ſides of any right-lined figure within the ſaid figure.

The ſum of all the internal angles of any right-lined figure is equal to twice as many right angles as the figure hath ſides, excepting four. This is eaſily demonſtrated from Euclid, prop. 32. lib. i.

The external angle of a trapezium inſcribed in a circle is equal to the internal oppoſite one; and the two internal oppoſite angles are equal to two right ones.

ANGLES, *homologous,* or *like,* are ſuch angles in two figures, as retain the ſame order from the firſt, in both figures.

ANGLE *at the periphery,* is an angle whoſe vertex and legs do all terminate in the periphery of a circle. Such is the angle EFD (*Plate* I. *Geom. fig.* 21.)

ANGLE *in the ſegment,* is the ſame with that at the periphery.

It is demonſtrated by Euclid, that all the angles in the ſame ſegment are equal to one another; that is, any angle EHD, is equal to any angle EFD in the ſame ſegment EFD.

The angle at the periphery, or in the ſegment, is comprehended between two chords EF and FD, and ſtands on the arc ED, and is meaſured by half that arc.

The meaſure of an angle without the periphery X (*fig.* 22.) is the difference between half the concave arc LM whereon it ſtands, and half the convex arc NO intercepted between its legs.

ANGLE *in a ſemicircle,* is an angle in a ſegment of a circle, whoſe baſe is the diameter of the circle.

It is demonſtrated by Euclid, that the angle in a ſemicircle is a right one; in a ſegment greater than a ſemicircle, it is leſs than a right one; and in a ſegment leſs than a ſemicircle, it is greater than a right one.

Since an angle in a ſemicircle ſtands on a ſemicircle, its meaſure is a quadrant of a circle; and therefore is a right angle.

ANGLE *of a ſemicircle,* is the angle which the diameter

of a circle makes with the circumference. The chief property of this angle is, that it is leſs than a right angle, and greater than any acute right-lined angle.

ANGLE *at the centre*, is an angle whoſe vertex is in the centre of a circle, and its legs terminated in the periphery thereof. Such is the angle CAB (*fig.* 21.).

The angle at the centre is comprehended between two radii, and its meaſure is the arc BC.

Euclid demonſtrates, that the angle at the centre BAC is double of the angle BDC, ſtanding on the ſame arc BC. And hence, half of the arc BC is the meaſure of the angle at the periphery.

Hence, alſo, two or more angles HLI, and HMI (*fig.* 23.) ſtanding on the ſame, or equal arcs, are always equal. All angles at the centre are proportional to the arcs upon which they ſtand, and ſo are likewiſe all angles at the circumference.

ANGLE *without the centre*, HKI, is that whoſe vertex K is not in the centre, but its legs HK and IK are terminated in the periphery.

The meaſure of an angle without the centre is half the ſum of the arcs HI and LM, whereon it and its vertical K ſtand when it is within the circle, or half the difference when it is without.

ANGLE *of contact*, is that made by the arc of a circle, or of any curve, and a tangent in the point of CONTACT.—Such is the angle IHK, (*fig.* 24.)

The angle of contact, in a circle, is proved by Euclid to be leſs than any right-lined angle; but from hence it does not follow, that the angle of contact is of no quantity, as Peletarius, Wallis, and ſome others, have imagined. V. Wall. Algeb. p. 71, &c. Clavius, on the other hand, rightly maintained, that it is not abſolutely nothing, but that it is of no magnitude compared with a right-lined angle, being a quantity of a very different nature: ſuch as a line with reſpect to a ſurface, or a ſurface with reſpect to a ſolid, &c. And ſince his time it has been proved by Sir Iſaac Newton, and others, that angles of contact may be compared with each other, though not with right-lined angles, and that the proportions which they bear to each other may be aſſigned. Thus, the circular angles of contact IHK, IHL, are to each other in the reciprocal ſubduplicate ratio of the diameters HM, HN; and the circular angle of contact may be divided by deſcribing intermediate circles into any number of parts, and in any proportion. And if, inſtead of circles, the curves be parabolas, and the point of contact H the common vertex of their axes, the angles of contact would in this caſe be reciprocally in the ſubduplicate ratio of their parameters. But elliptical and hyperbolical angles of contact would be reciprocally in the ſubduplicate of the ratio, compounded of the ratios of the parameters and the tranſverſe axes. Moreover, if TOQ (*fig.* 25.) be a common parabola to the axis OP and tangent VOW, whoſe equation is $x=y^2$, x being the abſciſs OP, and y the ordinate PQ, and the parameter being 1; and if OR, OS, &c. be other parabolas to the ſame axis, tangent and parameter, their ordinate y being PR, or PS, &c. and their equations $x=y^3$, $x=y^4$, $x=y^5$, &c.; then the ſeries of the angles of contact would be in ſucceſſion infinitely greater than each other; that is, the angle of contact WOQ would be infinitely greater than WOR, and this again infinitely greater than WOS, and ſo on infinitely. Beſides, between the angles of contact of any two of this kind, other angles of contact may be found *ad infinitum*, which ſhall infinitely exceed each other, and yet the greateſt of them be infinitely leſs than the ſmalleſt right-lined angle. Thus alſo $x^2=y^3$, $x^3=y^4$, $x^4=y^5$, &c. denote a ſeries of curves, of which every ſucceeding one makes an angle with its tangent infinitely greater than the preceding one; and the leaſt of theſe, *viz.* that whoſe equation is $x^2=y^3$, or the ſemicubical parabola, is infinitely greater than any circular angle of contact.

ANGLE *of a ſegment* is that made by a chord with a tangent, in the point of contact. Such are IHK (*fig.* 26.) the angle of the leſſer ſegment IMH, and IHL the angle of the greater ſegment INH. And the meaſure of each of theſe angles is half the alternate or ſupplemental ſegment, or it is equal to the angle in it; that is, the angle IHK=INH, and IHL =IMH.

ANGLES, *for the effects, properties, relations, &c. of, when combined into triangles, quadrangles and polygonous figures*, ſee TRIANGLE, QUADRANGLE, SQUARE, PARALLELOGRAM, POLYGON, FIGURE, &c.

ANGLES are again divided into *plane*, *ſpherical*, and *ſolid*.

ANGLES, *plane*, are thoſe above-mentioned; which are defined by the inclination of two lines in a plane, meeting in a point.

ANGLE, *ſpherical*, is an angle formed on the ſurface of a ſphere by the interſection of two great circles, or the inclination of the planes of two great circles of the ſphere.

For the properties of ſpherical angles, ſee SPHERICAL *Angle*.

ANGLE, *ſolid*, is the mutual inclination of more than two planes, or plane angles, meeting in a point, and not contained in the ſame plane. For the meaſure, properties, &c. of ſolid angles, ſee SOLID *Angle*.

We alſo meet with other leſs uſual ſorts of angles among ſome geometricians; as

ANGLE, *horned*, *angulus cornutus*, that made by a right line, whether a tangent or ſecant, with the periphery of a circle.

ANGLE, *lunular*, *angulus lunularis*, is that formed by the interſection of two curve lines; the one concave, and the other convex.

ANGLE, *ciſſoid*, *angulus ciſſoides*, is the inner angle made by two ſpherical convex lines interſecting each other. See CISSOID.

ANGLE, *ſiſtroid*, *angulus ſiſtroides*, is that which has the form of a SISTRUM.

ANGLE, *pelecoid*, *angulus pelecoides*, is that in figure of a hatchet. See PELECOIDES.

ANGLE, in *Trigonometry*. See TRIANGLE, and TRIGONOMETRY.

For the ſines, tangents, and ſecants of angles, ſee SINE, TANGENT, and SECANT.

ANGLE, in *Geography*, a town of France, in the department of Vendée, and chief place of a canton, in the diſtrict of Sables d'Olonne, ten miles weſt-ſouth-weſt from Luçon.

ANGLE is alſo a town of France, in the department of Vienne, and chief place of a canton, in the diſtrict of Mont Morillon, on the Creuſe, 25 miles eaſt from Poitiers.

ANGLE, in *Mechanics*. *Angle of direction*, is that comprehended between the lines of direction of two conſpiring forces. See DIRECTION.

ANGLE *of elevation*, is that comprehended between the line of direction of a projectile, and any plane upon which the projection is made, whether horizontal or oblique. Such is the angle RAB (*Plate* I. *Mechanics*, *fig.* 3.) which is comprehended between the line of direction of the projectile AR, and the horizontal line AB.

ANGLE *of incidence*, is that made by the line of direction of an impinging body, in the point of contact. Such is the angle DCA (*fig.* 4.)

ANGLE *of reflection*, is that made by the line of direction

of

of the reflected body, at the point of contact from which it rebounds. Such is the angle [illegible]

Angle, in *Optics*. *Visual*, or *Optic angle*, is the angle included between the two rays drawn from the two extreme points of an object to the centre of the pupil.—Such is the angle ABC (*Plate* I. *Optics*, *fig.* [illegible]) comprehended between the rays AB and BC. The apparent magnitude of objects is greater or less, according to the angle under which they appear. See Apparent Magnitude.

Objects seen under the same, or an equal angle, always appear equal.

The least *visible* angle, or the least angle under which a body can be seen, according to Dr. Hook, is one minute; though Dr. Jurin shews, that at the time of his debate with Hevelius on this subject, the latter could probably discover a single [illegible] But bodies are visible under [illegible] light or luminous. Dr. Jurin states the grounds of this controversy, and discusses [illegible] and indistinct [illegible]

Angle [illegible] is the angle subtended by two lines directed from the eye to those places.

Angle *of incidence*, in *Catoptrics*, is the lesser angle, made by an incident ray of light, with the plane of a speculum; or, if the speculum be concave or convex, with a tangent in the point of incidence. Such is the angle AED (*fig.* 3.) Or, as some define it, it is the angle which a ray of light makes with a perpendicular to that point of the surface of any *medium* on which it falls.

Every incident ray, AB, makes two angles, the one acute, ABD, the other obtuse, ABE; though sometimes both right. The lesser of such angles is the angle of incidence. See Incidence.

Angle *of incidence*, in *Dioptrics*, is the angle ABI (*fig.* 4.), made by an incident ray, AB, with a lens, or other refracting surface, HI.

Angle *of inclination*, is the angle ABD, contained between an incident ray, AB, and the axis of incidence, DB. See Axis, &c.

Angle *of reflexion*, } in *Catoptrics*. See Reflection.
Angle, *reflected*: }

Angle *of refraction*, } in *Dioptrics*. See Refraction.
Angle, *refracted*, }

Angle, in *Astronomy*. *Angle of commutation*. See Commutation.

Angle *of elongation*, or *Angle at the earth*. See Elongation.

Angle, *parallactic*. See Parallactic *angle* and Parallax.

Angle *at the sun*, is the *angle* under which the distance of a planet from the ecliptic is seen from the sun.

Angle *of the East*. See Nonagesimal.

Angle *of obliquity*, of the ecliptic, or the angle of inclination of the axis of the earth, to the axis of the ecliptic, is now nearly 23° 28′. By means of this inclination, such inhabitants of the earth as live beyond 45° of latitude, have more of the sun's heat, taking all the year round; and those who live within 45° have less of his heat, than if the earth always moved in the equinoctial. See Obliquity, and Ecliptic.

Angle *of longitude*, is the angle which the circle of a star's longitude makes with the meridian, at the pole of the ecliptic.

Angle *of right ascension*, is the angle which the circle of a star's right ascension makes with the meridian at the pole of the equator. See *Right* Ascension.

Angle *of Position*. See Position.

Angle, in *Navigation*. *Angle of the rhumb*, or *loxodromic Angle*. See Rhumb, and Loxodromy.

Angles, in *Fortification*, are understood of those formed by the several lines used in fortifying, or making a place defensible.

These are of two sorts; *real*, and *imaginary*. *Real angles* are those which actually subsist and appear in the works. Such are the *flanked angle*, the *angle of the epaule*, *angle of the flank*, and the *re-entering angle of the counterscarp*. *Imaginary*, or *occult angles*, are those which are only subservient to the construction, and which subsist no more after the fortification is drawn. Such are the *angle of the centre*, *angle of the polygon*, *flanking angle*, *saliant angle of the counterscarp*, &c.

Angle *of* or *at*, *the centre*, is the angle formed at the centre of the polygon, by two semidiameters drawn from the centre to two adjacent angles, and subtended by a side of it. Such is the angle CKF (*Plate Fortificat. fig.* 1.) This is found by dividing 360 degrees by the number of sides in the regular polygon.

Angle *of the circumference*, is the mixt angle made by the arc drawn from one gorge to the other.

Angle *of the counterscarp*, is that made by the two sides of the counterscarp, meeting before the middle of the curtin.

Angle *of the curtin*, or *of the flank*, is that made by, or contained between, the curtin and the flank; such is the angle BAE.

Angle *of the complement of the line of defence*, is the angle arising from the intersection of the two complements one with another.

Angle, *diminished*, is the angle which is made by the meeting of the exterior side of the polygon with the face of the bastion. Such is the angle BCF.

Angle *of the polygon*, is the angle GHM, intercepted either between the two internal sides GH, and HM, or the two external sides. This is the supplement of the angle at the centre, and is found by subtracting CKF from 180 degrees.

Angle *of the epaule*, or *shoulder*, is that formed by the flank and the face of the bastion. Such is the angle ABC.

Angle *of the interior figure*, is the angle GHM, made in H, the centre of the bastion, by the meeting in the innermost sides of the figure GH and HM.

Angle *of the tenaille*, or *flanking angle outward*, is that made by the two rasant lines of defence, *i. e.* the two faces of the bastion when prolonged.

Angle *flanking inward*, is the angle CIH, made by the flanking line with the curtin.

Angle, *flanked*, by some called the *angle of the bastion*, is the angle BCS, made by the two faces of the bastion, BC, CS; being the outermost part of the bastion, and that most exposed to the enemy's batteries, and therefore by some called the *point of the bastion*.

Angle *of the flank*, is that formed by the flank, and the curtin.

Angle *forming the flank*, is that consisting of one flank, and one demi-*gorge*.

Angle *forming the face*, is that composed of one flank, and one face.

Angle *of the triangle*, is half the angle of the polygon; or half the supplement of the angle at the centre.

Angle *of the moat*, is that made before the curtin, where it is intersected.

Angle,

ANGLE, *re-entering*, or *re-entrant*, is that whoſe vertex is turned inwards, towards the place.

ANGLE, *ſaliant*, or *ſortant*, is that which advances its point toward the field.

ANGLE *of the tenaille*, or *the outward flanking angle*, called alſo *the angle of the moat*, or *the dead angle*, is made by the two lines *fichant* in the faces of the two baſtions, extended till they meet in an angle towards the curtin. This always turns its point in towards the work.

ANGLE, *dead*, is a re-entering angle, which is not flanked or defended.

ANGLE *of a wall*, in *Architecture*, is the point or corner where the two ſides or faces of a wall meet.

ANGLE *Bar*, in *Carpentry*, is that which is perpendicular to the horizon, in the angle formed by any two faces of a bow-window, whoſe plan is a polygon.

ANGLE *Bracket* of a cove or cornice, is that which ſtands in a perpendicular plane, paſſing through the diagonal of the plan, ranging in every right line horizontally, directed along the edges of the common ribs that are fixed on either ſide of it.

ANGLE *Rib* of a groin, is that which ſtands in the perpendicular plane paſſing through the diagonal of the plan, and ranging in right lines in every horizontal direction with the common ribs that are fixed on either ſide of it. Theſe two laſt are the ſame in principle, their difference being only in the application; for their deſcription, ſee a GROIN.

ANGLEN, or ANGELEN, in *Geography*, a ſmall diſtrict of the duchy of Sleſwick, in Denmark, from 16 to 20 miles in length, and about as much in breadth, ſituate between Flenſburg and Sleſwick. ſee ANGLES.

ANGLER, a fiſherman, or other perſon who practiſes ANGLING.

Anglers are to be diſtinguiſhed from poachers. Some make the ſame difference between them, that is between the fair trader and ſmuggler. Accordingly the legiſlature has made the latter penal, but laid no reſtraint on the former. Angling can do no prejudice to the fiſh of a river. Anglers fiſh for their recreation, not for lucre; whereas poachers make it their livelihood.

ANGLER, in *Ichthyology*, the Engliſh name of the batrachos of Ariſtotle and Oppian, and the rana piſcatrix of Pliny and Ovid: a ſpecies of LOPHIUS.

ANGLERIA, PADRE CAMILLO DI CREMONA, in *Biography*, author of a muſical tract entitled, "Regole di Contrappunto," publiſhed at Milan 1622.

ANGLES *of a battalion*, in the *Military Art*, are thoſe ſoldiers that are placed where the ranks and files terminate. See BATTALION.

The angles of a battalion are ſaid to be *blunted*, when the ſoldiers at the four corners are removed, ſo that the ſquare battalion becomes octagonal; this was an evolution very common among the ancients, though now diſuſed.

ANGLES, in *Anatomy*, are underſtood of the *canthi*, or corners of the eye, where the upper eye-lid meets with the under.

That next the noſe is called the *great* or *internal*, and that towards the temples, the *leſs* or *external angle*, or CANTHUS.

ANGLES, in *Aſtrology*, denote certain houſes of a figure, or ſcheme of the heavens. Thus the horoſcope of the firſt houſe is termed the *angle of the eaſt*.

ANGLES, *Inſtruments for meaſuring horizontal*, in *Aſtronomy*. See HORIZONTAL.

ANGLES, in *Geography*, a town of France, in the department of the Herault, and chief place of a canton, in the diſtrict of St. Pons, three leagues weſt-north-weſt from St. Pons.

ANGLES, in *Hiſtory*, are ſaid to have been a tribe of the Suevi, who, in the time of Cæſar (Bell. Gall. lib. iv.), were the greateſt and braveſt of all the German nations. This tribe, after various adventures and migrations, ſettled in that part of the Cimbric Cherſoneſus, which now forms the duchy of Sleſwick, where ſome veſtiges of their name ſtill remain in the diſtrict of Anglen. The moſt probable etymology of the name deduces it from the Saxon "Angel or Engel," ſignifying "a fiſh-hook;" and intimating that the Angles were much addicted to piracy, and were ſo called by the neighbouring nations, becauſe, like fiſh-hooks, they caught all that was in the ſea. From theſe people the Engliſh are ſaid to have originated; for when they were ſolicited by the Britiſh ambaſſador to ſuccour their countrymen againſt the Scots and Picts, they embarked, with greater ſpirit and in greater numbers than any of the other German nations; and having expelled the Picts, and made themſelves maſters of the country, they had the honour of giving their name to England and its inhabitants. The reaſon, it is ſaid, why the name of Angles was preferred to that of Saxons ſeems to have been, becauſe it was more diſtinctive and more honourable: there being at that time a large nation of Saxons on the continent, who were in diſrepute on account of their manners, and the defeats which they had ſuffered from Charlemagne. It may be added, that the Angles conſtituted the greateſt part of Egbert's ſubjects: all the northern, eaſtern, and midland counties, being inhabited by them. Egbert publiſhed an edict, dated at Wincheſter in the year 827, aboliſhing the diſtinctions of Saxons, Jutes, and Engliſh, commanding all his ſubjects for the future to be called by the latter name only. Rapin's Hiſt. vol. i. p. 89.

ANGLESEA, or ANGLESEY, the Mona of Tacitus, in *Geography*, the Engliſh name for Môn, an iſland on the northern extremity of Wales, from which it is ſeparated only by a narrow channel, called the Menai. It is about 20 miles in length, by 17 miles in breadth; or as others ſay, 25 long, and 18 broad; and is one of the ſix counties of North Wales; which is divided into three hundreds: that is to ſay, Aber Fraw, with its townſhips of Llivon and Malltreath; Rhoſyr, with its townſhips of Tindaethwy and Menai; and Cemaes, with its townſhips of Twrcelyn and Talybolion. According to a late eſtimate Angleſea contains about 200,000 acres of land, and 20,000 inhabitants; and is divided into ſeven hundreds, 74 pariſhes, and four market towns; ſituate within the dioceſe of Bangor. The chief town is Beaumaris. The air is in general good, except when the thick fogs ariſe from the Iriſh ſeas; but in autumn it is cold and aguiſh. The ſoil, which, on the firſt aſpect, appears rocky and mountainous, is nevertheleſs fertile, and produces a number of cattle, and great quantities of corn, ſent annually to England. However much of the land lies undrained, and full of turfy bogs, or pointed rocks; and yet there are ſome rich farms in the interior and along the coaſt, particularly that which is oppoſite to Caernarvonſhire. The general face of the country is low, flat, and unpleaſant.

This iſland, which is known to the Welſh only by the name of Môn, obtained the appellation of Angleſey, among the Engliſh, from the following circumſtance: in the year 819, Egbert invaded North Wales; and after ravaging ſeveral diſtricts, he paſſed over into Mona; defeated the Welſh in a bloody battle near Beaumaris; and, in conſequence of his victory, he got poſſeſſion of the whole iſland. He was able to maintain himſelf there only for a ſhort time; being driven out by Mervyn, king of North Wales; nevertheleſs, the Engliſh ever after continued to call the place Angleſey, or the iſland of the Angles.

According to a curious hiſtorical document, contained in

the Britiſh Triads, this iſle once formed a part of the main land. The paſſage is to the following purport: "The three original iſlands adjoining to Britain were Orkney, Man, and Wight; and afterwards the ſea broke the land, ſo that Môn became an iſland; and in like manner Orkney was broken; ſo that there were formed a multitude of iſlands; and other places on the coaſts of Scotland and Wales were broken by the ſea, and became iſlands."

The book entitled Mona Antiqua Reſtaurata, was written by Rowlands, to prove that Angleſea was the metropolitan ſeat of druidiſm. An hypotheſis formed from the recital of the deſtruction of the druids there by Suetonius Paulinus; or probably ſuggeſted by a partiality for his native place, and certainly without duly weighing its title to that preeminence, for if he had done ſo, he muſt have diſcovered ſuch a poſition to be deſtitute of any ſolid foundation.

Nothing more ought to be inferred from the account of the Druids having been found by the Romans in Angleſey, than that they were overtaken in their retreat; for they always avoided the ſeat of war, agreeably to their principles; but here they did not expect the appearance of the enemy ſo ſuddenly, and very likely they had not the means time enough of retreating farther.

In the next place, that iſland does not abound with any monuments or remains, in ſufficient numbers to induce a belief of its having been the permanent centre of druidiſm; and in truth there is not perhaps a country in all Wales, but which abounds more with ſuch veſtiges than Angleſey.

It is alſo to be naturally ſuppoſed that the principal place of meetings would have been fixed upon in the moſt convenient ſituation for the different ſtates of Britain and of Gaul to attend; and free from the obſtructions of large rivers, and other obſtacles; whereas the iſle of Angleſey was peculiarly the reverſe of all this; and we muſt, therefore, ſeek elſewhere for the alma mater of the Bards, Druids, and Ovates.

The open grounds of Wiltſhire then neceſſarily draw our attention: there we find Avebury, the grand national circle of the Britons; and there too is it ſaid to be by the bardic Triads; and compared with this, no ſimilar work in the country bears any compariſon in grandeur and extent of deſign.

The glory of Mona muſt, therefore, be conſigned to its proper ſphere; for it never had a more extended orbit than it has now: in druidical times it had its ſmall provincial circles, as in the preſent day it has its pariſh churches.

The greateſt curioſity which Angleſea can boaſt, and the chief ſource of its wealth, is the Paris mountain, the name of which is moſt probably derived from the old Welſh word "Fraos," ſignifying "braſs," which might eaſily be corrupted into Paris. The copper-mines in this part of the iſland are ſuppoſed to have been known and worked by the Romans; a pool on the top of the mountain having been diſtinguiſhed, long before the preſent works were formed, by the name of the Mine-pool. The mine of this mountain is conſiderably more than a mile in circumference, and on an average 1500 men are conſtantly employed in it. It has the ſingular advantage of being worked in the open air; a circumſtance which expedites the labour, and ſecures the health of thoſe that are employed.

Abundance of vitriolic water is found in theſe works, which is ſo ſtrong as inſtantaneouſly to turn whatever ſteel or iron is dipped into it, to the colour and appearance of copper. This water is expoſed to the ſun in large open troughs, and the copper quality is extracted from it by a curious proceſs. Great quantities of ſulphur are alſo produced, and its ſublimation is carried on in various ſpots upon the mountain, till at laſt the whole is collected into ſome large boiling-houſes, and formed into rolls of brimſtone. The copper ore is then carried down to ſome ſmelting-houſes, conſtructed in the valley below near the ſea-ſide, where every remaining operation is performed with wonderful art and aſſiduity. Lead-ore, rich in ſilver, is alſo found in the ſame mountain; and in the north-weſtern part of the iſland is a quarry of green marble intermixed with aſbeſtos.

Angleſea ſends two members to the imperial parliament; one for the county, and one for Beaumaris.

ANGLESQUEVILLE, a town of France, in the department of the Lower Seine, and chief place of a canton, in the diſtrict of Dieppe, 16 miles north from Rouen.

ANGLIA, East, in *Hiſtory*, one of the kingdoms of the Heptarchy, founded by the Angles that landed on the eaſtern coaſts of Britain, under 12 chiefs, the ſurvivor of whom, Uffa, in 571, aſſumed the title of king of the Eaſt-Angles. This kingdom was bounded on the north by the Humber and the German Ocean, on the eaſt by the ſame ocean, on the ſouth by the kingdom of Eſſex, and on the weſt by Mercia. Its greateſt length was 80, and its greateſt breadth 55 miles. It contained the two counties of Norfolk and Suffolk, with part of Cambridgeſhire. The chief towns were Norwich, Thetford, Ely, and Cambrige. Earpwold, the fourth monarch of this kingdom, was converted to Chriſtianity by the influence of Edwin, king of Northumberland; but his wife, who was an idolatreſs, ſoon brought him back to her religion. After his death, and the interregnum that followed, Sigebert, who had been educated in France, reſtored Chriſtianity, and introduced learning among the Eaſt-Angles. Some pretend that he founded the Univerſity of Cambridge, or rather ſome ſchools in that place. Ethelbert, who was the laſt ſovereign of this kingdom, and who received his crown from Etheldred in 790, was treacherouſly murdered by Offa, king of Mercia, in 792, who ſeized his kingdom; and from that time Eaſt-Anglia was united with Mercia.

ANGLICA, in *Entomology*, a ſpecies of Pimelia, found in England very rarely. It is black, anterior part of the thorax roundiſh, wing-caſes ſtriated with dots, antennæ reddiſh at the apex. Gmelin. This is the deſcription of Fabricius, which Gmelin adopts. It was deſcribed by Fabricius in the ſpecies inſectorum, under the name Pimelia Morio; but in the laſt arrangement of inſects by that author, it is placed in the genus Helops, under the ſpecific name *Pimelia*. Gmelin makes a ſubdiviſion of the genus pimelia, under the name Helops, in which this ſpecies is included.—Alſo, a ſpecies of Chrysomela, found in England. It is blue-black, wing-caſes black, braſſy and ſtriated with dots; wings red. Forſt. Nov. Inſ.—Fabricius.

ANGLICANA, a ſpecies of Altica, in the Fabrician arrangement, and found in England. It is in general black, except the wing-caſes and ſhanks of the legs, which are pale. Fabricius.

ANGLICANÆ *guttæ*. See Guttæ.

ANGLICANUS *ſudor*. See Sudor.

ANGLICISM, a word, or phraſe, in the Engliſh idiom; or a manner of ſpeech peculiar to the Engliſh tongue.

ANGLICUS, in *Entomology*, a ſpecies of Cerambyx, found in England and France. It has a ſpinous thorax, and two oblique yellow ſtripes on the wing-caſes. Gmelin. This is the Fabrician deſcription, and in that arrangement it belongs to the Rhagium genus. It is alſo the leptura mordax of Degeer, and Stenocorus of Geoffroy.

ANGLING is a branch of fiſhing; or the art of catching fiſh by means of a rod, to which is attached a line, a hook, and a bait. It is more generally practiſed for amuſement than for profit, and is a ſport of conſiderable antiquity, and followed with the greateſt avidity by ſome perſons in every rank in life. It has ſome eminent advan-

tages over many other rural ſports; it is but little dangerous, incurs but little expence, and is productive of ſome profit. It is peculiarly fitted for the placid and thoughtful; nor need the gay and volatile deſpair of finding their attention engaged, while the more active mode of fly-fiſhing remains in uſe. Perhaps there are few purſuits that diſplay more elegant attitudes than that of throwing the fly; nor are there but few in which the expectation is ſo much kept alive, with ſo little bodily or mental exertion, as in this delightful branch of the art. On the other hand, ſimple float angling has its advantages likewiſe; for in this the infirm and aged may partake, and the ſolitary or recluſe may purſue the amuſement, without fear of the interruptions of the buſy or impertinent; here, likewiſe, the contemplative may combine relaxation with improvement, as few perſons have a greater opportunity of ſtudying nature in her varied garb than the angler.

The laws have ever been favourable to this purſuit, protecting the authoriſed fiſher, and puniſhing the depredations of the poacher. As early as Edward I. we find, that impriſonment and triple damages, were awarded againſt any treſpaſſers, if attainted at the ſuit of the party. 3 Ed. I. c. 20.

By Elizabeth it was enacted, that if any perſons wrongfully take or kill fiſh, from any ponds, &c. kept for the purpoſe of angling, he or they ſhall be impriſoned, pay triple damages, and find ſecurity for his or their good behaviour for ſeven years. 5 Eliz. c. 21. The 22d and 23d Car. II. c. 29. recites, that the uſe of an angle, net, hair, nooſe, troll, or ſpear, or the taking of fiſh in any way, or the being aiding therein, without the conſent of the owner, or lord of the manor, is forbidden; and that perſons ſo offending ſhall, on diſcovery and conviction thereof, have triple damages awarded againſt them, to be levied by diſtreſs. And in the ſame ſtatute it appears, that any juſtice of the peace is authoriſed to take and deſtroy every inſtrument uſed for theſe purpoſes. By the 4th and 5th W. III. c. 23. § 5, 6. no perſon was even to have or keep in his poſſeſſion any net, angle, or other engine for the taking or deſtroying of fiſh, other than the makers and ſellers thereof, and than the owners and occupiers of a river or fiſhery. And again, 5 Geo. III. c. 14. § 1, 2. not only perſons who entered any park or other ground fenced in, wherein there was any water containing fiſh, and ſtole thereout; but thoſe who receive and buy ſuch fiſh, ſhall be ſubjected, equally with the offenders, to ſeven years tranſportation. By the ſame act, the taking fiſh unlawfully from any water, not ſituated in encloſed ground, is puniſhable by the forfeiture of 5*l.*; but by the black act, the breaking down of the head and mound of any fiſh-pond, was made felony without benefit of clergy.

There is no art, the practice of which appears more ſimple, at firſt view, than that of angling; yet there are few that require more nicety and preciſion, nor is there any for which it is more difficult to give preciſe rules. There is a ſpecies of acquired knowledge, amounting to a knack, that conſtitutes a ſucceſsful angler, but which he can with difficulty impart to others.

The fiſh uſually caught by angling are the ſalmon, ſalmon fry, ſalmon trout, bull trout or ſcurf, ſewen or whitling, laſtſpring or ſhedder, mullet, ſmelt, barbel, flounder, eel; all which viſit the ſalt water. Thoſe which are likewiſe taken by this mode, and do not viſit the ſalt water, are the trout, grayling, pike or jack, perch, tench, carp, chub, bream, rudd, roach, dace or dare, gudgeon, bleak or whiting, minnow, loach, &c. which ſeveral fiſh ſee under their proper heads.

Theſe ſeveral fiſh require different tackle, baits of various kinds, and ſome are taken in one ſeaſon, while others are ſecured in another; of all which it is eſſentially neceſſary that the angler ſhould be aware, as well as of the particular weather favourable to the ſport.

The tackle made uſe of muſt be carefully attended to, the principal of which is the rod. An angler intending to fiſh at a diſtance from home, ſhould be furniſhed with two rods; if near home, he muſt ſtill carry a ſpare top, or he may be much inconvenienced. When two rods are taken, it is prudent to let one be of the cuſtomary form; the other may be a ſtrong cane, in the form of a walking-ſtick, which may prove uſeful in caſe of emergency. It ſhould be ſo contrived as to fit the ſtock of the landing-net, and it will moreover be uſeful in fording rivers, &c. It is neceſſary to conſider the ſize and nature of the fiſh in the choice of a rod. The larger kinds require one of conſiderable ſtrength, with the addition of a reel and running line, paſſing through rings or eyes placed on the rod from one end to the other. A fiſhing-rod ſhould be pliant, yet firm, with an eaſy play in the hand, and a regular bend, as though formed of one entire piece. Thoſe which are jointed with ferrules are the beſt, and for large fiſh, as ſalmon, it is proper that within each ferrule there ſhould be a male ſcrew, to fit into a female ſcrew, within the attached joint, by which means the rod is farther ſecured, and is certain of a regular play. In dry weather it is prudent to dip each joint in the water previouſly to introducing them to each other, and if any difficulty occurs in undoing them from the ſwelling of the wood, they ſhould be held over a candle or before the fire. A rod ſhould be kept neither too dry nor too moiſt; in the one caſe it becomes brittle, in the other it is rendered rotten. It ſhould be hung up with a weight attached to the end, by which it is kept from warping, and it may be varniſhed to preſerve it from worms. See FISHING-*rod*.

The angler ſhould farther have a variety of lines of various ſtrengths, and of colours adapted to the waters he ſports in, which is a caution of the utmoſt moment, and not in general ſufficiently attended to. Lines ſhould be coiled or wound on a cylinder. When wound, as is uſual, on a bit of ſplit cane, or flat ſtick, forked at the two ends, or on long line machines, the ſharp turns are apt to cut the gut or line. See FISHING-*lines*.

Hooks of various ſizes are neceſſary, attached and unattached, with floats of cork, of quills and of porcupine ſpears. Spare caps, ſplit ſhot, ſhoemaker's wax, bullets, plummets, are all likewiſe neceſſary; nor ſhould the angler forget a clearing-ring, which is uſeful in diſengaging the hook when entangled among weeds, or faſtened to a ſtump. It is formed of a heavy braſs or iron ring, of about two inches in diameter, with ſeveral yards of twine attached, and is made uſe of by paſſing it over the large end of the rod, and gently letting down the line to the obſtruction; when by pulling the twine, the hook will be either diſengaged, or it will be broken off without damage to the reſt of the line, by ſtraining it or the rod.

A diſgorger is likewiſe among the requiſites, as ſome fiſh by their eagerneſs ſwallow the hook with the bait; in which caſe, a piece of flat cane or wood, about ſix inches long, and half an inch wide, forked at the ends, and paſſed down the throat, removes the hook, by gently pulling the line. A landing-net will often be found neceſſary when a large fiſh is caught; thoſe are the beſt whoſe hoops fold up, and the handle may be the walking-ſtick rod before mentioned. All theſe, with any other neceſſary articles, may be taken in a baſket, firſt wrapped up in an oil ſkin caſe, when on the return, the fiſh in the baſket will not injure them. For the articles neceſſary for fly fiſhing, ſee FISHING-*fly*.

It may in this place be remarked, that the prudent fiſher will always be cloathed in grave colours, or at leaſt in ſuch as are not gaudy. For thoſe who wade much, but which is not a prudent method, a ſhort ſhooting-jacket is convenient. The experienced fiſherman will always likewiſe provide himſelf with ſpruits, in caſe of falling into the water or other accidents. There are many other ſmall articles alſo neceſſary, as twine, pliars, ſciſſars, a penknife; and it will be found uſeful always to be furniſhed with ſome trimmers, to act, if the ſport ſhould not prove ſo good as expected.

The baits made uſe of muſt be particularly attended to by the angler, he ſhould not only procure the beſt of every kind, but he muſt be careful to appropriate his bait to the fiſh he means to entrap, and likewiſe according to the various ſeaſons. He muſt ſelect ſuch articles to allure moſt, that nature gives at that particular time in the greateſt plenty. For the ſtomach of the fiſh is adapted to outward circumſtances, preferring food at one time that at others it wholly rejects, and this is more particularly the caſe in fly fiſhing. An excellent mode of judging what bait is moſt likely to allure any particular kind of fiſh is, when one is caught to open it, and examine the ſtomach, and whatever is found there will ſurely be the proper bait for others. It is ſaid, but with what truth we are not aware, that the eyes of other fiſh are a moſt excellent bait. Baits made uſe of in angling are of two kinds, the natural and artificial; the natural are whatever is eaten by the animal in a ſtate of nature, as ſmall fiſh, frogs, worms of moſt kinds, inſects in great varieties, as beetles, butterflies, all the tribe of Summer flies, moths, waſps, hornets, graſshoppers, maggots of various kinds, and ſnails; vegetables are uſed with ſucceſs, as wheat, barley, peas, beans, &c.: artificial baits are the forming of whatever imitates the natural food of the animal, as the making and painting ſmall fiſh, and the imitating flies of various kinds, which latter forms a very conſiderable and intricate branch of the art. See FLY-*fiſhing*. Artificial baits are likewiſe various compoſitions in the form of paſte: paſtes are made with dough, bread, all kinds of flour mixed with honey, ſuet, butter, oil, &c. and in mixing theſe, it is found uſeful to add a little cotton, tow, or lint, to make the paſte more adheſive. The ſpawn of other fiſh is frequently uſed as a bait with ſucceſs, and it is very commonly potted for this purpoſe.

Ground-bait is a previous method made uſe of by anglers to induce fiſh to frequent particular ſpots; ſome are in the habits of throwing this kind of bait into particular places every now and then, by which they are almoſt certain of finding ſport among the fiſh who reſort to this favoured place. Others only do it in the evening, or even an hour before they angle. Ground baits are of grains, barley, moiſtened bread, raſpings, blood mixed with chopped liver, &c. In running ſtreams a tin box is introduced, bored with holes, with a plummet to ſink it, and a line to draw it back at pleaſure, the worms, crawling through theſe holes gradually, are a great inducement to the fiſh to hover about the ſpot. All the recipes of fœtid oils and other allurements are uſeleſs. See FISHING-*baits*.

The proper ſeaſons for angling are from the Spring to the Autumn, but much depends on the kind of fiſh angled for; ſome may be caught at all times, others, as thoſe of paſſage, are only to be met with at particular ſeaſons, and others, though always confined to one piece of water, yet are nearly torpid during the Winter, and are found only in the deeps.

Weather influences fiſh much, and when the wind is in ſome points, few fiſh will bite. The moſt unfavourable is the eaſtern quarter; when the wind is eaſterly no ſport is to be expected. A warm lowering day is the moſt favourable, with flying ſhowers, and a ſlight ripple on the water. Water ſlightly diſturbed inſures good ſport; fiſh then do not eaſily diſtinguiſh the tackle, and are moſt voracious, having faſted while the ſtream was clear. Hence angling is always good when turbid water is clearing, or in the riſe before it becomes too thick. Opening a mill-dam, raiſing a ſluice, or the turning water from a meadow, inſures the angler good ſport, as it induces the fiſh to come to meet the food they expect. In waters affected by the tide, the flood is the beſt time for angling; but either ebbing or flowing is fit. Whirlpools, eddies, the mill-tails, ſides of bridges, and under the arches, are places the anglers ſhould not paſs over.

All places not diſturbed by wind or weather are proper; deep ſpots, covered with weeds, are much ſought after by fiſh.

Sometimes when you are angling in any ſpot, and have had good ſport, and the fiſh ſuddenly leave off biting; it is probable a pike or ſome fiſh of prey is at hand, in which caſe a minnow, placed on your hook alive, will probably take him; but the trimmers, before mentioned, are the beſt preventive. See FISHING.

ANGLING, *Bladder*, differs from trimmer angling, in this; inſtead of a cork, a bladder is made uſe of, by which means much diverſion is occaſioned; for as the bladder is drawn under the water by the force of the fiſh; it returns by its own want of ſpecific gravity, which ſerves to ſtrike him more forcibly and prevents his diſgorging the hook.

ANGLING, *Float*, is made uſe of in contradiſtinction to ground angling, trimmer angling, and fly angling, &c. and conſiſts in the uſe of a line longer than the rod by two or three feet, with ſhot not to ſink the float, but to let it go under water on the ſlighteſt touch or bite of the fiſh. In the rivers a cork float is moſt proper, in ſtanding water a quill is generally uſed. Perch, chub, carp, tench, barbel, and grayling, are caught in this manner.

ANGLING, *Ground*, is practiſed with a fine rod and line, without a float, and ſometimes produces excellent ſport. A bullet or plumb of lead is attached to the line, eight or nine inches from the baited hook, by boring a hole and paſſing the line through it; at the lower end placing a ſhot in the uſual manner to prevent the plummet from ſlipping. This mode proves excellent for large deep-ſwimming wary fiſh; and in Winter when they confine themſelves wholly to the deeps. A well-ſcoured worm is an excellent bait for this method, which is found very ſucceſsful againſt the barbel. When one of theſe fiſh is obſerved to take the bait, as he bites ſtrong, he ſhould be inſtantly ſtruck; the rod uſed for him likewiſe ſhould be ringed, and furniſhed with a winch or reel, and twenty-five or thirty yards of line, which ſhould have gimp to the bottom of it. But as a general rule for other fiſhes, the rod and line ſhould be fine, and when the bait is obſerved to be taken, the angler ſhould not ſtrike immediately; but ſlacken his line, to give the fiſh an opportunity to ſwallow the hook. Trout are often taken in this manner, as well as chub; for the former, morning and evening prove the beſt, except in cloudy weather, or muddy water, when you may fiſh for him the whole day.

ANGLING, *Night*, is of two kinds; that wherein the angler attends in perſon to watch his ſport; and that wherein he lays lines in different modes, as trimmers, bladders, &c. and returns in the morning to ſee his ſucceſs. By the former method may be taken ſome of the fineſt and largeſt fiſh of moſt kinds; but among trout it has been found ſingularly ſucceſsful; and it is obſerved, that the largeſt trout are caught by this means in the ſtill clear deeps. The tackle uſed in this ſport ſhould be ſtrong, and the bait ſtriking; as the large garden-worm, ſnails, a minnow, &c.

Caſt off at a diſtance, drawing your line gently againſt the ſtream, if any; not ſuffering it to ſink, but keeping it near the ſurface. A float may be uſed or not at diſcretion. When the fiſh riſes, the noiſe will alarm the angler, who is then to give both time and line enough to ſwallow the hook, when ſlightly ſtriking ſecures him. When this method does not ſucceed, it will be prudent in the angler to apply a plummet, as in ground angling, and to ſink his bait, for though there may be fiſh in that part, they may not probably be diſpoſed to riſe.

ANGLING, *Sea*. It is frequent for perſons to go out in boats ſome way from ſhore, to angle for whiting, cod, &c. From pier heads, and the mouths of rivers likewiſe, it is often ſucceſsfully practiſed: from the former are often taken haddock, cod, whiting, plaiſe, and ſmall barbel, by means of a ſtrong rod and line well leaded, with a cork float, and a large hook, baited with ſcoured red worms, ſhrimps, and gentles, a raw muſcle, the inſide of a ſmall crab, whipt round the hook with a little white wool; or a bit of any other fiſh. If the water is very deep, the bait is permitted to paſs to about mid water; if not, towards the bottom.

ANGLING, *Snap*, is a method made uſe of for thoſe fiſh that eaſily part with the bait when taken; or for any fiſh, at thoſe times when they are ſpawning, for being then ſick, they will eaſily diſgorge the bait before the hook has been ſtruck, but by means of a double ſpring hook, which is ſtruck with a forcible jerk the contrary way to that in which the fiſh runs, he is ſecured. The beſt hooks made uſe of for this purpoſe are purchaſed at fiſhing-tackle ſhops, being made with a double ſpring. The rod ſhould be ſtrong and the line ſtrong likewiſe, and not ſo long as the rod, with a large cork float. The mode of baiting the ſnap hook is thus: make a hole with a ſharp penknife in the ſide of the bait fiſh, then put the gimp that is faſtened to your hook into it, and draw it out at the mouth, till the ſpring hook comes to the place where the inciſion was made; when this is done, put it into the belly of the fiſh, then have a piece of lead, about the ſize of a horſe bean, though of an oval form, with a hole through it from end to end large enough for the gimp to go through, draw it down to the fiſh's mouth, then put it in it, and ſew it up.

ANGLING, *Trimmer*, is an economical mode made uſe of either at night, or when you are fiſhing by other methods, by ſetting ſome trimmers at a diſtance, waiting the event, and continuing your angling in another part. It is particularly ſucceſsful in meers, canals, large ponds, or any ſtill water. It requires a round cork, ſix inches in diameter, with a groove on which to wind your line, except ſo much of it near the line hook, as will allow the bait to hang about mid-water; and ſo much of the other end as will reach to the bank or a ſtump; but if you have a boat, they need not be faſtened at all. As ſoon as a fiſh takes the bait and runs away with it, the line unwinds itſelf off the trimmer without giving any check; but it will be prudent when you come to the line, to give a ſlight jerk to make your prey more ſecure.

ANGLO-CALVINISTS, a name given by ſome *Eccleſiaſtical Hiſtorians* to the members of the church of England, becauſe their doctrinal articles are built on the ſyſtem of Calvin; though ſome modern writers, without ſufficient reaſon, pretend that the doctrinal ſyſtem of the Engliſh church is Arminian.

The Anglo-Calviniſts make one of the four branches or diviſions of Calviniſm; and as ſuch ſtand diſtinguiſhed from the pure CALVINISTS, the PISCATORIANS, and the ARMINIANS.

ANGLOISE, in *Muſic*, an Engliſh country-dance, is ſo called in France. tune and figure.

ANGLO-NORMANS, in *Hiſtory*. See NORMANS.

ANGLO-SAXONS. See SAXONS.

ANGLO-SAXON *language*, that ſpoken by the ancient Angli, or Saxons, who ſettled in England.

It was thus called from the people, who were partly Angli, partly Saxon.

It is otherwiſe denominated ſimply, *Saxon*.

The Anglo-Saxon, or Engliſh-Saxon, is properly the original Engliſh; being the language which our Saxon anceſtors firſt eſtabliſhed in this iſland. It is now called Anglo-Saxon, to diſtinguiſh it from the modern or preſent Engliſh.

Many extravagant things have been advanced concerning the great antiquity and ſuperior excellence of the Anglo-Saxon language, which was a dialect of the Gothic or Teutonic. According to ſome writers, it was the moſt ancient and moſt excellent language in the world; ſpoken by our firſt parents in Paradiſe, and from it they pretend to derive the names Adam, Eve, Cain, Abel, and thoſe of all the antediluvian patriarchs. But it will be ſufficient for us to ſay, that the Teutonic or Anglo-Saxon tongue is ſo ancient, that it is impoſſible to trace it to its origin; and that it was ſo excellent and copious, as to enable thoſe who ſpoke it to expreſs all their ideas with ſufficient force and perſpicuity. Some have ſaid that this language conſiſted almoſt entirely of words of one ſyllable; but we do not find that the moſt ancient ſpecimens of this language abound in any remarkable degree in monoſyllables; but they contain a competent number of words, conſiſting of two, three, and four ſyllables. Some learned men have either diſcovered, or imagined, a very great affinity between the Greek and the Anglo-Saxon, both in their radical words, and in their general ſtructure; and it muſt be acknowledged, that in ſome of the words which they have ſelected, the ſimilarity is very obſervable, whilſt in others it ſeems to be fanciful and far-fetched. With regard to their general formation and ſtructure, a great analogy has been obſerved between theſe two languages, in the termination of the infinitive of their verbs, in the uſe of their articles and negatives, and in the manner of comparing their adjectives and compounding their words, and alſo in ſome other particulars. The affinity between theſe languages is ſuppoſed to have been occaſioned by the vicinity, relationſhip, and commercial intercourſe between the Goths and Greeks in very remote ages. The Anglo-Saxon language in this country underwent gradual changes, but from the ſpecimens of different ages we may perceive the difference that ſubſiſted between the Anglo-Saxon and modern Engliſh; and, at the ſame time, diſcover their great reſemblance, and the gradual approaches of the former of theſe languages to the latter. The following is a ſpecimen of the moſt ancient copy of the Lord's prayer in Saxon, with a very literal tranſlation, ſaid to have been written by Æadfrid, biſhop of Lindisfarne, about A. D. 700.

Urin Fader thic arth in heofnas,
Our Father which art in heaven;
1. Sic gehalgad thin noma,
be hallowed thine name;
2. To cymeth thin rye,
To come thine kingdom;
3. Sic thin willa ſue is in neofnas and in eortho,
Be thine will ſo is in heaven and in earth;

4. Urin

4. Urin hlef ofirwiſtlic ſel us to daig,
Our loaf ſuper-excellent give us to day;
5. And forgefe us ſeylda urna, ſue we forgefan ſeyldgum urum,
And forgive us debts ours, ſo we forgiven debts of ours;
6. And no inlead uſig in cuſtnung,
And not lead us into temptation;
7. Ah gefrig uſich frum ifle,
But free us each from evil. Amen.

In this ſpecimen we ſee that there are not above three or four words altogether obſolete, and quite unintelligible to an Engliſh reader. The language ſpoken by our anceſtors above a thouſand years ago was copious, expreſſive, and muſical; abounding very much in vowels, diphthongs, and polyſyllables, which are eſteemed the greateſt excellencies of language. The ſubſtance of it reſembles modern Engliſh, and moſt of the words are ſtill in uſe, though the ſpelling and meaning of many of them are changed. The Anglo-Saxon language was ſteadily retained by the Engliſh; and it overcame all the efforts of the Conqueror and his ſucceſſors to ſubſtitute the Norman in its place. It forced its way at length into the courts of juſtice, from which it had been excluded almoſt 300 years; and in 1362, an act of parliament was made, that all pleadings in all courts, both of the king and of inferior lords, ſhould be in the Engliſh tongue. The Anglo-Saxon that was ſpoken in England about 200 years after the conqueſt, was ſurpriſingly pure, and had very little mixture of Latin, French, or any other language. In the courſe of the 14th century, it gradually changed into what may be called Engliſh. This was owing to various cauſes. The animoſity ſubſiſting between the poſterity of the Normans and Anglo-Saxons was extinguiſhed, and they were conſolidated, in a great meaſure, by inter-marriages and other means, into one people. Many of the Normans, who were engaged in agriculture, trade, and manufactures, found it neceſſary to ſpeak the prevailing language of the multitude. Moreover, Chaucer, Gower, Wickliff, and others, compoſed voluminous works, both in proſe and verſe, in Engliſh; and being men of learning, well acquainted with French and Latin, and ſome of them with Greek and Italian, they borrowed many words and idioms from thoſe languages, with which they adorned and enriched their own. Thus the Anglo-Saxon tongue was greatly changed, and the language of the beſt writers approached nearer to modern Engliſh than that of Robert of Glouceſter and others who flouriſhed in the 13th century. Nevertheleſs, the Engliſh of the 14th century was ſtill ſo different from that of the 18th and 19th, that a mere Engliſh reader cannot always underſtand it without a gloſſary. Beſides various dialects and different modes of pronouncing the Engliſh prevailed, at the time to which we now refer, in different diſtricts. Henry's Hiſt. vol. iv. p. 363—373., vol. viii. p. 391—395.

Anglo-Saxon *verſions* of the New Teſtament are extant in manuſcript, and a copious account is given of ſeveral of them in Le Long's Bibliotheca Sacra; the beſt edition of which is that of Marſh, publiſhed at Halle, in ſix vols. 4to. 1778—1790. Some books of the Bible were tranſlated by Biſhop Eadfried, and the goſpel of St. John by Bede; but the tradition that King Alfred tranſlated the greateſt part of the New Teſtament is very uncertain. The whole verſion has never been printed, but the four goſpels have been publiſhed by Matthew Parker, William Liſle, and Thomas Marſhall, in 1571, 1638, and 1665; and as they are evidently tranſlated from the old Latin, they may be of uſe in determining the readings of that verſion. Marſh's Michaelis, vol. i. p. 158.

ANGLURE, in *Geography*, a town of France, in the department of Marne, and chief place of a canton, in the diſtrict of Sezanne, three leagues ſouth-ſouth-eaſt from Sezanne.

ANGLUS, Thomas, in *Biography*, an Engliſh Catholic prieſt, whoſe name was White; was a profeſſed follower of the Ariſtotelian philoſophy in the ſeventeenth century. Being of a roving diſpoſition, he wandered through ſeveral parts of Europe. After reſiding for ſome time at Paris and at Rome, he was principal of a college at Liſbon, and ſub-principal at Douay. In England he adopted the opinions of Sir Kenelm Digby, with whom he lived, and reſiſted the efforts made by Des Cartes to proſelyte him to his own ſyſtem. He was a man of a ſingular character, and combined ſome degree of acuteneſs with conſiderable obſcurity of underſtanding; but his writings did not excite the notice and oppoſition which he expected. Some of them, however, were cenſured by the congregation of the Index Expurgatorius at Rome, in 1658; particularly a treatiſe entitled "Inſtitutiones Peripateticæ ad mentem ſummi viri clariſſimique Philoſophi Realmi Equites Angliæ," printed at Lyons in 1646. He wrote alſo "Queſtio Theologica," with a view of reconciling, in the principles of Digby's peripateticiſm, free will with effectual grace; "Inſtitutiones Theologicæ," and ſeveral other tracts. He is ſaid to have written, at the period of the commencement of the conteſts between Charles I. and his parliament, in favour of the doctrine of paſſive obedience; and he ſurvived the reſtoration of Charles II. Gen. Dict.

ANGOI, or Angoy, in *Geography*, a province of Africa, ſituate upon the Loango coaſt, lying between Cacongo on the north, and Congo on the ſouth; ſeparated from the former by the river Cabind, and from the latter by the Zaire. The inhabitants are extremely indolent, and the country little cultivated; the coaſts abound with fiſh, and the foreſts with apes and other animals; the chief town is Bomba-Cengoy. The chief port is Cabinda, at the mouth of a river of the ſame name, about five leagues north of Cape Palmerino, on the north ſide of the mouth of the Zaire. The bay lies commodiouſly for trade, wooding and watering on the ſea-ſhore.

ANGOKA, Angoxa, or Angadoxa, *iſlands* of, are iſlands of Africa in the Mozambique Gulf, and to the ſouth of Mozambique, ſituate in 16° 20′ ſouth latitude. They are ſterile, but inhabited. The violent currents occaſioned by the river St. Eſprit, and which drive veſſels to the north-north-weſt againſt the ſhores of the continent, terminate near the northernmoſt of theſe iſlands.

ANGOL, or *Villa nueva de los Infantes*, a town of South America, in the province of Chili, ſituate on the arm of the river Biobia, and about 125 miles north north-eaſt of Baldivia. This is one of the moſt agreeable towns in Chili. S. lat. 37° 36′. W. long. 72° 59′.

ANGOLA, a country of Africa, anciently called Abonda, or Ambonda, and afterwards Dongo, and by the Portugueſe Angola, may be divided into Angola proper, or that which was formerly a province of Congo, and the kingdom of Angola. In the firſt ſenſe, it is confined between two rivers of Danda, which parts it from that in the north, and that of Coanza on the ſouth. In the ſecond ſenſe, including its additional conqueſts, it extends along the Ethiopic coaſts from the mouth of the Danda, ſituate in S. lat. 8° 10′, to that called St. Francis, in 13° 15′, according to ſome; but according to the moſt accurate geographers, quite to Cape Negro, in 16° 21′. According to this laſt extent, Angola forms a coaſt of 480 miles, but its greateſt depth

eaſtwa d

caſtward has not been aſcertained. The whole of Angola proper abounds with mountains, interſperſed with a few plains, on the ſea ſide, and between the ridges of the mountains. The kingdom of Angola, in its moſt flouriſhing ſtate, contained the following 17 provinces; *viz.* Chiſſama, under the 11th degree of ſouth latitude, and near the mouth of the Coanza; which produces an excellent ſalt, and fine honey and wax; Sumbi, in the ſame climate with the former, admirably adapted for breeding cattle and ſowing grain, if the inhabitants were not ſhamefully indolent; Benguela, retaining the title of a kingdom; Rimba, ſituate between Sumbi on the weſt, Lubolo on the north, Temba on the eaſt, and Scetta on the ſouth, and producing great quantities of grain and of fiſh; Scetta, ſouth of the former, and north of Benguela, extremely mountainous, and having a rock that extends 30 miles, the top of which is cultivated and inhabited, and enjoys ſalubrious air and water, and in the lower parts feeding large herds of cattle: Bembea, extending on one ſide along the ſea, and on the other dividing Angola from the other foreign ſtates in the ſouth, populous, and abounding with cattle; Temba, a flat low province, full of rivers and ſmall ſtreams, and abounding with wild cattle and wholeſome roots; Oacco, ſituate between the Coanza on the north-eaſt, and Lubolo on the ſouth-weſt, beautifully variegated with hills and plains, and furniſhed with ſprings and ſtreams which render it fertile; Cabezzo, having Coanza on the north-eaſt, and Rimba on the ſouth-weſt, populous, and well ſtored with cattle and other proviſions, and having alſo a mine of iron on a mountain called the Iron Mountain; the lord of Oacco was baptized in 1657, and the lord of this province in 1658, and they both induced many of their ſubjects to become Chriſtians: Lubolo, ſituate along the ſouthern banks of the Coanza, famed for its noble palm-trees, and yielding in great abundance oil, wine, and other produce: moſt of the inhabitants are Chriſtians. The ten provinces above recounted lie on the ſouth ſide of the Coanza; and within the Coanza is Loanda, an iſland on the coaſt of the kingdom of Bengo, chiefly remarkable for the capital of Angola, called San Paulo de Loanda, built upon it by the Portugueſe in 1578, large and populous, and well defended: Bengo, commonly known by the name of Zenza, yielding maize and manioc root, of which the inhabitants, who are all Chriſtians, make their bread; Danda, ſituate on a river of this name, dividing Angola from Congo; well watered, and fertile in grain and all kinds of fruits, but much infeſted with crocodiles and ſerpents; the inhabitants are Chriſtians: Moſeche, extending along the northern banks of the Coanza, very fertile in manioc, having mines of ſeveral metals, and poſſeſſing zimbis, or ſhell-money, of ſuch exquiſite beauty, that the Congoeſe will give a ſlave for a collar of them, and ſo much valued as to be worn by perſons of the higheſt rank, particularly the ladies, about their necks, arms, legs, and middle: Illamba, divided into the higher, between Bengo and Calacata; and the lower, between Danda to the north, and Bengo to the ſouth, both fertile and tributary to the Portugueſe, and the former having mines of excellent iron: Oarri, contiguous to Moſeche, well watered, and diſtinguiſhed by the libalto, or ancient royal reſidence of the kings of Angola; and Embacca, or Membacca, ſituate on the north ſide of the river Lucala, wholly ſubject to the Portugueſe.

The principal rivers of Angola are the Danda, Coanza, Rimba, Lutano or San Franciſco, and Congo; the traffick of this country is ſlaves, of whom the number is very great, partly for ſale and partly for domeſtic uſe. The traffick is ſaid to have diveſted the people of their humanity, as parents ſell their children, and huſbands their wives, at a very cheap rate. Polygamy is prevalent in this country; and ſo is alſo, amongſt thoſe people that are not converts to Chriſtianity, the inhuman cuſtom of butchering a great number of human victims at the funeral obſequies of their relations, and piling their carcaſes in heaps on their tombs.

Before the arrival of the Portugueſe, this kingdom was ſubject to the kings of Congo, and governed by a deputy. One of theſe deputies, whoſe name is ſaid to have been Ngola, or Angola, ſhook off the Congoeſe yoke, and aſſumed the royal title. In this rebellion the ambition of Ngola was aſſiſted by the Portugueſe, who, diſcovered this coaſt in the year 1484. Ngola lived to a very advanced age, and was much reſpected; but having raiſed a favourite ſlave to the rank of lieutenant-general, he fell a ſacrifice to the treachery and ambition of this viceroy, who, in order to effect his purpoſe and ſecure the ſucceſſion, pretended great reſpect for Zunda Riangola, one of the king's daughters. Upon his death, which happened ſuddenly, the princeſs was univerſally acknowledged and crowned queen of Angola. Such were the pride and jealouſy of the queen, that ſhe would not marry, becauſe ſhe would have no rival; and as ſhe feared a competition on behalf of the two ſons of her ſiſter, ſhe ordered them to court under a pretence of having them educated as her children and heirs to her crown; but upon the arrival of the eldeſt, ſhe inſtantly cauſed him to be murdered. The incenſed parent avenged herſelf by plunging a dagger in her breaſt; and for this act of retributive juſtice, the Angolans placed the crown on her head, but ſhe immediately ſurrendered it to her ſurviving ſon. He was ſucceeded by one of his younger ſons, Dambi Angola, who, upon aſcending the throne, determined to put all his brethren to death. Two of them, however, eſcaped. Dambi was a monſter of perfidy, cruelty, avarice, and lewdneſs; but happily for his ſubjects, his reign was not of long duration. Dambi was ſucceeded by Ngola Chilvagni, a warlike prince, who extended his conqueſts along the rivers Danda, Lucalla, Zanda, and Coanza, and literally tinged them with blood. Having carried his victories within eight leagues of Loanda San Paulo, he cauſed a tree to be planted, which he fixed as the limit of his ravages, near which the Portugueſe afterwards erected a fortreſs, and they called the tree Iſanda, or Iſandaura. This ambitious and ſucceſsful monarch could not forbear fancying himſelf to be one of the deities of the country, and exacting honours ſimilar to thoſe which were paid to them. It was not long, however, before he was obſerved to ſubmit to the fate of other mortals. His ſucceſſor, Ngingha Angola, was a cruel tyrant; but the country was ſoon delivered from his oppreſſions; and exchanged thoſe of the father for the more ſevere and grievous ones of the ſon, Bandi Angola. The life of this oppreſſor was threatened by the rebellion of his aggrieved ſubjects; but the Portugueſe defeated the rebels, and thus enſured the favour of the king, who took them into his ſervice, and even into his council. The Portugueſe general was the favourite at court, and more eſpecially with the daughter of the ſovereign. Her attachment was ſoon diſcovered by the father; and with a mind inflamed by reſentment, and an apprehenſion that a connexion of this kind would be the means of depriving him of the crown, he formed a reſolution to extirpate all the Portugueſe, as a meaſure eſſential to his own ſecurity. They were, however, appriſed of his deſigns by the young princeſs; and retreated into the kingdom of Congo, without interruption or moleſtation. The Portugueſe general obtained permiſſion of the king of Congo to ſail for Liſbon, under a promiſe of returning with a powerful reinforcement, in order to avenge himſelf on the perfi-

dious

dious ſovereign of Angola. He ſoon obtained the deſired armament, and returned, at the head of his ſquadron, up the river Coanza: he landed his forces about two leagues from Maſſingano, a city on the banks of the Coanza, and erected a fortreſs for their ſecurity. The king of Angola prepared for his defence: but in an engagement between his forces and the Portugueſe, he ſuffered a total defeat, and was merely able to eſcape with his life. His diſcontented ſubjects united with the victorious troops of the admiral, and after committing many dreadful ravages, executed their purpoſe of maſſacring their ſovereign. Bandi Angola was ſucceeded by his ſon Ngola Bandi, who began his reign by wreaking his reſentment upon all who had oppoſed his election. The next objects of his hatred and jealouſy were the Portugueſe; but they, though much inferior in number, obliged him to ſave his life by flying, firſt into the iſland of Chicendi, in the river Coanza, and from thence into one of the neighbouring deſerts of Oacco, where he was permitted to live among the wild beaſts, without any other ſuſtenance than that which the deſerts afforded him. Having been guilty of treachery in evading the fulfilment of a contract with the Portugueſe governor, and dreading his reſentment, he condeſcended to intreat his ſiſter Zingha, whoſe ſon he had murdered, to undertake an embaſſy to the governor, and to procure peace with him upon any terms. In order to effect her purpoſe, he adviſed her even to embrace the Portugueſe religion, if it ſhould prove the means of facilitating her negociations. Zingha accepted the office, and was received by the viceroy in a very reſpectful manner. During her ſtay at Loanda San Paulo, ſhe conſented to be inſtructed in the principles of Chriſtianity; and profeſſing her approbation of them, ſhe was baptized with great ſolemnity in the year 1622, which was the 40th of her age. The articles, which were ſettled between Zingha and the governor, were ratified by her brother; and he requeſted a prieſt to be ſent, in order to inſtruct him in the Chriſtian religion. But he refuſed to be baptized, becauſe the perſon who adminiſtered it was the ſon of one of his ſlaves. Ngoli Bandi delayed executing the ſtipulated articles, and determined to renew the war againſt the Portugueſe. In executing this purpoſe, his troops were all cut off, and he was forced to ſwim into a little iſland in the Coanza, where he was purſued; and he eſcaped being murdered by terminating his life with a doſe of poiſon adminiſtered to him by order of his ſiſter Zingha. Zingha aſcended the throne; and, in order to ſecure her power, ſhe murdered her nephew with her own hand. The object to which her principal attention and anxiety were directed, was the deliverance of the realm from the Portugueſe, who were now become numerous, wealthy, and powerful, and who were dreaded by all her ſubjects. With this view ſhe commenced a war againſt them, and gained at firſt ſome temporary advantages. At length ſhe was abandoned by her allies, and by her own forces, and obliged to abdicate her dominions, and to retire into ſome of the eaſtern deſerts, where ſhe remained unmoleſted. During her retirement, the Portugueſe appointed Angola Oarii, a deſcendant of the royal family, to be king; and before they crowned him obliged him to declare himſelf a Chriſtian, and to be baptized under the name of John. His reign, however, was of ſhort duration; death made way for his ſucceſſor, Philip, the ſecond Chriſtian king, who prolonged his reign to the year 1660. Zingha, in the mean while, ſeeing herſelf ſtripped of eleven of her beſt provinces, and diveſted of her authority and tribute in the other five, renounced her religion, and devoted herſelf to all the idolatrous ſuperſtitions and inhuman rites of the Giagas; and ſhe thus acquired ſuch authority and influence, that they were ready, at the firſt intimation of her will, to follow her through the moſt hazardous enterpriſes. By this influence ſhe was able to haraſs the Portugueſe, and to keep them in a ſtate of perpetual terror. At length they ſent two deputies to negotiate a peace with her; but their embaſſy was unſucceſsful. Upon renewing the war before the fortreſs of Maſſangano, ſhe loſt a great number of her men, her two ſiſters were taken priſoners, and ſhe herſelf eſcaped with great difficulty. Zingha had two councils, one for affairs of ſtate and war, the other for religious concerns: the firſt conſiſted of four officers; the other of five ſingollos, or prieſts of the Giagan religion. Having convened theſe nine counſellors to deliberate, ſhe propoſed to them whether ſhe ſhould embrace the Chriſtian faith, or continue in the religion of the Giagas. She had recourſe to the uſual mode of conſulting the ſpirits of her anceſtors, and the oracle's decree was ſuch as ſhe had foreſeen. The demon declared againſt his own intereſt, and exhorted her to be reconciled to the faith from which ſhe had apoſtatized. Whilſt this farce was carried on, ſhe had her troops collected, and in the ſpeech, which ſhe addreſſed to them, ſhe confeſſed and bewailed her apoſtacy, and declared her purpoſe of conforming to the obſervance of the Chriſtian precepts and rites. Her addreſs was received with univerſal acclamation, and ſhe conſidered this as a happy omen of their ſpeedy converſion. The conſequence was her reconciliation with the Portugueſe, and ſingular zeal and activity in promoting the profeſſion of Chriſtianity among her ſubjects. She prohibited the practices of heatheniſm which then prevailed, under the ſevereſt penalties; and in order to encourage marriage, and thus to reſtrain the plurality of women, ſhe took a huſband, and publiſhed an edict againſt polygamy, which produced effect. She alſo reformed the tyranny of the lords in her dominions, who did not allow their vaſſals to marry without their licence, for which they paid a conſiderable ſum. Nothing ſeemed to be now wanting to complete the progreſs of Chriſtianity but a new ſupply of miſſionaries from Europe; in order to obtain theſe, ſhe ſent a letter to Rome in the year 1658, and received a favourable anſwer in 1662. The pope's letter was publicly announced in the new church which ſhe had built, on the 15th of July, and ſhe repaired to the place, with the letter ſuſpended about her neck in a rich golden purſe. After much ſolemn ceremony on this occaſion, ſhe gave a magnificent treat to the Portugueſe reſident, and to all her court, which was accompanied with the grant of largeſſes to her chief officers, and with a releaſe of a number of ſlaves; and terminated in her performing, at the head of her ladies of honour, who were dreſſed and armed in the Amazonian ſtyle, a kind of combat, in which this princeſs, though above 80 years of age, behaved with great vigour and activity. Whilſt the queen was diligently employed in promoting the converſion of her ſubjects in her new capital, ſhe was ſeized with a diſorder which proved fatal. Father Antony attended her in her laſt moments, and received inſtructions concerning her interment; and ſhe committed the whole conduct of her laſt obſequies to him; ſhe likewiſe recommended, with her laſt breath, the propagation of Chriſtianity, the protection and encouragement of the miſſionaries, and the enforcement of all the edicts againſt the impious rites of the Giagas. On the 17th of December, in the 82d year of her age, ſhe cloſed her life and reign. The deceaſed queen was buried with great pomp; and, from reſpect to her memory, her ſiſter Barbara, who ſucceeded her, was inaugurated a ſecond and a third time, with joyful acclamations. She was a very zealous Chriſtian, but her efforts to promote Chriſtianity were reſtrained or diſcouraged by an ill-natured and cruel huſband, whoſe name was

Mona

Mona Zingha, and who had been raiſed by the late queen from the condition of the ſon of a ſlave to the rank of her chief general. The queen's diſorder and infirmities increaſed, and, after a ſhort reign of about two years and a half, ſhe cloſed her life A. D. 1066. Mona Zingha ſucceeded her, and exhibited ſufficient evidence of his abhorrence of Chriſtianity, and of his ſteady attachment to the abominable rites of the Giagan ſect. To remove all doubt with regard to his ſentiments, he cauſed five young ladies of the firſt rank to be buried alive in his wife's grave. By various methods to which he had recourſe, he almoſt extirpated Chriſtianity; but his career was ſoon ſtopped by Don John, the princeſs Barbara's firſt huſband, from whom ſhe had been divorced on account of his having another wife. Upon his arrival, the uſurper fled into an iſland in the Coanza; but he returned again, and having killed Don John, regained the throne without any further oppoſition. Don Franciſco, however, the ſon of Don John, headed an army againſt the uſurper, and Mona Zingha having been defeated and ſlain, Don Franciſco became ſole maſter of the empire. The following kings of Angola poſſeſſed only a ſhadow of royalty, The laſt of this deſcription was Ngola Sedeſio, who revolted, and was taken priſoner. His head was cut off, put in pickle, and ſent from Loanda to Liſbon. After this it does not ſeem that the Portugueſe government have thought it proper or perhaps ſafe to amuſe their Angolic ſubjects with even a mock monarch of their own nation: but they have committed the ſole command of the kingdom to the viceroy of Angola, and his council. This kingdom hath long ſince been erected into a biſhopric, ſuffragan to that of St. Thomas. The manners, language, religion, dreſs, and ceremonies of the Angoleſe, are ſimilar to thoſe of the inhabitants of Congo. Mod. Un. Hiſt. vol. xiii.

ANGOLENSIS, in *Ornithology*, a ſpecies of FALCO, found in Angola. It is white, cere bluiſh, orbits fleſh-coloured and naked, primary wing-coverts and baſe of the tail black. Gmelin. The ſize of this ſpecies is half as large again as the kite. The bill is whitiſh, long, and but little curved; irides ſtraw colour; head and neck clothed with feathers, craw pendulous; head, neck, back, breaſt, belly, and leſſer wing-coverts of a pure white; greater wing-coverts and primaries black; the laſt tipped with white; end of the tail white; legs dirty white and ſcaly. Latham, Gen. Syn. This ſpecies was firſt deſcribed by Mr. Pennant from ſpecimens in the collection of R. P. Parry, Eſq. He obſerves, that they were very reſtleſs and querulous, and more active than is uſual with this ſluggiſh race.

Angolensis, a ſpecies of MEROPS, of a ſhining golden-green colour, with a cinereous band through the eyes ſpotted with black; wings and wedge-ſhaped tail cinereous beneath; chin yellow, throat cheſnut. Gmelin. This is APIASTER ANGOLENSIS, and Le Gueſpier d'Angola of Briſſon, who figured and deſcribed it from a drawing ſent to him by M. Le Poivre. It is Le petit Guépier vert & bleu à queue étagée of Buffon, and Angola bee-eater of Latham, Gen. Syn. This bird is five inches and a-half in length. The bill is three quarters of an inch in length, and black; the irides red; upper part of the head, neck, body, and wings, are green gloſſed with gold; on each ſide of the head an aſh-coloured ſtripe dotted with black, beginning at the baſe of the bill, and paſſing through the eyes; breaſt, belly, ſides, and thighs, greeniſh blue, with a ſlight golden tinge; under-tail coverts greeniſh, intermixed with cheſnut. The ſide feathers of the tail margined with cinereous; legs aſh-coloured, claws black. Latham, &c.

Angolensis, a ſpecies of LOXIA that inhabits Angola. This is the black groſbeak of Edwards, and Angola groſbeak of Latham. It is blue-black, belly ferruginous, and a white ſpot on the wing. Gmelin. Size of the common bulfinch, length five inches, bill duſky, eyes dark, ridge of the wing white, legs purpliſh fleſh-coloured.

Angolensis, a ſpecies of EMBERIZA, about the ſize of a finch, that inhabits Angola. This is the gros-bec à poitrine couleur de feu of Salerne, whoſe deſcription has been adopted by Latham and Gmelin. It is black, crown of the head and neck yellow, and tail long. It is the Angola bunting of the Gen. Syn. The bill is ſhort like that of the bulfinch, and the breaſt is fire-coloured.

Angolensis, a ſpecies of FRINGILLA: above it is browniſh aſh colour, beneath orange, front of the head black, round the eyes, and on each ſide of the throat white, rump pale yellow, wings and tail brown. Gmelin. This kind inhabits Angola, where the male bears the name of negral, or tobaque; the female benguelinha; or at leaſt it is conjectured by Edwards and Latham, that theſe are the two ſexes of the ſame ſpecies. It is the ſize of the common linnet. The ſuppoſed male has the bill brown, upper part of the head, neck, and body browniſh aſh-colour, each feather darkeſt on the middle; the greater wing-coverts and quills brown, edged with yellow; tail brown edged with grey; legs fleſh-coloured. The female has the upper parts rufous brown, ſides of the head pale rufous, near the baſe of the bill a brown mark, which paſſes towards the hind head; from the breaſt to the vent pale rufous, ſpotted with brown. This is the Vengoline of Buffon and the Hon. D. Barrington. Phil. Tranſ. Linaria Angolenſis of Briſſon, and Angola finch of Latham. The laſt author has given a new ſpecific character to this bird in the Ind. Orn. It is aſh-coloured brown, with brown ſpots; beneath cheſnut; front of the head and chin black; cheeks and throat ſpotted with white; rump pale yellow.

ANGOLI, a name given by Buffon and others to the Madras gallinule, FULICA MADERASPATANA of Gmelin. See MADERASPATANA.

ANGON, in the *Ancient Writers on Mechanics*, denotes a military engine of the bow-kind. Others again ſpeak of it as a kind of javelin uſed by the French, the iron head of which reſembled a fleur de lys. It is the opinion of ſome writers, that the arms of France are not fleur de lys, but the iron points of the angon, or javelin of the ancient French.

ANGONÆUS, in *Anatomy*, a name given by Riolanus and others to a muſcle called by the generality of other writers *anconæus*, and *cubitalis minor*.

ANGOR is uſed by ſome phyſicians to denote a ſhrinking inwards of the native heat of the body, or its retiring to the centre; upon which enſues a pain, and palpitation of the heart, attended with ſadneſs and melancholy.

In this ſenſe angor amounts to much the ſame with what the Greeks call *agonia*.

The angor is reputed a bad ſymptom, when it happens in the beginning of an acute fever.

ANGORA, ANGOURA, ANGOURI, and formerly ANCYRA, in *Geography*, a town of Natolia, in Aſiatic Turkey. This is an agreeable city, in a lofty ſituation, and has many veſtiges of its ancient magnificence and ſplendour. The caſtle has a triple incloſure, and the walls are formed of large pieces of white marble, and a ſtone reſembling porphyry. The number of inhabitants is eſtimated at 80,000. The trade is chiefly in yarn, of which our ſhalloons are made, and in their own manufacture of Angora ſtuffs, made principally of the fine hair of a particular breed of goats, which, like that of the cats, occurs in no other country. The ſoil of the adjacent country is a fine red marl. The baſhaw of Angora has about 30 purſes annually; and here are about 300 janizaries,

under the command of a ſundar. The Armenians have ſeven churches, beſides a monaſtery; and the Greeks two. N. lat. 39° 30′. E. long. 32° 5′.

Angora is famous for the battle between Tamerlane and Bajazet, A. D. 1402, which has immortalized the glory of the former, and the ſhame of the latter.

ANGOT, a province or kingdom of Abyssinia, formerly rich and fertile, but almoſt ruined by the Gallas, who are now in poſſeſſion of it.

ANGOTE, a town of Africa, in the kingdom of Congo, and province of Pango.

ANGOULEME, a city of France, and capital of the department of Charente; before the revolution, the capital of Angoumois, and ſee of a biſhop, ſuffragan of Bourdeaux. It is ſeated on a rock, at the foot of which runs the river Charente. The inhabitants are ſaid to be about 8000, and their manufacture is paper. N. lat. 45° 37′ 3″. E. long. 8° 45′.

ANGOUMOIS, a diſtrict of France, before the revolution a province, bounded on the north by Poitou, on the eaſt by Limoſin and Marche, on the ſouth by Perigord, and on the weſt by Saintonge. It is between 15 and 18 French leagues in length, and about 16 in breadth. The principal rivers are the Charente and Touvre; there are many iron mines in this province, and the land produces wheat, rye, barley, oats, ſaffron, wine, and all kinds of fruits.

ANGOUSTRINA, a town of France, in the department of the Eaſtern Pyrenées, and chief place in the diſtrict of Prades, on the frontiers of Spain; four miles north-eaſt of Puyarda, and eight weſt of Mont Louis.

ANGOY. See Goy and Loango.

ANGRA, a ſea-port town of Terceira, one of the Azores, the capital of that iſland and of all the Azores, and the reſidence of the governor. It is ſituated in a bay between two mountains on the ſouth ſide of the iſland, and it is equally ſecure againſt ſtorms and the aſſault of an enemy. On theſe hills are two pillars, and a watchman who gives ſignals of ſhips approaching the iſland by means of flags. The town is ſaid to have received its name from Angra, a creek, bay, or ſtation for ſhipping; this bay being the only convenient harbour in all the Azores. It opens from the eaſt to the ſouth-weſt, is not above four cables length in breadth, and, according to Frezier, it has not above two cables of good bottom. In ſummer, ſhips may ride here with ſafety; but when the ſtorms of winter come on, the approach of which is indicated by clouds hanging on the Pico, a high mountain in another of the Azores, and the fluttering and chirping of flocks of birds round the city, ſhips ſhould put off with all expedition to ſea. The town is well built and populous, and is an epiſcopal ſee, under the juriſdiction of the archbiſhop of Liſbon. It has five pariſhes, a cathedral, four monaſteries, and as many nunneries, beſides an inquiſition and a biſhop's court, which extends its juriſdiction over all the Azores, Flores, and Corvo. The town is ſurrounded by a wall and dry ditch, and defended by a ſtrong caſtle, in which king Alphonſo was impriſoned by his brother Peter, in 1668. The houſes have a handſome external appearance, but they are indifferently furniſhed, for which the Portugueſe allege, as a plea for their poverty, that warm furniture would be inconvenient in ſo hot a climate. N. lat. 38° 39′. W. long. 27° 12′ 15″. At Angra are kept the royal magazines for anchors, cables, ſails, and all ſorts of ſtores, for the royal navy or for merchantmen in diſtreſs. All maritime affairs are under the inſpection of an officer called "deſambargador," who hath ſubordinate officers and pilots for conducting ſhips into the harbour, and the proper watering places. The Engliſh, French, and Dutch, have each a conſul here, though their commerce with the Azores is not very conſiderable. Mod. Un. Hiſt. vol. xii. p. 55, &c.

Angra de los Reyes, a town of South America, in the capitainſhip of Rio de Janeiro in Brazil, ſubject to the Portugueſe, about 36 miles from Rio de Janeiro. It is ſituate upon the coaſt, in a ſmall bay, whence it has its name; being, in Engliſh, King's Bay. It has two churches, a monaſtery, a ſmall guard-houſe of about 20 ſoldiers. Its chief produce is fiſh. S. lat. 22° 28′. W. long. 17° 41′.

Angra *Bay*, or Great Bay, lies on the weſtern coaſt of Africa, to the north of Cape Blanco, in N. lat. 20° 55′, and W. long. 17° 10′. This is the moſt weſterly coaſt of Africa.

Angra *River* is alſo on the coaſt of Africa, in N. lat. 1°, and E. long. 9° 35′, having at its mouth the iſland of Koriſco, about five leagues ſouth of Cape St. John, which is its northerly extreme point, as Cape Eſturas, ſeven leagues from Cape St. John, is the ſoutherly point.

Angra *River* is alſo on the ſame coaſt, and on the ſouth ſide of the equator, and of the river Gabon.

Angra *Iſland* lies in the Perſian gulf, and has a ſpacious harbour at Burka; but it is uninhabited.

ANGRAB, a river of Abyſſinia, formed by ſeveral ſtreams in the provinces of Tcherkin and Sire, and which, by its confluence with the Guangua, forms the Tacazze.

ANGRÆCUM, in *Botany*. See Epidendrum.

ANGRIVARII, in *Ancient Geography*, a people of Germany, ſuppoſed by ſome to have been the ſame with the Angerii of the middle age; ſituate, according to Tacitus (Annal ii. c. 8.), between the Weſer and the Ems, and extending eaſtward beyond the Weſer as far as the Cheruſii, on which ſide they raiſed a rampart; with the Tubantes on the Ems to the ſouth; to the weſt the Ems and the confines of the Bructeri, and to the north between the Chamave and Anſibarii. They are placed by Ptolemy between the Cauchi and Catti, or Suevi. Their territory is ſuppoſed now to contain a part of the country of Schaumburg, half of the biſhopric or principality of Minden; and to the ſouth, the greateſt part of the biſhopric of Oſnaburg, the north part of the county of Techlenburg, and a part of the county of Ravenſberg. Some trace of the name is obſervable in a ſmall town of Ravenſberg, called Engern.

ANGROGNA, a pariſh of Piedmont, watered by a river of the ſame name, and producing excellent fruits, particularly cheſnuts. This is a valley ſurrounded by high mountains, to which there is acceſs only by two paſſes. At a village called La Tour, the valley preachers uſed to officiate, and qualify young men for the miniſtry, without diſturbance, before the reformation.

ANGRUS, a river of Illyria, which, according to Herodotus, ran towards the north-eaſt, paſſed along the plain of the Triballi, and diſcharged itſelf into the Brongus, which joined the Iſter.

ANGSANA, or Angsava, in *Botany*, names by which ſome authors have deſcribed the *draco arbor* or *dragon-tree*; one of the trees ſaid to afford the ſanguis draconis, or dragon's blood of the ſhops.

It is eſteemed an aſtringent, and an excellent remedy in the aphthæ.

ANGUADA *Cape*, in *Geography*, is the moſt weſterly point of Porto Rico Iſland in the Weſt Indies, and is diſtant from Cape Sumana, or the neareſt land at the north-eaſt of Hiſpaniola iſland, 22 leagues.

ANGUEAH, a conſiderable river of Abyſſinia, not far from Kellah, in N. lat. 14° 24′ 34″. Where Mr. Bruce croſſed it, it was 50 feet broad and three deep, and the largeſt river which he had ſeen in Habeſh. It was perfectly clear, and ran rapidly over a bed of pebbles. It was full of ſmall

fiſh,

fiſh, eſteemed excellent. It has its name from a beautiful tree which covers both its banks, and which, by the colour of its bark and richneſs of its flowers, is a great ornament to it. Bruce's Trav. vol. iii. p. 113.

ANGUEG, in *Zoology*, a name given in Abyſſinia to the water-lizard, or caudiverbera of the Italians.

ANGUELLA, in *Ichthyology*, a name by which ſome former naturaliſts diſtinguiſhed the ſpecies of ATHERINA HESPETUS of Linnæus, a ſmall fiſh that inhabits the ſhores of the Mediterranean ſea. Piſciculus *anguella Venetiis* dictus; forte *hepſetus* Rondeletii, vel *atherina* ejuſdem. Wil. Icht.

ANGUIENSIS, in *Ancient Geography*, a place of Africa, ſituate, according to Hardouin, in Numidia.

ANGUIER, FRANCIS and MICHAEL, in *Biography*, ſculptors, were born at Eu in Normandy. The elder, Francis, was born in 1604; and having been brought up under Guillain, a ſculptor at Paris, was ſent for to England, and there acquired a ſufficiency to enable him to viſit Italy for improvement. After having ſpent two years in Italy, he returned to France, and was made keeper of Antiques by Louis XIII., and had apartments in the Louvre. He was employed in ſeveral celebrated works, chiefly of the monumental kind, ſuch as the tomb of James Souvre, at St. John de Lateran; and the mauſoleum of the laſt duke de Montmorency, at Moulins. He died at Paris in 1669.

Michael was born in 1612, became an artiſt at 15, and employed his firſt ſavings under Guillain, at Paris, for viſiting Italy, where he entered into the ſchool of the famous Algardi at Rome. After 10 years he returned to France, and aſſiſted his brother in executing the monument of Montmorency. His reputation was great, and he was employed, according to the taſte of the times, in many works of decoration. He adorned the apartment of queen Anne of Auſtria, in the old Louvre, with many allegorical figures; he executed the altar-piece of the church of St. Denis de la Chartre, and the rich ſculpture of the gate of St. Denis. His laſt work was a marble crucifix over the high altar of the church of Sorbonne. He died in 1686. Gen. Biog.

ANGUILARA, in *Geography*, a town of Italy, belonging to the Venetian States in the Paduan, 12 miles ſouth of Padua.

ANGUILHAS, *Cape d'*, lies to the eaſt of the Cape of Good Hope, on the African coaſt in the Indian Ocean, in S. lat. 34° 50', and E. long. 20° 6'.

ANGUILLA, or *Snake Iſland*, ſo called from its ſnake-like form, is the firſt of the ſmaller Antilles, and the moſt northerly of all the Carribee iſlands poſſeſſed by Britain in the Weſt Indies. On the ſouth ſide it has good anchorage and a gentle current, but on the eaſt ſide it is inacceſſible on account of flats, ſhoals, and ſmall iſlands. It was diſcovered and ſettled by the Engliſh in 1650; but the firſt cultivators were moleſted by rapacious invaders, particularly French pirates; and, after the revolution, a party of wild Iriſh. New ſettlers from Barbadoes and other Engliſh Caribbees, knowing the value of the ſoil, removed to Anguilla, and carried on a lucrative trade, without any government, civil or eccleſiaſtical. In 1745, a ſmall body of their militia reſiſted the attack of a conſiderable number of French, and obliged them to retire with great loſs. The inhabitants ſubſiſt moſtly by farming, planting India corn, and other kinds of huſbandry. The climate is healthy, and the people ſtrong and vigorous. The exports, in 1770, amounted, in ſugar, rum, and cotton, to near 6000l. The iſland is 10 leagues in length, and three in breadth; and is ſituated 25 leagues north-weſt of Barbuda, and 15 from St. Chriſtopher's. N. lat. 18° 15'. W. long. 62° 57'.

ANGUILLA is alſo a bank iſland, and eaſt of the great Bahama bank, and north of the iſland of Cuba. N. lat. 23° 22'. W. long. 78° 47'.

ANGUILLA, in *Ichthyology*, a ſpecies of MURÆNA. This is the common eel, having the lower jaw longeſt, and the body of one colour. Linn. & Gmel. The dorſal fin is ſaid to contain 1000 rays, pectoral fin 19, and the anal fin 100. See EEL.

ANGUILLA INDICA, in *Natural Hiſtory*, a name given by Willoughby to a ſpecies of TRICHIURUS in the Linnæan arrangement of fiſhes. See TRICHIURUS INDICUS.

ANGUILLÆ, a ſpecies of TÆNIA that inhabits the inteſtines of eels. The head is ſeſſile, diſtinct, and thickeſt, joints oblong, with irregular protuberances, and two mouths on one ſide. The body conſiſts of about 600 joints, and is ſometimes four feet in length, front of the head truncated, the firſt eight joints longeſt. The upper joints of the body are nearly ſquare, and twice as long as they are broad, the lower ones eight times as broad as they are long. Gmelin, Redi, &c. This is tænia claviceps of GOEZE.

ANGUILLARA, in *Geography*, a town of Italy, in the eſtates of the church and province of Patrimonio; ſituate on a ſmall river near the lake of Bracciano, 12 miles north-weſt from Rome.

ANGUILLARA, GIOVANNANDRA DELL', in *Biography*, an eminent Italian poet, was born of a mean family at Sutri, in 1517. From Rome, where he was engaged with a printer, and whom he left on account of an intrigue with his wife, he went to Venice, and formed an intimate acquaintance with a bookſeller, who bought his tranſlation of Ovid's Metamorphoſes, which contributed to his reputation. It was firſt publiſhed at Paris, and dedicated to Henry II.; and his fame, in conſequence of this work, was probably the cauſe of the pomp with which his tragedy of Œdipus was acted at Vicenza, in 1565, where Palladio was employed in erecting a magnificent temporary theatre for the purpoſe. He undertook a tranſlation of Virgil's Æneid, but never finiſhed it. By various other poems, ſatirical and burleſque, he obtained a precarious ſubſiſtence. He died at Rome in indigent circumſtances, and in conſequence of his diſſolute mode of living. Gen. Biog.

ANGUILLARA, LEWIS, an Italian botaniſt of the 16th century, travelled over the greater part of Greece, the iſlands of Cyprus and of Candia, over Switzerland, &c. Returning to Italy, he was made director of the botanical garden at Padua, in which poſt he continued to the time of his death, in 1550. He left behind him a work on the knowledge of ſimples, in Italian, which was publiſhed by Murinelli, at Venice, in 4to. in 1561. It was afterwards tranſlated into Latin by C. Bauhine, and printed at Baſle in 1593, in 8vo. Haller ſays (Bib. Botan.), Anguillara was the firſt Italian who had travelled to acquire a knowledge of plants, in which he attained ſo much perfection as to be able to correct the works of Dioſcorides and of Matthiolus. "Eximius auctor, ſi quæ recte viderat, paulo fuſius docuiſſet." This deficiency is ſupplied by Bahine, in his edition of his works.

ANGUILLARIA, in *Botany*. See ARDISIA. Anguillaria is made a diſtinct genus by Gmelin, though his ang. bahamenſis and ang. exceiſa are the ſame plant. Linn. Tranſ. vol. ii. p. 22.

ANGUILLARIS, in *Ichthyology*, a ſpecies of SILURUS that inhabits the Nile, and is deſcribed by Haſſelq. and Ruſſel. Aleppo. The dorſal fin is ſingle, and conſiſts of 70 rays, and it has eight beards. Gmelin. Body above the lateral line marbled with black and grey, beneath reddiſh grey. It has two beards on the upper lip, four on the lower lip, and one at each angle of the mouth. The rays of the gill membrane are nine, dorſal fins 70, and ſometimes 72, pectoral fins eight, ventral fins ſeven, anal fin 50, and caudal fin 20.

ANGUILLARIS, a ſpecies of GOBIUS, having a ſingle dorſal fin and red tail. Gmelin. This kind inhabits China, is fat, and ſlippery like an eel. The teeth are exerted out of the mouth, the fins are all red, dorſal and anal fin unite with the tail, pectoral fins very ſmall and roundiſh, and the ſkin ſomewhat tranſparent.

ANGUILLE, *Bay* and *Cape*, in *Geography*, lie on the weſt ſide of Newfoundland iſland in the gulf of St. Lawrence, about 10 leagues north from Cape Ray, the ſouth-weſtern extremity of the iſland. N. lat. 47° 55'. W. long. 59° 11'.

ANGUILLE is alſo a bay on the north-north-eaſt ſide of the Iſland of St. John's, in the gulf of St. Lawence, oppoſite to Magdalen iſles, having St. Peter's harbour on the eaſt, and Port Chimene on the north-weſt.

ANGUILLIFORM, ANGUILLIFORMIS, in *Zoology*, having the ſhape or appearance of an eel. The word is derived from *anguilla*, an *eel*, and *forma*, *ſhape* or *appearance*; and was formerly applied by naturaliſts to a number of different fiſhes that are ſoft, lubricous, and deſtitute of very apparent ſcales. Several of thoſe, as the *ſea ſerpent*, *conger*, &c. are now included with the eel (in the Linnæan arrangement), in the genus *muræna*, and the others are chiefly referred to that of *ammodytes*, *ophidium*, or *petromyzon*.

ANGUILLULA, in *Natural Hiſtory*, a ſpecies of VIBRIO found in vegetable ſediment, ſour paſte, infuſions of blighted wheat, and other grain, &c. and known generally by the name of paſte-eel. It is of equal ſize throughout, and ſomewhat rigid. Gmelin. See EELS *microſcopic*.

ANGUINA, in *Botany*. See CALLA and TRICOSANTHES.

ANGUINA, in *Conchology*, a ſpecies of SERPULA that inhabits the Indian Ocean. The ſhell is roundiſh and ſomewhat ſpiral, with a longitudinal articulated fiſſure. It varies conſiderably in form, being either round or angular, ſtraight or waved, ſmooth or rough, and the articulations of the fiſſure often obſolete. The SERPULA MUZICATA of Born is a variety of this ſpecies. Gmelin.

ANGUINA, in *Entomology*, a ſpecies of phalæna, of the BOMBYX family, found in North America by Abbot, and deſcribed by Dr. Smith. The anterior wings are clouded, baſe and tranſverſe ſtreak pale; a whitiſh ſpot with a double black pupil near the apex.

ANGUINA, in *Natural Hiſtory*, a ſpecies of SERTULARIA, called the ſnake coralline by Ellis. It is deſtitute of denticles, and the ſtem is ſimple, with clavated obtuſe branches, each of which has a lateral aperture. Gmelin, Ellis, &c. This kind inhabits the Mediterranean Sea; it is white, ſoft, and flexible, and adheres to other marine ſubſtances.

ANGUINA, in *Zoology*, a ſpecies of LACERTA, having a verticillated tail which is ſtiff at the extremity, ſtriated body, and ſubulated feet without toes. This is *vermis ſeptentiformis ex Africa* of Seba, and *chalcides pinnata* of Laur. The head is rather depreſſed and ſmall, ears tranſverſe, body round and verticillated, the ſcales on each ſide longitudinally furrowed; tail twice as long as the body, ſharply pointed at the end; legs ſix, anterior ones ſlender, body covered with ſubulate ſcales. Gmelin. The general deſcription of this creature does not clearly correſpond with thoſe of the authors quoted by Linnæus and Gmelin. The figure in Seba is about 15 inches in length, of which the body is four inches: the whole is covered with ovate ſcales, is brown above, with duſky longitudinal ſtripes, yelloviſh beneath, and aſh coloured on the ſides. It is common in muddy places about the Cape of Good Hope.

ANGUINEAL *hyperbola*. See HYPERBOLA and CURVE.

ANGUINEI *verſus*, in *Poetry*, thoſe which may be read backwards. Theſe are otherwiſe called recurrent verſes. Such, *e. g.* are,

> "Optimum jus, lex amica, vox diſſerta:
> Diſſerta vox, amica lex, jus optimum."

ANGUINUM, *ovum*, among *Ancient Writers*, denotes an extraordinary ſort of an egg, ſaid to be produced by the joint *ſaliva* of a cluſter of ſnakes interwoven and twined together; and when it was found, it was raiſed up in the air by the hiſſing of theſe ſerpents; and was to be caught in a clean white cloth before it fell to the ground. The perſon who caught it was obliged to mount a ſwift horſe, and to ride away at full ſpeed to eſcape from the ſerpents, who purſued him with great rage until they were ſtopped by ſome river.

The opinions which the Druids, both of Gaul and Britain, entertained of their anguinum, or ſerpent's egg, both as a charm and a medicine, are in a very high degree romantic and extravagant. The method of aſcertaining the genuineneſs of this was no leſs extraordinary. It was to be enchaſed in gold, and thrown into a river; and if it was genuine, it would ſwim againſt the ſtream. "I have ſeen," ſays Pliny (H. N. l. xxi. c. 3.), "that egg; it is about the bigneſs of a moderate apple; its ſhell is a cartilaginous incruſtation, full of little cavities, ſuch as are on the legs of the polypus; it is the inſignia or badge of diſtinction of the Druids." Among other wonderful virtues aſcribed to this egg, it was repreſented as particularly efficacious for rendering thoſe who carried it about with them, ſuperior to their adverſaries in all diſputes, and for procuring on their behalf the favour and friendſhip of great men. We have the following account of this egg, in the part of a Druid, in Maſon's "Caractacus:"

> ——"But tell me yet,
> From the grot of charms and ſpells,
> Where our matron ſiſter dwells,
> Brennus, has thy holy hand
> Safely brought the Druid wand;
> And the potent adder-ſtone,
> Gendered 'fore the autumnal moon,
> When in undulating twine,
> The foaming ſnakes prolific join;
> When they hiſs, and when they bear
> Their wondrous egg aloof in air;
> Thence, before to earth it fall,
> The Druid in his hallow'd pall
> Receives the prize,
> And inſtant flies,
> Follow'd by the envenom'd brood,
> Till he croſs the cryſtal flood?"

Some have thought that the ſerpent's egg was a mere fraud contrived by the Druids to delude the vulgar, who purchaſed theſe marvellous eggs at a high price. Others have imagined that the ſtory of the anguinum was an emblematical repreſentation of the doctrine of the Druids concerning the creation of the world. The ſerpents, they ſay, repreſent the divine wiſdom forming the univerſe, and the eggs the emblem of the world formed by that wiſdom. It may be added, that the virtue aſcribed to the anguinum of giving thoſe who poſſeſſed it a ſuperiority over others, and endearing them to great men, may perhaps be intended to repreſent the natural effects of learning and philoſophy.

Our modern Druideſſes, ſays Mr. Pennant, have an opinion of the virtues of the ovum anguinum, "glain neidr," as the Welch call it, or the "adder-gum;" according to the modern philoſophers, ſimilar, though inferior, to that which the ancients entertained concerning it: they merely apply it to aſſiſt in cutting children's teeth, to cure chin-cough, or

to cure an ague. Theſe eggs were, in reality, beads of glaſs, to which the Druids annexed a charm; and they were of a rich blue colour, either plain or ſtreaked.

ANGUINUS, in *Entomology*, a ſpecies of CURCULIO that inhabits Germany. It is cylindrical, grey, and lineated with brown. Gmelin. This inſect ſomewhat reſembles curculio paraplecticus, the legs and underſide of the body are grey, dotted with black, the beak much bent, wing caſes marked longitudinally with a double row of minute excavated points.

ANGUIS, in *Zoology*, the name of a genus of ſerpents in the Linnæan arrangement, which is diſtinguiſhed from the reſt by having the belly and under part of the tail covered with ſcales like thoſe on the other parts of the body. Gmelin. The ſpecies, according to Gmelin, are, ſtriatus, meleagris, colubrinus, miliaris, jaculus, maculatus, reticulatus, ceraſtes, naſutus, lumbricalis, laticauda, ſcytale, eryx, fragilis, ventralis, platuros, lineatus, clavicus, annulatus, ſcutatus, corallinus, rufus, hepaticus, and teſſellatus; which ſee reſpectively.

ANGUIS BIPES, in *Natural Hiſtory*, the Linnæan name of a creature in the claſs AMPHIBIA, inſerted in the *twelfth edition* of the Syſtema Natura, but referred by Gmelin from the genus ANGUIS to that of LACERTA. The latter author alſo refers ANGUIS QUADRUPES of Linnæus to the ſame genus. See LACERTA SERPENS.

ANGUIS, in *Conchology*, a ſpecies of TURBO figured in Martyn's Univ. Conch. It is ſtriated tranſverſely, green ſtriped with black; pearly within. Gmelin.

ANGUIS *Æſculapii*, ſee COLUBER.

ANGUIUM *lapis*, a name given to a ſuppoſed ſtone in Germany, which is of a cylindric figure, and has a cavity capable of admitting a finger, and of a yellow colour, with a great many variegations. The vulgar call it *duchaneck*, and have an idle opinion of its having its origin in ſome manner from a ſerpent-ant. De Boot, who had ſeen many of them, declares them to be fictitious, and made of glaſs tinged with two or three colours. Theſe were probably of the ſame kind, and uſed for the ſame purpoſes, with the ANGUINUM *ovum*.

ANGULAR, ſomething that relates to, or hath angles. Angular objects at a diſtance appear round; the little inequalities diſappearing at a much leſs diſtance than the bulk of the body.

ANGULAR *Motion*, in *Mechanics* and *Aſtronomy*, is the motion of a body which deſcribes an angle, or which moves circularly round a point. Thus, a pendulum has an angular motion about its centre of motion; and the planets have an angular motion about the ſun. Two moveable points M and O (*Plate* I. *Mechanics, fig.* 3*.), one of which deſcribes the arc MN, and the other, in the ſame time, the arc OP, have an equal, or the ſame, angular motion; although the real motion of the point O be much greater than that of the point M, *viz.* as the arc OP is greater than the arc MN. The angular motions of revolving bodies, as of the planets about the ſun, are reciprocally proportional to their periodic times; and they are alſo as their real or abſolute motions directly, and as their radii of motion inverſely.

ANGULAR *motion* is alſo a kind of motion compoſed of a right-lined and circular motion, or in which the moveable body ſlides and revolves at the ſame time. Such is the motion of the wheel of a coach, or other vehicle. The phenomena, &c. of ſuch motion, ſee accounted for under the article ROTA *Ariſtotelica*.

ANGULAR, *acute, ſection*, ſee ACUTE.

ANGULAR, *capital*, ſee CAPITAL.

ANGULAR *column*, ſee COLUMN.

ANGULAR *niche*, ſee NICHE.

ANGULAR, *Angulatus*, in *Botany*, denotes a ſtem, &c. having edges or corners, oppoſed to cylindrical. A ſtem may have one, two, three, four, or more angles or corners. The white archangel hath four. The flower-de-luce, or flag, has an angular capſule.

ANGULARIS *Scapulæ*, in *Anatomy*, a name given by Winſlow, and ſome others, to the muſcle of the ſhoulder generally called the LEVATOR *ſcapulæ*.

ANGULATA, in *Zoology*, a ſmall ſpecies of LACERTA, firſt diſcovered by Rolander in America. The body is brown above, and covered with carinated ſcales; thoſe on the belly are ſmooth; under the throat are two large rounded ſcales; the head is naked, with various, unequal, elevated wrinkles, which appear truncated at the collar, or behind the head; tail very angular, and half as long again as the body: the ſpecific character of this ſnake is, tail very long and ſexagonal, with carinated and mucronated ſcales. Gmelin

ANGULATA, in *Entomology*, a ſpecies of HISPA, that inhabits Cayenne. The antennæ are fuſiform, body yellow; head, dorſal line on the thorax, and waved, margin of the wing-caſes black. Fabricius and Gmelin.

ANGULATA, a ſpecies of PIMELIA, that inhabits Egypt. The wing-caſes are ſpinous, the lateral line elevated and ſerrated. Fabricius. This is the tenebrio ſpinoſus of Forſk. and tenebrio aſperrimus of Pall. This inſect is black and without wings, and the wing-caſes not divided; the thorax is rough, with three rows of ſpines, and intermediate rows of tuberculated ones, the lateral line deeply ſerrated.

ANGULATA, a ſpecies of CANTHARIS, found in the iſland of Amſterdam, South Seas. It is of a teſtaceous colour, thorax angulated and ſpinous, end of the wing-caſes blue, antennæ and legs black. Fabricius.

ANGULATA, a ſpecies of PHALÆNA, of the *bombyx* tribe. The wings are incumbent, angulated, teſtaceous-brown colour, with numerous black dots, and two obſolete bars of aſh colour. Fabricius. This muſt not be confounded with the BOMBYX ANGULATA of Gmelin, N° 475, whoſe deſcription is taken from *bombyx*, N° 26, of the ſpecies inſectorum of Fabricius, and ſhould have been written *argulata*, inſtead of *angulata*.

ANGULATA is alſo a ſpecies of PHALÆNA, of the *geometra* tribe. The wings are angular and tailed; it is varied with large and ſmall grey ſtreaks, and a black dot near the tail. Fabricius and Gmelin. This is a ſmall inſect, and inhabits Africa. Gmelin has alſo another ſpecies of PHALÆNA, of the *geometra* tribe, under the name of angulata; the wings are angular and pale. It inhabits Europe. Gmel. 1398.

ANGULATA, a ſpecies of ARANEA. It is ovate, front and ſides acutely angulated; centre of the thorax excavated. This is an European inſect, lives in trees, and ſpins a perpendicular web.

ANGULATA, in *Conchology*, a ſpecies of TELLINA that inhabits the Indian ocean. This ſhell is ſomewhat ovate, and marked with tranſverſe recurved ſtriæ, anterior part angulated, and no lateral teeth. Gmelin. This is about an inch and a half in length, and two inches in breadth. It differs from tellina virgata, which it in ſome reſpects reſembles, in being leſs oblong, entirely white, the anterior angle ſeated more outwardly, and the aperture behind oval. Gmel.

ANGULATA, a ſpecies of ANOMIA. The ſides of the baſe compreſſed, anterior part plaited, three teeth in the middle. Gmelin. Found in a foſſil ſtate; this ſhell is ſmooth, and varies in the number of plaits on the anterior part.

ANGULATUS, in *Zoology*, a ſpecies of COLUBER, of a browniſh colour, with dark or blackiſh, broad, lanceolate, tranſverſe

transverſe bands meeting alternately beneath. The Linnæan ſpecific character is, ſcales of the belly one hundred and ſeventeen, and thoſe of the tail ſeventy. The length of this ſnake is above two feet, head rather ſmall, and covered with large ſcales; the ſcales of the body diſpoſed in about nineteen longitudinal rows, and each ſcale rather ſtrongly carinated: its ſpecific name is taken from the angular appearance of the body. This kind is a native of Aſia.

Dr. Shaw having obſerved, that the number of abdominal and ſubcaudal ſcales vary conſiderably in different ſpecimens, has aſſigned this ſpecies a new ſpecific character, ſubfuſcus, faſciis tranſverſis lanceolatis nigricantibus, ſubtus alternatim concurrentibus. Gen. Zool.

ANGULATUS, in *Entomology*, a ſpecies of ATTELABUS, that inhabits Cayenne. It is ferruginous, wing-caſes angulated, black in the diſk. Fabricius. Antennæ black, ferruginous at the baſe; thorax ferruginous, with a black ſpot at the baſe.

ANGULATUS, a ſpecies of CARABUS, of the apterous kind. It is black and hairy, thorax guttered, wing-caſes furrowed, with two interrupted yellow ſtripes. Inhabits Coromandel. Fabricius.

ANGULATUS, a ſpecies of GRYLLUS, that inhabits Germany. It is yelloviſh, abdomen brown, ſegments of the joints obtuſe and angular. Fabricius.

ANGULATUS, a ſpecies of CANCER, with two ſpines on each ſide of the thorax, fore-claws very long. Gmelin.

ANGULOSA, in *Conchology*, a ſpecies of TELLINA, that inhabits America. This ſhell is oval, rather flat, and tranſverſely ſtriated: one end inflected and angulated; firſt tooth of the hinge bifid, lateral ones remote. Gmelin and Chemnitz.

ANGULOSA is likewiſe a ſpecies of ARCA, that inhabits the ſhores of the African and American ocean. It is ventricoſe, longitudinally marked with ſtriæ and fine lines, and has one ſide angulated; the beaks are contiguous, hinge arched. Gmelin. Its general colour is brown, with a few ſpots.

ANGULOSA is alſo the ſpecific name of a PATELLA, figured by Liſter and Martin. It is rather oval, white, thin, ſtriated, and varied with ſpots and dots of red; margin octangular. Gmelin. An orange-coloured ſhell, with elevated white ſtriæ and dots, bottom yellow, central orange ring and white margin; figured by Martini; is ſuppoſed to be a variety of this ſpecies. Its native country is not aſcertained.

ANGULOSA, in *Natural Hiſtory*, a ſpecies of MADREPORA, that inhabits the American ſeas. It is ſhort, thick, cellular, ſmooth, and white: the ſpecific character is, dichotomous, faſtigiate, with terminal, turbinated, angular ſtars; the lamella or gills dentated. Pallas and Gmelin.

ANGULOSUS, in *Conchology*, a ſpecies of ECHINUS. It is hemiſpherical, with granulated ſpaces, and double ſeries of warts, the larger ones divided by ferrated ſutures down the middle; three ſeries of pores upon the avenues. The native country is unknown; it is of a cinereous grey tinged with violet. Seba, Klein, Gmelin, &c.

ANGULUS, in *Natural Hiſtory*, a ſpecies of TRICHODA, deſcribed by Müller, Hiſt. Verm. It is angular, with a hairy tip. Gmelin. This kind is found in infuſions of hay; it is long and convex, and is divided by an articulation into two parts, of equal breadth, but differing in length, the fore part ſhorter than the hind part, the apex furniſhed with ſhort waving hair, indiſtinct molecules within, and no hair on the poſterior part.

ANGURA, in *Geography*. See ANGORA.

ANGURIA, in *Botany*, a genus of the *monœcia diandria* (*diandria monogynia*, Gmelin), and natural order of *cucurbitacei*. Its characters are, that it has male and female flowers; the *calyx* of the male is monophyllous, quinquefid, ſwelling at the baſe, diviſions lanceolate and ſhort; the *corolla* is pentapetalous, ſpreading, growing to the border of the calyx; the *ſtamina* have two filaments, oppoſite, inſerted into the calyx, anther creeping up and down; the *calyx* and *corolla* of the female as in the male; the filaments of the *ſtamina* as in the male, but no anthers; the *piſtillum* has an inferior oblong germ, ſtyle ſemibifid, and ſtigmas bifid and acute; the *pericarpium* a pome, oblong, quadrangular, and bilocular; the *ſeeds* are very many, oval, compreſſed, and neſtling. There are three ſpecies: 1. A. *trilobata*, with three-lobed leaves; a native of Carthagena in South America, where it flowers in June. 2. A. *pedata*, with leaves pedate and ſerrate; a perennial plant, climbing trees, by means of long tendrils, to the height of 20 feet; a native of St. Domingo; flowering in September, and fruit ripening in December. 3. A. *triſoliata*, with leaves ternate and quite entire; a native of St. Domingo; differing from the former in having the leaves quite entire and narrower, and ſeveral fruits collected together.

ANGURIA. See CUCURBITA.

ANGUS, in *Geography*, a diſtrict of the county of FORFAR in Scotland, formerly an earldom belonging to the Douglaſſes, now extinct.

ANGUSTA, in *Entomology*, a ſpecies of MANTIS, that inhabits the iſland of Antigua. It is greeniſh, tail bifurcated, antennæ as long as the body, and filiform. Gmelin.

ANGUSTA, a ſpecies of TENTHREDO, found in Europe. It is black, the body narrow, and covered with greyiſh down. Gmelin.

ANGUSTA, in *Conchology*, a ſpecies of PATELLA. The ſhell is depreſſed, white, with elevated ſtreaks, of which every fourth is larger than the reſt; aperture very narrow, with a cheſnut coloured band on the outſide, and a green belt within. Gmelin. This is about three quarters of an inch in length.

ANGUSTATA, in *Entomology*, a ſpecies of CASSIDA, found in India. It is yelloviſh, poſterior part of the wing-caſes narrow. Gmelin.

ANGUSTATA, a ſpecies of PIMELIA, that inhabits the ſouthern parts of Ruſſia and Egypt. It is gloſſy, poſterior part of the thorax narrow, wing-caſes pointed at the end. Gmelin. This creature lives in the dry dung of animals, under ſtones, &c. and is ſuppoſed to be the tenebrio longicornis of Pallas.

ANGUSTATA, in *Conchology*, a ſpecies of LEPAS, figured by Bonani. The ſhell is elongated, ſmooth, of ſix valves, the aperture narrow, and operculum ſmall. Gmelin. It is grooved where the valves unite, and is ſometimes ſtriated with red and white.

ANGUSTATA, a ſpecies of CYPRÆA. It is narrow, and of a brown colour, with reddiſh ſpots. Gmelin and Gualteri.

ANGUSTATUS, in *Entomology*, a ſpecies of CURCULIO, ſometimes, though rarely found in England. It is cylindrical and black, wing-caſes obtuſe and punctated. Fabricius.

ANGUSTATUS, a ſpecies of CRYPTOCEPHALUS in Gmelin's arrangement, and CISTELLA of Fabricius; the thorax and wing-caſes are of an obſcure reddiſh brown, and black in the middle. Fab. Inhabits England.

ANGUSTATUS, a ſpecies of CARABUS, that inhabits Germany. The thorax is cylindrical and blue, wing-caſes teſtaceous, black at the tips. Fabricius.

ANGUSTATUS, a ſpecies of CIMEX, with oblong body, and

and filiform antennæ; it is black, with an elongated head and thorax. Gmelin and Thunb.

ANGUSTIA, in *Ancient Geography*, a town of Europe in Dacia, according to Ptolemy.

ANGUSTICLAVIA, or ANGUSTUS CLAVUS, in *Antiquity*, a *tunica*, embroidered with little purple ſtuds, or flowers, worn by the Roman knights, inferior magiſtrates, and ſome officers of the army.

The word is compounded of *anguſtus*, *ſmall*, and *clavus*, *ſtud*, becauſe thoſe ornaments were ſmaller in this garment than in the *laticlavia* which was worn by the ſenators.

ANGUSTIFOLIUS, in *Botany*, denotes narrow-leaved.

ANGUSTURA *Bark*, in the *Materia Medica*, a ſpecies of bark imported here in convex pieces, about an inch and an half or leſs in breadth, and about ſix inches long. It is hard and compact, of a yellowiſh brown colour, and covered with a whitiſh, uneven epidermis. In powder it has the yellow appearance of rhubarb; its taſte is bitteriſh and aromatic; its odour, when recent, is ſaid to be not ungrateful. An ounce of this bark yields, by means of alcohol, about two drams of a reſinous, bitter extract; and from the ſame quantity, nearly three drams and a half of a gummy extract may be obtained by water. This drug, according to ſome, ſhould be called *Auguſtine*, from St. Auguſtine, in Eaſt Florida; but it is more properly named *Anguſtura*, from a place of this name in South America, whence it was brought by the Spaniards to the iſland of Trinidad.

The tree which produces it is not aſcertained. Some ſuppoſe it to be MAGNOLIA *glauca;* but it has been thought, with greater probability, to be the bark of the BRUCEA *antidyſenterica*, or BRUCEA *ferruginea* of L'Heritier and Aiton; for the deſcription of the bark of this tree given by Mr. Bruce agrees very well with the cortex anguſturæ; and this opinion is confirmed by the bark of a living plant of this ſpecies growing in the royal garden at Kew.

This bark has been ſucceſsfully uſed during the 12 years from 1789, in which it has been known as a medicine in this country, under the characters of a febrifuge, tonic, and aſtringent. In intermittents it has been found no leſs effectual than Peruvian bark, and generally more acceptable to the ſtomach; and in caſes of diarrhœa, dyſpepſia, ſchropule, and great debility, it has been found to be an uſeful remedy. The doſes in which Mr. Brandi has exhibited this remedy have been, of the powder as much as 20 grains every three hours, but generally leſs.

The infuſion is made with half an ounce of the bruiſed bark to a pint of boiling water; the decoction of the ſame ſtrength; the doſe, one ounce to an ounce and an half. Of the tincture, prepared with one ounce of bark to 16 of proof ſpirit, the doſe is about one drachm. Woodville's Med. Bot. vol. iv. p. 162. Murray's Mat. Med. vol. vi. p. 172—177. Brandi's Exp. and Obſ. on the Anguſtura bark, 1791.

ANGUSTUS, in *Entomology*, a ſpecies of CIMEX, that inhabits China. It is greyiſh above, beneath yellowiſh; antennæ and legs teſtaceous brown. Fabricius.

ANGUSTUS, in *Conchology*, a ſpecies of MUREX. This ſhell is narrow, the firſt wreath of the ſpire plaited longitudinally, and ribbed tranſverſely, the reſt ſmooth and round, beak ribbed tranſverſely. Gmelin.

ANHALDIN, *anhaldinum*, an epithet given to various medicines, formerly kept as ſecrets in the family of Anhalt. Three of the moſt celebrated medicines under this denomination are a corroſive, a water, and a ſpirit.

The corroſive, as deſcribed by Burggrave, is compounded of calcined antimony, ſublimate mercury, ſal ammoniac, and calcined tartar, diſtilled and rectified. The Anhaltin water, or rather ſpirit, is a farrago of ſeveral aromatics, balſamics, and turpentine diſtilled with ſpirit of wine. It is nauſeous to the palate; but has been applied externally in the palſy, ſyncopea, vomitting, and gripes. Murray, Mat. Med. vol. i. p. 36.

ANHALT, in *Geography*, a principality of Germany, in the circle of Upper Saxony, terminating to the north-eaſt on the marche of Brandenburg, to the eaſt on the electorate of Saxony, to the ſouth on the margravate of Miſſen, to the ſouth-weſt on the county of Mansfeld, to the north-weſt on the duchy of Brunſwick, and to the north on the principality of Halberſtadt and the duchy of Magdeburg, and extending about 90 miles from eaſt to weſt, and in its greateſt breadth about 35 miles. The ſoil produces corn and hops, and various kinds of fruits. The rivers, which are the Elbe, the Mulde, the Saele, the Wipper, the Seike, the Bude, the Futine, the Zitau, the Nuke, and the Roſzlau, yield excellent fiſh. The mines afford lead, copper, ſilver, iron, coals, ſulphur, vitriol, alum, ſaltpetre, and other minerals; and the principal article of trade is beer. The air is healthy, though cold. In this principality are 19 towns and two boroughs, and the number of inhabitants is about 100,000. Chriſtianity was introduced into Anhalt in the ninth century; and the reformation took place in 1521. Until 1596, the whole country profeſſed Lutheraniſm; but at that time Calviniſm was introduced. This principality derives its name from the caſtle of Anhalt; and the princes of Anhalt are deſcended from the Aſcanians. Some of the beſt genealogiſts derive their origin from Berenthobaldus, who made war upon the Thuringians in the ſixth century; and in the German hiſtory the princes of this family make a conſpicuous figure. Joachim Erneſt II. was the founder of all the preſent princes of Anhalt. He died in 1586; and five of his ſons ſhared their father's territories. To the eldeſt of the family they all agreed to ſubmit; and with him, to whom belonged *Anhalt-Deſſau*, was veſted the ſupreme government. The other four are *Anhalt-Bemburg*, *Anhalt-Schaumburg*, *Anhalt-Cothen*, and *Anhalt-Zerbſt*. Each of the reigning lines has its regency, exchequer, and conſiſtory. The annual produce of the whole principality of Anhalt is eſtimated at between 5 and 600,000 rix dollars.

ANHELITUS, formed of the verb *anhelo*, *I breathe with difficulty*, ſignifies a ſhortneſs and thickneſs of breath, as in an ASTHMA. See RESPIRATION.

ANHIMA, in *Ornithology*, a name given by Marcgrave, Willughby, Ray, and other old writers, to the PALAMEDEA CORNUTA of Linnæus. See CORNUTA PALAMEDEA.

ANHINGA, a ſpecies of PLOTUS, having a ſmooth head, and white belly. Gmelin. This is the anhinga of Marcgrave, Briſſon, Ray, and others; and *white bellied darter* of Latham.

This ſpecies is ſcarcely ſo big as a mallard in the body, but its length from the tip of the bill to the end of the tail is not leſs than two feet ten inches; the bill is three inches long, ſtraight, pointed, and jagged at the edges; the colour greyiſh, yellowiſh at the baſe; head ſmall, neck very long and ſlender, and covered with downy feathers of a rufous greyiſh colour; upper part of the back and ſcapulars duſky or blackiſh, the middle of each feather daſhed with white; lower part of the back, rump, and upper tail coverts black; belly pure ſilvery white; tail of twelve large black feathers, legs and toes yellowiſh grey.

It inhabits Braſil, and feeds on fiſh, which it is ſaid to catch with much cunning and dexterity, firſt drawing up its neck like a ſerpent, and then darting its bill upon its prey. Like the corvorant, this bird builds the neſt upon trees, generally thoſe which grow by the ſides of rivers. When at reſt

reſt it frequently ſits with the head drawn in between the ſhoulders, like the heron. It is for the moſt part very fat, but the fleſh has an oily, rank, and diſagreeable taſte.

ANHLOTE, in *Law*, a ſingle tribute or tax. The words *anhlote* and *anſcot* are mentioned in the laws of William the Conqueror; and their ſenſe is, that every one ſhould pay, according to the cuſtom of the country, his part and ſhare, as ſcot and lot, &c. Leg. W. I. cap. 64.

ANHOLT, in *Geography*, a ſeignory of Weſtphalia, lies between the biſhopric of Munſter, the duchy of Cleve, and the county of Zutphen. When the antient lords of Anholt became extinct, towards the cloſe of the 12th or beginning of the 13th century, a female heir of this houſe transferred it to her conſort John of Bronkhorſt. His two ſons divided the maternal and paternal eſtates, and thus Count Theodorica obtained the ſovereignty of Anholt. In 1641, he gave this ſeignory to his daughter, who was married to Leopold Philip Charles, prince of Salm, whoſe houſe, on account of this ſeignory, enjoys both ſeat and voice in the Weſtphalian college of the counts of the empire, and alſo at the diets of the circle of Weſtphalia. The province of Guelders, in the Low Country, now appropriates to itſelf the ſuperiority over this ſeignory. The chief place in it is *Anholt*, a ſmall town and citadel lying in the Old Yſſel. N. lat. 51° 54′. E. long. 6° 7′.

ANHOLT, is an iſland of Denmark, in North Jutland, ſituate in the Cattegat, eight miles from the coaſt of Jutland on the weſt, ten from Zealand on the ſouth, and ſeven from Smaland on the eaſt. It is ſurrounded with ſand-banks, and, therefore, dangerous to ſeamen, but a fire is conſtantly kept up in a light-houſe upon it. On each ſide of it is a channel, as ſhips may be ſailing for Copenhagen on the eaſt or on the weſt ſide of Zealand. Profeſſor Bugge obſerves, that in all the beſt maps of the Cattegat, the poſition of Anholt is very erroneous. The light-houſe and the whole iſle are from ſeven to nine minutes too much weſterly; and the diſtance from the light-houſe to the Swediſh coaſt, in a direction perpendicular to the meridian of the light-houſe, is, in all maps hitherto publiſhed, nearly four Engliſh miles, or one-eighth part of the whole, too great. Experience has taught the navigators that they come too ſoon down upon Anholt; or that, on cruiſing between Anholt and Sweden, they over-run their reckoning, which was aſcribed to the currents; whereas, the true reaſon was the great error in the geographical and hydrographical poſition of Anholt in a narrow and dangerous paſſage. The light-houſe is in N. lat. 56° 44′ 20″. E. long. 11° 39′ 51″. Phil. Tranſ. vol. lxxxiv. p. 46.

ANHUIBA, in *Botany*, a name by which ſome authors call the SASSAFRAS tree, the wood of which is ſo much uſed in medicine.

ANHYDROS, a name given by the ancient Greeks, and from them copied by the Romans in the time of Pliny, to expreſs one of thoſe kinds of the STRYCHNA, or night-ſhades, which, when taken internally, cauſed madneſs.

ANI, in *Ornithology*, a ſpecies of CROTOPHAGA, in the Linnæan and Gmelinian arrangement, and very briefly deſcribed as Cr. minor pedibus ſcanſoriis (ſmall feet-climbers). This character is, perhaps, inſufficient to diſtinguiſh it from another ſpecies of the ſame genus deſcribed by Gmelin, as Cr. major pedibus ſcanſoriis, without attending to the characters admitted by other authors; both are of a blackiſh violet colour, and have the edges of the feathers gloſſed with green, but in the former the green has a coppery aſpect: the bill of this is alſo ſhorter in proportion, and riſes higher at the top, and its uſual length is thirteen inches and an half, which is about four inches and an half leſs than that of C. major. Some authors have been diſpoſed to conſider them as the two ſexes of the ſame ſpecies, or mere varieties; but both ſexes of each ſeem to be well aſcertained, and Dr. Latham ſays he is aſſured they are diſtinct ſpecies, and never mix together.

This is the Braſilian bird, called by Marcgrave in his Hiſtory of Braſil, ANI; and Pſittaco congener *Ani*, by Ray and Willughby. It is not, however, peculiar to this part of South America, being alſo found in Guiana. It is Monedula tota nigra major garrula, mandibula ſuperiore arcuata of Sloane, Jamaica; and is likewiſe deſcribed as a Weſt Indian bird by Brown. Cateſby calls it the razor-billed black-bird; Buffon, ani des Savanes, and in the Pl. enl. Petit Bout-de-Petun. Crotophagus, by Briſſon, and it is ſuppoſed the Cacalototl of Ray is the ſame bird.

"Contrary to all other birds, the Crotophaga Ani," ſays Dr. Latham, "have the ſingularity of many lying in the ſame neſt, to make which they all unite in concert; and, after laying their eggs, ſit on them cloſe to each other, in order to hatch them, each unanimouſly ſtriving to do the beſt for the general good; and when the young are hatched, the parents, without reſerve, do the beſt to feed the whole flock. A ſtill greater ſingularity occurs, which is, that as ſoon as each female lays her eggs, ſhe covers them with leaves, doing the ſame thing whenever ſhe is obliged to leave the neſt for food: this might be neceſſary in a cold climate; but why it ſhould be wanted in a hot one, ſeems not clear, eſpecially as it has not been obſerved in other birds. It generally has two broods in a year, except accidents happen; in which caſe it has been known to make three neſts. The eggs are about the ſize of thoſe of a pigeon, of a ſea-green colour, ſpotted at the ends."

"Their food is various; worms, inſects, fruits, and grain, according to the ſeaſon. They have the ſame manners as the greater ani, C. major, and are continually gregarious, from ten to thirty in a flock, whether it be in breeding time or not. They are not difficult to be ſhot, not being ſo wild as many other birds; but are known to chatter much on the ſight of a man, though they do not fly to a great diſtance; hence they are not well reliſhed by ſportſmen, as, like jays in England, they are the occaſion of hindering his ſport in reſpect to other game, without making him amends in their own fleſh, which is never ſought after for food, being rank and unſavory." *Vide* Gen. Syn. tom. i. p. 362.

ANI, a name adopted by Dr. Latham in his arrangement, Gen. Syn. for the Linnæan genus CROTOPHAGA: thus the ſpecies C. ani is called the *leſſer ani*, C. major, *greater ani*, C. ambulatoria, *walking ani*; and, no doubt, the newly-diſcovered ſpecies deſcribed as C. *varia*, rufo nigroque varia, in Ind. Orn. of the ſame author, would have been called the *variegated ani*, had any Engliſh name been aſſigned to it.

ANI, a name given by ſome early writers on natural hiſtory to the UPUPA MEXICANA of Linnæus, and Mexican pomerops of Latham. Avis *ani* Mexicana cauda longiſſima. Seba, &c.

ANI, or ANIKAGA, in *Geography*, a town of Greater Armenia, in Aſia, in the government of Kers, and under the beglierbeg of Erzerum. Its walls are watered by a river, which deſcends with rapidity from the mountains of Mingrelia. It was formerly known under the name of *Am*; and was ſo conſiderable and ſo ſtrong, that the ancient kings of Armenia depoſited their treaſure in its caſtle.

ANIAN *Straits*, lie between the north-eaſt extremity of Aſia, and the north-weſt point of the continent of America. The weſt point of this ſtrait is N. lat. 65° 52′, and W. long. 169° 20′, and the eaſt point, called Cape Prince of Wales, in N. lat. 65° 46′, and W. long. 168° 15′; and its breadth is about 14 leagues. See BEERING's *Straits*.

ANIAN is also a barren, sandy desert, which is excessively hot, and inhospitable, on the east coast of Africa; frequented only by wandering Arabs, who live in camps. It lies upon or near the Eastern Ocean and the Red Sea. See ABEX.

ANIAN-FU, or ANIEN, a town of China, in the province of Chuquami.

ANIANA, in *Ancient Geography*, a town placed by Ptolemy in Mesopotamia.

ANIANE, in *Geography*, a town of France, in the department of the Herault, and chief place of a canton in the district of Lodeve, 13 miles west-north-west of Montpellier. N. lat. 43° 41′. E. long. 3° 29′.

ANJAR, a town of Asia in Syria, between Aleppo and Alexandretto.

ANIBA, in *Botany*. See CEDROTA.

ANICETUS, Pope, in *Biography*, a Syrian by birth, succeeded Pope Pius, according to Eusebius, in the year 157; but, according to other writers, at a somewhat earlier period. In his time, the Gnostic doctrines of Valentine and Marcion prevailed at Rome; but many of the persons who adopted them were reclaimed by Polycarp, who came from Smyrna to Rome, in order to settle the controversy about the celebration of Easter. Anicetus differed with him on this point; and after a conference, each retained his own opinion, whilst both of them manifested mutual forbearance and charity. In token of their amity they communicated together at the eucharist; and Anicetus testified his respect for Polycarp, by yielding to him the honour of performing the service on the occasion. Happy would it have been for the Christian church, if the successors of Anicetus had manifested a similar disposition. Several ordinances and decrees are ascribed to this pope by modern writers, but their authority is doubtful, and therefore they are not worthy of notice. After having governed the church 11 years, he died, as some have said, a martyr; but of this there is no sufficient evidence. The letters ascribed to him are spurious. Euseb. Eccl. Hist. lib. iv. c. 11. 14. 22. Dupin. Bower.

ANICH, PETER, a mathematician, mechanic, and astronomer, was born of obscure parentage at Oberperzuff, near Inspruck, in 1723; and discovered an early taste for the sciences of astronomy and geometry, which Father Hill, a Jesuit, and professor in the university of Inspruck, afforded him an opportunity of cultivating. In a short time he was distinguished by his knowledge both of astronomy and mechanics. He made a very curious pair of globes for the university of Inspruck, and constructed many mathematical instruments of his own invention. He also delineated maps with neatness and accuracy. He died much regretted in 1766; and the empress queen testified her respect for his memory, by settling upon his sister a pension of 50 florins. Nouv. Dict. Hist.

ANICULA, in *Conchology*, a name given by Rumphius to a species of conus, called by Linnæus and later authors, CONUS MONACHUS; which see.

ANICULUS, in *Entomology*, a species of CANCER, having an ovate thorax, ciliated at the sides, and rugged, hairy legs. Fabricius. This creature inhabits the southern ocean, and is the largest of the family *Parasitici*. The rostrum is bifid, teeth elongated and acute; the eyes cylindrical and porrected; thorax smooth, tail soft, claws and legs rugged, with hairy tufts.

ANJENGO, in *Geography*, a small town and factory, with a fort, on the coast of Malabar, belonging to the East India company. The chief trade of this settlement is pepper, and rupees are the current money. N. lat. 8° 39′. E. long. 76° 40′.

ANIERES, a town of France, one league north-west from Paris.

ANIGRUS, in *Ancient Geography*, a river of Triphylia, in the territory of Elis, to the north of Lepreum. Its source was in Lepithas, a mountain of Arcadia; the inhabitants of which thought that it was the same with the Mingeus of the ancients, mentioned by Homer. Near this river was a cavern, called the cave of the nymphs *Anigrides*, or *Anigriades*, mentioned by Strabo and Pausanias; and it was pretended that any persons who had a complaint of the skin might be cured, if, after having sacrificed to the nymphs, they swam over the Anigrus.

ANIKAN, or INGHENITRAN, a town of Africa, on the Gold Coast, where the English and Portuguese have both a factory and a fort.

ANILL, in *Botany*. See INDIGOFERA.

ANILIS, in *Entomology*, a species of MUSCA, in the Linnæan system, and BIBIO in that of Fabricius. It is villous, whitish grey, with transparent whitish wings, and is found in Europe. Gmelin.

ANILLE, in *Heraldry*, a mill-rind, or, as the French term it, a fer de moline.

ANIM, in *Ancient Geography*, a town of Palestine, situate in the mountains of the tribe of Juda, according to the book of Joshua.

ANIMA, a SOUL; whether rational, sensitive, or vegetative.

The word is pure Latin, formed of ανεμος, *breath*.

ANIMA is sometimes used by physicians to denote the principle of life in the body.

In which sense Willis calls the blood *anima brutalis*.

ANIMA is also figuratively used by chemists for the volatile principles in bodies, whereby they are capable of being raised by the fire.

In which sense we meet with *anima jaspidis*, the soul of *jasper*, &c. Phil. Trans. N° 74. p. 2233.

ANIMA is more peculiarly applied to simple medicines, artfully exalted by solution and extraction, to a high degree of power.

In which sense we meet with *anima aloes*, *anima rhabarbari*, *anima veneris*, &c.

Sometimes also it denotes medicines which are peculiarly salutary to particular parts of the body. Thus we meet with

ANIMA *articulorum*, which is a denomination sometimes given to HERMODACTYLS, on account of their efficacy in disorders of the joints.

ANIMA *hepatis*, *soul of the liver*, a term applied by the chemists to the *sal martis*, salt of iron or steel; on account of its utility in distempers of that part.

It is more usually prescribed under the name of *vitriolum martis*.

ANIMA *pulmonum*, used for *crocus*, or saffron, by reason of its supposed great use in diseases of the lungs.

ANIMA *mundi*, q. d. *soul of the world*, or *of the universe*, denotes a certain pure ethereal substance or spirit, diffused, according to many of the ancient philosophers, through the mass of the world, informing, actuating, and uniting the divers parts thereof into one great, perfect, organical, and vital body or animal. See PLASTIC *Nature*.

Plato treats at large of the ψυχη του κοσμου, in his Timæus; and is even supposed to be the author of the *dogma*; yet interpreters are much at a loss about his meaning. Aristotle, however, taking it in the common and obvious sense, strenuously opposes it.

The modern Platonists explain their master's *anima mundi*

by a certain univerſal ethereal ſpirit, which in the heavens exiſts perfectly pure, as retaining its proper nature; but on earth, pervading elementary bodies, and intimately mixing with all the minute atoms thereof, it aſſumes ſomewhat of their nature, and becomes of a peculiar kind. So the poet;

"Spiritus intus alit, totoſque infuſa per artus
Mens agitat molem, & magno ſe corpore miſcet."

They add, that this *anima mundi*, which more immediately reſides in the celeſtial regions as its proper ſeat, moves and governs the heavens in ſuch manner, as that the heavens themſelves firſt received their exiſtence from the fecundity of the ſame ſpirit: for that this *anima*, being the primary ſource of life, every where breathed a ſpirit like itſelf, by virtue whereof various kinds of things were framed conformable to the divine ideas.

The notion of an *anima mundi* is rejected by moſt of the modern philoſophers; though M. du Hamel thinks without any great reaſon, ſince the generality of them admit ſomething very much like it. Thus the Peripatetics have recourſe to celeſtial influxes, in order to account for the origin of forms, and the ſecret powers of bodies.

The Carteſians have their ſubtile matter, which anſwers to moſt of the uſes and intentions of Plato's *anima mundi*; being ſuppoſed to flow from the ſun, and the other heavenly bodies, and to be diffuſed through all the parts of the world, to be the ſource or principle of all motion, &c.

Some later philoſophers, in the place of theſe ſubſtitute fire; and others a ſubtle elaſtic ſpirit, or *medium*, diffuſed through all parts of ſpace.

The principal thing objected to, on the Chriſtian ſcheme, againſt Plato's doctrine of the *anima mundi*, is, that it mingles the Deity too much with the creatures; confounds, in ſome meaſure, the workman with his work, making this, as it were, a part of that, and the ſeveral portions of the univerſe ſo many parts of the godhead. Yet is the ſame principle aſſerted by Seneca, Epiſt. 92. *Totum hoc quo continemur, & unum eſt, & Deus. Et ſocii ejus ſumus, & membra*——

ANIMA *gemmarum*, a term uſed by Becher and ſome others, to expreſs that principle, to which the gems, and other beautiful ſtones owe their colours.

This *anima lapidum* is no more than the metalline ſulphur to which theſe ſtones and gems, naturally colourleſs, owe their tinges; and, like other metalline ſulphurs, it may be raiſed and evaporated by fire. Becher, Phyſ. Subt.

ANIMA *ſaturni, the ſoul of lead*, a preparation of lead, ſerving to many purpoſes in the enamel work. The method of making it is this: put litharge, powdered fine, into a glazed earthen veſſel, and pour diſtilled vinegar upon it to the height of four fingers; let it ſtand till the vinegar is of a white or milky hue; pour off this coloured vinegar and put on freſh, and ſo do till the vinegar will no longer be coloured by the litharge; then ſet theſe liquors together in open glazed earthen veſſels, that the white powder may ſubſide, and the vinegar be poured off clear. This white ſubſtance is the *anima ſaturni*. Sometimes this white matter will not precipitate without the addition of water; and ſometimes it is neceſſary to evaporate the liquors, but by that means it is always prepared. Neri's Art of Glaſs, p. 184.

ANIMACHA, or ANIMACA, in *Geography*, a river of India, in Malabar, which riſes in Calicut, and diſcharges itſelf into the ſea, in the vicinity of Cranganor.

ANIMADVERSION, formed of *animus*, the *mind*, and *adverto, I turn to*, ſometimes ſignifies *correction*, and ſometimes remarks or obſervations made on a book, &c. and ſometimes a ſerious conſideration and reflection on any ſubject, by the rules of criticiſm.

ANIMAL, in *Natural Hiſtory*, an organiſed and living body, endowed with the powers of ſenſation, and of ſpontaneous loco-motion. The word is derived from *anima, ſoul*, and literally denotes ſomething that is endued with a ſoul. Boerhaave defines an animal to be an organical body, conſiſting of veſſels and juices, and taking in nutrition by a part called the mouth; whence it is conveyed into another called the inteſtines, into which it has roots implanted, whereby it draws in its nouriſhment after the manner of plants. The imperfection of this definition is obvious, not merely as it excludes the ſentient principle, but becauſe it diſtinguiſhes the animal by the inſtruments or means of its nutrition, which it poſſeſſes in common with vegetables, and which, notwithſtanding ſome variation in their form and ſtructure, are not ſufficient to conſtitute an eſſential diſtinction. Dr. Tyſon fixes the criterion of an animal in the "ductus alimentalis," *i. e.* a gula, ſtomach, and inteſtines, all which make one continued canal; but this definition is liable to the ſame objection with that of Boerhaave. Some, as Klein and others, have defined animals, from their loco-motion, as being capable of ſhifting from place to place, whereas plants adhere to the ſame ſubject. This property they aſſume as the great characteriſtic by which animals may be diſtinguiſhed from the other orders of beings. On this principle, however, oyſters, muſcles, cockles, &c. would be almoſt excluded from the claſs of animals, inaſmuch as they uſually adhere, or grow to rocks, &c. and yet it is certain that theſe creatures are real animals. But loco-motion alone is not ſufficient to conſtitute the generic difference of animals; nor indeed does it ſufficiently diſtinguiſh an animal from a plant. Many inſtances are produced, in which plants manifeſt loco-motive power. This is the caſe with thoſe denominated ſenſitive plants, many of which, upon the ſlighteſt touch, ſhrink back, and fold up their leaves; as the ſnail, on the ſlighteſt touch, retires into its ſhell. There are ſome, on which if a fly perches, inſtantly cloſe and cruſh the inſect to death. Plants alſo change their poſition and form in different circumſtances and ſeaſons; they take advantage of good weather, and guard themſelves againſt bad weather; they open their leaves and flowers in the day, and cloſe them at night; ſome cloſe before ſun-ſet, and ſome after; ſome open to receive rain, and ſome cloſe to avoid it; ſome follow the ſun, and ſome turn from it; the leaves of ſome plants are in conſtant motion during the day, and at night they ſink to a kind of reſt or ſleep. It has alſo been obſerved that a plant has a power of directing its roots for procuring food; and that it has a faculty of recovering its natural poſition after it has been forced from it. A hop-plant, for inſtance, in twiſting round a pole, directs its courſe from ſouth to weſt, as the ſun does; if it be tied in the oppoſite direction, it dies; but if it be left looſe in this direction, it will regain its natural courſe in a ſingle night. A honey-ſuckle proceeds in a certain direction till it be too long to ſuſtain itſelf; it then acquires ſtrength by ſhooting into a ſpiral form; and if it meet with another plant of the ſame kind, both theſe coaleſce for mutual ſupport, one twiſting to the right and the other to the left. Lord Kaimes mentions many other inſtances in which plants manifeſt a faculty of loco-motion; and, perhaps, in almoſt as eminent a degree as ſome animals. Muſcles, *e. g.* are fixed to one place as much as plants; nor have they any power of motion, beſides that of opening and ſhutting their ſhells; nor do they ſeem, in this reſpect, to have any ſuperiority, with regard to the powers of motion, to the ſenſitive plant and others of a ſimilar kind.

In

In order, therefore, to form a complete and ſatisfactory diſtinction between animals and vegetables, as well as minerals, it is neceſſary to combine with ſpontaneous loco-motion, which they unqueſtionably poſſeſs in a more perfect degree than plants, the powers of ſenſation. Theſe ſeem to be unexceptionably diſtinguiſhing and characteriſtic. However, M. Buffon (Nat. Hiſt. by Smellie, vol. ii. p. 6.), after allowing that, although progreſſive motion conſtitute a perceptible difference between an animal and a vegetable, this diſtinction is neither general nor eſſential; proceeds to ſtate, that ſenſation more eſſentially diſtinguiſhes animals from vegetables. But he adds, that this diſtinction is neither ſufficiently general nor decided. If ſenſation, he ſays, implied no more than motion conſequent upon a ſtroke or impulſe, the ſenſitive plant enjoys this power; whereas, if by ſenſation we mean the faculty of perceiving, and of comparing ideas, it is uncertain whether brute animals are endowed with this faculty. If it ſhould be allowed to dogs, elephants, &c. whoſe actions ſeem to proceed from motives ſimilar to thoſe by which men are actuated, it muſt be denied to many ſpecies of animals, particularly to thoſe that appear not to poſſeſs the faculty of progreſſive motion. If the ſenſation of an oyſter, *e. g.* differ in degree only from that of a dog, why do we not aſcribe the ſame ſenſation to vegetables, though in a degree ſtill inferior? In examining the diſtinction which ariſes from the manner of feeding, he obſerves, that animals have organs of apprehenſion, by which they lay hold of their food: they ſearch for paſture, and have a choice in their aliment. But it is alleged, that plants are under the neceſſity of receiving ſuch nouriſhment as the ſoil affords them, without exerting any choice in the ſpecies of their food, or in the manner of acquiring it. However, if we attend to the organization and action of the roots and leaves, we ſhall ſoon be convinced, that theſe are the external organs by which vegetables are enabled to extract their food; that the roots turn aſide from a vein of bad earth, or from any obſtacle which they meet with, in ſearch of a better ſoil; and that they ſplit and ſeparate their fibres in different directions, and even change their form, in order to procure nouriſhment to the plant. From this inveſtigation he concludes, that there is no abſolute and eſſential diſtinction between the animal and vegetable kingdoms; but that Nature proceeds by imperceptible degrees from the moſt perfect to the moſt imperfect animal, and from that to the vegetable; and that the freſh-water polypus may be regarded as the laſt of animals and the firſt of plants. After examining the diſtinctions, this author proceeds to ſtate the reſemblances which take place between animals and vegetables. The power of reproduction, he ſays, is common to the two kingdoms, and is an analogy both univerſal and eſſential. A ſecond reſemblance may be derived from the expanſion of their parts, which is likewiſe a common property, for vegetables grow as well as animals; and though ſome difference in the manner of expanſion may be remarked, it is neither general nor eſſential. A third reſemblance reſults from the manner of their propagation. Some animals are propagated in the ſame manner, and by the ſame means, as vegetables. The multiplication of the ſacceron, or vine-fretter, which is effected without copulation, is ſimilar to that of plants by ſeed; and the multiplication of the polypus by cuttings, reſembles that of plants by ſlips. Hence it is inferred, that animals and vegetables are beings of the ſame order, and that Nature paſſes from the one to the other by imperceptible degrees; ſince the properties in which they reſemble one another are univerſal and eſſential, while thoſe by which they are diſtinguiſhed are limited and partial. Dr. Watſon, biſhop of Llandaff, has examined, with his uſual judgment, the diſtinguiſhing marks between animals and vegetables. See Eſſ. iii. in the fifth volume of his Chemical Eſſays, 12mo. 1787. He rejects, as inſufficient, both *figure* and *ſpontaneous motion*; and if *perception* be ſubſtituted in their ſtead, it will be found to be a criterion that is in many reſpects liable to exceptions. However, the ingenious and learned prelate produces many chemical, phyſical, and metaphyſical reaſons, which ſerve to render the ſuppoſition not altogether indefenſible, that vegetables are endowed with the faculty of perception. Dr. Percival, likewiſe, in a paper read before the Literary and Philoſophical Society of Mancheſter, produces ſeveral arguments to evince the perceptive power of vegetables. From the reaſoning adduced by both theſe ingenious writers, of which a more particular account will be given in the ſequel of this work (ſee PLANTS and VEGETABLES), thoſe who duly advert to it, will, we conceive, incline to the opinion, that plants are not altogether deſtitute of perception. But on a queſtion that has perplexed and divided the moſt ingenious and inquiſitive naturaliſts, it is very difficult to decide. If we extend to the vegetable kingdom that kind of vitality with which ſenſation and enjoyment are connected, there will remain no diſcernible boundary between this and the animal kingdom; and that which has been conſidered as the diſtinctive characteriſtic of animals, and by which they are ſeparated from vegetables, will be aboliſhed. For a diſcuſſion of this queſtion more in detail, ſee BRUTE, INSTINCT, *Phyſiology* of PLANTS, and particularly the article SENSATION. Before we cloſe this article, we ſhall add, that the principle of ſelf-preſervation belongs to all animals; and it has been argued, that this principle is the true characteriſtic of animal life, and that it is unqueſtionably a conſequence of ſenſation. There is no animal, when apprehenſive of danger, that does not put itſelf into a poſture of defence. A muſcle, when it is touched, immediately ſhuts its ſhell; and as this action puts it into a ſtate of defence, it is aſcribed to a principle of ſelf-preſervation. Thoſe who adopt this reaſoning, allege, that vegetables do not manifeſt this principle. When the ſenſitive plant, for inſtance, contracts from a touch, it is no more in a ſtate of defence than before; for whatever would have deſtroyed it in its expanded ſtate, will alſo deſtroy it in its contracted ſtate. They add, that the motion of the ſenſitive plant proceeds only from a certain property called IRRITABILITY; and which, though poſſeſſed by our bodies in an eminent degree, is a characteriſtic neither of animal nor vegetable life, but belongs to us in common with brute-matter. The ſenſitive plant, after it has contracted, will ſuffer itſelf to be cut in pieces, without making the leaſt effort to eſcape. This is not the caſe with the meaneſt animal. An hedge-hog, when alarmed, draws its body together, and expands its prickles, thus putting itſelf in a poſture of defence. When thrown into the water, the ſame principle of ſelf-preſervation prompts it to expand its body and ſwim. A ſnail, when touched, withdraws itſelf into its ſhell; but if a little quick-lime be ſprinkled upon it, ſo that its ſhell is no longer a place of ſafety, it is thrown into agonies, and endeavours to avail itſelf of its loco-motive power, in order to eſcape the danger. Muſcles and oyſters alſo, though they have not the power of progreſſive motion, conſtantly uſe the means which Nature has given them for ſelf-preſervation.

We ourſelves poſſeſs both the animal and vegetable life, and ought to know whether there be any connection between vegetation and ſenſation, or not. We are conſcious that we exiſt, that we hear, ſee, &c. but of our vegetation we are abſolutely unconſcious. We feel a pleaſure in gratifying the demands of hunger and thirſt; but we are totally ignorant of the proceſs by which our aliment is formed into

chyle, the chyle mixed with the blood, the circulation of that fluid, and the feparation of all the humours from it. If we then, who are more perfect than other vegetables, are utterly infenfible of our own vegetable life, why fhould we imagine that the leaft perfect vegetables are fenfible of it? We have within ourfelves a demonftration that vegetable life acts without knowing what it does; and if vegetables are ignorant of their moft fagacious actions, why fhould we fuppofe that they have any fenfation of their inferior ones; fuch as contracting from a touch, turning towards the fun, or advancing to a pofe? As to that power of irritability which is obferved in fome plants, our folids have it when deprived both of animal and vegetable life; for a mufcle cut out of a living body will continue to contract, if it be irritated by pricking, after it has neither fenfation nor vegetation. The following moral reafon has alfo been fuggefted againft believing vegetables to be endued with fenfation: if this were the cafe, they would fuffer pain when they were cut or deftroyed, and their ftate would be very unhappy if they had not the leaft power to avoid the injuries daily offered them. Accordingly it is maintained, that the goodnefs of the Deity is confpicuous in not giving to vegetables the fame fenfations as to animals; and as they have no means of defence, we may conclude from this circumftance, that they were granted as food to animals. Encycl. Brit. On the other hand, thofe who are of opinion that plants poffefs powers of perception, allege that their hypothefis recommends itfelf by its confonance to thofe higher analogies of nature, which lead us to conclude, that the greateft poffible fum of happinefs exifts in the univerfe. The bottom of the ocean is overfpread with plants of the moft luxuriant magnitude; and immenfe regions of the earth are overfpread with perennial foreft. Nor are the Alps, or the Andes, deftitute of herbage, though buried in depths of fnow: and can it be imagined that fuch profufion of life fubfifts without the leaft fenfation or enjoyment? Let us rather, with humble reverence, fuppofe, that vegetables participate, in fome low degree, of the common allotment of vitality; and that one great Creator hath appointed good to all living things, "in number, weight, and meafure." Percival, ubi fupra.

For an account of the various fyftems that have been adopted in the diftribution of animals, fee ZOOLOGY. See alfo MAMMALIA, BIRDS, AMPHIBIA, FISHES, INSECTS, and WORMS. ANIMALS make the principal figures in *Heraldry*, both as bearings and as fupporters, &c.

ANIMAL is alfo ufed adjectively to denote fomething that belongs to, or partakes of, the nature of an animal body. Thus we fay *animal* FOOD, *animal* ECONOMY, &c.

Moraliits frequently oppofe the *animal* part, which is the fenfible, fleffy part of a man, to the rational part, which is the underftanding.

ANIMAL *actions* are thofe peculiar to animals, or which belong to animals as fuch:

Such are SENSATION and *mufcular* MOTION.

ANIMAL *earth*. See EARTH.

ANIMAL *flower*, a name indifcriminately applied to a variety of different creatures in the VERMES tribe, that bear fome refemblance to a flower; and is fynonymous with fea anemone, urtica marina, or fea-nettle, &c. Thefe, for the moft part, belong to the *molluſca* order in the Linnæan fyftem, as the actiniæ, and holothuriæ; yet the fame is given to the tubulariæ and hydræ, which belong to an entirely different order, the *zoophyta* of Linnæus. See ACTINIA, ANIMONE, *(ſea,)* HOLOTHURIA, TUBULARIA, and HYDRA.

ANIMAL *functions*, among *Phyſicians*. See FUNCTION.

ANIMAL *glue*. See GLUE.

ANIMAL *gods*, *dii animales*, in *Mythology*, thofe into which human fouls are converted by means of certain religious ceremonies.

Labeo has written expreſsly on the animal gods.

ANIMAL *heat*. See HEAT.

ANIMAL *hunger*. See HUNGER.

ANIMAL *liquors*. The common opinion is, that all the animal liquors, excepting chyle and milk, are of an alcalefcent nature; but M. Queſnay, in his book Sur l'Oeconomie Animale, affirms, that our gelatinous liquors contain a very acefcent falt, capable of refifting a heat of two hundred degrees. The proof of which, fays he, offers itfelf daily to every one: who is it that has not remarked, that broth made with flefh, well freed from fat, when corrupted, becomes as four as verjuice? The foundation on which M. Queſnay builds his doctrine concerning animal liquors, is the feparation of milk into its oily, cheefy, and watery fubftances. Med. Eff. Edinb.

ANIMAL *magnetiſm*. See MAGNETISM.

ANIMAL *manures*, in *Agriculture*, are all fuch as are formed from the decompofition of animal fubftances of any kind, as flefh, blood, hair, wool, bones, fat, &c. Agricultural writers conſider them, in general, as more powerful in their effects, in promoting vegetation, than fuch as are derived from vegetable matters. However, on account of their being ſeldom procured in large quantities, they are moftly made ufe of in the ftate of mixture or combination with other materials, either of the earthy or littery kinds; in both which cafes they may be highly beneficial. In the former by the action of the ammoniac, which is conftantly formed in large quantities, during the decompofition and decay of animal matters on the mould, and rendering it more ſuitable for the ſupport of plants; and, in the latter, by their well known property of promoting fermentation, and thus haftening the reduction of the materials into the ftate of manure. See MANURE.

ANIMAL *matter*, in *Chemiſtry*. The ancient diviſion of all natural bodies into the three grand claſſes of *mineral*, *vegetable*, and *animal*, a diviſion founded upon ſimple obſervation, and not upon pre-conceived theory, may ſtill be retained as a claſſification of ſome practical utility to the chemiſt, though infinitely leſs ſo than to the phyſiologiſt.

A complete knowledge of the chemiſtry of animal matter would comprehend an intimate analyſis of all the materials out of which it is formed, and of their mode of combination; whereby, from a few ſimple elements, the great variety of aliments uſed by the living animal are produced: it would alſo require a minute examination into the proceſs of digeſtion and aſſimilation of food, ſtep by ſtep, in order to trace the curious and intereſting converſion of inanimate matter into an integrant part of the living animal; and more than all, it would include an inveſtigation into the moſt ſecret receſſes of nature, in order to determine how far the known laws of chemical affinity are affected by animal organization, and by the vital principle. The very imperfect progreſs which has been made in this branch of chemical inquiry ſhews the great and almoſt inſuperable difficulties which attend its purſuit; and, notwithſtanding the real diſcoveries made by modern chemiſts, and the ſelf-complacency with which they are ſo often brought forward, little elſe can be related on the chemiſtry of animal matter, than a collection

lection of detached facts and unconnected experiments, from which no plauſible theory of the proceſs of animalization has been deduced, and but little aſſiſtance has been afforded to the ſcience of phyſiology, and perhaps ſtill leſs to the cure of diſeaſe.

Before we enumerate the particular parts of animal matter which have afforded the greateſt ſcope to chemical experiment, it may be proper to premiſe a few remarks on the materials out of which animal matter is formed; on the mode in which they are elaborated within the living body; and on the chemical properties which appear to be common to every part of the animal kingdom.

Two principal functions, poſſeſſed, apparently, by every living creature, prepare the materials out of which the animal body is conſtituted, and from which it draws perpetual ſupplies: theſe are, *digeſtion* and *reſpiration*.

The food taken in by the mouth is the moſt obvious and abundant ſource of ſupply to the body; and this cannot be ſaid to have become an integrant part of the animal which receives it, till it has been prepared in the ſtomach by the proceſs of digeſtion, and till the chyle, or nutritive part which it furniſhes, has been further aſſimilated in the lymphatics, and, at laſt, added to the maſs of circulating blood.

The vegetable kingdom furniſhes, directly or indirectly, the whole of alimentary matter, except the common diluent, water. Hence, chemiſts have with great propriety directed much of their inquiries relating to this ſubject, to an examination of the characteriſtic differences which exiſt between vegetable and animal matter in general, and ſome important facts have appeared, which we ſhall preſently relate. The *ultimate* analyſis of vegetables, or that which reduces them to their ſimpleſt forms, furniſhes us with very few materials. Of theſe, water is by far the moſt abundant ingredient; carbonaceous matter the next in quantity, and equally conſtant; and chemical analyſis will alſo ſhew a certain portion of hydrogen and of oxygen unconnected with the compoſition of water, and a few ſaline and earthy parts, which, from their conſtant occurrence, have a claim to be conſidered as neceſſary conſtituents of vegetable matter. In tracing the decompoſition of vegetable aliment, however, it ſhould be remembered, that theſe materials are preſented to the animal organs, not merely as ſo much hydrogen, carbon, and oxygen, but in the intermediate and already very compounded forms of farina, ſugar, mucilage, and the like; forms in which their tendency to chemical change is much ſtronger than when they are reduced to their ſimpleſt mode of exiſtence.

With regard to that very large proportion of aliment which is furniſhed from the animal kingdom itſelf, forming ſo much of the food of man, and the whole nutriment of many entire claſſes of living creatures, this, it is obvious, is ſtill produced indirectly from vegetable matter, and the art of chemiſtry has not yet been able to detect any very ſenſible difference between the firſt, and the ſubſequent reſults of aſſimilation by animal organs. The moſt accurate chemical analyſis could not determine with any certainty, whether a given portion of animal ſubſtance was a part of a carnivorous or a herbivorous animal; and this ſingle circumſtance ſhews, perhaps, as much as any other, the very imperfect ſtate of our knowledge of the changes produced during digeſtion in the living organs.

A chemical change equally important with digeſtion, and ſtill more uniform and conſtant in its operation, is the action of the external air on the animal fluids through the medium of reſpiration. The part which immediately receives the action of the air, is the blood whilſt circulating in the extreme branches of the pulmonary arteries and veins in the cells of the lungs. Under the articles RESPIRATION, and BLOOD, we ſhall relate more at large the facts that have been diſcovered by the ſucceſſive labours of ſome of the moſt ingenious philoſophers which the world has produced, which prove inconteſtably the analogy between this proceſs and that of combuſtion, and its connexion with the animal temperature. There can be no doubt that reſpiration is a chemical proceſs, the operation of which, as it is exerted on the general maſs of circulating fluid, is extended through every part of the living body; and perhaps its effects are more peculiarly and excluſively *chemical*, than moſt of the other animal functions. Reſpiration too may properly be conſidered as the laſt ſtep in the proceſs of the aſſimilation of food, ſince the chyle, when thoroughly elaborated, is thrown into the maſs of blood returning to the heart, whence it directly paſſes to the lungs (entirely in ſome claſſes of animals, and partially in others), and is ſubjected to the chemical action of the external air, before it renews the round of circulation to ſupply the different purpoſes of the body.

As a defective reſpiration, in the caſe of original malconformation as well as of diſeaſe, produces a train of diſorders which are very ſtrongly and pointedly marked, we may infer that the chemical analyſis of the ſeveral parts of the body, if we had the means of ſufficient accuracy of examination, would readily indicate the deficiency in ſo powerful a chemical agent as the atmoſpherical air. Opportunities for ſuch an examination have not, however, been ſufficiently frequent, nor is it certain that, in the preſent ſtate of chemical knowledge, they could be rendered very concluſive.

In conſidering the mode whereby alimentary matter is *aſſimilated*, or undiſtinguiſhably blended with the ſolids and fluids of the living animal in which this function is going on, a very intereſting inquiry preſents itſelf, namely, to determine how far this proceſs is purely *chemical*, (that is, conducted by the ſame laws of ſimple and complex affinity which operate on inanimate matter), and how far it is affected by the circumſtances of the *living principle*. In favour of the former opinion the following arguments may be urged: firſt, that the food, whether derived from the vegetable, or the animal kingdom, or from a mixture of both, is a ſubſtance which ſtrongly tends to ſpontaneous decompoſition, in whatever ſituation it is placed; and that, *cæteris paribus*, it is more or leſs digeſtible in proportion to its greater or leſs diſpoſition to chemical change. Likewiſe, as we have before mentioned, it is already a very compounded mixture, compoſed of ſimple elements indeed, but united by very complex affinities; and when in the form of animal fleſh, of vegetable farina and the like, it is infinitely more liable to chemical change than if it were reduced to its elementary parts. Secondly, it may be urged, that a part at leaſt of the preparation which the food undergoes in the organs of digeſtion is obviouſly a ſeries of chemical proceſſes. By the action of the teeth, of the gizzard, and ſimilar apparatus, the mechanical proceſs of *comminution* is performed: to this ſucceeds *maceration* in the ſaliva, in the gaſtric liquor, and in other animal ſecreted juices: the contractile power of the ſtomach affords conſtant *preſſure* and *agitation* to the materials which it contains: a ſeparation of the different parts of the heterogeneous maſs under digeſtion, or a ſpecies of *filtration*, is performed by the lacteals and the meſenteric glands: during the courſe of circulation, a moſt intimate *mixture* takes place between the freſh ſupply of nutritive matter from the aliment, and the animal juices already contained in the veſſels; and laſtly the newly aſſimilated chyle undergoes a proceſs ſimilar to *combuſtion*, whilſt in a ſtate of intimate diviſion within the ultimate ramifications of the

pulmonary

pulmonary veſſels. To this it may be added, that the temperature of the animal in which theſe ſeveral proceſſes are carrying on, is found by experiments out of the body to be highly favourable to that gradual and complex chemical change which educes from animal or vegetable matter the greateſt variety of important products.

Thirdly, it may be alleged, in anſwer to the forcible objection which will immediately ariſe to an explanation of digeſtion on purely chemical principles, from the impoſſibility of carrying on the ſame proceſs *out* of the body, that the chemiſt cannot imitate animal digeſtion, becauſe he has not all the materials at command, and eſpecially becauſe he cannot conſtruct, by mechanical means, any apparatus reſembling in the moſt diſtant degree the curious, beautiful, exquiſitely elaborated and complicated organs which nature has furniſhed for this important proceſs. This imitation has appeared ſo hopeleſs, that no ſuch attempt has, to our knowledge, been made; for the valuable and intereſting experiments of the late eminent phyſiologiſts, Spallanzani and Hunter, on what may be called, a partly *artificial* digeſtion, which will be mentioned in a future part of this work, do not come under this point of view.

It is far from our intention, however, to deny that in this, as well as in other functions of the body, the vital principle is to be eſteemed as an agent *ſui generis*, of the higheſt importance; and, from the diſturbance which certain affections of the nervous ſyſtem will directly produce on the whole proceſs of digeſtion, we cannot, perhaps, at any period truſt to merely chemical facts for an explanation of its phenomena. The difficulty of inveſtigation into the ſubject, which at all times is great, is moreover conſtantly increaſing in proportion as the proceſs of aſſimilation advances, and at laſt becomes inſurmountable, from the impoſſibility of gaining acceſs to the interior parts of the animal ſtructure, without producing a total derangement of the functions, and deſtroying life.

The chemiſt muſt, therefore, content himſelf with examining in detail the properties of animal matter, wherein very ſenſible differences may be detected, both between different parts and organs, and between the ſame parts and ſpecies, taken at the ſeveral periods of life, at different ſtates of activity, and under the various circumſtances of health and diſeaſe.

Chemiſts have long directed their attention to diſcover ſome characteriſtic properties common to every ſpecies of animal matter, whereby it might be diſtinguiſhed from the products of the vegetable kingdom. Formerly the method of analyſis was principally directed to the proceſs of diſtillation in a retort, by a heat, at firſt gentle, and afterwards increaſed gradually, till every part of the animal matter was volatilized, and only a fixed reſidue of very difficult combuſtion, called *caput mortuum*, remained in the retort. The difference between animal and vegetable matter, when ſubjected to diſtillation, is highly important, and is well laid down by the celebrated Neuman, one of the moſt ſkilful and accurate chemiſts of his time. "Animal ſubſtances," he obſerves, "a few excepted, on being diſtilled in cloſe veſſels, by a ſtrong fire, give over, not a manifeſt acid liquor as vegetables do, but an urinous or volatile alkaline one, and commonly more or leſs of a concrete volatile alkaline ſalt, together with an empyreumatic oil more fetid than the oils of vegetables, and of a different kind of fœtor. On calcining the remaining coal in open veſſels, and elixating the aſhes with water, we ſometimes obtain a portion of a kind of fixed ſaline matter, but very rarely a perfect alkali, like that extracted from the aſhes of vegetables." In the analyſis by fire, therefore, the production of ammonia, or volatile alkali, is the moſt ſtriking circumſtance which characterizes animal matter; and hence the preparation of ſal ammoniac, ſalt of hartſhorn, and a variety of the ammoniacal ſalts, from the diſtillation of horn, bones, urine, camel's dung, and other animal matter, which forms a very extenſive branch of chemical manufactures.

Animal PUTREFACTION, conſidered as a method of chemical analyſis, gives reſults ſimilar to thoſe of diſtillation, particularly in the production of the volatile alkali; and hence it has long been remarked by the manufacturers of this alkali, that the product is much increaſed by ſuffering the materials to undergo a certain degree of putrefaction.

Chemiſts, however, were fully aware that the exiſtence of ammonia, in its alkaline ſtate, in freſh animal matter, could not with certainty be inferred from its appearance after diſtillation, but only the preſence of the materials out of which the volatile alkali may be compoſed. So, the author laſt quoted expreſsly obſerves, that "the volatile alkalies obtained from animals are artificial productions, never found to exiſt naturally in any animal ſubſtance in its perfect ſtate. They are generated by the action of fire, and by putrefaction, and not by any known power beſides."

The method of analyſis, by ſimple diſtillation, has another imperfection (beſides that of the introduction of an alkali, *formed* by the proceſs, and not previouſly contained in the ſubſtance examined), which is, that it confounds in a few common products of diſtillation, a variety of parts, which in their natural ſtate poſſeſs very ſpecific and diſtinguiſhing qualities. This is particularly the caſe with thoſe active and acrid ſubſtances, which produce ſuch powerful effects, either as medicines or poiſons. It cannot but be a very imperfect analyſis which exhibits no ſtriking difference between the mildeſt and the moſt acrimonious ſubſtances; between the common articles of food, and thoſe animal products of which the minuteſt portion introduced into the living body is capable of exciting the moſt violent commotions.

Modern chemiſtry has added to the analyſis by fire, the uſe of a more refined and delicate mode of experimenting, the advantage of which we ſhall preſently ſhew; though it muſt be confeſſed that it ſtill throws little, if any, light on thoſe inquiries into the animal body which are the moſt intereſting to the naturaliſt and phyſician.

Another important difference between animal and vegetable matter when analyſed by fire, is found in the fixed reſiduum which remains after diſtillation in cloſe veſſels. In vegetable matter this is compoſed principally of charcoal, in a very pure and eaſily combuſtible ſtate, and of a ſmall proportion of vegetable aſhes, from which a fixed alkali is procurable. In animal matter, the coal which remains is very difficult of combuſtion, and leaves, for the moſt part, a large proportion of PHOSPHORIC ſalts, generally united with lime. Likewiſe, if the animal matter be mixed with a fixed alkali before calcination, the PRUSSIC *acid*, a ſubſtance peculiarly of animal origin, is found in the reſidue of combuſtion.

The great energy with which the nitrous acid acts upon almoſt every ſubſtance immerſed in it, has long rendered it a moſt valuable inſtrument of analyſis to the chemiſt; but as this acid is itſelf more or leſs decompoſed in by far the greater number of operations in which it is employed, a previous knowledge of the intimate nature of this acid is requiſite, in order to enable the chemiſt to explain the appearances which it produces when in chemical action. This having been obtained by the ingenious reſearches of ſeveral eminent chemiſts, among whom we may particularly mention the names of Cavendiſh and Prieſtley, the uſe of the nitrous acid has thrown conſiderable light on the nature of

animal matter. The experiments of M. Berthollet on this ſubject (Mem. Acad. des Sciences, 1780 and 1785), are ſo complete and original, as to leave little further to be done by ſubſequent experimenters, to explain the ultimate compoſition of the great maſs of animal matter.

M. Berthollet began his operations by treating various animal ſubſtances with nitrous acid, in the ſame method which Bergman had purſued in order to obtain that acid from ſugar, which has been termed the *ſaccharine* or *oxalic*. He choſe ſilk for his firſt experiment, on account of the apparent uniformity of its compoſition. On diſtilling ſilk with ſeven or eight times its weight of nitrous acid, it was ſoon attacked by the acid, gave out copious red fumes, and preſently diſſolved into a clear bluiſh liquor. This, on cooling, yielded a conſiderable quantity of cryſtals of oxalic acid, exactly ſimilar to that obtained from ſugar by a ſimilar treatment. Beſides this acid, however, there was found ſwimming on the ſurface of the liquor, when cooled, a quantity of oily or greaſy matter, which again diſſolved by heat, and remained in intimate combination with the ſolution of the oxalic acid. To obtain this greaſy matter, M. Berthollet obſerves, leſs of the nitrous acid ſhould be uſed than is neceſſary to give the largeſt product of oxalic acid.

This excellent chemiſt then repeated the experiment with a variety of animal matters, in all of which he found ſimilar reſults, though with a wide difference in the reſpective proportions of animal greaſe, and oxalic acid. Of all the ſubſtances uſed, wool was found to give the greateſt quantity of oxalic acid. From ſix gros M. Berthollet obtained ſomewhat more than half the weight of the cryſtallized acid, whereas ſugar itſelf only gives about one third of its weight. Skin and hair gave nearly the ſame reſults as wool. On the other hand, animal muſcle or fleſh, deprived as much as poſſible from any adhering fat, yielded, with nitrous acid, a very large portion of the abovementioned greaſe, and a very ſmall quantity of oxalic acid, which could hardly be ſeparated by cryſtallization from the greaſe which the liquor contained. Sixteen ounces of veal, reduced by drying to four ounces, yielded three gros (eight of which make an ounce) of oxalic acid, and a ſmall portion of greaſe. Thirty-two ounces of whites of eggs, hardened by boiling, and reduced by drying to two ounces, gave two gros and a half of acid, and a moderate quantity of greaſe.

The author then proceeds to ſome remarks on the nature of this peculiar greaſy matter, which deſerve attention.

Vegetable ſubſtances, he obſerves, though certainly containing oil in their compoſition, when treated with nitrous acid, have their oil ſo entirely deſtroyed by its action, that no traces of it can be detected after this operation. Animal matter, on the contrary, always yields more or leſs of an oily or greaſy ſubſtance after diſtillation with nitrous acid, which greaſe in part adheres ſtrongly to the oxalic acid, and makes it difficult of cryſtallization, and in part combines with the diſtilled acid, giving it an unuſual yellow colour, and the diſagreeable odour of all animal oils. This latter portion may be ſeparated chiefly, but not entirely, by ſaturating the acid with an alkali, when the animal oil concretes into a ſtiff greaſe.

The animal oil differs alſo from the vegetable, particularly in giving much volatile alkali by diſtillation, whereas the vegetable yields an empyreumatic acid. It is to be obſerved, that the oil, both animal and vegetable, which is here ſpoken of, is not that which in animals is ſeparated in the form of fat, and is ſecreted in the cells of the adipoſe membranes; and in vegetables, is depoſited in the oil cells of ſeeds and fruits, or united with mucilage and farina in the emulſive plants; but it is an oil which ſeems to be moſt intimately united with every animal and vegetable ſubſtance, and never appears in the form of oil or greaſe, unleſs when ſeparated by ſome powerful chemical agent, ſuch as the nitrous acid.

We have mentioned it to be the moſt ſtriking characteriſtic of animal matter, to yield a certain quantity of ammonia by diſtillation *per ſe*; and we ſhall now return to this ſubject, which indeed is directly connected with all that has preceded, and examine into the cauſe of this product. Under the article AMMONIA, we mentioned how much chemiſtry was indebted to the ſucceſsful labours of M. Berthollet for a knowledge of the exact proportion of the conſtituent parts of this alkali, and particularly of the theory of its production during the decompoſition of animal matter.

Ammonia is formed of about three parts of azot, or animal mephitis, as it is ſometimes termed, and one of hydrogen. A ſimple and convincing proof that it is not originally contained in animal matter in the form of an alkali, is, that after animal ſubſtances have been diſſolved in nitrous acid, no nitrated ammonia can be detected by the minuteſt examination. But the conſtituent parts of the volatile alkali muſt be contained in the animal matter, otherwiſe it could not yield it by ſimple diſtillation. Dr. Prieſtley has obſerved, that when animal fleſh is immerſed in nitrous acid, there is an immediate diſengagement of gas which is chiefly phlogiſticated (*azotic*) air, but ſometimes mixed with nitrous gas, and with fixed air. With the ſame view, M. Berthollet added to an ounce of ſilk (Mem. Acad. des Sciences, 1785), ſix ounces of concentrated, pale, nitrous acid, at the temperature of 70°. Nearly 120 ounce meaſures of gas were diſengaged without heat, of which a ſmall part was abſorbed by lime water, and was fixed air, and the remainder gave all the appearances of azotic air. The ſilk being entirely diſſolved, a ſmall portion of the greaſy matter which we have mentioned above, concreted, and was ſeparated from the ſolution. Lime-water being added, no precipitation took place, which was a proof that no oxalic acid had yet been formed by the action of the nitrous acid, for, adding afterwards a drop of oxalic acid, an immediate precipitate appeared. The ſolution being then gently warmed, a violent effervеſcence took place, nitrous gas was given out in abundance, with the production of much heat, and the ſolution *now* contained a conſiderable quantity of oxalic acid. From this experiment it appears, that there are two diſtinct periods of the operation of nitrous acid on animal matter; the firſt, its action without heat; the ſecond, after heat has been applied. The firſt produces a large portion of nearly pure azotic gas, and it is intereſting to determine whence is its origin, as azot is a conſtituent part of nitrous acid, as well as of animal matter: it is rendered highly probable, however, that the azotic gas produced in the firſt inſtance, owes its origin to the animal matter, and not to the nitrous acid, ſince the latter is capable of acting afterwards with equal energy, as if heat had been applied immediately, and of giving as much nitrous gas. Moreover, M. Fourcroy has obſerved, that the nitrous acid, after being digeſted *without heat* upon animal matter, is able to ſaturate as much alkali as before the proceſs, which is as convincing a proof of its non-decompoſition as we can well have. Therefore, we may conſider it as well eſtabliſhed, that when nitrous acid and animal matter are digeſted together, without uſing artificial heat, the azotic gas which is produced in ſuch abundance ariſes ſolely from the animal ſubſtance; that at this period no oxalic acid is formed, but ſome of the peculiar greaſy matter is produced. Afterwards, on heating the mixture, the nitrous acid is itſelf rapidly decompoſed, forming the nitrous gas which eſcapes, and giving its oxygen to that part of the animal matter which furniſhes the baſis of the oxalic acid, beſides probably occaſioning other

changes

changes in which, as the component parts of the nitrous acid are alſo found in animal matter, the exact operation of the materials furniſhed by each can not be diſtinguiſhed.

The proof of the exiſtence of azot in animal matter being thus eſtabliſhed, we can readily account for the formation of ammonia during diſtillation *per ſe*, or putrefaction, by an union of the animal azot with hydrogen, which may be furniſhed alſo from the animal ſubſtance, perhaps from the decompoſition of water, which is abundantly contained in every part of the animal kingdom.

Another proof of the connexion between the azot of animal matter, and the production of ammonia, has been furniſhed in the following ingenious manner by M. Berthollet. For this purpoſe he made comparative experiments between the inflammable gas of marſhes, the gas furniſhed by the diſtillation of ſugar, of charcoal, and of oil, and the gas yielded by ſilk diſtilled *per ſe*. Of theſe four latter ſubſtances (for the former may be neglected for our preſent purpoſe), the ſugar, charcoal, and oil, are vegetable, and give no ammonia by diſtillation; the latter is animal, and, like all animal matters, produces this alkali. The gas furniſhed by each was expoſed to lime water, and detonated with oxygen, in order to abſorb every thing but the azot. Now, as the ſilk, being of animal origin, contained much more azot than the other ſubſtances, it ought to have left a much greater reſiduum of azotic gas, unleſs the latter entered into ſome new combination during the diſtillation of the ſilk, by which its form of azotic gas would be loſt. As the reſiduum was not ſenſibly greater than the reſt, the azot muſt have aſſumed a new form during diſtillation, and this could have been no other than the volatile alkali which was directly diſſolved in the water, through which the diſtilled gaſſes paſſed unto the recipient.

Experiments of a later date than thoſe of M. Berthollet, juſt cited, have ſhewn a diſengagement of azotic gas, or a production of ammonia from animal matter, by the action of ſome other of the more powerful acids, and even of the fixed alkalies; but the operation of theſe is not yet ſatisfactorily explained, nor does it illuſtrate in ſo ſtriking a manner the compoſition of the animal kingdom.

The limits between animal and vegetable matter, laid down by the preſence of azot and the production of ammonia, though for the moſt part ſufficiently preciſe, are, in a few inſtances, ſurpaſſed.

Theſe are, by thoſe vegetable products, which have been termed *vegeto-animal*, becauſe they reſemble certain correſponding animal matters in the characteriſtic properties above mentioned.

The *gluten* of wheat, and ſome other parts of vegetables, bears a conſiderable affinity to animal gluten in various properties, and, like it, contains azot, and yields ammonia. The *albumen* found in the freſh juice of the ſucculent parts of the tetradynamious plants, is equally ſimilar to the albumen of animals; and the vegetable fungi, when under putrefaction, exhibit to the chemiſt appearances ſtrongly reſembling thoſe of decompoſing animal matter.

In the analyſis of animal matter, we have principally dwelt on the operation of the nitrous acid, as it has been the means of elucidating this ſubject in a peculiar manner, and as it furniſhes a method of compariſon by which the action of other chemical agents may be inferred with conſiderable accuracy. A few words ſhould, however, be ſaid on the operation of other re agents in analyſis.

The effect of heat on animal matter varies according to the degree which is applied. A gentle warmth ſimply diſſipates the watery part, during which operation the ſubſtance generally loſes a great part (ſometimes by far the greateſt) of its weight and bulk.

Animal matter, when thus dried, is long preſerved from putrefaction, as moiſture is eſſential to this proceſs of decompoſition. So, bodies of animals that have been overwhelmed in the dry hot ſands of the African deſerts, are firſt thoroughly deſiccated, and then will remain in this medium for many years unaltered. A lower degree of warmth, however, if not ſufficient to evaporate the moiſture from animal ſubſtance, favours putrefaction, and increaſes all the tendencies to decompoſition. On the other hand, animal matter, ſo periſhable in itſelf, is preſerved to all appearance abſolutely unaltered, whilſt expoſed to a ſevere freezing cold. The blood (which when at reſt in a moderate temperature, even within the blood-veſſels, but eſpecially when drawn out, very ſpeedily coagulates), if ſuddenly frozen before coagulation, retains for a while its original properties; and when thawed in a gentle warmth, at *firſt* becomes liquid; and *afterwards* coagulates. In like manner, animal fleſh employed for food may be preſerved, when frozen, for any length of time; and, if thawed gradually, retains all its properties, even to the peculiar flavour which it poſſeſſed at firſt. A degree of heat from about 150° to that of boiling water, begins to produce upon animal matter certain chemical changes independent of the mere evaporation of water: the moſt important of theſe is the coagulation of the albumen, which is an abundant and almoſt conſtant ingredient in the animal juices. Under the article of albumen we have given the opinions of chemiſts concerning the cauſe of the ſingular property of coagulation by heat, which, however, is ſtill not very clearly aſcertained. Albumen, when once coagulated, is no longer ſoluble in boiling water, and hence it may be ſeparated with eaſe from any watery ſolution in which it may be contained. A heat conſiderably greater than that of boiling water cauſes animal matter to ſwell conſiderably, to twiſt in every direction as if it ſtill retained ſome degree of irritability; to ſoften or melt down, to exhale a copious denſe vapour of a fœtid ſmell; and, according as the heat is regulated, to yield an empyreumatic oil, an ammoniacal liquor, and often the pruſſic acid, with a conſiderable quantity of carbonic and hydrogen gaſſes, ariſing from the total decompoſition of the ſubſtance employed.

Water is another re-agent in the analyſis of animal matter, which may often be employed with conſiderable advantage. All the ſoft parts of animals, when kept immerſed in cold water for a conſiderable time, appear to become thoroughly penetrated with this liquor, have their texture ſoftened, and their bulk enlarged, and yield to its diſſolving power all their ſaline, gelatinous, and albuminous contents. This ſolution is likewiſe conſiderably aſſiſted by the commencement of putrefaction, which ſoon takes place in moiſt animal matter at a moderate warmth. The gluten or coagulum of the blood is, however, inſoluble in water, when it has once ſeparated by coagulation from the circulating liquor; and hence, by long and repeated effuſion of cold water, the coagulum of blood may be freed from the red globules which give it its colour, and from every other extraneous matter, and at laſt remains in a ſtate of great purity, in the form of a grey, tenacious, and elaſtic ſubſtance. Muſcular fleſh may be, in like manner, brought, by mere waſhing with cold water, into a ſimilar ſtate of purity. Animal oil or fat, which is naturally mixed with a kind of mucilage, may alſo be freed from it by melting, and repeated mixture with water, aſſiſted by ſtrong agitation. Heated water is a more active agent in ſoftening the texture of animal matter, and extracting its ſoluble part; and the aſſiſtance of a boiling temperature renders completely ſoluble every kind of condenſed

denſed animal membrane, ſuch as ſkin, cartilage, tendon, and the like. At the ſame time, however, heat coagulates the albumen, and renders it inſoluble in water, ſo that to obtain the full action of water on animal matter, it ſhould be uſed firſt cold, or only moderately warmed, and afterwards heated to ebullition. But there is no ſoft part of animal matter which can reſiſt the united action of water and heat, when a temperature much above the boiling point is employed, by means of Papin's digeſter. Gluten, albumen, gelly, and ſalts, are then all brought down to complete ſolution; the oil alone, for the moſt part, remaining unmixed. Papin's digeſter, therefore, when judiciouſly employed, may prove an inſtrument of ſome importance in animal analyſis: but its uſe is attended with this inconvenience, that the ſubſtances diſſolved in water by its powerful aſſiſtance, cannot be ſeparated from each other by any means with which we are acquainted.

The cauſtic alkalies are alſo employed in the analyſis of animal matter, particularly as a ſolvent for gluten and coagulated albumen, after the action of water has been exhauſted. The ſolution of animal matter in alkali, which is the moſt familiar to us, is that of oil or fat, forming the well-known compound, Soap. It would be of advantage to the experimental chemiſt if the operation of the alkalies were here confined to the oily ingredient, as this is ſo little ſoluble in any other menſtruum. But the inconvenience of uſing theſe powerful re-agents is ſimilar to that of employing Papin's digeſter, for they act with great energy on all the ſoft parts of animals indiſcriminately, and confound the whole in one ſaponaceous maſs. This, indeed, may be conſidered in general as the principal obſtacle to any ſatisfactory analyſis of animal matter, that all the methods which the chemiſt can employ, are too general in their operation, and little calculated to mark thoſe ſhades of difference in the animal compoſition, which, though perhaps ſlight when chemically conſidered, certainly produce very important effects on the functions of the *living* body.

The chemiſtry of animal matter appears to us to be ſtill too little known to admit of any ſcientific arrangement which can give juſt and comprehenſive views of this extenſive, intereſting, and complicated ſubject. We ſhall, therefore, refer the reader to the ſeveral articles under their reſpective heads, which include, either generic diſtinctions, ſuch as gluten, albumen, gelly, and the like; or ſpecific ſolids and fluids, ſuch as bone, blood, milk, ſkin, &c. The detail of a variety of important experimental inquiries which have been made by ſeveral eminent chemiſts, affords an abundance of intereſting matter, which promiſes a copious harveſt of diſcovery to the follower of this branch of chemical purſuit.

Animal *motion* is the ſame with what we call *muſcular motion*.

It is divided into two branches; natural or involuntary, and ſpontaneous.

Animal *oil*, ſee Oil.

Animal *ſecretion* is the act whereby the divers juices of the body are ſecreted or ſeparated from the common maſs of blood, by means of the glands. See Secretion.

Animal *ſpirits* are a fine ſubtle juice or humour in animal bodies; ſuppoſed by many to be the great inſtrument of muſcular motion, ſenſation, &c.

The ancients diſtinguiſhed ſpirits into three kinds, *viz. animal, vital*, and *vegetative*: but the moderns have reduced them to one ſort, *viz. animal*; about the nature of which, and the matter whence they are formed, great diſputes have ariſen among anatomiſts, though their exiſtence has never been fairly proved.

In the Hiſtory of the Royal Academy of Sciences at Paris, an. 1759, there is an ingenious memoir on this ſubject by Mr. Bertin. He undertakes to prove, that the nervous fluids, or animal ſpirits, circulate; that if they depart from the brain, they return to it by the nerves. In ſhort, he propoſes to form the courſe of this fluid into a ſyſtem of circulation, leſs demonſtrable, indeed, to the ſenſes than that of the circulation of the blood, but, in other reſpects, grounded on equally ſolid reaſons.

As it is hard to define what could never yet be brought under the judgment of our ſenſes, all that we ſhall here offer concerning them, is, that they muſt needs be extremely ſubtile bodies, which eſcape all manner of examination by the ſenſes, though ever ſo well aſſiſted; and pervade the tracts of the nerves, which yet have no diſcovery of cavity or perforation; nor could ever by any experiment be collected; yet are conſtantly moving in vaſt quantities, as they muſt of neceſſity be, to perform all thoſe mighty operations which are aſcribed to them. However, the antiquity of the opinion claims ſome reverence.

By the help of theſe ſpirits we are furniſhed with a vaſt number of precarious ſolutions of great *phenomena*; and without them we muſt leave a great chaſm in the philoſophical hiſtory of animal bodies; but, after all, the *phenomena* that would, in this caſe, be unexplained, are, perhaps, to us inexplicable.

They are ſuppoſed to be ſeparated in the brain from the ſubtileſt parts of the blood; and thence carried by the nerves to all the parts of the body, for the performance of all animal and vital functions; and the diſcovery of the Galvanic *electricity* will probably throw conſiderable light on this obſcure ſubject. See Nervous Fluid.

Animal *ſubſtances*, comprehend all the component parts of animals, of what uſe or intention ſoever they may be.

Animal *foſſile ſubſtances*, thoſe found buried in the earth at various depths, and embodied among various *ſtrata*.

Theſe are principally of four kinds: 1. Sea ſhells. 2. The teeth, bony palate, and bones of fiſhes. 3. The bones of land *animals*. And, 4. complete fiſh. See *Foſſile* Bones, *Foſſile* Shells, Marine *remains*, and *Foſſile* Ivory.

Animal *ſubſtances, fermentative quality of*. See Ferment, and Fermentation.

Animal *ſyſtem*, imports the whole claſs of beings endowed with animal life.

In which ſenſe *animal ſyſtem* amounts to the ſame with what chemiſts and others call the *animal kingdom*.

Animal is alſo ſometimes applied, in a figurative ſenſe, to artificial or moral things.

Hobbes conſiders government as a huge complex animal, under the denomination of *Leviathan*.

The reaſon of the appellation is founded on the analogy between an animal and a political body. The ſovereign, or legiſlative power, anſwers to the ſoul; the magiſtrates, to the limbs or members; rewards and puniſhments are the nerves; riches, the ſtrength; counſellors, the faculty of memory; equity, reaſon; ſedition, ſickneſs; civil war, death.

ANIMALCULE, Animalculum, a diminutive of animal, and applied, in a general manner, to thoſe creatures whoſe true figure cannot be diſcerned without the help of glaſſes, and more eſpecially of ſuch as are inviſible to the naked eye.

Animalcules are uſually divided into two, and, by ſome, into three diſtinct ſections, *viſible, microſcopical*, and *inviſible*: the firſt, though viſible, cannot be accurately diſ-

cerned without the help of glaſſes; the ſecond are diſcoverable only by the microſcope; and the laſt are merely preſumed to exiſt, for they are ſtill unknown. The exiſtence of the latter cannot well be diſputed, though it cannot be aſſerted, unleſs we conclude, that the microſcope has not yet arrived at its higheſt degree of perfection. Reaſon and analogy give ſome ſupport to the conjectures of naturaliſts in this reſpect: animalcules are diſcerned of various ſizes, from thoſe which are viſible to the naked eye, to ſuch as appear only like moving points under the microſcopic lenſes of the greateſt powers; and it is not unreaſonable to imagine, therefore, that there are others which may ſtill reſiſt the action of the microſcope, as the fixed ſtars do that of the teleſcope with the greateſt powers hitherto invented.

ANIMALCULES, *viſible*; amongſt theſe are included an amazing variety of creatures by no means of an analogous nature. Thoſe numerous creatures which crowd the water in the ſummer months, changing it ſometimes of a deep or pale red colour, green, yellow, &c. are of this deſcription. The larger kinds are chiefly of the inſect, or vermes tribes, and of which the monoculus pulex is particularly remarkable, being ſometimes found in ſuch abundance, as to change the water apparently to a deep red. A ſimilar appearance is likewiſe occaſioned by the cercaria mutabilis, when it varies in colour from green to red; vorticella faſciculata alſo changes it to green; and rotatoria to yellow. To this ſection we muſt alſo refer many of the acarus and hydrachna genera, and a multitude of other creatures, that will be noticed hereafter.

ANIMALCULES, *microſcopical*.—The microſcope diſcovers legions of animalcules in moſt liquors, as water, vinegar, beer, dew, &c. They are alſo found in rain and ſeveral chalybeate waters; and in infuſions of both animal and vegetable ſubſtances, as the ſeminal fluids of animals, pepper, oats, wheat and other grain, tea, &c. &c.

Thoſe who have made the moſt minute reſearches, and the moſt accurate inquiries into the natures of the ſeveral objects ſubjected to their ſenſes, have found that the ſubſtances, upon which they employed their curioſity, were often quite different from what at firſt they appeared to be. Thus, for inſtance, the whole earth has been found repleniſhed with an inexhauſtible ſtore of what we ſhould leaſt of all ſuſpect, that is, an infinite number of animalcules floating in the air we breathe, ſporting in the fluids we drink, or adhering to the ſeveral objects we ſee and handle. The conjectures and hypotheſes relating to the production, generation, ſtructure, and uſes of theſe animalcules, have been as various as were ever contrived by caprice, or embraced by credulity. Not to bewilder ourſelves, however, in theſe labyrinths, but to confine our aſſertions to actual diſcoveries, by the aſſiſtance of the microſcope we not only perceive that ſuch animalcules exiſt, but are alſo enabled, in ſome degree, to determine their ſhapes, and the various peculiarities of their motion.

The contemplation of animalcules has made the ideas of infinitely ſmall bodies extremely familiar to us. A mite was anciently thought the limit of littleneſs; but we are not now ſurpriſed to be told of animals twenty-ſeven millions of times ſmaller than a mite.

Minute animals are found proportionably much ſtronger, more active, and vivacious than large ones. The ſpring of a flea in its leap, how vaſtly does it outſtrip any thing greater animals are capable of! A mite, how vaſtly faſter does it run than a race-horſe! M. de l'Iſle has given the computation of the velocity of a little creature ſcarce viſible by its ſmallneſs, which he found to run three inches in half a ſecond: ſuppoſing now its feet to be the fifteenth part of a line, it muſt make five hundred ſteps in the ſpace of three inches; that is, it muſt ſhift its legs five hundred times in a ſecond, or in the ordinary pulſation of an artery, Hiſt. Acad 1711, p. 23.

The exceſſive minuteneſs of microſcopical animalcules conceals them from the human eye. One of the wonders of modern philoſophy is, to have invented means for bringing creatures to us ſo imperceptible, under our cognizance and inſpection: an object a thouſand times too little to be able to affect our ſenſe, ſhould ſeem to have been very ſafe. Yet we have extended our views over animals to whom theſe would be mountains. In reality, moſt of our microſcopical animalcules are of ſo ſmall a magnitude, that through a lens, whoſe focal diſtance is the tenth part of an inch, they only appear as ſo many points; that is, their parts cannot be diſtinguiſhed, ſo that they appear from the vertex of that lens under an angle not exceeding a minute. If we inveſtigate the magnitude of ſuch an object, it will be found nearly equal to $\frac{3}{10000}$ of an inch long. Suppoſing, therefore, theſe animalcules of a cubic figure, that is, of the ſame length, breadth and thickneſs, their magnitude would be expreſſed by the cube of the fraction $\frac{3}{10000}$, that is, by the number $\frac{27}{1,000,000,000,000}$, that is, ſo many parts of a cubic inch is each animalcule equal to.

Leeuwenhoeck calculates, that a thouſand millions of animalcula, which are diſcovered in common water, are not altogether ſo large as a grain of ſand. This author, upon examining the male ſperm of various animals, diſcovered in many, infinite numbers of animalcula not larger than thoſe above mentioned. In the milt of a ſingle cod fiſh, there are more animals than there are upon the whole earth, for a grain of ſand is bigger than four millions of them. The white matter that ſticks to the teeth alſo abounds with animalcules of various figures, to which vinegar is fatal; and it is known, that vinegar contains animalcules in the ſhape of eels. In ſhort, according to this author, there is ſcarcely any thing which corrupts without producing animalcules. Animalcules are ſaid to be the cauſe of various diſorders. The itch is known to be a diſorder ariſing from the irritation of a ſpecies of animalcula found in the puſtules of that ailment: whence the communication of it by contact from one to another is eaſily conceived, as alſo the reaſon of the cure being effected by cutaneous applications. On this foundation ſome have attributed the ſmall-pox and meaſles, and infectious diſeaſes; others the epilepſy, &c. to animalcules. Langius goes farther, and pretends to reduce all diſeaſes in general to the ſame principle; and many other chimerical theories have been formed upon the diſcoveries made by Leeuwenhoeck and other naturaliſts, on the ſubject of animalcula.

The diſcovery of animalcules in the ſemen of animals was made known to the world about the end of the year 1677, or beginning of 1678, both by Leeuwenhoeck and Hartſoker; but as the obſervations of the former are more particular, and his experiments more numerous than thoſe of the latter, the merit of the diſcovery is generally attributed to Leeuwenhoeck. According to this naturaliſt, theſe animalcules are found in the ſemen of male animals of every kind, and their appearance is much the ſame in all; nor do they differ in ſize, in proportion to that of the animal to which they belong. The bodies of all of them ſeem to be of an oblong-oval form, with long tapering ſlender tails iſſuing from them; and as by their ſhape they reſemble tadpoles, they have been frequently called by that name; though the tails of them, in proportion to their bodies,

cles, are much longer than the tails of tadpoles are; and it is obſerved, that the animalcules in the ſemen of fiſhes have tails much longer, and more ſlender, than thoſe in the ſemen of other animals, inſomuch that their extremities are not to be diſcerned without the beſt glaſſes.

These animalcules appear to be very vigorous and tenacious of life; for they have been obſerved to move long after the animals, from which they were taken, were dead; and ſeem to be peculiar to the ſemen, as nothing that has the leaſt appearance of life has been yet diſcovered in the blood, ſpittle, urine, gall, or chyle.

The production of animalcula infuſoria is very ſurpriſing. In four hours time, an infuſion of cantharides has produced animalcules leſs than even the tails of thoſe in the ſemen of animals; and it is ſaid, that hot mutton gravy, ſecured in a phial with a cork, and afterwards ſet among hot aſhes, to deſtroy as effectually as poſſible every living creature that could be ſuppoſed to exiſt in it, has, nevertheleſs, been found ſwarming with animalcules, after ſtanding a few days.

In the Philoſophical Tranſactions, vol. lix., is the following curious account of the animalcules produced from an infuſion of potatoes, and another of hemp-ſeed, by the late Mr. Ellis. "On the 25th of May, 1768, Fahrenheit's thermometer 70°, I boiled a potatoe in the New River water, till it was reduced to a mealy conſiſtence. I put part of it, with an equal proportion of the boiling liquor, into a cylindrical glaſs veſſel that held ſomething leſs than half a wine pint, and covered it cloſe immediately with a glaſs cover. At the ſame time I ſliced an unboiled potatoe; and, as near as I could judge, put the ſame quantity into a glaſs veſſel of the ſame kind, with the ſame proportion of New River water not boiled; and covered with a glaſs cover, and placed both veſſels cloſe to each other.

"On the 26th of May, twenty-four hours afterwards, I examined a ſmall drop of each by the firſt magnifier of Wilſon's microſcope, whoſe focal diſtance is reckoned at $\frac{1}{50}$ part of an inch; and, to my amazement, they were both full of animalcula, of a linear ſhape, very diſtinguiſhable, moving to and fro with great celerity; ſo that there appeared to be more particles of animal than vegetable life in each drop.

"This experiment I have repeatedly tried, and always found it to ſucceed in proportion to the heat of the circumambient air; ſo that even in winter, if the liquors are kept properly warm, at leaſt in two or three days the experiment will ſucceed.

"What I have obſerved are infinitely ſmaller than ſpermatic animals, and of a very different ſhape: the truth of which every accurate obſerver will ſoon be convinced of, whoſe curioſity may lead him to compare them; and, I am perſuaded, he will find they are no way akin.

"At preſent, I ſhall paſs over many curious obſervations which I have made on two years experiments, in order to proceed to the explaining a hint which I received laſt January from M. de Sauſſure, of Geneva, when he was here; which is, that he found one kind of theſe animalcula infuſoria that increaſe by dividing acroſs into nearly two equal parts.

"I had often ſeen this appearance in various ſpecies a year or two ago, as I found upon looking over the minutes I had taken, when I made any new obſervation; but always ſuppoſed the animals, when in this ſtate, to be in coition.

"Not hearing, till after M. de Sauſſure left this kingdom, from what infuſion he had made his obſervation; his friend, Dr. de la Roche, of Geneva, informed me, the latter end of February laſt, that it was from hemp-ſeed.

"I immediately procured hemp-ſeed from different ſeedsmen in different parts of the town. Some of it I put into New River water, ſome into diſtilled water, and ſome into very hard pump water. The reſult was, that in proportion to the heat of the weather, or warmth in which they were kept, there was an appearance of millions of minute animalcula in all the infuſions; and, ſome time after, oval ones made their appearance. Theſe were much larger than the firſt, which ſtill continued: theſe wriggled to and fro in an undulatory motion, turning themſelves round very quick all the time they moved forwards. I was very attentive to ſee theſe animals divide themſelves; and, at laſt, I perceived a few of the appearance of *fig.* 3. *a*, as it is repreſented by the firſt magnifier of Wilſon's microſcope: but I am ſo well convinced by experience that they would ſeparate, that I did not wait to ſee the operation: however, as the following ſketches, which I have drawn from five other ſpecies, will very fully explain this extraordinary phenomenon, there will be no difficulty in conceiving the manner of the firſt. See *fig.* 4, 5, 6, 7, 8.

"The proportion of the number of theſe animals, which I have obſerved to divide in this manner, to the reſt, is ſcarce 1 to 50; ſo that it appears rather to ariſe from hurts received by ſome few animalcula among the many, than to be the natural manner in which theſe kinds of animals multiply; eſpecially if we conſider the infinite quantity of young ones which are viſible to us through the tranſparent ſkins of their bodies, and even the young ones that are viſible in the young ones while in the body of the old ones.

"But nothing more plainly ſhews them to be zoophytes than this circumſtance, that when, by accident, the extremity of their bodies has been ſhrivelled for want of a ſupply of freſh water, the applying more freſh water has given motion to the part of the animal that was ſtill alive; by which means this ſhapeleſs figure has continued to live, and ſwim to and fro all the time it has been ſupplied with freſh water."

The preceding remarks of Mr. Ellis are particularly ſatisfactory, as they point out the manner in which animalcula of various other kinds may be produced by infuſions of vegetable matter; but it is probable he is miſtaken reſpecting the ſpecies generated in the infuſion of hemp-ſeed; and which is called volvex ovalis, or egg-ſhaped volvex. Perhaps this is volvex globulator, Linn., which is uſually ſpherical, but of an oval form at intervals, and eſpecially at the time the infant brood is ſeparated from the parent: for it ſeems at that moment to divide, and become two diſtinct animalcules, as Mr. Ellis mentions. Vide *Plate* III. of Vermes Infuſoria, Microſcopical Objects, &c. &c.

As the different ſpecies will be more fully noticed in their reſpective places, we ſhall conclude our remarks with a few obſervations on the doctrine of equivocal generation, and the different opinions that have ariſen reſpecting the origin and nature of animalcules in particular. Before the invention of microſcopes, the doctrine of equivocal generation, both with regard to animals and plants of ſome kinds, was univerſally received; but this inſtrument ſoon convinced every intelligent perſon, that thoſe plants which formerly were ſuppoſed to be produced by equivocal generation, aroſe from ſeeds; and the animals, in like manner, from male and female. But as the microſcope threw light upon one part of nature, it left another involved in darkneſs: for the origin of animalcula infuſoria, or the ſpermatic animals already mentioned, remains as yet as much unknown as that of many other kinds was, when the doctrine of equivocal generation reigned in full force.

The diſcovery of ſpermatic animalcules was thought to throw ſome light on the myſterious affair of generation itſelf; and the minute creatures were imagined to be each of them individuals of the ſame ſpecies with the parent. Here

the infinite number of theſe animalcules was an objection, and the difficulty remained as great as before; for, as every one of theſe animalcules muſt neceſſarily be produced from a male and female, to explain their origin by animalcular generation in the ſame manner, was only explaining generation by itſelf.

This hypotheſis, therefore, having proved unſatisfactory, others have been invented. M. Buffon, particularly, hath invented one, by which he at once annihilates the whole animalcular world; and in this he has been followed by ſeveral ingenious philoſophers. His hypotheſis is diametrically oppoſite to that of Leeuwenhoeck, who deſcribed many diſtinct ſpecies of the ſpermatic animalcula as living bodies, and conceived it neceſſary that one or more of them ſhould penetrate, or impregnate, the ovum, to effect the purpoſe of generation.

From a variety of experiments made on the human ſemen (mas.), M. Buffon concludes, that what have been called ſpermatic animals, are not creatures really endowed with life, but ſomething proper to compoſe a living animal; and he diſtinguiſhes them by the name of *organic particles*. The ſame individual kinds of animals he declares he has found in the fluids ſeparated from the ovaria of females; and for the truth of this appeals to the teſtimony of Mr. Needham, who was an eye witneſs of his experiments. He alſo brings an additional proof of his doctrine from Mr. Needham's obſervations on the milt of the calmar, a ſpecies of cuttle-fiſh. Here the ſpermatic animals, at leaſt what have only the appearance of life, are vaſtly larger than in any other creature, ſo as to be plainly viſible to the naked eye. After conſidering the organization of theſe particles very fully, he concludes, that they are not animalcula, or endowed with life; and infers, that all the moving bodies that are to be found in the infuſions of either animal or vegetable ſubſtances, are of a ſimilar nature. To diſcover whether all the parts of animals, and all the ſeeds of plants contained moving organic particles, he made an infuſion of fleſh of different animals, and of the ſeeds of more than twenty different ſpecies of vegetables; and, after remaining ſome days in cloſe glaſſes, had the pleaſure of ſeeing organic moving particles in all of them. In ſome they appeared ſooner, in others later; ſome preſerved their motions for months, and others ſoon loſt it. Some, at firſt, produced large moving globules, reſembling animals, which changed their figure, ſplit, and became gradually ſmaller. Others produced only ſmall globules, whoſe motions were extremely rapid; and others produced filaments, which grew longer, ſeemed to vegetate, and then ſwelled, and poured forth torrents of moving globules. This obſervation gave riſe to a new ſyſtem; Baron Munchauſen, perceiving that the laſt mentioned moving globules, after moving for ſome time, began to vegetate, concluded they were at firſt animals, and then plants: an hypotheſis which Mr. Ellis endeavoured to overturn, by aſſerting, that they were no other than the ſeeds of that genus of fungi called *mucor*, or mouldineſs; and that their motion is owing to numbers of minute animalcules attacking them for food.

M. Buffon is not, however, content with denying life only to thoſe beings where the ſigns of it are moſt equivocal, but includes, in the ſame rank of organic particles, almoſt every animal too ſmall to be diſcovered by the naked eye; and even ſome of thoſe whoſe motions are evidently perceptible to the naked eye. He obſerves, that "almoſt all microſcopic animals are of the ſame nature with the moving bodies in the ſeminal fluids, and infuſions of animal and vegetable ſubſtances. The eels in paſte and vinegar, &c. are all of the ſame nature, and derived from the ſame origin. There are, perhaps, as many beings that either live or vegetate, produced by a fortuitous aſſemblage of organic particles, as by a conſtant and ſucceſſive generation. Some of them, as thoſe of the calmar, are only a kind of machine, which, though exceedingly ſimple, are very active. Others, as the ſpermatic animalcules, ſeem to imitate the movements of animals. Others reſemble vegetables in their manner of growth and extenſion. There are others, as thoſe of blighted wheat, which at pleaſure can be made alternately to either live or die, and it is difficult to know to what they ſhould be compared. There are ſtill others, and in great numbers, which are at firſt a kind of animal, then become a ſpecies of vegetables, and again return alternately to their vegetable ſtate. The eels in paſte have no other origin than the union of the organic particles of the moſt eſſential part of the grain. The firſt eels that appear are certainly not produced by other eels; but though they are not propagated themſelves, they fail not to engender other living eels. By cutting them with the point of a lancet, we diſcover ſmaller eels iſſuing in great numbers out of their bodies. The body of this animal ſeems to be only a ſheath, containing a multitude of ſmaller animals, which perhaps are other ſheaths of the ſame kind, in which the organic matter is aſſimilated into the form of eels."

The accurate experiments of Baker, Ellis, Muller, Corti, Roſſredi, and many others, ſufficiently refute the inconcluſive reaſoning of Buffon; and we cannot do better than conclude, in the words of a late ingenious writer, Mr. Adams, who has treated at ſome length on the ſame ſubject in his Eſſays on the Microſcope.

"Though we can by no means pretend to account for the appearance of moſt animalcula, yet we cannot help obſerving, that our ignorance of the cauſe of any phenomenon is no argument againſt its exiſtence. Though we are not, for inſtance, able to account in a ſatisfactory manner for the origin of the native Americans, yet we ſuppoſe M. Buffon himſelf would reckon it abſurd to maintain, that the Spaniards, on their arrival there, found only ORGANIC PARTICLES moving about in diſorder. The caſe is the very ſame of the eels in paſte, to whoſe animation he objects. They are exceedingly ſmall in compariſon with us; but, with the ſolar microſcope, Mr. Baker has made them a more reſpectable appearance, ſo as to have a diameter of an inch and an half, and a proportionate length. They ſwam up and down very briſkly; the motion of their inteſtines was very viſible; when the water dried up, they died with apparent agonies, and their mouths opened very wide. Now, were we to find a creature of the ſize of this magnified eel gaſping in a place where water had lately been, we ſhould certainly never conclude it to be merely an ORGANIC PARTICLE, or fortuitous aſſemblage of them, but a fiſh. Why then ſhould we conclude otherwiſe with regard to the eel in its natural ſtate, than that it is a little fiſh? In reaſoning on this ſubject, we ought ever to remember, that however eſſential the diſtinction of bodies into great and ſmall may appear to us, they are not ſo to the Deity, with whom, as Mr. Baker well expreſſes himſelf, 'an atom is a world, and a world but as an atom." Were the Deity to exert his power a little, and give a natural philoſopher a view of a quantity of paſte filled with eels, from each of whoſe bodies the light was reflected as in the ſolar microſcope; our philoſopher, inſtead of imagining them to be mere organic particles (as the paſte would appear a little mountain), would probably look upon the whole as an aſſemblage of ſerpents, and be afraid to come near them. Whenever, therefore, we diſcover beings, to appearance endowed with a principle of ſelf-preſervation, or whatever we make the characteriſtic

racteriſtic of animals, neither the ſmallneſs of their ſize, nor the impoſſibility of our knowing how they came there, ought to cauſe us to doubt of their being animated."

ANIMALIZED *Matter* of *Vegetables*. See VEGETO-*Animal Matter*.

ANIMALLY, in *Geography*, a town of Hindoſtan, in the Coimbetore country, 35 miles weſt of Daraporum, and 18 ſouth of Coimbetore. N. lat. 10° 40′. E. long. 77°.

ANIMATE, ANIMATED, ſomething endued with life, or a living ſoul.

In mechanics, *animate power* is uſed to denote a man, or brute; in contradiſtinction to *inanimate power*, as ſprings, weights, &c.

Naturaliſts and philoſophers differ extremely in aſſigning the characters, ſubjects, and ſpecies of animate bodies. Some include ſtocks and ſtones in this rank; others exclude brutes themſelves.

Some of the ancient philoſophers have held all nature to be *animated*; that the ſun, the earth, the planets, rivers, trees, ſtones, &c. are ſo many animals; others, that the whole ſyſtem is only one huge animal, informed with a ſoul, or *anima mundi*. Plato, in Timæo. Morhoff. Polyh. Phil. lib. ii. p. 1. cap. 11.

ANIMATED *Horſe-hairs*. See GORDIUS SETA.

ANIMATED is alſo uſed to denote a thing impregnated with vermin or ANIMALCULES.

In this ſenſe the whole earth may ſeem to be animated; ſince in every part of it we meet with an infinite number of animals, either viſible or inviſible; they are found in air, water, earth, plants, and even in the hardeſt ſtones; and there is, perhaps, no animal known which does not breed numbers of others in the different parts of its body.

ANIMATED *mercury*, among *Chemiſts*, ſignifies quickſilver, impregnated with ſome ſubtle and ſpirituous particles, ſo as to render it capable of growing hot when mingled with gold.

ANIMATED *needle*, a needle touched with the loadſtone, or MAGNET.

ANIMATION, ſignifies the informing of an animal body with a ſoul.

Thus the *fœtus* of the womb is ſaid to come to its animation, when it begins to act as a true animal; or after the female that bears it is *quick*, as the common mode of expreſſion is.

The learned are not agreed about the time when the female becomes quick; ſome compute it at forty days after conception; others fix it about the middle of the term of GESTATION.

T. Fienus Gardinius, Verde, Fort. Licetus, F. de Bonnonia, have written expreſsly on the animation of the FOETUS; Fr. Zanellis, on the animation of the SEED.

ANIMATION is alſo uſed by ſome *Mechanical Philoſophers* for the act of ſoliciting the deſcent of a body, ſo as to give it continually new degrees of ACCELERATION.

ANIMATON is alſo uſed, by *Alchemiſts*, for the operation of fermenting a white foliated earth, with a kind of philoſophical or celeſtial water or ſulphur.

ANIMATION is alſo uſed, in a moral or figurative ſenſe, for the act of giving life and force to a diſcourſe, or the like.

ANIMATION is alſo uſed by *Hermetic Philoſophers*, to denote a certain ſtate of perfection to which a body is brought by ſome appropriate proceſs, in virtue whereof it becomes capable of producing ſome extraordinary *phenomena*.

ANIMATION, *ſuſpended*, for the method of treatment in caſes of, ſee DROWNING.

ANIME, ANIME *& caneamum*, in *Pharmacy*, a kind of reſin, whereof there are two kinds, the *weſtern* and *eaſtern*. The *weſtern* flows from an inciſion of a tree in Braſil and New Spain, and in the iſland of Antigua, called *courbaril*, a ſpecies of HYMENÆA; and by Piſo, itaiba: the liquid juice, according to Piſo, running down from the tree, ſinks into the ground, and is afterwards dug up; ſo that the larger maſſes are often full of earth.

The *eaſtern* gum anime, which is a finer ſort, is diſtinguiſhed into three kinds: the firſt is white; the ſecond blackiſh, in ſmell like myrrh; the third pale, reſinous, and dry.

The ſmall tears are the pureſt; it has little taſte, but an agreeable ſmell; it eaſily breaks between the teeth, but if chewed for ſome time, it ſoftens, and becomes adheſive. Laid on red-hot iron, it melts immediately, catches flame, and burns quickly away, leaving a ſmall quantity of white aſhes. It gives but little or nothing to water, but diſſolves entirely in rectified ſpirit; the ſolution being of a yellow colour, with the odour of the anime, and a warm, pungent, bitteriſh taſte. A ſmall portion of eſſential oil is obtained by diſtilling with water a large quantity of anime. This reſin has often been confounded with gum copal.

The Braſilians are ſaid to employ anime in fumigations for pains proceeding from cold and rheumatiſm; they alſo chew it for the relief of colics and flatulencies; it has been alſo recommended in catarrhal and paralytical affections; and applied for complaints of this kind, bruiſes, &c. in liniments and plaſters. With us, however, it is rarely, if ever, made uſe of for any medicinal purpoſe. The Indians prepare from it an excellent varniſh. Lewis and Murray. In our ſhops we have only the American ſorts of this reſin.

ANIMÉ, in *Heraldry*, a term uſed by the French heralds, when the eyes of any rapacious animal are borne of a different colour. The Engliſh blazon it *incenſed*.

ANIMELLÆ, the glands under the ears, &c. called alſo *lacticinea*.

ANIMETTA, in *Eccleſiaſtical Writers*, denotes the pall or cloth wherewith the cup is covered in the euchariſt.

ANIMI *deliquium*. See LIPOTHYMIA and SWOONING.

ANIMOTHA, in *Ancient Geography*, a town of Arabia, according to the notitia imperii.

ANINA, a town of India, on the other ſide of the Ganges, according to Ptolemy.

ANINACHA, was alſo, according to Ptolemy, a town of India beyond the Ganges.

ANINETUS, ANINETUM, or ANITATUM, in *Geography*, a town of Aſia under the patriarchate of Conſtantinople.

ANINGA, in *Commerce*, a root growing in the Caribbee iſlands, of uſe in the refinement of ſugar.

The decoction of this root is found a more certain, as well as more innocent means of clarifying ſugar, than the ſublimate and arſenic uſed for this purpoſe, before the diſcovery of the *aninga*.

ANIO, or ANIEN, of Statius (lib. i. v. 20.), in *Ancient Geography*, now IL TEVERONE, a river of Italy, riſes in Mount Treba or Trevi, towards the frontier of Abruzzo, paſſes through the country of the Æqui, then ſeparates the Latins from the Sabines, forms three large lakes in its courſe, and running through the Tiburtine territories, it precipitates itſelf from a great height, and forms a rapid cataract, whence Horace "Præceps Anio." It falls into the Tiber, about three miles to the north of Rome, not far from Antemnæ. The epithet, formed from the name of this river, is Anienus; and this was ſaid to be the name of the god of the river.

ANIOIA, in *Geography*, a town of Italy, in the kingdom of Naples, 13 miles ſouth-eaſt of Nicotera.

ANJOU, ſo called from the ancient *Andes*, or *Andegavi*, a province of France before the revolution, about ſeventy miles

miles long and ſixty broad; is bounded to the eaſt by Touraine, to the ſouth by Poitou, to the weſt by Bretagne, and to the north by the river Maine. The capital is ANGERS; beſides which, the chief towns are La Fleche, Chateau-Gontier, Saumur, Briſac, Beauge, Paſſavant, Beaufort la Valee, Beaupreau, &c. It has many rivers, ſix of which are navigable; namely, the Loire, Vienne, Thoué, Loire, Mayenne and Sarte. The climate is temperate, and the face of the country agreeably diverſified with hills and vallies. The productions of the ſoil are wine, chiefly white, grain, peas and beans, flax, hemp, and various kinds of fruit-trees, particularly walnuts and apple-trees. The fine paſtures of Anjou furniſh rich breeds of cattle; it has alſo ſeveral coal and iron mines, and good quarries of ſlate, ſtone, and marble; there are alſo ſaltpetre works, and ſome glaſs-houſes: its commerce principally conſiſts of wine, brandy, grain, cattle, cloths, ſtuffs, ironmongery, &c. It formerly conſiſted of two counties, which, towards the end of the ninth century, were united; and it was annexed to the crown by Philip Auguſtus, in the year 1202. The departments of Mayne and Loire, the Sarte and the Mayenne, now contain a part of this province.

Anjou Cabbage, in *Botany*. See CABBAGE.

ANJOUAN, or ANJUAN, in *Geography*, a very ſmall iſland of Africa, in the Ethiopic ocean. It is ſituated in the Mozambique gulf, between Madagaſcar and the coaſt of Zanguebar. The ſoil is fertile, and it produces excellent fruits.

ANIRITTE, in *Ancient Geography*, a people of the northern part of Marmarica, according to Ptolemy.

ANISCALPTOR, in *Anatomy*, a muſcle, otherwiſe called LATISSIMUS *dorſi*.

ANISE-SEED, *aniſum*, *aniſum herbariis*, *aniſum vulgare*, in the *Materia Medica*, a medicinal ſeed, produced by an umbeliferous plant of the ſame name, which is a ſpecies of PIMPINELLA, an annual plant, growing naturally in Egypt, Syria, and other eaſtern countries; and cultivated for culinary and medicinal uſes in France, Spain, Malta, Upper Saxony, and Thuringia. It was cultivated here in the time of Turner, in 1551; but our ſummers are ſeldom warm enough to bring the plant to perfection. The ſeeds are annually imported from Malta and Spain; and the ſeeds of Spain, which are ſmaller than thoſe of France and Germany, are accounted the beſt.

Aniſe-ſeeds are roundiſh and ſtriated, flatted on one ſide and pointed at one end, of a pale colour inclining to green. They have an aromatic ſmell, and a pleaſant warm taſte, accompanied with a degree of ſweetneſs. They totally give out their virtue to rectified ſpirit; the tincture is of a bright lemon colour, and agreeable taſte. The ſpirit diſtilled from the filtered tincture has a light taſte of the ſeeds, but the greateſt part of their virtue is left behind in the extract, which is a pleaſant, ſweetiſh, moderately warm, and not very pungent aromatic. Infuſed in water, they impart a little ſmell, but ſcarcely any taſte; and in diſtillation they give out their whole flavour. With the water riſes an eſſential oil, to the quantity of an ounce or more from three pounds; this oil is of a yellowiſh colour, and it congeals, when the air is not ſenſibly cold, into a butyraceous white concrete; its ſmell is extremely durable and diffuſive, but in taſte is milder and leſs pungent than that of any other diſtilled vegetable oil.

The ſeeds likewiſe yield by expreſſion an oil of greeniſh colour, leſs grateful taſte, and ſtrongly impregnated with the flavour of the ſeeds; ſixteen ounces, lightly moiſtened by being expoſed to the ſteam of boiling water, are ſaid to afford one ounce. This oil is compoſed of a groſs, inſipid, inodorous one, ſuch as the common expreſſed oils, and a part of the eſſential oil of the ſeed, on which the flavour depends. The eſſential oil is contained in the outer thin ſkin of the ſeeds, and the expreſſed oil in the kernel itſelf.

Aniſe-ſeeds, which are ranked among the four greater hot ſeed, have been long employed as a carminative and aromatic; they have alſo been eſteemed uſeful in pulmonic complaints, and to poſſeſs, like thoſe of fennel, a power of promoting the ſecretion of milk, and on this account given to nurſes; in proof of which it is alleged from Geoffroy, that the odour is perceived in the milk. But their chief uſe is in flatulent colics, in the gripes to which children are ſubject, in flatulent pains and obſtructions of the breaſt, in weakneſs of the ſtomach and indigeſtion, in diarrhœas, and for ſtrengthening the tone of the viſcera and inteſtines in general: and hence they were called by Van Helmont, "Solamen inteſtinorum." The eſſential oil, which is the only officinal preparation of aniſeeds now directed by the Pharmacopeias, is uſually grateful to the ſtomach, and may be taken in the doſe of twenty drops. In diſeaſes of the breaſt, the oil is preferred; but in flatulencies and colics, the ſeeds, in ſubſtance, are ſaid to be more effectual. It is aſſerted, that the oil is poiſonous to pigeons. A ſpirituous water prepared from a mixture of equal parts of aniſeed and angelica, by drawing off a gallon of proof ſpirit from half a pound of each of the ſeeds, is commonly kept in the ſhops, and proves an elegant carminative cordial. They are uſefully combined with the purgatives that are adminiſtered in flatulencies and gripes. Lewis. Newman. Murray. Bergius.

ANISE-SEED, *ſtarry*, *aniſum ſtellatum*, is a ſeed thus called from the affinity it bears in ſmell to the common aniſe-ſeed, and the ſtar like figure of its *capſulæ ſeminales*. It is the produce of a ſmall tree growing in Tartary, China, and the Philippine iſlands, which is the ILLICIUM *aniſatum* of Linnæus.

It was firſt brought into Europe from the Philippine iſlands by an Engliſh mariner, named Thomas Candy, Candiſh, or Cavendiſh, in his return from a voyage round the world in the year 1601. The natives call it *damor* and *zingi*; the Europeans ſometimes *foeniculum Sinenſe*, or Chineſe fennel; botaniſts, *aniſum Indicum*, *aniſum peregrinum*, *aniſum exoticum Philippinarum inſularum*, *cardamomum Siberienſe*, *badianum*, &c. In ſmell and taſte this reſembles the common aniſe-ſeed; but with the aromatic taſte is combined a ſweetneſs, and in both reſpects it is ſtronger. The capſules or huſks affect the tongue more than the ſeed, but the flavour of the ſeeds is accompanied with a greater ſweetneſs. The ſeeds afford in diſtillation with water, the largeſt quantity of eſſential oil; and the capſules yield with ſpirit, the moſt acrid, reſinous extract. The oil is more limpid, and more fragrant, than that of the common aniſe-ſeeds; and the ſpirituous extract is much warmer and more pungent: for medical purpoſes, the capſules and ſeeds are bruiſed together.

Its virtues are of the ſame kind with thoſe of the common aniſe ſeed, only that it is ſweeter, more grateful, penetrating, and aromatic. It is reputed a general cordial and ſtrengthener, and uſed for this purpoſe in the eaſtern countries, and in ſome parts of Europe; but it has not been received in practice among us, and is rarely found in the ſhops.

The Chineſe uſe it in the preparation of their tea, and they chew it for ſweetening their breath; and after their example, the Dutch alſo uſe it in this liquor, pretending it makes it more pleaſant.

The wood is alſo imported into Europe, where it is employed in works of marquetry and moſaic: it is alſo called *anil*. Lewis. Murray. Newman. Cartheuſer.

ANISIFOLIUM, in *Botany*. See LIMONIA.

ANISOCALIUM,

ANISOCALIUM, a name given by ſome naturaliſts to the SERTULARIA MYRIOPHYLLUM of Linnæus; myriophillum pelagicum of Zanich. Ginann, &c.; muſcus maritimus, filicis folio of C. Bauh. and pheaſants' tail coralline of Ellis. See MYRIOPHYLLUM, SERTULARIA.

ANISOMARATHRUM, in *Botany*. See SCANDIX.

ANISUM *Africanum*. See BUBON.

ANISUS, or ANASUS, in *Ancient Geography*, a river of Norica, which falls into the Danube.

ANITHA, a town of Arabia Petrea, according to Ptolemy.

ANTIGORGIS, a town of Hiſpania Bœtica, mentioned by Livy (lib. xxv. c. 32.), when deſcribing the campaign of Cornelius and Scipio, who advanced to this town, and encamped in the ſight of the enemy, from whom they were ſeparated by the river.

ANIUS, a river called *Æas* by Stephan. Byz.; and by Livy, *Aous*; which diſcharges itſelf into the Adriatic to the ſouth of Apollonia.

ANIUS, *Lugo Sudatorio*, a place of Campania, near Puteoli.

ANIZA, in *Geography*, a town of Arabia, 200 miles north-weſt from Jamama.

ANIZY LE CHATEAU, a town of France, in the department of the Aiſne, and chief place of a canton, in the diſtrict of Chauny, eight miles north-eaſt of Soiſſons, and ten ſouth-eaſt of Chauny.

ANKER, ANCHOR, a liquid meaſure chiefly uſed at Amſterdam, &c.

The *anker* is the fourth part of the *awn*, and contains two *ſtekans*; each *ſtekan* conſiſts of ſixteen *mengles*, the *mengle* being equal to two Paris pints.

ANKER, in *Geography*, a river of England, which riſes about one mile and a half ſouth-weſt of Hinkley, in Leiceſterſhire, and joins the Tame at Tamworth, in Warwickſhire.

ANKEVEEN, a town of the United Netherlands, in the State of Utrecht, one mile and a half ſouth-weſt from Naerden.

ANKLE, *Joint of the*, in *Anatomy*, is made by the appoſition of the aſtragalus, or upper bone of the foot, to the lower part of the tibia and fibula, which are, for that purpoſe, tied together by a ſtrong band of ligaments both before and behind.

The tibia and fibula ſend down two proceſſes, called malleoli, which are applied to the ſides of the aſtragalus, ſupport it in its ſituation, and render the joint very ſecure. The form of the bones allows them to be moved chiefly forwards and backwards, ſo that the joint is accounted a ginglymus. When the back part of the aſtragalus is moved forwards, the toes are pointed to the ground, and the foot is ſaid to be extended; in the contrary poſition, it is ſaid to be bent upon the leg.

When the joint is bent, the form of the aſtragalus ſo exactly correſponds to the ſpace in which it is received between the tibia and fibula, that no motion can take place; but when it is extended, the narrow back-part of the aſtragalus coming forwards between the malleoli, a ſpace exiſts between the bones, and a motion of the aſtragalus from ſide to ſide (ſuch as takes place in directing our ſteps) is permitted.

In this joint we have the uſual apparatus of cartilages to cover the ends of the bone; a capſule to contain the ſynovia; portions of fat, denominated ſynovial glands; and reſtraining ligaments to bind the bones together (ſee JOINT, *Structure of*). The capſule of that joint appears in front a little looſe, ſo that it can be pinched up with a pair of forceps, and here alſo are ſeen thoſe portions of fat which have been accounted ſynovial-glands: behind, the capſule is covered by bands of reſtraining ligaments which conceal it, and ſtrengthen that part of the joint; but the principal ſtrength and reſtraint to the improper motions of the joint is found, as is common in ginglymoid articulations, at the ſides. The internal lateral ligament (ligamentum deltoides malleoli interni of Weitbrecht), which is radiated, extends from the point of the malleolus internus to the aſtragalus and os calcis. The external lateral ligament (ligamentum malleoli externi perpendiculare, Weitbrecht), extends from the point of the malleolus externus to the os calcis. There are alſo two other bands of ligaments paſſing from the fibula to the aſtragalus, one in front, and the other behind the laſt-mentioned ligament. Weitbrecht mentions theſe under the names of ligamentum malleoli externi, anterius & poſterius. Theſe ligaments are in a ſtate of great tenſion, and prohibit any motion when the joint is bent; but are relaxed, and allow of that motion which is uſeful in the direction of our ſteps when it is extended.

ANKLE, *luxation of*, in *Surgery*; ſee LUXATION and DISLOCATION.

ANKUN, in *Geography*, a town of Germany, in the circle of Upper Saxony and principality of Anhalt; is ſo near to Zerbſt on the weſt, that it is denominated a ſuburb to that city, but has a corporation of its own.

ANLERY, a town of France, in the department of the Nyevre, and chief place of a canton, in the diſtrict of Decane, 15 miles eaſt from Nevers.

ANN, *Cape*, is the point of land, in the town of that name, or GLOUCESTER, which forms the north ſide of Maſſachuſett's Bay, as Cape Cod does the ſouth ſide. It was ſo named in honour of Ann, conſort of king James I. N. lat. 42° 45'. W. long. 70° 17'.

ANN, *St.* is the chief town of the province of Parana, in the eaſtern diviſion of Paraguay, in South America.

ANN, *St.* a lake in Upper Canada, to the north of Lake Superior, which ſends its waters north-eaſterly into James's Bay, through Albany River. Its north-eaſtern point lies in N. lat. 50°. W. long. 88°.

ANN, *Fort*, in the ſtate of New York, lies at the head of Battyzaux navigation, on Wood Creek, which falls into South Bay, Lake Champlain, near Skeneſborough.

ANN'S, *St.* a port, on the eaſt ſide of Cape Breton iſland, accommodating fiſhing-veſſels, and lying on the north-weſt ſide of the entrance into Labrador Lake. N. lat 47°. W. long. 60°.

ANN'S, *St.* a ſmall town on the river St. John's, in the province of New Brunſwick, about 80 miles from St. John's, and almoſt oppoſite to Frederick-town. It is at preſent the ſeat of government.

ANN'S, *St.* ſometimes called *Egane*, lies at the bottom of a bay, on the north-eaſt part of Borneo iſland, in the Eaſt Indies. N. lat. 5° 50'. E. long. 116° 20'. This bay, called *St. Anne's Bay*, is a very conſiderable bay of the Eaſtern Ocean, oppoſite to St. Michael's iſlands. It has a free and open entrance, a good depth of water, and ſafe anchorage.

ANN'S, *St.* a bay of Campeachy, in the gulf of Mexico, in N. lat. 18° 10'. and W. long. 92° 25', nearly ſouth-weſt from Cape Condecedo.

ANN'S, *St.* is a harbour on the north coaſt of the iſland of Jamaica, in N. lat. 18° 54', and W. long. 77° 12'. It is a good anchoring-place, and the largeſt ſugar ſhips may lie with their ſides cloſe to the wharf.

ANN'S, *St. Point*, is to the larboard of the entrance into Milford Haven, on the coaſt of Wales.

Ann's, *St. Point*, is alſo in the ſtraits of Magellan, in that part which bends to the ſouth, and on the weſt ſide of it, on the Patagonian ſhore, four leagues from Cape Froward, the moſt ſoutherly point of the American continent. Here are good wooding, watering, and fiſhing.

Ann's, *St. Port, Arglas*, or *Killough*, lies on the eaſt coaſt of Ireland, between Carlingford and Strangford.

ANNA is one of the three principalities into which Arabia Deſerta is divided.

Anna is alſo one of the chief cities of the above principality, and was formerly a famous market town, though it is now not much frequented. It is ſituated in N. lat. 33° 57′, E. long. 42° 10′, on the river Euphrates, in a fruitful and pleaſant ſoil, and has two ſtreets which are divided by the river: that on the Meſopotamia ſide is about two miles long, and thinly peopled by tradeſmen; that on the oppoſite ſide is about ſix miles in length, and this part is inhabited by the principal people. Every houſe has ſome ground belonging to it, which produces a variety of excellent fruit-trees, as lemons, oranges, citrons, quinces, figs, dates, pomegranates, and olives: ſome of the flat ground is ſown with corn and other grain, which it yields in great abundance. The city is the common rendezvous of all the robbers that infeſt the country; here they hold their council, and ſettle their plans of depredation, and from hence they diſperſe themſelves into all parts of the deſert. This is one of the great thoroughfares through which the caravans paſs to and from Aleppo Tripoli, Damaſcus and Bagdad, and ſome other parts of the Turkiſh empire; and it is with difficulty, ſuch is the character of the inhabitants, that the Turkiſh aga and the janizaries, who are kept here, can levy the tribute impoſed by the Turks on all the commodities carried through this city. Mod. Un. Hiſt. vol. xxxvi. p. 440.

Anna, in *Ancient Geography*, is a town of Paleſtine, to the north of Jericho. Joſephus calls it *Aina*; and Berkelius thinks it is the ſame with Kana.

Anna, a town placed by the periplus of Scylax on the coaſts of Lydia; ſuppoſed to be *Anzia*, or *Anæa*, which belongs to Ionia or Caria.

ANNABERG, in *Geography*, a mine town of Germany, in the circle of Erzgebirg and electorate of Saxony, five miles ſouth-ſouth-weſt from Wolkenſtein. The occupation of its inhabitants conſiſts partly in mining, but chiefly in the lace-trade. The ſilver-mines of Schreckenberg are not far from the town.

ANNABI, the name of mountains in Independent Tartary, ſuppoſed by M. d'Anville to be thoſe of Altai; but they are evidently thoſe of Alak, called by ſome Muſart, on the north of Little Bucharia.

ANNABON, or Annobon, or *Happy Year*, the name given to an iſland of Africa by the Portugueſe, who diſcovered it on New Year's Day, in 1526. This iſland lies to the eaſt of St. Matthew, in S. lat. 1° 50′, and E. long. 5° 10, 25 leagues ſouth from St. Thomas iſland, and 45 from Cape Lopez Gonſalvo. According to Pyrard, it is five or ſix French leagues in circuit; but Baudrand makes its compaſs ten leagues. It has two high mountains, which being almoſt always covered with clouds, occaſion frequent rain. It has a number of fertile vallies, producing Turkey corn, rice, millet, potatoes, yams, bananas, pine-apples, citrons, oranges, lemons, figs, tamarinds, and other delicious fruits. This iſland alſo affords oxen, hogs, ſheep, goats, and poultry, in great plenty, and abundance of fiſh; but the only mercantile production is cotton, which is ſaid to be equal to any produced in India; the quantity, however, is ſmall. The governor is a Portugueſe; but the majority of the inhabitants are natives, who pay him implicit obedience, and are bigoted in their attachment to the Roman Catholic faith. There are two rocks on the ſouth-eaſt end of the iſland, which are dangerous to ſhipping: they are inhabited by a number of birds, ſo tame, that the ſailors frequently feed and catch them with their hands. Ships, ſailing for Europe from the Cape of Good Hope, frequently make this iſland; and the right road for them is on the north-eaſt ſide, where they may anchor in ſix or ſeven fathoms water, and good ground.

The climate is wholeſome, and the air clear and ſerene. Every part of the iſland is watered by pleaſant brooks and freſh-water ſprings, which, in all high tides, become brackiſh: the banks are covered with palms, from which the inhabitants obtain their wine by inciſion; and among other fruits, this iſland produces a ſpecies of black nut of a purgative quality. Moſt of the dwellings on this iſland are cane-huts: the inhabitants are meanly clothed; the women have the upper part of the body naked; they carry their children on their backs, and ſuckle them over the ſhoulder; the men wear a linen-girdle round the loins, with a ſmall flap before. Mod. Un. Hiſt. vol. xi. p. 459.

ANNABURG, formerly called *Lochau*, a town of Germany, in the Electorate of Saxony, and in a prefecturate of the ſame name. This town is ſituated on an iſland, and contains a citadel which Anne, conſort to the elector Auguſtus, cauſed to be rebuilt in the year 1572; whence the name. N. lat. 51° 42′. E. long. 12° 54′.

Anna Comnena, in *Biography*, was the daughter of the emperor Alexius Comnenus I. by his wife Irene, and no leſs diſtinguiſhed by her talents than her rank. She was born at Conſtantinople in 1083, and devoted herſelf to the ſtudy of literature and philoſophy, by which ſhe acquired the reputation of the moſt learned lady of her age. Upon the death of Conſtantine, the ſon of Michael Ducas, her intended huſband, ſhe married Nicephorus Bryennius, a young nobleman of diſtinction; on whoſe behalf ſhe joined with the empreſs Irene in ſoliciting her father, in his laſt illneſs, to diſinherit his ſon. When this ſcheme failed, ſhe excited a conſpiracy for depoſing her brother; and upon her huſband's impeding its ſucceſs, ſhe lamented that nature had miſtaken their ſexes, as he ought to have been the woman. Her plot was defeated; and Anna was puniſhed by the confiſcation of her property, which, however, was reſtored to her by the emperor; but ſhe loſt her whole influence at court. Having loſt her mother firſt, and afterwards her father in 1118 (ſee Alexius I.), and her huſband in 1137, ſhe endeavoured to ſoothe her mind in retirement, by compoſing a hiſtory of her father's reign; a work that was finiſhed in 1148, ſtill extant, and preſerved in the collection of Byzantine hiſtorians. "This hiſtory was written," ſays Mr. Gibbon (Hiſt. vol. ix. p. 83. 8vo.), "with an elaborate affectation of rhetoric and ſcience, that betrays in every page the vanity of a female author." Nevertheleſs, it forms an uſeful contraſt to the degrading and partial ſtatements of the Latin hiſtorians. Zonaras gives her an excellent character, and informs us, that ſhe engaged vigorouſly in the purſuit of learning, and had a peculiar attic elegance in her ſtyle; and being endued with a genius ſuited to elevated contemplations, ſhe improved her natural abilities by intenſe ſtudy, for ſhe was perpetually reading, or converſing with men of learning. Gen. Dict.

ANNAGH, in *Geography*, an iſland on the weſt coaſt of Ireland, about five miles in circumference, between the iſle of Achil and the main land of the county of Mayo. N. lat. 53° 58′. W. long. 9° 39′.

Annagh, a ſmall iſland of Ireland, in Lough Conn, in the county of Mayo, eight miles from Killala.

Annagh *iſland*, a ſmall peninſula on the weſt coaſt of Ireland, and weſt coaſt of the county of Mayo.

Annagh Uan, a ſmall iſland on the ſouth-weſt coaſt of the county of Galway, 22 miles weſt from Galway.

Anna Ivanowna, in *Biography*, the ſecond daughter of the Czar Ivan Alexiowitch, elder brother of the Czar Peter the Great, was born in 1693, married in 1710 to Frederick-William, duke of Courland, left a widow in 1711, and advanced to the Ruſſian empire on the deceaſe of Peter II. in 1730. Her counſels were under the abſolute direction and influence of Erneſt John Biren, a favourite of mean deſcent. Notwithſtanding attempts to prevent his coming to Ruſſia, he appeared immediately upon her arrival at Moſcow; and formed a party, by whoſe influence the crown was offered to Anna, with the deſpotic authority poſſeſſed by her predeceſſors. Biren governed with vigour and capacity; but with ſuch rigour, that more than 20,000 perſons are ſaid to have been ſent to Siberia during this reign, though the empreſs herſelf was of a gentle and merciful diſpoſition. The influence of Biren was ſo great, that though he treated the empreſs with arrogance and diſreſpect, he was able to carry any meaſure by a mere threat of returning to Courland, of which ſhe made him grand duke. He lived in a ſtyle of magnificence ſuperior to her's; and ſhe had no table of her own, but uſed to dine with his family. The election of a king of Poland, a treaty to be concluded with Perſia, and a war with the Turks, were the tranſactions that occupied Anne in the firſt years of her reign. Auguſtus, elector of Saxony, ſupported by Ruſſia and Auſtria, became king of Poland, under the name of Auguſtus III. In 1735, Ruſſia made a formal ſurrender of all her Perſian poſſeſſions, for which the Ruſſian merchants obtained mercantile privileges, to a conſiderable extent, in the territories belonging to Perſia. The empreſs alſo, on this occaſion, concluded a defenſive treaty with the Shah againſt the Turks. Although, during the reign of Anne, the Ruſſians and Auſtrians combined their forces, and threatened to ſhake the Ottoman empire, yet the expectations that were formed from the united efforts of theſe two powers were utterly diſappointed. The Auſtrians made overtures of peace to the Turks; and inſtead of having made new conqueſts, they were obliged to reſtore Belgrade, the rampart of Hungary againſt the Turks; and the articles agreed upon between the Porte and Auſtria, were ſigned at Belgrade, September the 1ſt, 1739. Soon after this event, the vizier manifeſted a diſpoſition to negociate even with Ruſſia, nor was the empreſs averſe from the meaſure: accordingly, on the 18th of September, a peace was effected between the court of St. Peterſburgh and the Porte. The conditions of this peace were, that Azof ſhould be evacuated, together with its territory, and lie waſte as a boundary between the two empires. Ruſſia, however, was allowed to build a fortreſs on the Don, and the Porte was at liberty to conſtruct another in the Kuban. The Greater and the Leſs Kabardia were to remain unoccupied as a frontier. The Ruſſians were prohibited from keeping a fleet either in the Palus Mœotis, or in the Euxine; and the Ruſſian merchants had licence only to carry on commerce in Turkiſh bottoms, in the latter. The Moldau, and all the other conqueſts made by the Ruſſians, were reſtored to the Turks. In this conteſt, ſo diſadvantageouſly terminated, Ruſſia had loſt above 100,000 men, and expended prodigious ſums of money. Soon after the concluſion of peace with the Turks, the Ruſſians were threatened by Sweden; but before the ſtorm could burſt from theſe threatening appearances, the empreſs Anne died, in 1740, aged 47; and left the crown to her grand-nephew, Ivan, under the regency of Biren. Anne, during her reign of 10 years, acquired ſome portion of fame, by completing many things that had been begun by her uncle Peter I. Although her war with the Turks did not redound to much benefit, yet it convinced the Porte of the ſuperiority of the Ruſſian arms. The canal along the Ladoga lake, commenced under Peter I. conducive to the eaſier conveyance of proviſions to St. Peterſburgh, was completely finiſhed under Anne, in 1738. Anne renewed the project for inveſtigating whether any connexion ſubſiſted between North America and Siberia, and for exploring thoſe regions that were unknown. Anne likewiſe, by the advice and aſſiſtance of Count Munich, improved the diſcipline of the Ruſſian army; and eſtabliſhed a ſeminary for the military education of young men of good families. With a view to the extenſion of commerce, Anne was induced to relinquiſh the Perſian provinces; ſhe ſought for expert and induſtrious artiſans and manufacturers, and procured for the country a great number of manufacturers in woollen ſtuffs and ſilk. She executed a new treaty of commerce with Great Britain, and governed at home with gentleneſs and equanimity, except in caſes where puniſhment was thought neceſſary, which ſhe inflicted with ſeverity. The manners of the court at Peterſburgh, during her reign, took a ſofter and politer turn; drunkenneſs was diſcouraged, and the more decent pleaſures of muſic and dancing were promoted.

Under Anne, the number of ſubjects was augmented by the return of the Zaporogian Coſſacks to their ſubmiſſion to the Ruſſian ſceptre; the territory of the empire was alſo enlarged by the ſubmiſſion of the Kirghiſes; and thus the commerce between Ruſſia and China was ſecured againſt the interruption which had been occaſioned by the hoſtilities of the neighbouring Ruſſian tribes. The reign of Anne would have been more happy for Ruſſia, and her memory had in greater honour, if her favourite Biren had not abuſed the confidence ſhe repoſed in him, and rendered a multitude of perſons and families completely wretched. Tooke's Hiſt. of Ruſſia, vol. ii. p. 207—239.

ANNALE, in ſome *Middle-Age Writers*, denotes a day held every year in commemoration of the dead. In which ſenſe annale amounts to the ſame with what is otherwiſe called anniverſarium.

Annale is more particularly applied to the maſſes celebrated, during the ſpace of a year, for the dead.

Annales *libri*, in the *Civil Law*, denote books wherein the acts and proceeding of a whole year were contained.

In which ſenſe *annales* ſtand oppoſed to *ſemeſtres libri*, wherein the acts and conſtitutions of ſix months were contained. See Annals.

Annales *baculi*. denote a kind of wooden almanacks uſed among our anceſtors, called alſo *runſtocks*, or *clogs*.

Annales, in *Middle Age Writers*, denote yearlings, or young cattle of a year old, or under two.

Annales alſo denote a kind of rent, or annual revenue.

ANNALIS *Actio*, in the *Civil Law*, denotes an action which may be put in practice any time within the year. In the like ſenſe we meet with *annale decretum*, or *negatum*, *annalis reſciſio*, &c.

Annalis *clavus*, in *Roman Antiquity*, the nail which the prætor, conſul, or dictator, fixed every year in the wall of Jupiter's temple, on the ides of September, to ſhew the æra or number of years from the building of Rome. This cuſtom was afterwards changed, and the years were reckoned by the consuls.

Annalis *exceptio*, a kind of privilege anciently granted the people of Italy, that whoever had made a contract could not be compelled to the performance or payment of what had been

been agreed on within the year. Some extend this privilege ſo as to render it ſtill more grievous, by computing the year excluſive of all holidays.

ANNALIS *Lex*, a law fixing the age for enjoying the different offices at Rome, which was firſt made by L. Villius or L. Julius, a tribune of the commons, A. U. 573; and hence his family had the ſurname of *Annales*. Liv. lib. xl c. 45.

ANNALS, an hiſtorical account of the affairs of a ſtate, digeſted in the order of years.

The difference between *annals* and *hiſtory* is variouſly aſſigned by various authors. Some ſay that hiſtory is properly a recital of things which the author has ſeen, or been a by-ſtander to. What they build upon is, the etymology of the word; hiſtory in the Greek, ſignifying the knowledge of things preſent; and, in effect, ἱστορέω properly ſignifies *to ſee*. On the contrary, annals, ſay they, relate to the tranſactions of others, and ſuch as the writer never ſaw.

Of this opinion the great annaliſt, Tacitus himſelf, ſeems to have been; becauſe the firſt part of his work, which treats of former times, he calls annals; but when he comes down to his own times, he changes his title, and calls it hiſtory. According to Sempronius Aſellio, annals are a bare relation of what paſſes each year; whereas hiſtory relates not only to the tranſactions themſelves, but alſo to the cauſes, motives, and ſprings of them. The annaliſt merely ſtates his facts, but the hiſtorian reaſons and deſcants on them.

Of this laſt opinion Cicero appears to have been, becauſe when ſpeaking of annaliſts, he ſays, *Unam dicendi laudem putant eſſe brevitatem, non exornatores rerum, ſed tantum narratores*. He adds that hiſtory, in its original, was the compoſition of annals. Cicero relates the origin of annals: to preſerve the memory of tranſactions, the *pontifex maximus*, ſays he, wrote what paſſed each year; and expoſed it on a table, in his own houſe, where every one was at liberty to read it. This they called *annales maximi*; and this cuſtom was kept up till the year of Rome 620. *Annales maximi* conſiſted of eighty books. They were moſt of them deſtroyed in the burning of the city by the Gauls. After the time of Sylla the pontifices ſeem to have diſcontinued the cuſtom of compiling annals; but ſeveral private perſons compoſed hiſtorical accounts of the Roman affairs, which, from their reſemblance to the pontifical accounts in the ſimplicity of their narration, they likewiſe ſtiled annales; as Cato, Pictor, Piſo, Hortenſius, and Tacitus. The like annals were kept from the earlieſt ages by the Egyptians, Babylonians, Perſians, Chaldeans, &c.

The Annals of Grotius is a book finely written, and contains excellent materials. Grotius is not ſo particular as Strada, but more profound, and comes much nearer to Tacitus.

ANNAMATIA, in *Ancient Geography*, a place of Lower Pannonia.

ANNAMETHUS, an iſland in the Indian ocean, according to Pliny, who makes it dependent on Arabia Felix.

ANNAMOOKA, in *Geography*. See ANAMOOKA.

ANNAN, the capital of Annandale, in Scotland, is a ſmall town, and royal borough, pleaſantly ſituate on a river of the ſame name, which abounds with ſalmon, and is navigable, within half a mile of the town, for veſſels of 250 tons burden. The river at the town is croſſed by a bridge of five arches. It was formerly a place of trade, but lying contiguous to the Engliſh border, and in the track of their weſtern incurſions, it was often pillaged, deſtroyed, and burned: the laſt of theſe deſtructive inroads was in the reign of Edward VI. when Lord Wharton, preſident of the Marches, burned the town, and demoliſhed the church. In this town, there was formerly a caſtle which was built by the Bruces, after they became lords of Annandale. The export-trade of Annan at preſent conſiſts of grain; and a building for carding and ſpinning of cotton has lately been erected, and there are ſome appearances of increaſe. N. lat. 54° 40′. W. long. 3°.

ANNAND, WILLIAM, in *Biography*, a Scots epiſcopalian divine, was the ſon of William Annand, miniſter of Air, and born in that town in 1633. His father was obliged to quit Scotland in 1638, on account of his loyalty to the king, and attachment to epiſcopalian government; and he was admitted, in 1651, a ſcholar in the univerſity of Oxford. Having completed his education, and diſtinguiſhed himſelf by his loyalty and zeal for epiſcopalianiſm, he removed to Scotland in 1662; and in 1676, he was nominated to the deanery of Edinburgh. He died in 1689, and was interred in the Greyfriars church at Edinburgh. The titles of his works, which he wrote in Engliſh, are as follows, *viz.* "Fides Catholica;" or, The Doctrine of the Catholic Church, in Eighteen Great Ordinances, &c. Lond. 1661-2, 4to. "Panem Quotidianum;" or, Daily Bread, in Defence of ſet Forms of Prayer. Lond. 1662, 4to. "Pater Noſter;" or, Our Father, an explanation of the Lord's Prayer. Lond. 1670, 8vo. "Myſterium Pietatis;" or, The Myſtery of Godlineſs, Lond. 1672, 8vo. "Doxologia." Lond. 1672, 8vo. "Dualitas;" including "Lex Loquens;" or, The Honour of Magiſtracy: and "Duorum Unitas;" or, The Agreement of Magiſtracy and Miniſtry, &c. Biog. Brit.

ANNANDALE, in *Geography*, a diſtrict or diviſion of Dumfries-ſhire, in Scotland, the capital of which is ANNAN. Upon the death of David II. in 1371, the lordſhip of Annandale deſcended to Thomas Randolf, earl of Murray; and by his ſiſter Agnes, was transferred to the Dunbars, earls of March: after their forfeiture, it paſſed to the Douglaſſes, who loſt it in the ſame way; and from them it went to Alexander, duke of Albany, who loſt it by his rebellion againſt his brother king James III. From his time, it continued in the hands of the king, and was the great key of the weſtern border. This diſtrict is a fertile vale, about 24 miles long and 14 broad: it was formerly, on account of its vicinity to England, ſubject to depredation, ſo that it was left uncultivated; but of late, the culture it has undergone has given it a new aſpect.

Annandale formerly conſtituted part of the Roman province of Valentia: and as the wall of Severus terminated here, it abounds with Roman ſtations and antiquities. Some of the Roman camps are preſerved; and the traces of a military road are viſible in different parts of the country. Annandale is a marquiſate belonging to the Johnſtones, and the chief of that name.

ANNANO, a ſtrong fort of Italy in the duchy of Milan, ſituate on the river Tanaro; twice taken by the French, and reſtored to the Duke of Savoy in 1706. N. lat. 44° 40′. E. long. 8° 30′.

ANNANORE is a Portugueſe factory, lying on the weſtern coaſt of the peninſula of India, 21 leagues nearly S. E. from Goa.

ANNA PERENNA, in *Mythology*, the ſiſter of Dido; of whom fable relates, that ſhe fled with Æneas to Italy, where ſhe fell a ſacrifice to the jealouſy of Lavinia, and was drowned by her in the river Numicus, whence ſhe was denominated the Numician nymph. It is certain, that the Carthaginians and Romans paid her divine honours. It is ſaid, that the ſurname *Perenna* was derived, "a perennitate cultus," from the perpetuity of her worſhip. The feaſt of this deity was celebrated by the Romans in the ides of March, on the banks of the Tiber; on which occaſion the people

people devoted themſelves to every kind of amuſement and pleaſure. Ovid refers to this goddeſs, in the third book of his Faſti. Some writers maintain, that Anna was the moon, becauſe its revolutions formed "annum," the year.

ANNAPOLIS, in *Geography*, a river of Nova Scotia, riſes in the eaſt, and paſſes into the bay of Fundy, through the baſon of its own name; on the ſouth ſide of which, at the mouth of the river, ſtands *Annapolis Royal*. The tide flows up this river thirty miles; and it is navigable for ſhips of any burden 10 miles; for thoſe of 100 tons, 15 miles; and for boats, within 20 miles of Horton.

ANNAPOLIS, a county on the above river, adjoining to King's county, having five townſhips, *viz.* Wilmot, Granville, Annapolis, the chief towns Clare and Monckton, and chiefly inhabited by Canadians, Iriſh, and New-Englanders.

ANNAPOLIS *Royal*, called by the French *Port Royal*, when a colony was ſettled here by M. de Ponts in 1605; is the chief town of a county of this name, and ſtands on the ſouth ſide of the river and bay of Annapolis.

This is reckoned the fineſt harbour in the world: it is two leagues long, and one broad; and has a ſmall iſland called Goat Iſland, almoſt in the middle of the baſon, which is ſaid to be large enough to contain ſeveral thouſand ſhips; its depth of water is no where leſs than four or five fathoms; the bottom is good; and ſhips may be ſecured from all winds. The entrance, however, is difficult, ſo that only one ſhip can paſs in or out at a time; and it muſt go ſtern foremoſt, on account of the ſtrong current and tides: the fogs alſo are very great here. The gulf through which ſhips paſs into the bay is about three quarters of a mile wide and about one and a half long; and on each ſide the land is rocky and mountainous. The town is not large, but has ſome very handſome buildings. It is fortified, and cannot be eaſily attacked except by bombardment. The fort in its preſent ſtate is capable of containing about 100 men. Furs are here exchanged by the Indians for European goods. N. lat. 45° 10′. W. long. 64° 5′.

ANNAPOLIS is alſo the chief town of Ann-Arundel county, and the capital of the ſtate of Maryland. It ſtands at the mouth of the Severn, 30 miles ſouth of Baltimore, 32 eaſt by north from the federal city, 72 ſouth-weſt from Wilmington, and 132 ſouth-weſt from Philadelphia. It was formerly called Severn; and in 1694, it was made a port and town. It is ſituated on a peninſula formed by the river and two ſmall creeks; and affords a beautiful proſpect of Cheſapeak bay, and the eaſtern ſhore beyond it. This town is the wealthieſt of its ſize in the United States. The houſes, about 300 in number, are ſpacious and elegant, indicating great wealth: the ſtate-houſe is a noble building, and ſtands in the centre of the city, whence the ſtreets diverge in every direction. N. lat. 38° 56′ 15″. W. long. 75° 8′.

ANN-ARUNDEL, the name of a county in Maryland, which lies between Patapſco and Patuxent rivers, and has Cheſapeak bay to the ſouth-eaſt. Its chief town is Annapolis. This county contains 22,598 inhabitants, of whom 10,131 are ſlaves.

ANNAT, or ANN, in *Scots Law*, denotes half a year's ſtipend, which the law allows to the executors of the miniſters of the church of Scotland, over and above what was due to the miniſter himſelf, for his incumbency.

ANNAT, FRANCIS, in *Biography*, a French Jeſuit, confeſſor to Louis XIV. was born at Rovergue, in 1590. Having taught philoſophy ſix years, and theology ſeven years, in the Univerſity of Toulouſe, he was invited to Rome to be cenſor-general of the books publiſhed by the ſociety, and theologiſt-general. On his return to France, he was diſtinguiſhed by ſucceſſive offices of honour to which he was appointed, and at length he was made confeſſor to the king, in which poſt he continued for 16 years; nor was he allowed to retire from court till within about four months of his death. It is ſaid, though not with much authority, that when Madame de la Valiere was taken into the royal favour, he entreated permiſſion to lay down his office. During his long connexion with the court, he never employed his intereſt in providing for his poor relations. He was chargeable, however, with the crime of perſecuting thoſe who profeſſed new opinions, and particularly the Janſeniſts; and he has been reproachfully denominated "The Flail of Heretics." He died at Paris in 1670. His writings, chiefly on the controverſy with the Janſeniſts, are numerous; and the principal of them were collected in three volumes, and printed at Paris in 1666. Gen. Dict.

ANNATES, ANNATA, in *Eccleſiaſtical Writers*, denote a year's income, due anciently to the pope upon the death of any biſhop, abbot, or pariſh-prieſt; and to be paid by his ſucceſſor.

ANNATES are alſo called from the Latin *annus*, YEAR; becauſe their rate is after the value of one year's purchaſe; and they are the ſame with what of later days are called *primitiæ*, or *firſt-fruits*; with this only difference, that firſt-fruits with us are paid to the king.

The invention of annates is aſcribed, by a late writer, to Anthonin, biſhop of Epheſus, who exacted from all biſhops conſecrated by him, a ſum proportionate to the annual revenues of their ſees. The council of Epheſus, held in 400, condemned this exaction, but not till Anthonin was dead. It was long after that annates got footing in the weſtern church. The time when they were firſt introduced is very obſcure. Clement V. is ſaid to have been the firſt pope who impoſed annates on England for three years, to which Edward I. immediately conſented; but the parliament boldly oppoſed it; the pope's bull was declared abuſive, and the king revoked his conſent. Polydore Virgil (Inv. et Rer. lib viii. c. 2.) ſays, that the council of Vienne, which was held in 1311, under Clement V. made an effort to ſuppreſs the annates; a circumſtance which ſhews they ſubſiſted in his time. John XXII. the ſucceſſor of Clement, publiſhed a bull, whereby he reſerved the firſt year's fruits of all eccleſiaſtical benefices that continued vacant for three years, archbiſhoprics, biſhoprics, and abbaſies, being exempted; but by degrees the firſt fruits were exacted, without obſerving whether the benefices were vacant three years or not. Benedict XII. who ſucceeded John, followed his example; and it was alſo imitated by ſucceeding popes; but the authority of their bulls extended no farther than their own lives. In 1399, during the ſchiſm of the antipopes, Boniface IX. iſſued the firſt bull for eſtabliſhing perpetual annates; not merely to be granted as a charitable ſupply on extraordinary occaſions, but as a matter of right annexed to the dignity of the ſovereign: ſo that he decreed what was local and particular, to be univerſal and perpetual. Before his time, the annates were not fixed, and the clergy often refuſed to pay them; but afterwards, the tax was not only impoſed at pleaſure, but frequently doubled, tripled, and quadrupled. However, it was always a grievance complained of and remonſtrated againſt both by the people and the clergy. There were even popes who condemned annates; and the ſecular princes frequently objected to the payment of them, forbidding any money to be carried out of their dominions on this account. See Lenfant's Hiſt. of the Council of Conſtance, vol. ii. p. 147, &c. Nic. de Clamangis, A Maſſa, Galleſius, Campegius, and Funandus Cordubenſis, have written expreſsly concerning annates.

Matthew Paris, in his Hiſtory of England, for the

year 746, relates, that the archbiſhop of Canterbury, in virtue of a grant or conceſſion of the pope, received annates of all the benefices that became vacant in England. Before this time, among the laws of king Ina, who began his reign in the year 712, there is an order for the payment of them. But, in after-times, the holy ſee thought fit to take theſe away from the biſhops and archbiſhops, and appropriate them to themſelves. And from the popes, the parliament under Henry VIII. took them, paſſing an act in 1532, againſt levying them, and gave them to the crown. 25 Hen. VIII. cap. 20. Finally, queen Anne reſtored them to the church by appropriating them to the augmentation of poor livings. See FIRST FRUITS.

ANNATTA, in *Geography*, the name of a river and bar in the iſland of Jamaica, nearly north from the town of Kingſton, on the north ſide of the iſland. N. lat. 18° 32'. W. long. 76° 4'.

ANNATTOM. See ANATTOM.

ANNE, in *Biography* and *Hiſtory*, queen of England, was the ſecond daughter of king James II. by his firſt wife Anne Hyde, and was born in 1664. In 1683, ſhe married prince George, brother to the king of Denmark, by whom ſhe had ſeveral children, though none of them lived to maturity. Upon the progreſs of the prince of Orange, and the retreat of the king, prince George, who was under the influence of lord Churchill, afterwards duke of Marlborough, as well as ſome other perſons of diſtinction, retired to the camp of the advancing prince. When this news reached London, the princeſs Anne, dreading the king's diſpleaſure, withdrew herſelf, in company with the biſhop of London and lady Churchill, and fled to Nottingham. The intelligence of her flight was the occaſion of great diſtreſs to her father; becauſe he foreſaw, in this incident, the total expiration of his royal authority; and becauſe he was abandoned by a child, whom he had always regarded with the moſt tender affection. "God help me," cried he, in the extremity of his agony, "my own children have forſaken me!" Upon her diſappearance, ſo violent were the prejudices that prevailed, the unhappy father was thought to have put her to death; and if the truth had not been ſeaſonably diſcovered, the populace, and even the king's guards themſelves, might have been engaged, in revenge, to commence a maſſacre of the prieſts and Catholics. Upon the ſettlement of the crown, in 1689, on the prince and princeſs of Orange, it was enacted by the Convention-bill, that the princeſs of Denmark ſhould ſucceed after the death of the prince and princeſs of Orange. Accordingly, ſhe aſcended the throne, on the death of king William III. in 1702. The ſplendour and importance of her reign were owing more to the circumſtances of the times, and to the influence of her miniſters and favourites, than to any diſplay or exertion of talents on her own part: as ſhe poſſeſſed no energy of mind, and her diſpoſition was meek and timid, ſhe ſurrendered herſelf to the direction of others, and diſtinguiſhed herſelf merely, or principally, by a ſtrong predilection for tory principles in church and ſtate. "Mildneſs, timidity, and anxiety," ſays Dr. Somerville, "were conſtitutional ingredients in the temper of this princeſs; and to their influence chiefly we may aſcribe moſt of the intereſting occurrences in her government and private life." Under the guidance of the counſels of the ducheſs of Marlborough, to which ſhe had been accuſtomed to ſurrender herſelf in the earlier period of her life and reign, ſhe purſued the projects for reducing the power of Louis XIV. of France, which her predeceſſor had begun; and after a ſeries of ſucceſſes, more glorious to her arms than profitable to the nation, the war cloſed by the peace of Utrecht, in 1713. Much more important to the proſperity of the nation, than all the brilliant ſucceſſes of Marlborough's campaigns, was the UNION of England and Scotland, which took place on the 1ſt of May 1707. The contention of parties was very violent during almoſt the whole of the queen's reign; and more eſpecially towards the cloſe of it, when it was apprehended that the queen, and thoſe in whom ſhe confided, wiſhed to ſecure the ſucceſſion to her exiled family; and when ſhe evidently favoured the tories in ſuch meaſures, as juſtly alarmed the whigs and the friends of conſtitutional liberty. Of this kind was the SCHISM-BILL, which, after violent debates during its progreſs through both houſes, obtained the royal aſſent on the 25th of June 1714. But the death of the queen, Auguſt the 1ſt, in the ſame year, the very day in which this bill was to take effect, rendered it in a great meaſure ineffectual. The queen's death, in the 50th year of her age and 13th of her reign, was occaſioned by a dropſy, contracted or aggravated by her habits of living. Although Queen Anne had no energy of mind, ſhe was not deficient in underſtanding, and her private character was amiable. She has been charged, however, by ſome, with the crime of deſerting her father in his diſtreſs. This charge has been obviated by the peculiar circumſtances in which ſhe was placed, and by the ſtate of the nation, when her huſband, by his example, countenanced this meaſure. "The habit (ſays Dr. Somerville) of a blind deference to the advice of lord and lady Churchill, and a conſcientious anxiety for the Proteſtant religion, expoſed to the extremity of danger, ſtifled the emotions of filial tenderneſs, in a moment of ſingular perplexity and agitation, and precipitated her into an action which would have been inexcuſable, if it had been the reſult of cool deliberation, and originated from motives of intereſt and ambition." In the management of her fortune this princeſs was economical, and yet ſhe was not deficient in charity; and ſhe even exceeded it in her bounty to her favourites. In the diſcharge of religious duties, ſhe was regular and exemplary; and ſhe manifeſted her zeal for the ſafety and proſperity of the church in various ways; ſome of which, indeed, were reckoned as impolitic and unjuſt; and particularly by augmenting, at her own expence, the livings of the poor clergy. See AUGMENTATION. "She poſſeſſed a conſiderable degree of taſte for the fine arts, amuſed herſelf with muſic and painting, and delivered her public ſpeeches with a melodious propriety, that charmed the ears of her audience. The deceitfulneſs of grandeur, as a criterion of happineſs, was remarkably verified in the life and reign of queen Anne. We behold a nation riſing, under her auſpices, to the ſummit of proſperity. Whilſt ſignal ſucceſs crowned her military exertions abroad, agriculture, commerce, manufactures, ſcience, and literature, advanced with rapid ſteps at home; every event, and every improvement, which contribute to the opulence, the power, and the renown of a nation, diſtinguiſh the reign of queen Anne as the moſt propitious and brilliant recorded in the annals of Britain. But when we follow this princeſs into retirement, and ſurvey the incidents of her private life, how much are we ſtruck with the diſtinction between external grandeur and perſonal felicity! She ſurvived a numerous family of children; the Duke of Glouceſter, deſtined by the act of ſettlement to ſucceed her, lived to the age of 12, and exhibited early bloſſoms of every accompliſhment that could elevate the hopes of a nation, and delight the heart of a parent. The poſſeſſion of a crown, held upon the condition of ratifying the degradation and exile of her own family, muſt have coſt her many a pang, which ſhe durſt not impart to her moſt confidential friends. Whilſt looked up to as the firſt potentate in Europe, and loaded with congratulations upon the ſucceſs of her arms, ſhe was a ſlave in her own houſe; and ſubjected to daily

daily affronts and mortifications, from the inſolence and uſurpations of her own ſervants. Emancipated, at length, from her chains, ſhe only entered upon a new ſcene of vexation and trial; and all her remaining days were embittered by the jealouſies of her people, the turbulence of faction, and the contentions and outrage of a diſtracted cabinet." By her ſubjects, whoſe prejudices coincided with her own, ſhe was honoured with the title of the "Good Queen Anne." Without attaching much merit to the queen herſelf, as either a patron or promoter of literature, the period of her reign was diſtinguiſhed as a kind of Auguſtan age of Engliſh learning, on account of the number of admirable and excellent writers who flouriſhed at this time.

Anne *of Auſtria*, queen of France, the daughter of Philip III. king of Spain, by Margaret of Auſtria, was born in 1604, and married to Louis XIII. in 1615. From this connexion, ſhe did not derive much happineſs; for Cardinal Richelieu contrived to perſuade the king that ſhe was concerned in conſpiracies againſt his life. Suſpicions were thus excited, which rendered it neceſſary for her to anſwer interrogatories; and on her confeſſion, to aſk pardon of the king, and promiſe to alter her conduct. When the king died, in 1643, ſhe was declared ſole regent during the minority of her ſon Louis XIV. Her whole confidence was repoſed in Cardinal Mazarin; who ruled with ſuch deſpotiſm, that diſcontents aroſe, which produced a civil war, and obliged her to fly with her ſon from Paris, and to ſolicit the aſſiſtance of the great Condé. In the conflicts and viciſſitudes of this period, the queen manifeſted great firmneſs: at length, the young king aſſumed the reigns of government, in 1661; and the queen retired, to paſs the remainder of her life in pious exerciſes. In 1666, ſhe died of a cancer, after having endured the pains of it with exemplary patience. In early life, the court of France was much indebted to her for its characteriſtic politeneſs and amenity. Nouv. Dict. Hiſt.

Anne Boleyn, queen of Henry VIII. of England, was the daughter of ſir Thomas Boleyn, employed by Henry in various embaſſies, by a daughter of the duke of Norfolk; and born in 1507. At an early age ſhe was taken to Paris, and reſided there for a conſiderable time. Here ſhe acquired a vivacity of manners and converſation, which was further ſet off by her perſonal charms. Henry, whoſe attachments were very variable, was enamoured when he ſaw her; and as he could not obtain the favour he ſolicited on any other terms, he haſtened to ſeek a divorce from Catharine of Arragon, and whilſt the grant of it was delayed, he married Anne Boleyn in November 1532; and publicly declared her queen in the April following. In September ſhe was delivered of a daughter, who was afterwards the famous queen Elizabeth. Anne Boleyn had imbibed the principles of the reformers during her reſidence with the ducheſs of Alençon; and her influence was for ſome time uſefully employed in widening the breach between the king and the court of Rome; and in overthrowing the power of that haughty favourite cardinal Wolſey. But her enemies were aſſiduous in their endeavours to ſupplant her; and the king's new paſſion for lady Jane Seymour, tended to inflame thoſe jealouſies of her conjugal fidelity which the levity of her carriage had excited, and in ſome meaſure juſtified. Having been accuſed of adultery with ſeveral officers of the houſehold, and with her own brother, lord Rochford, ſhe was brought to her trial for high treaſon, found guilty on very inſufficient evidence, and ſentenced to be beheaded: the ſentence was executed in May 1536. At her death, ſhe confeſſed indiſcretion, but perſiſted in denying any ſerious guilt. Her letter to the king, written after her condemnation, enhances her character and underſtanding in our eſtimation. Many calumnies have been circulated againſt this queen, by the bigotry of the Catholics, on account of the ſervice ſhe rendered to the cauſe of the Reformation. It is not poſſible to aſcertain her innocence with regard to the crime charged againſt her; but as an approved writer obſerves, "it ſeems much leſs certain that ſhe was criminal, than that her huſband was a capricious and bloody tyrant." Burnet's Hiſt. Reformation, vol. iii. p. 113. Hume's Hiſt. vol. iv. p. 79—159.

Anne, St. *of Sleſwick Holſtein*. This order was inſtituted in the year 1738, by Charles VI. emperor of Ruſſia. The badge of the order *is a croſs, compoſed of four large rubies ſet in gold, the angles between the croſs ſet with diamonds, and on the centre a medallion with the figure of St. Anne.* It is worn pendant to a broad crimſon velvet ribbon edged with yellow. The ſtar of the order is of ſilver, with eight equal points or rays; on the centre a red croſs on a gold ground, with the following motto written on a red ground, Amantibus juſtitiam, pietatem, fidem.

ANNE's, St. *Bay*, in *Geography*. See St Ann's.

Anne's, St. *Bay*, is a bay on the coaſt of Labrador, in North America, between Davis's inlet on the north, and Cape Charles, which is the north point of the entrance into the ſtraits of Beileiſle, on the ſouth. It is about N. lat. 54°, and W. long. 57°.

Anne's, St. *Cape* and *Iſland*, lie ſouth by eaſt from Sierra Leone river, on the weſt coaſt of Africa. The cape is the north-weſt point of the iſland, which is a narrow ſlip of land, near 80 miles in length from weſt by north to eaſt by ſouth. The inner paſſage within the channel is called Furno of St. Anne.

Anne, St. Larpana, or Rota, is one of the Ladrones, or Marianne iſlands, at the diſtance of ſeven leagues from Guam, and is about 45 miles in circumference, ſituate in N. lat. 14°. This is a pleaſant and fertile iſland, finely diverſified with riſing grounds, covered with lofty trees, and beautiful plains of a rich black ſoil, and very well watered. There are two excellent ports, one on the ſouth, and the other on the north-weſt ſide of the iſland.

Anne Chares, *Iſland* and *Road*, lie on the eaſt ſide of St. Thomas iſland, under the equator, and 40 leagues weſt from the mouth of the river Gabon, on the continent of Africa. This iſland is only a great rock, and the road is under its lee.

Anne's, St. *Gulf*, is round Cape Blanco, the moſt weſterly point of Africa, which forms a peninſula, as this gulf runs up northerly within the land, which bears away towards the eaſt. It is a large bay, with good ſandy ground.

Anne, *Cape Queen*, lies on the coaſt of Greenland, in the Northern Ocean, in N. lat. 64° 15′, and W. long. 50° 35′.

Anne's, Queen, *Foreland*, lies on the northern main from Hudſon's Straits, in N. lat. 64° 8′, and W. long. 74° 41′.

Anne's, St. *Harbour*, is in the iſland of Martinico, and has good anchorage and a ſafe port.

Anne's, St. in *Eccleſiaſtical Hiſtory*, is a feſtival of the Chriſtian church, celebrated by the Latins on the 26th of July; but by the Greeks, on the 9th of December. It is kept in honour of Anne, or Anna, the mother of the Virgin Mary.

ANNEALING, or as it is popularly called, *Nealing*. See Nealing.

ANNEBAUT, in *Geography*, a town of France, in the province of Normandy, ſituate on the Rille, and enjoying the title of marquiſate.

ANNECY,

ANNECY is a city of Savoy, and capital of the Genevois, ſeated between Chambery and Geneva, on a lake to which it gives name, at the mouth of the river Sier, which paſſes through it. This lake is about 10 miles long and 3 wide. Annecy is the ſee of a biſhop, whoſe dioceſe includes Faucigny, Chablais, the country of Gex, and part of Bugey. It has piazzas in ſeveral ſtreets for ſheltering the people from rain, ſeveral collegiate and pariſh churches, and convents for men and women. It is 10 miles ſouth of Geneva, and 21 north-north-eaſt of Chambery. N. lat. 45° 56'. W. long. 5° 57'.

ANNECY, *Old*, is now a village half a league north-eaſt of Annecy. It was formerly a conſiderable town.

ANNERY is the name of one of the tribes who inhabit the deſerts round Palmyra, which is remarkable for the fineſt breed of horſes in the world; the other is the Mowalli, who are much better ſoldiers, but fewer in number, and little inferior in the excellence of their horſes. The Annery poſſeſs the country towards the ſouth-weſt, at the back of Libanus, about Bozra, down the Hawran; and ſouthward towards the borders of Arabia Petrea and mount Horeb. The Mowalli inhabit the plains eaſt of Damaſcus to the Euphrates, and north to near Aleppo.

ANNESEL, in *Ancient Geography*, a place of Africa, ſituate, according to Antonine, in the track of the "Septis Magna," to Alexandria.

ANNESLEY, ARTHUR, in *Biography*, earl of Angleſey, and lord privy-ſeal in the reign of Charles II. was the ſon of Sir Francis Anneſley, bart. Lord Mount-Morris, and Viſcount Valentia in Ireland, and born at Dublin in 1614. At the age of 16 years, he was ſent to the univerſity of Oxford, where he purſued his ſtudies with ſuch aſſiduity, as to engage the eſteem of ſeveral reſpectable perſons, who conſidered him as an honour to Magdalen College, with which he was connected, and a young man of great hopes. At the commencement of the diſpute between king Charles I. and his parliament, he inclined to the royal cauſe, and ſat in the Oxford parliament in 1643. He afterwards abandoned the king's party, and was admitted into the confidence of the other; and was deputed in 1645, by the parliament, as one of the commiſſioners at Ulſter, where he concluded the buſineſs with which he was entruſted, to univerſal ſatisfaction, and very much to the benefit of the Proteſtant cauſe in Ireland. In his negociation with the Marquis of Ormond, lord lieutenant of that country, in 1647, he exerciſed prudence and temper, and brought the negociation to a happy iſſue. On his return to England he ſteered a kind of middle courſe between the extremes of party violence; had no concern with the king's trial and death; and on account of his oppoſition to ſome of the illegal acts of Cromwell, he was put among the number of ſecluded members. After the death of Cromwell, when there were appearances of the revival of the old conſtitution, he joined with thoſe who determined to recal the king, and entered into a correſpondence with him. After the reſtoration, he was rewarded for his ſervices on this occaſion with a barony and an earldom; and he manifeſted his loyalty, by ſitting as one of the judges on the trial of the regicides. Having been employed at home and in Ireland in ſeveral important offices, he was made privy-ſeal in 1673. At the time when it was the practice to contrive popiſh plots, he was charged by Dangerfield, at the bar of the houſe of commons, with an attempt to ſtifle evidence in this matter; and yet he was the only lord, who, in the houſe of peers, diſſented from the vote of the commons, aſſerting the belief of an Iriſh popiſh plot. On this account, he was unjuſtly charged with being a ſecret papiſt. In 1682, when the ſucceſſion produced a conſiderable degree of agitation, he repreſented, in ſtrong terms, and in a memorial to the king, the fatal conſequences of the duke of Norfolk's attachment to popery; and freely enjoined on the king his obligation to govern according to law. This freedom and faithfulneſs were not well received; and he was diſmiſſed from his office of privy-ſeal in 1682. From this time, he lived very much in retirement; but his ambition was not aſleep; for it appears, that he conducted himſelf ſo as to ſecure the favour of the duke of York, when James II., to ſuch a degree, that he deſigned him for the office of lord chancellor, if the deſign had not been prevented by his death, in April 1686, in the 73d year of his age. He left ſeveral children by his wife, who was one of the co-heireſſes of ſir James Altham.

The earl of Angleſey appears to have been poſſeſſed of diſtinguiſhed talents, and extenſive and various learning. He was a good writer, and the author of ſeveral publications in politics and religion, as well as hiſtory. He was a ready, but not a graceful ſpeaker: he was indefatigable in buſineſs, and of a grave deportment, and ſober manners. His verſatility has been cenſured, and, perhaps, not unjuſtly; but we diſcover ſtrong traces of integrity in his conduct. He ſucceeded, probably, in too great a degree in ingratiating himſelf with men of all parties; and it does not much add to his reputation, that he was deſigned for chancellor at a time when Jefferies was at the command of the king. Biog. Brit.

ANNESLEY, SAMUEL, a non-conformiſt miniſter, was born at Haxeley, in Warwickſhire, about the year 1620, and educated at Oxford. Whilſt he was a ſtudent, he was diſtinguiſhed by his temperance and induſtry. From Calamy, it appears that he was ordained after the Preſbyterian mode; though Wood ſays, that he received epiſcopal ordination. He was chaplain to the earl of Warwick; and afterwards rector of Cliffe in Kent, a valuable living, with peculiar civil juriſdiction.

During the civil wars, he was zealouſly attached to the parliamentary intereſt; and, in 1648, preached a violent ſermon before the parliament, in which he inveighed againſt the king, who was then a priſoner in the Iſle of Wight.

Under the protectorate, he ſurrendered Cliffe, and was preſented to the vicarage of St. Giles's, Cripplegate. He was ejected in 1662, but continued preaching till his death, which happened in 1696. Anneſley had the reputation of being a pathetic preacher, as well as a pious, prudent, and very charitable divine, laying by the tenth part of his income for the uſe of the poor. Some of the ſermons which he publiſhed are contained in the "Morning Exerciſe of Cripplegate;" printed in 1674. Biog. Brit.

ANNET, in *Geography*, one of the ſmaller Scilly iſlands, near the ſouth-eaſt coaſt of England, about half a league from St. Agnes iſland.

ANNESTUS, in *Ancient Geography*, or ANNESTRUS, in town of Arabia Felix.

ANNEXATION, in a *legal ſenſe*, the act of joining or uniting ſome leſs conſiderable thing to a greater.

ANNEXED, ſomething joined to, or dependent on another.—Thus, we ſay, ſuch a farm, ſuch an advowſon, is annexed to ſuch a fee, ſuch a manor, &c. Charles VIII., in the year 1486, annexed Provence to the crown of France.

ANNIBALI, DOMENICO, in *Biography*. See DOMENICO.

ANNIENTED, or rather ANIENTED, formed of the verb *aneantir*, *to bring to nothing*, or *to annihilate*, a term ſometimes uſed in *law*-books, in the ſenſe of fruſtrated, or annulled.

ANNIHILATION, compounded of *ad*, *to*, and *nihil*, *nothing*, the act of reducing a ſubſtance into nothing; or of totally

totally deſtroying and taking away its exiſtence. Annihilations ſtands oppoſed to creation; the one ſuppoſes ſomething made out of nothing, the other ſomething reduced to nothing.

All annihilation muſt be metaphyſical, or ſupernatural; bodies naturally admit of changes and alterations in their form, but not of annihilation.

The ancient philoſophers in effect denied all annihilation as well as creation, reſolving all the changes in the world into new modifications, without ſuppoſing the production of any thing new, or deſtruction of the old.

By daily experience they ſaw compounds diſſolved, and in their diſſolution nothing periſhed, but their union or connexion of parts: when in death the body and ſoul were ſeparated, the man they held was gone, but the ſpirit remained in its original, the great ſoul of the world, and the body in its earth from whence it came; theſe were again wrought by nature into new compoſitions; and entered new ſtates of being which had no relation to the former. According to ſome, nothing is ſo difficult as annihilation; it requires the infinite power of the Creator to effect it; ſome go farther, and ſeem to put it out of the power of God himſelf. According to others, nothing is ſo eaſy; exiſtence is a ſtate of violence; all things are continually endeavouring to return to their primitive nothing; it requires no power at all: nay, what is more, it requires an infinite power to prevent it.

The Talapoins hold it the ſupreme degree of happineſs, to have the ſoul totally annihilated, and freed from the burden and ſlavery of tranſmigrations.

Some Chriſtians maintain, that God will annihilate the ſouls of the damned, after a certain term of puniſhment; and this annihilation, they ſay, is the ſecond death. Irenæus, according to M. du Pin, was of this opinion. See DEATH, HELL, and PUNISHMENT.

ANNIHILATION is alſo uſed, in *Political Arithmetic*: thus, when the capital ſtock of any public fund is reduced, ſo much as is reduced is ſaid to be annihilated.

ANNI NUBILES, among *Law Writers*, the legal age at which a maid becomes fit for marriage; which is at twelve years.

ANNIS *Communibus*. See COMMUNIBUS.

ANNISEED. See ANISE-SEED.

ANNIVERSARY, is properly the yearly return of any remarkable day; anciently alſo called a *year-day*, or *mind-day*; that is, a memorial day.

The word is from *annus* and *verto*, on account of its returning every year.

ANNIVERSARY *days*, *dies anniverſarii*, among our anceſtors, more particularly denote thoſe days on which the martyrdoms of the ſaints were yearly celebrated in the church; as alſo days whereon, at every year's end, men were wont to pray for the ſouls of their deceaſed friends. *Anniverſaria dies ideo repetitur defunctis, quoniam neſcimus qualiter eorum cauſa habeatur in alia vita.* This was the reaſon given by Alcuinus, in his Divine Offices. The firſt origin of anniverſary days is referred by ſome writers to Pope Anacletus, and by others to Felix I.

ANNIVERSARY *winds*, are thoſe which blow conſtantly at certain ſeaſons of the year.

Theſe are otherwiſe called Etefian winds; ſuch are the TRADE *winds* and MONSOONS.

ANNIVERSARY is more particularly uſed for the *annale*, or maſs, rehearſed daily for the ſpace of a year after a perſon's death.

ANNIUS, of Viterbo, or JOHN NANNI, in *Biography*, a Dominican monk, was born, in 1427, and diſtinguiſhed as an impudent impoſtor. Furniſhed with talents and learning, he employed himſelf in writing books from his own invention, which he introduced to the world as genuine remains of ſeveral ancient authors, in "Seventeen books of Antiquities." This curious collection contained ſeveral tracts of Archilochus, Xenophon, Beroſus, Manetho, Megaſthenes, Philo, Q. F. Pictor, M. Cato, Antoninus Pius, Sempronius, &c. &c. This work was firſt publiſhed at Rome in 1498; a ſecond edition was publiſhed by Venetus at Venice; and in 1552, it was publiſhed in 8vo. at Antwerp. The editor pretended to have found the books at Mantua; and the impoſition was for ſome time ſucceſsful. Voſſius and Bayle mention ten advocates for the genuineneſs of theſe writings. On the other hand, the moſt approved critics examined theſe pieces, and pronounced them ſpurious; and this judgment is now univerſally received. Annius died at Rome in the year 1502. Gen. Dict.

ANNOBON, in *Geography*. See ANNABON.

ANNO *Domini*, q. d. *in the year of our Lord*; the computation of time from the EPOCHA of the incarnation of Jeſus Chriſt. This is generally inſerted in the dates of all public writings, with an addition of the year of the king's reign.

ANNOISANCE, in *Law*. See NUISANCE.

ANNOMINATION, *annominatio*, in *Rhetoric*, the ſame with what is otherwiſe called PARONOMASIA.

ANNONA, *Guanabanus* of Plum. in *Botany*, a genus of the *polyandria polygynia* claſs and order, of the natural order of *coadunatæ*, and the *anonæ* of Juſſieu: its characters are, that its *calyx* is a perianthium three-leaved and ſmall, leaflets cordate, concave, and acuminate; the *corolla* has ſix petals, cordate, and ſeſſile; the three alternate interior ones leſs; the ſtamina have ſcarcely any filaments, anthers very numerous, placed on the receptacle; the *piſtillum* is a roundiſh germ, placed on a roundiſh receptacle; ſtyles nine, ſtigmas obtuſe, numerous, covering the whole germ; the *pericarpium* a berry, very large; roundiſh, clothed with a ſcaly bark, one-celled (or a compenna berry, as in *Vahus*); *ſeeds* very many, hard, ovate-oblong, placed in a ring, and neſtling. Martyn enumerates ten, Willdenow eighteen, and Gmelin nineteen ſpecies. 1. A. *muricata*, rough-fruited cuſtard apple, or ſour ſop, guanabanus of Plum. Araticu-ponhe of Mareg. Pif. and Ray, with leaves oval-lanceolate, ſmooth and acute, fruits muricate, petals ovate, the interior ones obtuſe, ſhorter. This is a middle-ſized tree, rarely above twelve or fourteen, or at moſt twenty feet high. It is a native of the Weſt Indies, common in every ſavannah of Jamaica, and flowering in the ſpring. The ſmell and taſte of the fruit, flowers, and whole plant, reſemble very much thoſe of black currants. There is a variety in Jamaica, with inodorous leaves, large flowers of a fulvous colour, and ſpherical mucronate fruits. It was cultivated here in 1656 by Mr. J. Tradeſcant, jun. 2. A. *tripetala*, A. *charimolia* of Miller, broad-leaved cuſtard apple, with leaves ovate, acute, pubeſcent beneath, flowers three-petalled, and petals lanceolate, coriaceous, and tomentoſe. This grows to a large tree, with numerous branches, in South America. The fruit is eſteemed by the Peruvians as one of their moſt delicate ſorts. It was cultivated in 1739, by Mr. Miller. 3. A. *ſquamoſa*, A. tuberoſa of Rumph. atamaram of Rheed and Ray, undulated cuſtard apple, or ſweet ſop, with leaves oblong, acute, and ſmooth, fruits obtuſely ſcaled, outer petals lanceolate and inner ones minute. This is a ſmall tree about eight feet high, and commonly a ſhrub; a native both of the Eaſt and Weſt Indies; the fruit is ſweet, and eaten in theſe countries; cultivated in 1739, by Miller. 4. A. *reticulata*, guanabanus fructu aureo, &c. of Plum. Anona-maram of Rheed and Ray, netted cuſtard apple, with leaves oblong-lanceolate, acute and ſmooth, fruits ovate and reticulate-areolate, outer petals lanceolate, and inner minute.

This is a tree growing to the height of twenty-five feet and more, with ſpreading branches; a native both of the Eaſt and Weſt Indies; and the fruit, according to Browne, is much eſteemed by many people; but Swartz ſays, that it is ſeldom eaten; cultivated at Hampton court in 1690. 5. A. *hexapetala*, A. *ſenſis* of Gmelin, long-leaved cuſtard apple, with leaves elliptic-oblong, acute, and ſmooth, petals ſpatulate, equal and acute; a native of China, and cultivated in the Eaſt Indies; introduced in 1758, by Hugh, duke of Northumberland: ſuſpected by Loureiro not to be different from the third ſort. 6. A. *paluſtris*, guanabanus paluſtris, &c. ſhining-leaved cuſtard apple, with leaves oblong, rather obtuſe and ſmooth, and fruits areolate. This is a ſmall tree, about a fathom in height; growing wild in ſoft marſhy places in Jamaica, and bears a fine ſweet-ſcented fruit, of no diſagreeable flavour; but it is ſaid to be a ſtrong narcotic, and on that account not eaten. It is called *alligator apple*: its wood is ſo ſoft, that it is uſed inſtead of corks to ſtop up their jugs and calabaſhes; and hence it is now univerſally denominated the *cork-wood* in Jamaica: introduced here in 1778, by Dr. T. Clarke. 7. A. *triloba*, triſid-fruited cuſtard apple, with leaves elliptic, acute, and ſmooth; flowers pendulous and campanulate, calyxes ovate, and petals many and oval. This tree's trunk is about the ſize of a man's leg, and its height about ten or twelve feet. All parts of it have a rank, if not a fœtid ſmell; and few, except negroes, reliſh the fruit; it uſually grows in low ſhady ſwamps, and in a very fat ſoil. It is a native of the Bahama iſlands, Carolina, Maryland, and Virginia; and the ſeeds are frequently brought to England, under the name of *papaw-tree*; introduced in 1736, by P. Collinſon, Eſq. 8. A. *glabra*, ſmooth cuſtard apple, with leaves lanceolate-ovate, and fruits conoid ſmooth: grows to the height of about ſixteen feet, has an eatable fruit, ſweet but ſomewhat inſipid; it is the food of guanas, and many other wild creatures. A native of North America. 9. A. *aſiatica*, Aſiatic cuſtard apple, with leaves lanceolate, ſmooth, ſhining, and marked with lines: a middle-ſized tree, with ſpreading branches; a native of the Eaſt Indies; cultivated there and in China. 10. A. *africana*, African cuſtard apple, with leaves lanceolate, pubeſcent: a native of America, though diſtinguiſhed by the epithet *africana*.

Theſe fruits are much eſteemed by the natives of the countries where they naturally grow; are eſteemed very cooling and wholeſome, and are frequently given to ſick perſons. 11. A. *ægyptiaca*, with elliptic leaves and globoſe fruits. 12. A. *aperemoa*, with leaves oblong, very entire, tomentoſe, and ſomewhat ſeſſile, and ſmooth fruits. Aubl. pl. Guian. 13. A. *paludoſa*, with leaves oblong, very entire, tormentoſe, under ruteſcent, and tuberculated fruits. Aubl. pl. Gui. 14. A. *punctata*, with leaves oblong, ſmooth and very entire, and punctated fruits. Aubl. 15. A. *longifolia*, with leaves linear-oblong, very entire and ſmooth, and punctated reticulated fruits. Aubl. 16. A. *ambotai*, with leaves ovate, acute, very entire, beneath ferruginous-tomentoſe tube. 17. A. *rufeſcens*, with leaves ovate-cordated, petiolate, beneath tomentoſe, and tomentoſe fruits. Aubl. 18. A. *amara*, with leaves cordated, ſmooth, petiolated, under yelloviſh, and tomentoſe fruits. Aubl. 19. A. *mucoſa*, with oblong leaves, areolated fruits, and external corolla monopetalous. Jacq. Obſ. Bot. This is reckoned by Willdenow, a variety of the A. *reticulata*. To thoſe ſpecies that have been above enumerated Willdenow adds—A. *pygmæa*, A. pygmæa of Bartram, with lanceolate acute leaves, and oblong acute petals, the interior the longer: a native of Florida: A. *obovata*, A. grandiflora of Bartram, with leaves obovate and ſomewhat obtuſe, oblong ſmooth fruit, obovate obtuſe petals, the exterior the larger: a native of Florida. A. *grandiflora*, with leaves ovate-oblong and petiolate, of Vahl; with leaves ovate-lanceolate, ſmooth, and very large flower, of La Marck; and with leaves ovate-oblong, fruit elliptic and ſomewhat rough, and petals pubeſcent and oblong, the interior the ſhorter, of Willdenow: A. *amplexicaulis*, with leaves cordate-oblong, acute, double-rowed, and embracing the ſtem, of La Marck; or with leaves cordate-oblong and embracing, of Willdenow: a native of Madagaſcar and of the iſland of Mauritius.

Culture, &c. The ſeventh ſort will thrive in the open air in England, if the ſituation be warm; but the plants muſt be trained up in pots, and ſheltered in winter for two or three years; and in the ſpring they may be turned out of the pots, and planted in the open ground. The other ſorts, which are natives of the hot parts of America, or the Eaſt Indies, are too tender to live in this country, unleſs they are preſerved in warm ſtoves: the ſeeds that are brought over muſt be ſown on a good hot-bed, or in pots of light earth, and plunged into a hot-bed of tanner's bark in February, which is the beſt time, that the plants may get ſtrength before the colds of autumn. They ſhould be kept in the bark-ſtove, and with careful management they will make great progreſs; but in warm weather, they ſhould have plenty of freſh air. As they advance in their growth, they ſhould be cautiouſly ſhifted into larger pots, conſtantly remain in the tan-bed; and they will thus be vigorous. They are preſerved for the ſake of the beauty of their leaves, as few of them flower, and none produce fruit in England. The ſtoves in which they are placed ſhould, during the winter ſeaſon, be kept to the ananas heat, as it is marked on the botanical thermometer. The earth ſhould be light and rich, and the tan-bed frequently turned over and refreſhed. In ſummer they ſhould have frequent waterings; but in winter they ſhould be ſeldom watered, not oftener than once a week in open weather; and in froſt, it will be ſufficient to water them once in two or three weeks. Martyn's Miller.

Annona, in *Ancient Writers*, denotes victuals, or proviſion, or corn for a year.

Annona *civilis*, the corn with which the granaries of cities were filled every year, for the ſubſiſtence of the citizens.

The tax, called the *annona*, or ſupply of corn for the uſe of the army and capital, was a grievous and arbitrary exaction, which, in the time of Juſtinian, exceeded, perhaps in a ten-fold proportion, the ability of the farmer, and his diſtreſs was aggravated by the partial injuſtice of weights and meaſures, and the expence and labour of diſtant carriage.

Annona *militaris*, the corn and other proviſion laid up in the magazines, for the ſubſiſtence of an army during the campaign.

In ancient writers we alſo meet with the phraſes *ſingulæ annonæ*, *binæ annonæ*, *ternæ annonæ*: with regard to which Salmaſius lays down this rule, that when annona occurs in the ſingular number, it includes not only corn, but fleſh, wine, oil, and other neceſſaries; whereas, when it is uſed in the plural number, it imports bread alone. Aquinus is not contented with this rule, but inſtead of it advances another, *viz.* that annona in the ſingular number includes all kinds of proviſion; and, in the plural, imports ſo many rations or pittances of bread, fleſh, and the like, diſtributed to ſo many men.

In this ſenſe, ſoldiers are ſometimes ſaid to have riſen to the benefit of five or more annonæ; that is, were entitled to ſo many rations. The Emperors Arcadius and Honorius took great

great pains to reduce this profuſion. Hence we read of *annonæ præfectus*, or *curator*, who ſuperintended the ſale of corn; *annonæ ſtructor*, who managed the military proviſions; *annonarius*, an officer appointed to diſtribute proviſions to the ſoldiers; and *annonarii*, denoting monopoliſts.

ANNONAGE, *annonagium*, a tax on corn.

Annonage is much the ſame with *frumentage*.

ANNONAY, in *Geography*, a town of France, in the department of the Ardeche, and chief place of a canton in the diſtrict of Mezen, four leagues north-weſt of Tournon, and 11 north of Privas. N. lat. 45° 15′. E. long. 4° 52′.

ANNOT, or Anot, a town of France, in the department of the lower Alps, and chief place of a canton, in the diſtrict of Caſtellane; two leagues weſt of Entrevaux, and three north-eaſt of Caſtellane.

ANNOTATION, formed of *ad*, and *nota*, note, a ſuccinct commentary, or remark on a book or writing; in order to clear up ſome paſſages, or to draw ſome induction or conſequence from it.

Annotation, in the *Civil Law*, denotes a kind of reſcript or grant from the emperor, ſigned with his own hand. But this annotation differed from a mere reſcript and a pragmatic ſanction.

It took its name from the note or ſubſcription at the bottom, which was in red letters.

ANNOTTO, in *Commerce*, a kind of red dye, brought from the Weſt Indies. This is otherwiſe denominated *arnatto*, *anate*, *attole*, and *roucou*.

It is procured from the pulp of the ſeed-capſules of a ſhrub called *achiotte* and *urucu*; the BIXA *orellana* of Linnæus, which grows ſeven or eight feet high, and produces oblong hairy pods, ſomewhat reſembling thoſe of a cheſnut. Within each of theſe are thirty or forty irregularly figured ſeeds, which are enveloped in a pulp of a bright red colour, and unpleaſant ſmell, ſomewhat reſembling the paint called red lead when mixed up with oil; and it was uſed as paint by ſome of the Indians, in the ſame manner as woad was uſed by the ancient Britons. The ſeeds, together with the red tough matter that ſurrounds them, are ſoftened in a wooden trough with water, until, by a kind of fermentation, which ſpreads a very naufeous ſmell, and by diligent ſtirring and pounding, the kernels are ſeparated from the pulp. This maſs is then ſtrained through a ſieve, and boiled; upon which a thick reddiſh ſcum, which is the pigment, ſeparates. When ſkimmed off, it is carefully inſpiſſated in another kettle; and after being completely cool, is moulded in roundiſh lumps, wrapt round with leaves of trees, and packed for ſale. It ſeems to partake of the nature of vegetable albuminous matter. The method of extracting the pulp, and preparing it for market, is ſimply by boiling the ſeeds in clear water, till they are perfectly extricated; after which the ſeeds are taken out, and the water left undiſturbed for the pulp to ſubſide. It is then drained off, and the ſediment diſtributed into ſhallow veſſels, and dried generally in the ſhade. See Roucou.

The annotto is now only prepared by the Spaniards. The Engliſh had formerly a manufacture at St. Angelo, now ruined. This drug is preferred by the dyers to indigo, and ſold one-fourth dearer. The double Glouceſter cheeſe is coloured with this dye, not with marygolds. Some of the Dutch farmers uſe it to give a rich colour to their butter, and great quantities are ſaid to be applied to the ſame purpoſe in the Engliſh dairies. The poor people uſe it inſtead of ſaffron; and it is ſometimes mixed as an ingredient in chocolate, during the grinding of the cocoa, in the quantity of about two drams to the pound, in order to give it a reddiſh colour; but the opinion of its being an earth has brought it into diſrepute, and this uſe of it has been diſcontinued. Some have recommended it as a good cordial, and a preſervative againſt retention of urine. It is uſed by the Spaniards in America as a gentle laxative, as an antidote to the dyſentery, and a ſtomachic. But it is never preſcribed for medical purpoſes in Europe.

To water it gives only a pale browniſh yellow colour, and is not ſoluble in that liquid, nor in ſpirit of wine; but, in order to be fit for dyeing, it requires an alkaline menſtruum, to which it gives a bright orange colour; and hence it is uſeful as an ingredient in VARNISHES and LACQUERS, and in dying wax of a vermilion colour. Wool and ſilk, boiled in a ſolution of it by alkaline ſalts in water, acquire a deep, but not a durable orange dye; for though it is not changed by alum or acids, it is diſcharged by ſoaps, and deſtroyed by expoſure to the air. It is ſaid to be an antidote to the poiſonous juice of *manihot*, or *caſſada*. The liquid ſold under the name of "Scot's nankeen dye," ſeems to be nothing but annotto diſſolved in alkaline ley.

See more of this artificial preparation, and the manner of making it, in Dr. Lewis's Commercium Phil. Techn. p 224, &c. or Neumann's Works, p. 433, &c. Murray, Med vol. iii. p. 392. Gren's Chem. vol. i. p. 443.

ANNUAL, ſomething which returns every year, or cloſes at the end of the year. Thus we ſay, an annual or yearly ſeaſt, office, commiſſion, rent, revenue, income, &c.

The annual motion of the earth, ſee proved under EARTH.

Annual is ſometimes uſed for the yearly rent or income of a prebendary, &c.

In which ſenſe *annuale* amounts to the ſame with what we otherwiſe call *annat*.

Annual is alſo uſed, in *Eccleſiaſtical Writers*, to denote a yearly office, ſaid for the ſoul of a perſon deceaſed on the day of his obit, or anniverſary.

Annual, in the Scotiſh *Law*, denotes any yearly revenue or due paid at certain times, either legal, as Martinmaſs and Whitſuntide; or conventional, as the parties agree.

In the acts of parliament made by Queen Mary, mention is made of *ground-annuel*, *fue-annuel*, and *top-annuel*; the meaning whereof is ſomewhat uncertain. See Annuel.

Annual *argument of longitude*. See Argument.

Annual *epacts*. See Epact.

Annual *equation* of the mean motion of the ſun and moon, and of the moon's apogee and nodes. See Equation.

Annual *leaves*, are ſuch leaves of plants as come up afreſh in the ſpring, and periſh in winter. Theſe ſtand oppoſed to *ever-greens*.

Annual *plants*, called alſo ſimply *annuals*, in *Gardening*, commonly ſignify ſuch plants as are of one year's duration, or which continue for the ſummer ſeaſon, or a few months only. In general, however, all ſuch plants as riſe from ſeed ſown in the ſpring, arrive at maturity in the ſummer or autumn following, producing flowers and ripe ſeed; and which afterwards periſh in their tops and roots, are conſidered as annuals. This laſt effect takes place in moſt ſorts in the autumn and winter following; though ſome hardy kinds, when late ſown, will ſtand over the winter until the enſuing ſpring, eſpecially thoſe of the eſculent ſorts; but very few of the flowering kinds remain longer than October or November, unleſs protected by a greenhouſe, garden-frame, or ſome other covering of a ſimilar nature.

The plants of this tribe are very numerous, as moſt of

thoſe of the herbaceous kinds, conſiſting of uncultivated plants, weeds, &c.; and alſo a number of cultivated garden and field plants, both of the eſculent and flowery ornamental kinds, are of this deſcription. The laſt ſort are often termed ſimply *annuals*. They are likewiſe very extenſive, and both of the hardy and tender kinds, ſome of which, from the peculiarity of their nature, and others from their producing beautiful flowers, are cultivated as ornaments to the flower garden and pleaſure ground, during the ſummer and autumnal ſeaſons.

The flowering annual plants are diſtinguiſhed by gardeners into the *hardy* and *tender* ſorts; the former being ſuch as are capable of being raiſed from ſeeds ſown on beds, borders, or other places in the natural and open ground; while the latter conſtantly require to be ſown, and to have in ſome degree the aid of hot-beds, in order to promote their healthy growth.

The firſt ſort, or the hardy annuals, are alſo moſtly ſown in places where they are deſigned to remain and flower without being tranſplanted, as many of them do not ſucceed under ſuch management; ſome, however, will anſwer in either method, and may be occaſionally tranſplanted.

But the tender annuals, after being ſown and brought to a proper ſtate of growth in hot-beds, are generally to be tranſplanted about May or June, either into pots or borders in the open ground.

1. *Hardy Annuals.*—The following are ſome of the principal of the hardy ſort of flowering annuals: *adonis*, or adonis flower; *alkekengi*, white flowered, blue, yellow berried, red berried; *amaranthus*, prince's feather, love lies bleeding, purple; *clyſſon*, white, ſweet ſcented; *amethyſtea*, blue; *balm*, moldavian; *belvedere*, or ſummer cypreſs; *calendula*, or cape marigold; *candy tuft*, white flowered, purple, large white, crimſon; *catch-fly*, lobels red flowered, white purple, caterpillar; *clary*, red topped, white topped; *convolvulus*, three coloured minor, minor blue and white, minor blue, major blue, great white, great ſtriped blue, great purple, red; *cyanus*, or bluebottle, blue-flowered, purple, white, red, ſtriped blue and white; *cucumber*, ſporting; *devil in a buſh*, blue flowered, white, nettle leaved; *fumatory*, yellow; *hawkweed*, yellow, red; *hedge-hog trefoil*, ſnail-ſhaped, prickly, turbinated, globular, orbicular, long crooked twiſted; *honeywort*, greater, leſs; *holly-hock*, Chineſe variegated, double flowered; *jacobæa*, or ragwort, purple flowered white; *Indian corn*, tall growing, dwarf; *kidney beans*, ſcarlet runner, dwarf ſcarlet, large white runner; *ketmia*, bladder; *larkſpur*, upright blue, upright purple, upright white, upright roſe-coloured, white rocket, roſe rocket, dwarf roſe rocket, dwarf white rocket, dwarf blue rocket, dwarf red rocket, branching, blue branching, white branching, double and ſingle flowered of all the different ſorts; *lavatora*, cretan red flowered, white, purple; *lupine*, dwarf yellow, large yellow, white, great hairy blue, great hairy roſe coloured, narrow leaved blue; *lychnis*, dwarf; *marigold*, double orange coloured, double yellow, double lemon coloured, gold coloured, party coloured, yellow ranunculus flowered, childing or proliferous, cape marigold; *mallow*, curled leaved, oriental; *mignonette*, odoriferous or ſweet ſcented; *naſturtium*, major or large growing, minor or dwarf; *nolana*, peruvian dwarf blue; *nigella*, or devil in a buſh; *panſey*, or heart's eaſe, common ſmall variegated, large Dutch variegated, large purple, yellow, purple and yellow, purple yellow and white; *peas*, ſweet ſcented, purple, white, painted lady, ſcarlet, tangier; *pea*, winged; *pea*, crown, white bloſſomed crown, painted lady crown, roſe coloured; *perſicaria*, oriental, red flowered, white flowered; *poppy*, large double purple, double red, white variegated, red and white ſpotted or carnation, dwarf red, dwarf purple, dwarf variegated, double and ſingle of all the different ſorts; *queen's balm*, *ſcabious*, purple ſweet, red flowered, white, ſtriped, hen and chicken flowered, ſtarry flowered; *ſnail trefoil*, *ſtock gilliflower*, ten weeks, purple flowered, red, white, ſcarlet dwarf French, wall-flower leaved red, wall-flower leaved purple, wall-flower leaved white; *ſtock virgin*, purple white; *ſnap dragon*, annual with white flowers, purple flowers, major or greater with flowers, purple white, yellow, ſcarlet, red and white, purple and white, red and yellow, white and red, yellow and red, yellow and white, ſcarlet gold dotted; *ſtrawberry ſpinach*, *ſun-flower*, annual, tall growing dwarf, double flowered of each ſort; *ſweet ſultan*, purple, red, white, yellow; *toad flax*, three-leaved yellow, three-leaved purple, three leaved blue, variegated, white, branching yellow, tobacco, hardy round leaved, Virginia long leaved, Virginia broad leaved; *Virginia* or *virgin's ſtock*, *Venus's looking glaſs*, purple, white; *Venus's navel wort*, blue flowered; *xeranthemum* or *eternal flower*, red, white, purple, double flowered.

The authors of the "Univerſal Gardener," in which the above liſt is contained, obſerve, that the general ſeaſon for ſowing all ſorts of hardy annual plants is in the ſpring, from about the middle or latter end of February to the middle or latter end of April, for the principal *blow*; and alſo ſome in May and the beginning of June, for ſucceſſional and late flowering, eſpecially thoſe of the quick flowering kinds of ſhort duration, as *candy tuft* and *virgin ſtock*, &c.

The order or method of ſowing all theſe is principally in little patches or clumps, to remain as mentioned above. Theſe patches ſhould be formed from about three or four, to five, ſix, or eight inches in diameter, at moderate diſtances, and in ſome ſort of regularity, towards the front, middle, and back parts of the borders or beds; and alſo in a varied manner in reſpect to the plants; the ſmaller growing ſorts being conſtantly ſown more or leſs towards the fronts of the borders, according to their degrees of growth; and the larger kinds more backwards, in the ſame proportion. Some may likewiſe be occaſionally ſown in pots; and in all of which, each ſort and reſpective varieties ſhould be ſown in ſeparate patches, &c. from about a quarter of an inch to half an inch or an inch in depth, or but little more, according to the ſizes of the different ſorts of ſeeds; obſerving in this buſineſs to generally looſen and break the earth a little, ſo as to render it fine for each patch, eſpecially if hard, ſtubborn, or cloddy; then drawing off a little depth of mould, according to circumſtances, to one ſide, ſow the ſeeds many or few together in the patches, proportionately to the ſizes of the reſpective plants, covering them regularly with the earth drawn aſide to the depth required; and thus proceed in general, always placing a ſmall ſhort ſtick, or ſome other mark, to each patch as the ſowing goes on, in order to diſtinguiſh the places.

Some may alſo be occaſionally ſown in drills, either in beds ſeparately, or on the borders; the low growing kinds towards the fronts, and the larger ſorts towards the back parts; in which order of growing may be had *virgin ſtocks*, *candy tuft*, *larkſpur*, *ſweet peas* of the different ſorts, *lupines*, *tenweek ſtocks*, &c.

After ſowing, if it be dry warm weather, it will be beneficial to give occaſional light waterings, both before and after the plants are come up, eſpecially during their more early growth; and when they are come up about an inch or two in height, thoſe in the patches will, in many ſorts, require thinning, eſpecially thoſe of a large, tall growth, and

buſhy kind, ſuch as *ſun-flowers*, *perſicaria*, *Indian corn*, *tobacco*, *belvedere*, *marigold*, &c.: ſome to one good plant in each patch; others to two or three plants, as *lavatora*, *curled and oriental mallow*, *ſtrawberry*, *ſpinach*, *Chineſe hollyhock*, *xeranthemum*, *amaranthus*, *ſcabious*, *ſweet ſultan*, and ſimilar kinds; and ſome alſo left in ſmall bunches, as *candy tuft*, *lupines*, *larkſpurs*, *ſweet peas*, *cyanus*, *naſturtium*, *convolvulus*, *Venus's looking-glaſs*, and *navel wort*, *mignonette*, *virgin ſtock*, *moldavian balm*, and many others of ſimilar growth. Or ſome tenweek ſtocks and mignonette may either remain thin in patches, or, where too thick, ſome of each ſort be tranſplanted in that order, three, four, or five together, or as required; alſo in many of the other ſorts, ſome may occaſionally be thinned out for tranſplanting, when required to ſupply deficiencies, &c. always performing the buſineſs, as much as poſſible, in ſhowery weather.

It is farther remarked by the ſame writers, that in the advancing growth of the plants, the principal culture is to keep them clean from weeds; and where any large ſorts remain too cloſe or crowded together, to thin them according to their growth in ſome regular order; and in the larger tall growing kinds, ſome will require the ſupport of ſticks, as alſo moſt of the climbing or trailing ſorts, particularly the ſweet peas, convolvulus major, and large naſturtium, &c.; and to the climbers, ſome upright ſmall branching ſticks, trimmed up a little regularly, ſhould be placed: the convolvulus and ſcarlet bean being volubilate, or twining climbers, will aſcend ſpirally upon any ſtraight upright ſtick, pole, or ſtake.

If it ſhould be required to have any deſirable ſorts of theſe hardy annuals of moderate growth to flower early, they may be forwarded by ſowing the ſeeds in pots in February or March, and placing them in a hot-bed, or more ſucceſsfully in a hot-houſe, &c.; ſuch as *ſcarlet* and other *ſweet peas*, *virgin ſtock*, *candy tuft*, *mignonette*, *tenweek ſtocks*, *dwarf lupines*, *dwarf larkſpurs*, *queen's balm*, and ſeveral others, eſpecially of ſimilar moderate growth.

As all the plants of this tribe of annuals generally produce plenty of ripe ſeed in autumn, care ſhould be taken to ſave proper ſupplies of the different beſt ſorts, as it ripens in perfection, in order to have plenty for ſowing the enſuing ſpring to raiſe a production of new plants for flowering the following ſummer. In ſome ſorts the ſcattered, or ſelf-ſown ſeeds, diſſeminated from the plants on the borders, will often come up naturally early in the ſpring; ſuch as *larkſpur*, *prince's feather*, *perſicaria*, &c.; and which, if permitted to ſtand, will flower ſooner than the ſpring ſown plants; but as many of theſe often riſe irregularly, they ſhould be tranſplanted while young into ſome regular order; and as they are only chance productions, they ſhould not prevent the regular ſowing.

2. *Tender Annuals.*—The principal ſorts of which are contained in the following liſt: *African marigold*, orange coloured, lemon coloured, deep yellow fiſtulous or quilled, waved flowered, dwarf, ſweet ſcented, double flowered of each ſort; *amaranthus*, *greater or true, *bloody, trailing or love lies bleeding; **balſam*, red, ſcarlet, purple, ſtriped, variegated, double; **baſil*, common greater upright, ſweet with broad leaves, fringed leaved, purple leaved, tricolor leaved, red flowered, purple flowered, long ſpiked, &c., leaſt or buſh baſil with hoary leaves, dark purple leaved, variable leaved, &c.; *calendula*, or cape marigold; **capſicum*, long podded, ſhort podded, heart podded, bell podded, angular podded, cherry podded, olive podded, red podded, ſcarlet podded, yellow podded; *China-aſter*, blue flowered, purple, red, white, ſtriped, variegated, bonnet flowered, quilled flowered, double and ſingle of each ſort; *Chineſe hollyhock*, variegated, double; *chryſanthemum*, yellow, white, cream coloured, ſulphur coloured, fiſtular or quilled, double and ſingle of each ſort; *convolvulus*, major, with deep purple flowers, red, blue, white, deep blue; **cucumber*, ſnake ſhaped; **egg plant* or *melangena*, white, fruited, purple fruited; *french marigold*, deep yellow, golden yellow, crimſon coloured velvetty, crimſon and yellow ſtriped, variegated crimſon and yellow, ſweet ſcented dwarf, double and ſingle of each ſort; *gourd*, orange, pear ſhaped, ſtriped pear ſhaped, lemon, top ſhaped, bottle or calabaſh buckler ſhaped or ſquaſh, carbuncled, warted, long taper, long crooked, horn ſhaped, large barrel ſhaped, large globular, large oval, hemiſpherical yellow, ſtone, coloured, fleſh coloured, ſandy coloured, party coloured, white, &c.; **globe amaranthus*, purple headed, white variegated, ſilver ſpiked; *Indian corn*, tall growing dwarf; *India pink*, bright red, purple white, red and white variegated, differently variegated, numerous, large imperial, double and ſingle of each ſort; **love apple*, red fruited yellow fruited, cherry ſhaped; **marvel of Peru*, red flowered, yellow, white, purple, ſtriped, long tubed flowered; **melon*, ſnake ſhaped or ſerpent cucumber; *mignonette*, ſweet ſcented; *nolana*, trailing blue; **palma chriſti*, major or tall growing, minor or leſſer, moſt broad leaved, leſſer leaved, &c.; *perſicaria*, oriental, red flowered, white; *ſultan flower* yellow; *ſtock gilliflower*, ten weeks, red, purple, white, ſcarlet, dwarf ſcarlet, dwarf white, wall flower leaved, white, wall flower leaved purple, double of each ſort; *tobacco*, Virginia long leaved, Virginia broad leaved; **tree-amaranthus*, **zinnia*, red flowered, yellow.

In reſpect to the culture of the more tender annuals, it is remarked in the ſame work, that they ſhould be moſtly either ſown in a moderate hot-bed in March or April, and the young plants forwarded a little in growth therein, till ſettled warm weather, in the middle or latter end of May; and then tranſplanted; or ſown in a bed of natural earth or warm border in April, protected under a garden frame or glaſſes, or at leaſt defended in cold nights by garden mats; and in either method to be tranſplanted, in May or beginning of June, into beds, borders, pots, &c. in the flower and pleaſure garden, to remain for flowering in ſummer and autumn. But that, where the convenience of a hot-bed is attainable, it is always adviſeable to raiſe a principal ſupply by that means for earlier tranſplanting and flowering, as a portion of the different ſorts may be ſown and raiſed in one hot-bed, ſmaller or larger, according to the quantity required; ſuch as a bed for one light, or for two or three light frames; or where conſiderable ſupplies are wanted, a larger extent of hot-bed will be neceſſary in proportion; making the bed or beds in March or the beginning of April, and defending them with a frame and lights, or hand-glaſſes; or in want of theſe, protecting them with an awning of mats in cold nights and bad weather, obſerving, in general, that only a moderate hot-bed, of about two feet thick in dung, will be ſufficient; earthing it at top five or ſix inches deep, with fine rich mould; in which ſow the ſeed in ſmall drills croſſways, drawn with the finger two or three inches aſunder, from half an inch to an inch deep, according to the ſize of the different ſorts of ſeeds, which ſhould be ſown regularly, each ſort ſeparately, and covered in evenly with the earth the ſame depth, giving them air occaſionally, by raiſing one end of the glaſſes an inch or two; or if a covering of mats, by taking them off, or turning them up in front in the day time; and, according as the plants advance in growth, admitting a larger portion of freſh air to ſtrengthen and harden them by degrees, giving alſo occa-

fionally gentle waterings. Continue in this manner the care of the young plants until advanced two or three inches in growth, when it will be of advantage to prick out a quantity of the principal forts into another moderate hot-bed, three, four, or five inches afunder; or others into natural beds of light earth under frames and glaffes, or to be defended occafionally by mats; but in deficiency of hot-beds, frames, &c. they may, in general, be pricked out in the middle or latter end of May into natural beds in the open ground; all of which fhould be watered at the time, and afterwards occafionally; and fhaded with mats from the fun, if convenient, till the plants have taken frefh root; obferving alfo to give thofe in the hot-beds and under-glaffes lefs or more air every mild day. When in three, four, or five weeks, in either of thefe beds, they have acquired a tolerable degree of ftrength and fize, as four, five, or fix inches growth, or more, according to the difference of the forts, they fhould all be finally tranfplanted about the middle or latter end of May and beginning of June, into the open ground on the beds, borders, and other compartments, and into pots, to remain for flowering, taking the opportunity of moift weather, if poffible, for the work; and, where convenient, to remove and replant fome forts with a little ball of earth adhering about the roots, as it will be of great advantage in their more early flowering; watering them as foon as planted out, and afterwards as occafion may require, till frefhly rooted, and they difcover figns of a renewal of growth.

It is added, that as where any of the above raifed plants have remained fome time in the feed bed not pricked out, they may probably have drawn one another up into a weekly growth, care fhould be taken to plant them out in May, as foon as the weather is fettled and favourably temperate, efpecially the more tender fpecies that have this mark * prefixed to them.

It is alfo obferved, that tenweek ftocks and mignonette may be fown in a hot-bed fo early as February, or any time in March, in order to raife a few plants to prick out into pots, three or four in each, for the earlieft flowering; or fome may be fown in March in the natural earth, or a warm border, under glaffes or other occafional fhelter, for early tranfplanting in April or May, into pots and flower borders, &c.

In the gourd kinds, when defigned to raife them in hot-beds, they fhould not be fown before April; for if fown earlier, they are apt to grow too large before the feafon becomes fufficiently warm to admit of planting them out in the open ground; or in the beginning or middle of May fome may be fown in the natural ground, both for tranfplanting, and in patches to remain.

But where hot-beds, frames, glaffes, and other fimilar conveniencies are deficient, many of the fpecies and varieties of this clafs, as has been juft obferved, may be raifed in the open ground, efpecially if not generally fown till the beginning, or towards the middle or latter end of April, according to the ftate of the feafon, fowing them in a warm border or other compartment, of light earth, or in pots placed in fimilar fituations; and when the plants are advanced feveral inches in growth, pricking them out into beds, or finally planting them out in May and the beginning of June. In this way they will all flower in tolerable perfection, but not generally fo foon by a few weeks, nor all in an equal degree of full growth and perfection, as thofe which are forwarded in hot-beds, or under the protection of frames, glaffes, &c. to a proper fize for earlier fetting out.

The forts that will occafionally the moft readily fucceed without the afiftance of hot-beds, &c. are the *African* and *French marigold*, *cryfanthemum*, *china-after*, *fultan flower*, *Indian pink*, *love lies bleeding*, *Chinefe hollyhock*, *perficaria*, *tobacco*, *tenweek ftock*, *nolana*, *mignonette*, and *Indian corn*; alfo gourds, if not fown till May; and fometimes *palma chrifti* and the *love apple*, in a temperate warm feafon. All thefe may be fown in beds or borders of natural earth, in warm fituations, as has been obferved, but not in moft of the forts before the middle of April; the plants being pricked or planted out in May or June into beds, borders, and pots, to remain for flowering.

In fowing the above forts in the natural ground for want of hot-beds, if the beds or borders in which they are fown be defended under frames or hand-glaffes, or fheltered with mats, it will be of much advantage in raifing the plants more fuccefsfully to a forwarder growth; and they will fooner attain proper ftrength for tranfplanting out and flowering.

There are fome however of this kind, that cannot be raifed in any tolerable perfection without hot-beds to bring them forward at firft to a proper growth for tranfplanting. But when in want of hot-beds, fow fome under glaffes about the middle or latter end of April or beginning of May; and when the plants are advanced a few inches in growth, in the latter end of May or beginning of June, plant them out into borders, beds, and pots. The method by means of pots, beds, frames, and glaffes, is, however, by much the beft.

In finally pricking out the plants in May and June, where they are to remain for flowering, fhowery weather is alfo of great advantage; and where any particular forts can be removed and replanted with little balls of earth about their roots, that method fhould not be omitted. The bufinefs may be performed in fome with a garden trowel to make proper apertures, as for thofe with balls of earth or full roots; and others with a dibble, according to their growth. In moft forts, planting them fingly, or one plant only in a place, and difpofing them in the borders. &c. in a diverfified manner, the fmaller forts more or lefs forward, and the larger kinds towards the middle and back parts, in fome proportion to their different degrees of growth, as before directed. Some of the other principal forts may alfo be placed in pots as required. But in the tenweek ftocks, and other fimilar plants, it is always adviseable to plant fome in patches, three or four plants together, about three inches apart, both in the borders and in pots, in order that, as being of fmall growth, their flowers together may appear more confpicuous, and have a greater chance of producing fome double flowered plants. Some mignonette and nolana, as being low plants, may alfo be planted in the fame order. The love apple and gourd being of extenfive rambling growth, may be planted againft a fouth wall, paling, treillage, &c. efpecially the love apple, in order to have their extending branches trained thereto, that they may ripen their fruit more effectually in autumn. Gourds of the fmall fruited kinds may be planted in a fimilar manner, or againft the railing of arbours, &c. in order to be trained up thereto in their advancing growth; others in capacious fpaces, in large borders, &c. to have room to extend along the ground, or to be trained up to ftrong tall ftakes. Moderate watering fhould be given directly in every cafe, efpecially in dry weather, and repeated occafionally till the plants have taken frefh root, and begun to grow.

The after-culture is chiefly to keep the plants clear from over-running weeds, and to give occafional fupport to thofe of large or tall growth; and fometimes where any branch out

out very irregularly, or in a rambling manner, in their advanced growth, as often happens in the African and French marigolds and cryſanthemum, &c. they ſhould be trimmed to the regular order: and ſome ſorts, as the love apple and the gourd kinds, if planted any where in the borders, being of a very rampant growth, be trained up to ſtrong ſtakes, as before obſerved, both to prevent their over-running the adjacent plants, and that their fruit may appear more conſpicuous, and ripen in greater perfection, eſpecially the love apple. And ſuch plants as have been planted in pots, will now be ready for moving in their reſpective pots occaſionally, when in flower, to adorn particular compartments of the garden or other places, as may be required; and as the earth in the pots dries very faſt in hot weather, they will require watering every day or two during the ſeaſon. All or moſt of theſe plants will be flowering in June or July, and continue, in general, till September or October; and the greater part of them are highly ornamental, though there are a few ſorts that are of little or no value for their flowers, as the capſicum, love apple, egg plant and gourd, being chiefly eſteemed for the appearance of their fruit; and the palma chriſti for its majeſtic growth and large palmated leaves. All the ſorts produce ripe ſeed in Autumn, and ſoon after wholly periſh: particular attention ſhould therefore be given to collect proper ſupplies of ſeed from the beſt flowering plants of the different ſorts: when dry, to be preſerved for uſe in the ſucceeding ſpring.

There is, in addition to the above, a ſtill more tender kind of annual plants; and which, according to the writers already mentioned, are ſuperiorly ornamental and curious; ſome in the beauty of their flowers, others in the ſingularity of their beautifully coloured leaves, as in the *amaranthus tricolor* and *bicolor*; ſome for the curioſity of their fruit, as in the *egg plant* and *ſnake melon*, &c.; and the *humble* and *ſenſitive plants*, from the ſingularly beautiful ſenſitive motion of their leaves; the *ice plant*, in its icy-like or cryſtalline appearance; and the *tree amaranthus*, both in its large tall growth branching widely around, and its vaſt pendulous flower-ſpikes often two or three feet long or more.

Theſe are chiefly comprehended in the following liſt:

3. *Tendereſt Annuals.*—*Amaranthus*, tricolor, bicolor, maximus or tree amaranthus, bloody, &c.; *balſamine* or *balſam*, double ſtriped, double ſcarlet, double purple, double bizarre; *broualia*; *cock's comb*, tall purple headed, dwarf purple, crimſon, buff coloured, yellow, branching; *convolvulus*, ſcarlet; *egg plant*; *globe amaranthus*; *humble plant*; *ice plant*, or diamond ficoides, oval leaved, pinnatifid leaved; *marvel of Peru*; *martynia*, purple flowered, red, white; *melon*, ſnake ſhaped; *ſtramonium*, double white, double purple, double ſtriped; *ſenſitive plant*, double flowered annual, common ſhrubby, humble; *zinnia*.

Theſe very tender annuals are all to be raiſed in hot-beds in the ſpring, under frames, &c. till May or June; and in order to obtain them in a tolerable degree of perfection, two different hot-beds, at three, four, or five weeks intervals, will be neceſſary for ſowing or raiſing them in: one the latter end of February, or any time in March, but not later than the beginning of April; the young plants, when about one, two, or three inches in height, being pricked out, ſome into ſmall pots ſingly, others in the earth of the bed, three or four inches aſunder, the whole being in the ſame bed if there be room enough, if not, into another hot-bed; and when they have advanced in growth, ſo as to crowd one another, they ſhould be removed into another hot-bed, under a deeper frame, or the frame raiſed at bottom occaſionally, as the plants riſe in height. Some ſhould be put in large pots, and others potted that were not ſo before, plunging the pots in the earth of the bed; or ſome may be put in the bed, ſix or eight inches aſunder: water is then to be given in general, and the glaſſes put on. The whole from their firſt growth, muſt have an admiſſion of freſh air every day, by raiſing the upper end of the glaſſes one, two or three inches, ſupplying them with moderate waterings. In this way they may be forwarded until the latter end of May, or ſome time in June, according to their growth or the temperature of the ſeaſon, as before ſuggeſted; but in the mean time, in their advancing ſtate, inure or harden them by degrees to the weather, particularly by gradually admitting a larger ſhare of air, or by ſometimes taking the glaſſes off entirely in warm days, &c.

The *humble* and *ſenſitive* plants ſhould, in general, be continued conſtantly under glaſſes, in a green houſe, &c. or in a room window within, in the full ſun; as, if fully expoſed to the open air, it would deprive them of much of their lively ſenſitive motion, in which curious ſingularity their principal merit conſiſts.

In order to raiſe ſome of the more curious ſorts of this kind of annuals in the greateſt perfection, ſuch as the tall *cock's comb*, *tricolor*, *bicolor*, *double balſams*, *ſtramoniums*, *globe amaranthuses*, *egg plants*, &c. it will be neceſſary to have two or three different ſucceſſional hot-beds under frames and glaſſes, at a month's interval; that is, a ſmall one in March, to ſow the ſeeds, and raiſe the plants an inch or two high in; a ſecond in April, of larger dimenſions, in which to prick out the young plants from the ſeed bed, three, four, five, or ſix inches aſunder; and ſometimes a third in May, for a larger frame to receive them when tranſplanted in pots to remain till June, and they grow to full ſize; obſerving that while they are in the ſecond and laſt hot-beds, the frames be occaſionally raiſed or augmented in depth, according as the plants riſe in height.

The firſt hot-bed for the ſeed ſhould be made, as already directed, of ſuitable dimenſions, and about two feet and a half deep in dung; the frame and glaſſes then put on, leaving one end of them open, to let out the rank ſteam of the dung; and in a few days, or when the firſt great ſteam and heat of the bed are gone off, the earth, which muſt be rich, light and dry, be put on four or five inches thick. The ſeeds of different ſorts may now be ſown, each kind ſeparately, in ſmall ſhallow drills, drawn with the finger, covering them with fine mould, from a quarter to half an inch deep, or with the very ſmall ſeeds but very thinly. The glaſſes are then to be put on again, ſetting one end of them a little open, for the evaporation of the riſing ſteam of the bed, covering them every night with garden mats. The plants moſtly appear in a few days, when freſh air muſt be judiciouſly and with caution admitted, by propping up the ends of the glaſſes about an inch or two every mild day; and when the earth becomes dry, a very ſlight ſprinkling of water be given in a ſunny forenoon. The glaſſes ſhould be moſtly kept cloſe in the nights; but if a ſtrong ſteam and heat take place, they may be raiſed a little at one corner, for air to enter, and the ſteam to paſs away, hanging the end of a mat over the tilted part, and continuing to cover the glaſſes with mats every night.

The care of the ſeedling plants is to be continued in the beds for about three weeks, or till they are advanced one, two, or three inches in growth, according to the different ſorts; they are then to be pricked out into another new-made hot-bed.

When the plants in the ſeed hot-bed are advanced one,

two,

two, or three inches, as above, another hot-bed ſhould be put in readineſs to receive them, making it for a two or three light frame according to the quantity of plants that are ready for the purpoſe. When the bed has imparted a proper degree of warmth to the earth, take up the plants with care, and in the ſame manner as directed above, prick them out into this, four or five inches diſtant, then give them a very light watering, and occaſionally ſhade them in the middle of ſunny days till they have ſtruck freſh root; and admit air as before every fine day, by raiſing the upper ends of the glaſſes one or two inches; alſo occaſional light waterings two or three times a week, in warm weather, and defend them in the nights with mats, and raiſe the frames, according as they extend in height, as before adviſed. After having had four or five weeks growth in this bed, if they have advanced conſiderably, ſo as to meet and crowd one another much, it will be adviſeable, as already noticed, to remove them into a third and final hot-bed where it can be conveniently obtained: ſome being planted in the bed, others previouſly potted and placed in them, to be covered by glaſſes, as directed above.

The frames, glaſſes, or other conveniencies for theſe uſes ſhould be ſufficiently large, eſpecially for the tall plants, and capable of being raiſed at pleaſure, as they advance in growth. The other management being the ſame as directed above. (See HOT-BED.)

Before the plants are finally ſet out, they ſhould always be occaſionally expoſed, and have the air freely admitted to them in the frames, at proper times, in order to harden them. And about the latter end of June, or beginning of July, when the weather is ſettled, they may be removed in their pots to the places where they are deſigned to remain for the ſummer.

This claſs of annual plants ſhould always occupy the principal ſituations both in gardens and pleaſure grounds, as in the moſt public and moſt frequented compartments in the front courts, &c.

The only culture that is neceſſary in any of the different ſorts, when removed into the full air, is principally to ſupply them with ſuitable quantities of water, eſpecially thoſe in pots; and occaſionally to ſuch as are in borders, when firſt planted out, and till faſt rooted; and to keep the whole clean from weeds, and ſupported with ſticks, &c. where required.

They all flower from June or July till the end of autumn; and in Auguſt and September ripen ſeed, which ſhould then be gathered from the beſt and moſt perfect plants, when the weather is quite dry.

The particular management of the different plants will be found under the *genera* to which they reſpectively belong.

ANNUAL *meadow graſs*, called in ſome parts of England Suffolk graſs, is a ſpecies of graſs which makes the fineſt turfs, and ſeems well adapted to dairy-farms. See POA ANNUA.

ANNUALIA, yearly oblations anciently made by the relations of deceaſed perſons on the day of their death.

This day they called *year-day*, &c. and on it maſs was celebrated with great ſolemnity.

ANNUEL, *ground*, according to Skene, is when the property of any land, whether built or unbuilt, is let or ſold for a yearly rent, to be paid either to the proprietor, or to ſome chaplain or prieſt.

ANNUEL, *fue*, is either when the mail or due is diſpoſed of as a yearly revenue; or, when the land or tenement is let in a fee-farm hereditary, for a certain yearly ſum to be paid under the denomination of *feuda firma*.

ANNUEL, *top*, is a due given or aſſigned out of houſes or buildings, where the property remains with the former owner, only with the condition of his paying the ſaid *annuel*.

ANNUEL *of Norway*, of which mention is made in the acts of parliament of King James the Third, was an annuel payment of an hundred marks ſterling, which the kings of Scotland were obliged to pay to the kings of Norway, in ſatisfaction for ſome pretenſions which the latter had to the Scottiſh kingdom, by virtue of a conveyance made thereof by Malcolm Canmoir, who uſurped the crown after his brother's deceaſe.

This *annuel* was firſt eſtabliſhed in 1266; in conſideration whereof the Norwegians renounced all title to the ſucceſſion of the iſles of Scotland. It was paid till the year 1468, when the *annuel*, with all its arrears, was renounced in the contract of marriage between King James the Third, and Margaret, daughter of Chriſtian the Firſt, king of Norway, Denmark and Sweden. See Skene de verb. Signif.

ANNUENTES *Muſculi*, in *Anatomy*, a pair of tranſverſe muſcles, at the root of the *vertebræ* of the back, called alſo by Mr. Cowper RECTI *interni minores*, becauſe they lie under the RECTI *majores*.

They are called *annuentes*, from *annuere*, *to nod towards*, becauſe they help to nod the head, or draw it directly downwards and forwards.

ANNUITIES ſignify any intereſt of money, rents, or penſions, payable from time to time, at particular periods.

The moſt general diviſion of annuities is into *annuities certain*; and annuities the payment of which depends on a *contingency*; ſuch, in particular, as the continuance of a life.

Annuities have been alſo divided into annuities in *poſſeſſion* and annuities in *reverſion*; the former meaning ſuch as either *have* commenced, or are to commence *immediately*; and the latter ſuch as will not commence till ſome particular future event has happened, or till ſome given period of time has expired.

Annuities may be farther conſidered as *payable yearly*, *half-yearly*, or *quarterly*.

The preſent value of an annuity is that ſum which, being improved at compound intereſt, will be ſufficient to pay the annuity.

The preſent value of an *annuity certain*, payable yearly, and the firſt payment of which is to be made at the end of a year, is calculated in the following manner.

Let the annuity be ſuppoſed to be 100*l.* the preſent value of the firſt payment of it, or of an hundred pounds to be received a year hence, is that ſum in hand, which being put out to intereſt, will increaſe to 100*l.* in a year. In like manner, the preſent value of the ſecond payment, or of 100*l.* to be received two years hence, is that ſum in hand, which being put out to intereſt, will increaſe to 100*l.* in two years. The like is true of the value of the 3d, 4th, 5th, &c. payments; and the ſum of the values of all the payments is the value of the *annuity*.

Let the intereſt be ſuppoſed to be 4 *per cent.* The ſum which improved at 4 *per cent.* intereſt for the year will produce 100*l.* at the end of the year, is the ſum which bears the ſame proportion to 100*l.* that 100*l.* bears to 100*l.* with 4 added to it, that is, to 104*l.* Say then, as 104*l.* is to 100*l.* ſo is 100*l.* to a fourth proportional, which will be 96.15, or 96*l.* 3*s.* the value of the firſt payment.

Again, the ſum which improved at 4 *per cent.* for two

years, will produce 100*l.* at the end of *two* years, is the ſum which being now put out to intereſt will produce in a year that ſum which in one year more will produce 100*l.* that is, it is the ſum that will produce in a year 96*l.* 3*s.*; for it has been juſt ſhewn, that 96*l.* 3*s.* will in a year produce 100*l.* Say then, as 104*l.* is to 100*l.* ſo is 96*l.* 3*s.* or 96.15, to a fourth proportional, which will be 92.45, or 92*l.* 9*s.* The value therefore of the ſecond payment is 92*l.* 9*s.*

By proceeding in this method it will be found that the value of the 3d, 4th, 5th, &c. payments, are £88.89, £85.48, £82.19, &c. The ſum of 10, 20, or 100 of theſe values, is £811, £1359, £2450, reſpectively, or the preſent value of an *annuity* of 100*l.* payable for 10, 20, or 100 years. The ſum of an infinite number of theſe values is 2500*l.* or the value of a perpetual *annuity* of 100*l.* at 4 *per cent.*

In general: ſuppoſe r to denote 1*l.* increaſed by its intereſt for a year, or the amount of 1*l.* in a year. Then $\frac{1}{r}$ will be the preſent value of 1*l.* to be received a year hence; for r is to 1 as 1 is to $\frac{1}{r}$. Alſo $\frac{1}{r^2}$ will be the value of 1*l.* to be received at the end of two years; for r is to 1 as $\frac{1}{r}$ is to $\frac{1}{r^2}$. In like manner, $\frac{1}{r^3}$, $\frac{1}{r^4}$, $\frac{1}{r^5}$, &c. will be the values of 1*l.* to be received at the end of 3, 4, 5, &c. years reſpectively; and $\frac{1}{r^n}$ will be the value of 1*l.* to be received at the end of n years. The value, therefore, of an *annuity* of 1*l.* for n years is $\frac{1}{r}+\frac{1}{r^2}+\frac{1}{r^3}+\frac{1}{r^3}$ &c. continued to n terms. And the value of the perpetuity is the ſeries continued *in infinitum*.

In order to find the ſum of n terms of this ſeries, put S equal to it, or $S=\frac{1}{r}+\frac{1}{r^2}+\frac{1}{r^3}$, &c. $+\frac{1}{r^n}$. Then,

$Sr=1+\frac{1}{r}+\frac{1}{r^2}$, &c. $+\frac{1}{r^{n-1}}$. And

$Sr-1=\frac{1}{r}+\frac{1}{r^2}$, &c. $+\frac{1}{r^{n-1}}=S-\frac{1}{r^n}$. Therefore $Sr-1=S-\frac{1}{r^n}$. And conſequently

$Sr-S=1-\frac{1}{r^n}$, and $S=\frac{1}{r-1}-\frac{1}{r-1}\times\frac{1}{r^n}$

This is the general theorem for finding the ſum of any given number of the firſt terms of the ſeries $\frac{1}{r}\times\frac{1}{r^2}+\frac{1}{r^3}$, &c. that is, for finding, from the rate of intereſt given, the value of an *annuity certain*, payable yearly for any number of years. If the annuity is a perpetuity, it is plain that $\frac{1}{r^n}$, or the laſt term vaniſhing, $\frac{1}{r-1}\times\frac{1}{r^n}$ alſo vaniſhes; and, conſequently, that the expreſſion becomes $S=\frac{1}{r-1}$: from whence it reſults that the value of a perpetuity is always unity divided by the intereſt of 1*l.* for a year, or 100*l.* divided by the rate of intereſt.

Annuities certain differ in value as they are made payable, *yearly*, *half-yearly*, *quarterly*, or at ſhorter intervals. Let r, inſtead of denoting as before, 1*l.* increaſed by its intereſt for a year, denote the intereſt only of 1*l.* for a year, and let n denote the term or number of years during which the annuity is to be paid. By reaſoning as in the former caſe, the value of the annuity will be $\frac{1}{1+\frac{r}{2}}+\frac{1}{1+\frac{r}{2}|2}+\frac{1}{1+\frac{r}{2}|3}\ldots$ $\ldots\ldots\ldots+\frac{1}{1+\frac{r}{2}|2n}$ ..... or $\frac{1}{1+\frac{r}{4}|}+\frac{1}{1+\frac{r}{4}|2}+\frac{1}{1+\frac{r}{4}|3}$ $\ldots\ldots\ldots+\frac{1}{1+\frac{r}{4}|4n}$, according as it is payable, either *half-yearly* or *quarterly*. The firſt of theſe ſeries is $=\frac{1}{r}-\frac{1}{r}\times\frac{1}{1+\frac{r}{2}|2n}$ ..... and the ſecond is $=\frac{1}{r}-\frac{1}{r}\times\frac{1}{1+\frac{r}{4}|4n}$ ..... If the annuity is made payable at m, any ſmaller fraction of a year, the ſum of the ſeries will be $=\frac{1}{r}-\frac{1}{r}\times\frac{1}{1+\frac{r}{m}|mn}$; ſo that when m becomes infinite, or the annuity is made payable momently, the ſeries will be $=\frac{1}{r}-\frac{1}{r}\times\frac{1}{1+\frac{r}{1000,\text{ &c.}}|1000,\text{ &c. }n}$. By the Binomial Theorem $1+\frac{r}{1000,\text{ &c.}}|1000,\text{ &c. }n$ is $=1+rn+\frac{r^2n^2}{2}+\frac{r^3n^3}{2\times3}+\frac{r^4n^4}{2\times3\times4}$ &c. which ſeries is known to expreſs the number of which rn is the hyperbolic logarithm. Let this number be called N, and the value of the annuity in this caſe will be $=\frac{1}{r}-\frac{1}{rN}$. . . . If P be put for $\frac{1}{r}$, or the perpetuity, and y, h, q, and m, for the values of the annuity according as it is payable, *yearly*, *half-yearly*, *quarterly*, or *momently*, the general theorems will then be

$$y=P-P\times\frac{1}{1+r|n}$$

$$h=P-P\times\frac{1}{2+\frac{r}{2}|2n}$$

$$q=P-P\times\frac{1}{1+\frac{r}{4}|4n}$$

$$m=P-P\times\frac{1}{N}.$$

Example

Example I.

Let the rate of intereſt be 4 *per cent.* and the term five years; and conſequently $r = .04$, $n = 5$, $P = 25$, then

$$y = 25 - 25 \times \frac{1}{1.04^5} 5 = 4.4518$$

$$h = 25 - 25 \times \frac{1}{1.04^{10}} 10 = 4.4913$$

$$q = 25 - 25 \times \frac{1}{1.04^{20}} 20 = 4.5120$$

$$m = 25 - 25 \times \frac{1}{1.22198} = 4.5415$$

Example II.

Let the rate of intereſt be the ſame, and the term for which the *annuity* is payable 25 years.

Then, $y = 15.0220$
$h = 15.7118$
$q = 15.7694$
$m = 15.8010$

Example III.

Intereſt being the ſame, let the term be 50 years.

Then, $y = 21.4822$
$h = 21.5491$
$q = 21.5820$
$m = 21.6160$

Example IV.

Intereſt being the ſame, let the term be 100 years.

Then, $y = 24.505$
$h = 24.523$
$q = 24.532$
$m = 24.542$

Sums may alſo be made payable at longer intervals than a year: ſuch are fines required at ſtated times for the renewal of leaſes. Suppoſing thoſe periods to be at the end of every n^{th} year, the ſeries expreſſing their value will be

$$\frac{1}{1+r}n + \frac{1}{1+r}^{2n} + \frac{1}{1+r}^{3n} \ldots ad\ infinitum = \frac{1}{1+r}^{n} - 1,$$

that is, divide 1*l.* by the *amount* of 1*l.* in n years (ſee Tab. I.) leſſened by unity, multiply the quotient by the fine, and the product will be the preſent value of all thoſe fines for ever, if the *firſt* of them be payable at the end of n years. But if the fine be now due, unity muſt be added to the above-mentioned quotient, and the ſum being multiplied by ſuch fine, the product will be the value in this caſe.

Example. Suppoſing an eſtate of 10*l. per annum* held by leaſe, renewable every ſeven years at a certain fine of 20*l.*; what is the value of ſuch eſtate, computing at five *per cent.*? *Anſ.* The amount of 1*l.* in ſeven years, by Tab. I. is 1.628895. Deducting unity from this number, and dividing 1*l.* by .628895, the remainder, we have 1.59 for the quotient, which, being multiplied into 20*l.* the given fine, produces 31.80*l.* for the preſent value of all ſuch fines, ſuppoſing the firſt of them to be paid at the end of ſeven years. Now ſince the fee ſimple is worth 20 years purchaſe, or 200*l.* it follows that the difference between 200*l.* and 31.80*l.* or 168*l.* 4*s.* will be the value of this eſtate, ſubject to the payment of the fines every ſeven years. But if the fine be *due*, it will be worth 20*l.* leſs, or 148*l.* 4*s.*

The value of the *reverſion* of a perpetual annuity, to be entered upon after a particular term, is "the value of the annuity for the given term ſubtracted from the perpetuity." For example; the value of an annuity, to be entered upon 10 years hence, is (reckoning intereſt at 4 *per cent.*) 8.11 (the value by Tab. III. of an annuity certain for 10 years,) ſubtracted from 25 (the perpetuity), or 16.89; that is, 16⅞ years purchaſe nearly. If the annuity is to be entered upon at the end of 18 years, the value will be 12.66 ſubtracted from 25, or 12.34 years purchaſe.

If the reverſion be not a perpetuity, but an annuity, certain for a given term, to be entered upon after another given term, the value will be "the value of the annuity for the *firſt* term ſubtracted from its value for *both* terms, added together; that is, ſuppoſing the reverſion an annuity for eight years, to be entered upon after ten years, the value is (reckoning intereſt at 4 *per cent.*) the difference between 8.11 (the value of an annuity by Tab. III. for 10 years) and 12.659 (the value by the ſame Table of an annuity for 18 years) or 4.548, which is little more than 4½ years purchaſe.

The following Tables, together with the account of their conſtruction and uſe, contain all that is moſt important on the ſubject of annuities certain.

TABLE I.

Shewing the amount of the principal in a given number of years, not exceeding 100, at any rate of compound intereſt, from three to ſix per cent.

Years.	At 3 per Cent.	3½ per Cent.	4 per Cent.	4½ per Cent.	5 per Cent.	6 per Cent.
1	1.030000	1.035000	1.040000	1.045000	1.050000	1.060000
2	1.060900	1.071225	1.081600	1.092025	1.102500	1.123600
3	1.092727	1.108718	1.124864	1.141166	1.157625	1.191016
4	1.125509	1.147523	1.169859	1.192519	1.215506	1.262477
5	1.159274	1.187686	1.216653	1.246182	1.276282	1.338226
6	1.194052	1.229255	1.265319	1.302260	1.340096	1.418519
7	1.229874	1.272279	1.315932	1.360862	1.407100	1.503630
8	1.266770	1.316809	1.368569	1.422101	1.477455	1.593848
9	1.304773	1.362899	1.423312	1.486095	1.551328	1.689479
10	1.343916	1.410599	1.480244	1.552960	1.628895	1.790848
11	1.384234	1.459970	1.539454	1.622853	1.710339	1.898299
12	1.425761	1.511069	1.601032	1.695881	1.795856	2.012196
13	1.468534	1.563956	1.665073	1.772196	1.885649	2.132928
14	1.512590	1.618695	1.731676	1.851945	1.979932	2.260904
15	1.557967	1.675349	1.800944	1.935282	2.078928	2.396558
16	1.604706	1.733986	1.872981	2.022370	2.182875	2.540352

Vol. II.

Construction of Table I.

The numbers in this Table are the powers of 1*l.* increased by its interest for a year: that is, they are the powers of the *amount* of 1*l.* in a year, at the several rates of interest: supposing r to be that amount, they are r, r^2, r^3, r^4, &c.

Use. *To find the amount of any sum in any number of years, not exceeding* 100. Ans. Oppolite to the given number of years, and under the rate of interest, is the amount of 1*l.* in that time, which, multiplied by the given sum, produces the required amount.

Examples.

1. What will 10*l.* amount to in 100 years at 4 *per cent. per ann.* compound interest? *Ans.* 50.504948, multiplied by 10, is 305*l.* 1*s.*

2. What will 250*l.* amount to in 50 years, at 5 *per cent. per ann.* compound interest? *Ans.* 11.4674 multiplied by 250, is 2866*l.* 17*s.*

TABLE II.

Shewing the principal that will amount to 1*l.* in any number of years not exceeding 100; or the present value of 1*l.* to be received at the end of any number of years not exceeding 100; discounting at any rate of compound interest from 3 to 6 *per cent.*

Years.	At 3 per Cent.	3½ per Cent.	4 per Cent.	4½ per Cent.	5 per Cent.	6 per Cent.

Construction of Table II.

The numbers in this Table are the reciprocals of the corresponding numbers in the last, or the quotients of unity divided, by those numbers; that is, $\frac{1}{r}, \frac{1}{r^2}, \frac{1}{r^3}, \frac{1}{r^4}$, &c. Supposing *r* to denote 1*l.* with its interest for a year.

Use. *To find what the present value is of any sum payable in any future time: and also what principal will amount to a given sum in any number of years.* *Ans.* Opposite to the given number of years, and under the rate of interest, is the present value of 1*l.* to be received at the end of the given time, or the sum that will amount to 1*l.* in that time, which, multiplied by the given sum, produces the required value or principal.

1. What is the present value of 1000*l.* to be received 10 years hence, reckoning compound interest at 5 *per cent.?* *Ans.* .613913, multiplied by 1000, is 613*l.* 18*s.* 3*d.* nearly.

2. What principal will amount to 1000*l.* in 10 years, at 5 *per cent. per ann.* compound interest? *Ans.* .613913, multiplied by 1000*l.*, is 613*l.* 18*s.* 3*d.*

3. What sum put out for 25 years at 4½ per cent. compound interest will clear a debt of 4000*l.*? *Ans.* .332731, multiplied by 4000, is 1330*l.* 18*s.* 6*d.*

TABLE III.

The prefent value of an *annuity* of 1*l.* for any number of years not exceeding 100, at any rate of compound intereft from 3 to 6 *per cent.*

Years.	At 3 per Cent.	3½ per Cent.	4 per Cent.	4½ per Cent.	5 per Cent.	6 per Cnt.

Conſtruction of Table III.

The 2d, 3d, 4th, &c. numbers in this Table, are the ſums of the firſt 2, 3, 4, &c. numbers in the ſecond; that is, the ſums of $\frac{1}{r}+\frac{1}{r^2}$, of $\frac{1}{r}+\frac{1}{r^2}+\frac{1}{r^3}$, of $\frac{1}{r}+\frac{1}{r^2}+\frac{1}{r^3}+\frac{1}{r^4}$, &c.

Uſe. *To find the preſent worth of an annuity for any given term.* Multiply the preſent value oppoſite to the given number of years, and under the rate of intereſt, by the given *annuity*, and the product will be the anſwer.

Example.

What is the preſent value of an *annuity* of 40*l.* to continue 20 years, at 4 per *cent?* *Anſ.* 13.590326, multiplied by 40, is 543*l.* 12*s.* nearly.

ANNUITIES.

TABLE IV.

The amount of an annuity of *l.* in any number of years not exceeding 100, when improved at compound intereſt.

Years	At 3 per Cent.	3½ per Cent.	4 per Cent.	4½ per Cent.	5 per Cent.	6 per Cent.

Construction

Conſtruction of Table IV.

The firſt number of each column in this Table is unity. The ſecond is the firſt number in this Table added to the firſt number in the firſt Table. The third number is the ſecond in this table added to the ſecond in the firſt Table, and ſo on: that is, the numbers in this Table are 1, $1+r$, $1+r+r^2$, $1+r+r^2+r^3$, &c. which ſeries, by proceeding in the ſame manner as in the caſe of $\frac{1}{r}+\frac{1}{r^2}+\frac{1}{r^3}$, &c. expreſſing the value of an annuity certain, may be found $=\frac{r^{-}-1}{r-1}$.

Uſe. *To find the amount of an annuity forborne any number of years not exceeding* 100. Multiply the amount in the Table oppoſite to the given number of years, and under the rate of intereſt, by the given *annuity*. The product is the anſwer.

Examples.

1. What will an *annuity* of 5*l.* amount to in 15 years, at $3\frac{1}{2}$ *per cent.* compound intereſt? *Anſ.* 19.295681, multiplied by 50, is 964*l.* 15*s.* 8*d.*

2 What is the amount of an *annuity* of 20*l.* in 28 years, at 4 *per cent?* *Anſ.* 49.9675, multiplied by 20, is 999*l.* 7*s.*

3. A perſon is poſſeſſed of 1000*l.* principal, bearing 4 *per cent.* intereſt, and in order to increaſe his income, reſolves, in addition to the intereſt of 40*l.* to take out of his principal 20*l.* the firſt year, and afterwards as much more as will be neceſſary to make a conſtant income of 60*l. per ann.* in what time will he reduce his principal to nothing? *Anſ.* In the ſame time that an *annuity* of 20*l.* would increaſe at 4 *per cent.* compound intereſt to 1000*l.* that is, in 28 years by the preceding queſtion.

He that would gain farther information on this ſubject ſhould conſult Malcolm's Arithmetic, from page 595 to the end; Simpſon's Algebra, ſect. 16.; Mr. Dodſon's Mathematical Repoſitory, p. 298, &c. Jones's Synopſis, ch. 10. Phil. Tranſ. vol. lxvi. p. 109, &c.

For an explanation of the doctrine of *annuities on lives*, ſee ASSURANCE, COMPLEMENT, EXPECTATION, LIFE *Annuities*, MORTALITY, REVERSIONS, SURVIVORSHIPS.

ANNUITY, in *Law*, is a thing very diſtinct from a rent-charge, with which it is often confounded; becauſe a rent-charge is a burden impoſed upon, and iſſuing out of lands; whereas, an annuity is a yearly ſum, chargeable only upon the perſon of the grantor. Therefore, if a man by deed grant to another the ſum of 20*l.* per annum, without expreſſing out of what lands it ſhall iſſue, no land at all ſhall be charged with it; but it is a mere perſonal annuity; which is of ſo little account in the law, that if granted to an eleemoſynary corporation, it is not within the ſtatutes of mortmain: and yet a man may have a real eſtate in it, though his ſecurity is merely perſonal.

If the annuitant of an annuity payable half yearly, ſince the laſt term of payment, die before the half year is completed, nothing is due for the time he lives. There are now very few, if any grants of annuities, without a covenant for payment, expreſſed or implied; and therefore, where a diſtreſs cannot be made, or is not approved of, the grantee may bring an action of covenant, and recover the arrears in damages, with coſts of ſuit. And that action is now uſually brought, real actions, and writs of annuity, being much out of uſe.

The practice of purchaſing annuities for lives, at a certain price or premium, inſtead of advancing the ſame ſum on an ordinary loan, ariſes uſually from the inability of the borrower to give the lender a permanent ſecurity for the return of the money borrowed, at any one period of time. He therefore ſtipulates (in effect) to repay annually, during his life, ſome part of the money borrowed; together with legal intereſt for ſo much of the principal as annually remains unpaid, and an additional compenſation for the extraordinary hazard run of loſing that principal entirely by the contingency of the borrower's death; all which conſiderations, being calculated and blended together, will conſtitute the juſt proportion or quantum of the annuity which ought to be granted. If, by the terms of the contract, the lender's principal is *bonâ fide* (and not colourably) put in jeopardy, no inequality of price will make it an uſurious bargain; though under ſome circumſtances of impoſition, it may be relieved againſt in equity. To throw, however, ſome check upon improvident tranſactions of this kind, which are uſually carried on with great privacy, the ſtatute 17 Geo. III. c. 26 uſually called the "Annuity Act," has directed, that upon the ſale of any life-annuity of more than the value of 10*l.* per annum (unleſs on a ſufficient pledge of lands in fee-ſimple, or ſtock in the public funds), the true conſideration, which ſhall be in money only, ſhall be ſet forth and deſcribed in the ſecurity itſelf; and a memorial of the date of the ſecurity, of the names of the parties, *ceſtuy que truſts*, *ceſtuy que vies*, and witneſſes, and of the conſideration money, ſhall, within 20 days after its execution, be enrolled in the court of Chancery, elſe the ſecurity ſhall be null and void; and in caſe of colluſive practices reſpecting the conſideration, the court in which any action is brought, or judgment obtained upon ſuch colluſive ſecurity, may order the ſame to be cancelled, and judgment (if any) to be vacated: if the ſecurity be ſet aſide for want of complying with the formalities of the act, the conſideration, if fair and legal, may be recovered back by the grantee, in action of "aſſumpſit" againſt the perſon *actually* receiving ſuch conſideration money, but not againſt a ſurety: and alſo all contracts for the purchaſe of annuities from infants, ſhall remain utterly void, and be incapable of confirmation after ſuch infants arrive to the age of maturity. Blackſt. Com. vol. ii. p. 40—461, &c.

ANNUITIES, *Public*. See NATIONAL DEBT and FUND.

ANNULAR, ANNULARIS, ſomething that relates to, or reſembles a ring, by the Latins called *annulus*.

ANNULAR *cartilage*, or ANNULARIS, in *Anatomy*, is the ſecond cartilage of the *larynx*, being round, in ſhape much reſembling a ring, and inveſting the whole *larynx*; called alſo *cricoides*. See LARYNX.

ANNULAR *eclipſe*, in *Aſtronomy*. See ECLIPSE.

ANNULAR *ligaments*, *ligamenta annularia*, is a name given to thoſe ligaments which confine the tendons of the CARPUS and TARSUS.

Add, that the ſphincter muſcle of the *anus* is alſo called *annularis*, or *annular* muſcle, from its figure.

ANNULAR *proceſs*, or *protuberance*, is a prominent part of the MEDULLA *oblongata*. See BRAIN.

ANNULAR is alſo an epithet given to the fourth finger; popularly called the *ring* FINGER.

ANNULARIA, in *Entomology*, a ſpecies of PHALÆNA, of the *geometra* ſection. The wings are cinereous, with a brown ſtreak, a ring in the middle, and two brown bands behind: inhabits Germany. Fabricius, Gmelin, &c.

ANNULARIS, a ſpecies of CERAMBYX, in the ſection *callidium*, Gmelin's arrangement. The thorax is ſpotted with black, wing-caſes bidentated and rather greeniſh, with three black bands, the firſt annular: inhabits Siam. Fabricius and Gmelin.

ANNULARIS,

A N N

Annularis, is alſo a ſpecies of TENTHREDO, that inhabits Auſtria. It is ſhining black, tips of the antennæ white, ſhanks of the legs ferruginous. Fabricius.

Annularis, in *Ichthyology*, a ſpecies of CHÆTODON. The body is ſtriated, and has a ſmall ring on the lateral line. Gmelin. The body is brown, with blue incurvated ſtreaks, and covered with very ſmall ſcales; the irides of the eyes are ſilvery; gill-covers of two pieces, the anterior one of which is toothed and ſpinous; lateral line parallel with the back, anus in the middle of the body; anal fin, round with a ſtreak of blue; dorſal fin, black brown, the others white. This is ikan batoe jang aboe, and ikan pampus cambodia, of Valent. Ind. &c.

ANNULATA, in *Entomology*, a ſpecies of CASSIDA, found in India, and deſcribed by Fabricius. It is blue, with two rufous ſpots on the thorax, and rings of the ſame colour on the wing-caſes. Fab. and Gmelin. *Obſ.* This is a large ſpecies; the thorax is obſcure, with a faint rufous ſpot on each ſide; wing-caſes gibbous, dull blue, with ſix rufous annulations; beneath, black, with a rufous dot on both ſides each ſegment of the abdomen.

Annulata, a ſpecies of CHRYSOMELA, in the ſection *altica*. It is brown bronzed; wing-caſes ſtriated and crenated; baſe of the antennæ rufous; ſhanks of the four anterior legs rufous, with a bronzy-brown annulation. Linnæus and Gmelin.

Annulata, a ſpecies of NEPA, that inhabits the coaſt of Coromandel. It is with a tail, ſubrotund, pale brown; ſhanks of the anterior legs pale, annulated with brown. Fabricius.

Annulata, a ſpecies of SPHINX, in the Linnæan arrangement; ZYGAENA, in that of Fabricius. It is black, with ſix yellow ſpots on the anterior wings; baſe of the poſterior wings and ſpot yellow; abdomen annulated with yellow: inhabits New Holland.

Annulata, a ſpecies of PHALÆNA, found in Hamburgh, and deſcribed by Fabricius. The wings are black, with ſnowy-white ſpots; ſhanks of the legs annulated with white.

Annulata, a ſpecies of PHRYGANEA, that inhabits Europe. It is brown, with long antennæ annulated with white; inner and poſterior margins of the wings ciliated. Linnæus, Gmelin, &c.

Annulata, a name under which two different ſpecies of TENTHREDO are deſcribed by Gmelin in the Syſtema Naturæ; one is the Linnæan ſpecies of that name, but the other is adopted, with great impropriety, from the mantiſſa of Fabricius. To prevent in ſome meaſure the confuſion which might evidently ariſe from the ſame name being aſſigned to two diſtinct inſects, it is neceſſary to attend to the characters of the two ſections to which they belong. Tenthredo annulata, Linn. is in the ſection "antennis filiformibus, articulis 7—9;" antennæ filiform, with from ſeven to nine articulations; and the other in that of "antennis ex-articulatis, extrorſum craſſioribus;" antennæ without articulations, and thickeſt at the tip. The firſt ſpecies is yellow, with the antennæ ſomewhat clavated and black; tip of the ſhanks and ends of the feet annulated with black. The ſecond is black, the abdomen yellow, feet of the poſterior legs black, annulated with white. Fabricius Mantiſ. Both kinds inhabit Europe.

Annulata, a ſpecies of APIS, found in Europe. It is ſmall, and ſmells like muſk; the colour is black; front and rings on the legs white. Linnæus and Fabricius.

Annulata, a ſpecies of TIPULA. The wings are brown, variegated; thighs annulated with white: inhabits Europe. Linnæus, Fabricius, &c.

Annulata, a ſpecies of CONOPS that inhabits Europe. The thorax is black; abdomen cylindrical, varied with yellow and black; baſe of the wings and legs ferruginous, the latter annulated with brown. Linnæus and Gmelin.

Annulata, a ſpecies of PODURA. It is livid, with black rings; and inhabits Europe. Fabricius and Gmelin. This is podura livida lutea, annulis tranſverſis nigris of Geoffroy.

Annulata, in *Conchology*, a ſpecies of OSTREA, that inhabits the North Seas; and ſuppoſed by ſome to be a variety of oſtrea papyracea. The ſhell is equivalve, orbicular, and white, with concentric ſemi-circles. Gmelin and Müll.

Annulata, a ſpecies of VOLUTA. It is white, ſmooth, with a carinated dorſal ring; its habitation is unknown, and there is a variety of it (β), undulated with pale red. Gmelin, Martini, &c.

Annulata, a ſpecies of HELIX. The ſhell is umbilicated, ſlightly depreſſed, and white; wreaths four, the firſt gibbous and bicarinated. Gmelin.

ANNULATORIUS, in *Entomology*, a ſpecies of ICHNEUMON, found in Great Britain, and deſcribed by Fabricius from a ſpecimen in the cabinet of Sir Joſeph Banks, Bart. The ſcutellum is yellowiſh; thorax ſpotted, and four firſt ſegments of the abdomen margined with yellow; wings tranſparent. Fabricius and Gmelin.

ANNULATUM, in *Conchology*, a ſpecies of DENTALIUM. It is round and ſtriated obliquely: found in a foſſil ſtate. Gmelin, Guettard, &c.

ANNULATUS, in *Conchology*, a ſpecies of TROCHUS, found in the ſands of the Indian ſea. The wreaths are reverſed, and ribbed on each ſide; aperture almoſt ſquare. Gmelin, Chemn. &c. This is a ſmall ſpecies, ſcarcely exceeding a quarter of an inch in length, and the number of wreaths are uſually from twelve to fifteen.

Annulatus, is likewiſe the ſpecific name of a ſhell of the TURBO genus; its native place is unknown: it is figured by Gualteri, and thus very conciſely characterized by Gmelin; wreaths with a prominent and margined ſuture: this ſhell is white, a quarter of an inch in length, aperture ſuboval.

Annulatus, in *Entomology*, a ſpecies of CURCULIO, that inhabits North America. It is pale, thorax and wing-caſes ſtreaked with black. Fabricius and Gmelin. The ſtreaks are diſpoſed tranſverſely, one upon the thorax, and two on the wing-caſes.

Annulatus, a ſpecies of CERAMBYX, in the ſection or family, *ſtenocorus*. The thorax is lineated, wing-caſes unidentated, antennæ long, with three white rings. Fabricius and Gmelin. *Obſ.* The thorax is grey, with four white lines; the wing-caſes grey, brown at the tip, and edged with white; and the legs grey, with brown annulations. Cabinet of Sir Joſeph Banks, Bart.

Annulatus, a ſpecies of GRYLLUS, in the ſection *locuſta*, having a flattiſh thorax, gibbous front, wings bluiſh-black, and blue within: it inhabits America, and is of a reddiſh grey, and rough, with elevated dots; abdomen annulated, with a few greeniſh rings; antennæ yellow, with black rings.

Annulatus, a ſpecies of CIMEX, deſcribed by Fabricius and Gmelin as a native of Virginia. It is greyiſh, thighs annulated with white. This belongs to the family *ſpinoſus*, in the Gmelinian arrangement of cimices, and muſt not be confounded with another of the ſame name in the family *oblongus*, which is an European inſect. It is black, poſterior part of the thorax and anterior of the wing-caſes greyiſh; legs annulated with brown. Gmelin. There is alſo another

another ſpecies of cimex in the family *reduvius*, called ANNULATUS, which likewiſe inhabits Europe. The tips of the antennæ are capillary; body black, with ſanguineous ſpots on the under ſide. Linnæus. This laſt is cimex niger rufipes of Degeer.

ANNULATUS, a ſpecies of ICHNEUMON, that inhabits Europe. It is black, with rufous legs; ſhanks and feet of the poſterior pair annulated with white. Gmelin.

ANNULATUS, a ſpecies of ASILUS, that inhabits India. It is cinereous; abdomen black at the end; thighs teſtaceous, annulated with black. Fabricius and Gmelin.

ANNULATUS, a ſpecies of CULEX. It is brown; abdomen and legs annulated with white; wings ſpotted. Fabricius and Gmelin. In the ſize and ſhape, this reſembles the common gnat (culex pipiens); the beak is half the length of the body. Inhabits Germany and Denmark.

ANNULATUS, in *Ornithology*, a ſpecies of ORIOLUS that inhabits America, and is conſidered as a bird of prey. It is yellow; head and neck black; greater wing-coverts and quill-feathers blackiſh, edged with pale yellow; a blackiſh band acroſs the tail. Gmelin, &c.

This is the ring-tailed oriole of Latham; avis ocotzinitzcan of Seba; arc-en-queue of Buffon; icterus cauda annulata of Briſſon; and cornix flava of Klein. It is about the ſize of a pigeon; the bill yellow, and a little bent at the point; head and neck black; body yellow; tail yellow; each feather marked tranſverſely with a broad blackiſh band; and which, when the tail is expanded, forms a creſcent, with the concave part towards the body; legs grey.

ANNULATUS, in *Zoology*, a ſpecies of COLUBER; deſcribed by Linnæus and Gmelin, as having 190 abdominal ſcuta or plates on the belly, and 96 ſubcaudal ſcales; but it appears from ſynonymous authors, that the number of thoſe plates and ſcales vary exceedingly in different ſpecimens, and that its ſpecific characters ſhould rather be taken from the colour, form and diſpoſition of the ſpots, which are leſs liable to variations: in one inſtance, for example, the abdominal ſcuta amounted to only 184, and the ſubcaudal ſcales to 60; in another to 186—84; and in a third to 196—95. Its general deſcription is, back, cinereous grey, browniſh, or browniſh-white, with a band, or ſeries of round, alternate, brown ſpots, that occaſionally join or become confluent, eſpecially at ſome diſtance down the neck, and are ſurrounded with pale margins; belly white. Dr. Shaw's ſpecific character is, C. griſeus, maculis dorſalibus rotundis fuſcis pallido marginatis. Grey ſnake, with round, brown, dorſal ſpots, with pale margins. Vol. iii. p. 2. 490.

This creature inhabits America, is from a foot and an half to two or three feet in length; the head is rather large, as are alſo the ſcales that cover it; the tail gradually tapering.

ANNULATUS, a ſpecies of ANGUIS, of a white colour, with ſtraight brown ſtripes that meet on the under ſide; tail tapering, and a double row of imbricated ſcales beneath. Laur. Gmelin.

ANNULET, from the Latin *annulus*, a ring, in *Heraldry*, granted in coat-armour to thoſe who were in confidence, or entruſted with eſpecial commiſſions by the king; the annulet, or ring, being the gage of the royal favour and protection. It is alſo borne as a mark of filiation for the fifth ſon. The colour of the *annulet* muſt always be expreſſed.

Annulets were anciently reputed a mark of nobility and juriſdiction; it being the cuſtom of prelates to receive their inveſtiture *per baculum & annulum*.

ANNULETS, in *Architecture*, are ſmall ſquare members, in the Doric capital, placed under the quarter round. They are alſo called *fillets*, *liſtels*, &c.

ANNULET is alſo uſed for a narrow flat moulding, common to other parts of a column; *viz.* the baſes, &c. as well as the capital; ſo called, becauſe it encompaſſes the column around. In which ſenſe annulet is frequently uſed for *baguette*, or *little aſtragal*.

ANNULLING, compounded of *ad* and *nullus*, *none*; q. d. *undoing*; the aboliſhing of an act, procedure, ſentence, or the like.

ANNULOSUS, in *Entomology*, a ſpecies of ICHNEUMON, found in Europe. It is black; antennæ ſlightly annulated with black; legs rufous; ſting ſhort. Linnæus and Gmelin.

ANNULUS, in *Conchology*, a ſpecies of CYPRÆA, very common about Amboyna, and alſo Alexandria. It is of an ochreous colour on the outſide, and blue within. Its ſpecific character is, ſhell ſurrounded on the back with a yellow ring. Linnæus and Gmelin. This is the thoracicum quadratum of Rumphius.

ANNULUS, in *Entomology*, a ſpecies of CASSIDA, that inhabits Cayenne. It is yellowiſh, brown in the diſk, and annulated in the middle with yellow. Fabricius, Spec. Inſ.

ANNULUS, a ſpecies of APIS, grey and downy, thorax black; and a black clouded band in the middle of the abdomen. Linnæus and Gmelin. Inhabits Europe.

ANNULUS, or *Ring*, in *Geometry*. The area of it may be had by finding the areas of the outer and inner circles, and their difference is the area required. Or, multiply the ſum of the diameters by their difference, and the product by .7854.

ANNUNCIADE, or ANNUNCIATION. This order was inſtituted by Ame VI. earl of Savoy, under the title of the *Collar*, in 1362, in honour of the fifteen divine myſteries of the roſary. Favin, on a miſtaken ground, calls it *The Order of the Manes of Love*, in regard its founder had received of his lady a bracelet made of the treſſes of her hair, plaited in love-knots; and that the Founder ſhould ſignify *frappes*, *entres*, *rompes tout*. It remained, however, as the collar, till Charles III. or Le-bon, duke of Savoy, who beſtowed on it the title of the Annunciation, from the picture of the Annunciation which he annexed to the collar. The founder appointed the number of knights to be fifteen; among whom was Sir Richard Muſard, an Engliſh gentleman, in 1434; their number was increaſed in 1568, to twenty. Riene caſtle, in Buger, was their principal ſeat. The ancient collar was of gold, three fingers broad; on which were engraved the letters F.E.R.T and one Knot, called the *Savoy Knot*, at the end of each F.E.R.T. which, with three other Knots entwined one within the other, made up the circumference pendant at the collar, without any figure. The initials were ſuppoſed to be for the words Fortitudo Ejus Rhodum Tenuit, alluding to Amadeus le Grand, who ſo valiantly defended Rhodes againſt the Turks in 1310. This, however, was long after the houſe of Savoy took that device, as appears from the coins of Lewis de Savoy, baron de Vaud, who died in 1301; as alſo from the monument of Thomas de Savoy, who died in 1233, whereon was lying at the feet of his portraiture, a dog, bearing a collar about his neck, with the word *Fert*; alſo a ſilver coin of Peter de Savoy (who erected in England the building of that name in the Strand, temp. Hen. III.) whereon is the word FERT, in Gothic characters. Duke Charles III. ſurnamed the Good, in 1518, ordered that the badge or *myſtery* of the Annunciation of the Bleſſed Virgin ſhould be repreſented within a circle of gold, formed of true-

true-lover's knots, pendant to the collar, which was to be of gold, weighing two hundred gold crowns, and compoſed of the letters F. E. R. T. intermixed with true-lover's knots, ſeparated by fifteen roſes of gold, five of them enamelled *white*, five *red*, and five partly *white and red*, and edged with two thorns gold. The knights wear in common the badge pendant to three ſmall chains of gold round the neck. The reigning king of Sardinia is ſovereign of the order.

ANNUNCIATION, compounded of *ad* and *nuncio, I declare*, the tidings which the angel Gabriel brought to the Holy Virgin, of the incarnation of Chriſt.

The Greeks call it *ευαγγελισμος, good tidings*, and *χαιρετισμος, ſalutation*.

ANNUNCIATION is alſo the name of a feaſt, celebrated annually on the 25th of March, popularly called *Lady-day*, in commemoration of that wonderful event.

Some authors are of opinion, that the feaſt was originally ſolemnized in honour of our Saviour; and that the holding it in the name and honour of the Virgin is of much later ſtanding. This feaſt ſeems to be of great antiquity. Among the ſermons of St. Auguſtin, who died in 430, we have two upon the Annunciation. Proculus, who died in 446, and Chryſoſtom in 407, have, in their works, diſcourſes on this ſubject. But the Proteſtant writers reject theſe authorities, and the writings on which they are founded, as ſpurious. Bingham refers the commencement of this feaſt to the ſeventh century.

Several of the eaſtern churches celebrate the Annunciation at a different ſeaſon from thoſe of the weſt. The Syrians call it *Baſcarach*, q. d. *ſearch, inquiry;* and mark it in the calendar for the firſt day of December. The Armenians hold it on the fifth of January: thus anticipating the time, to prevent its falling in Lent; but the Greeks make no ſcruple of celebrating the feſtival even in Lent. In the weſt likewiſe, there has been ſome variation as to the time of keeping this feaſt. The tenth council of Toledo, in 636, ordained it to be celebrated eight days before Chriſtmas.

The Jews alſo give the title Annunciation to part of the ceremony of their paſſover; *viz.* that, wherein they explain the origin and occaſion of that ſolemnity. This explanation they call הגדה, *Haggada*, q. d. the *Annunciation*.

ANNUNCIATOR, in the *Greek Church*, an officer whoſe buſineſs is to give notice of the feaſts and holydays to be obſerved.

ANNUNTIATE, ANNUNTIADA, or ANNUNTIATA, a denomination common to ſeveral orders, both religious and military; inſtituted with a view to the Annunciation. The firſt religious order of this kind was inſtituted in 1232, by ſeven Florentine merchants. Theſe are alſo called *ſervites*, q. d. *ſervants*.

The ſecond was a nunnery at Bourges, founded in 1500, by Joan of Valois, queen of France, after her divorce from Lewis XII.

The third was alſo a nunnery, founded by a Genoeſe lady in 1604. The fourth was a friary, founded by Cardinal Torrecremata, at Rome, in 1460; which laſt became ſo very rich, that they gave fortunes of 60 Roman crowns to above four hundred girls, on the anniverſary of the Annunciation.

ANNY, in *Geography*, a river of France, on the coaſt of the Engliſh channel, north of the river Soame, and ſouth from Boulogne.

ANOA, in *Zoology*, BOS *bubalus anoa*, a variety of the buffalo, mentioned by Pennant, Hiſt. of Quadr. vol. i. p. 30. This animal is about the ſize of a middling ſheep; it inhabits the mountains of Celebes; is very fierce, lives in ſmall herds, ſheltering itſelf in the caverns of the mountains; is caught with difficulty, and is very impatient of confinement.

ANOBIUM, in *Entomology*, a genus of COLEOPTEROUS inſects, in the Fabrician ſyſtem, having four clavate palpi, or feelers; jaws obtuſe and dentated; lip entire; and antennæ filiform; with the three extreme joints elongated, and rather thicker than the others. Fabricius. This genus includes ſome inſects of the PTINUS and DERMESTES genera, of the Linnæan ſyſtem, and BYRRHUS of Geoffroy; beſides ſome new ſpecies not deſcribed by either. In the *Species Inſectorum*, the ſpecies of this genus are, pertinax, molle, frumentarium, flavipes, nigrum, lineatum, cyaneum, & minutum, in all eight ſpecies: the arrangement in the laſt ſyſtem of that author, *Entomologia Syſtematica*, is ſomewhat different, being teſſellatum, ſtriatum, rufipes, caſtaneum, pertinax, boleti, molle, paniceum, abietis, planum, capenſe, minutum, micans, & nitidum.

Olivier adopts the genus ANOBIUM after Fabricius, deſcribing the ſpecies teſſellatum, ſtriatum, caſtaneum, & paniceum, as inſects of that genus; and Gmelin, in the Syſtema Naturæ, makes the firſt diviſion of the PTINUS of Linnæus, "palpis clavatis," (clavate feelers), ANOBIUM of Fab. to diſtinguiſh them from the true *ptini* which have the feelers filiform. Profeſſor Thunberg has alſo deſcribed ſeveral ſpecies of anobium in his Nov. Inſ. as rufipes, cœruleum, &c. but which Gmelin conſigns to the DERMESTES genus in the Linnæan ſyſtem.

ANOCHUS, an imaginary name of a *medicine*, concerning which many fruitleſs conjectures have been made. The word occurs only in Gaza's tranſlation of the account which Theophraſtus has left us of the EUONYMUS of thoſe times. The author ſays, that the goats which eat the leaves and fruit of the euonymus were killed by it, and that they died of a ſtoppage of the bowels, which he has expreſſed by the word *ανοχω*, derived from the verb *ανεσχειν*, which ſignifies a retention of the ſtools.

It is to be obſerved by the way, that the euonymus of the Greeks could not be the ſame plant known at this time by that name, ſince the cattle eat our euonymus or *fuſanus* whenever they can get it, and that without any danger; but the deſcriptions of theſe plants in the ancient and modern authors ſhew alſo that they were very different.

ANOCTORON, in *Eccleſiaſtical Hiſtory*, a name uſed by ſome writers for a church.

Anoctora properly import Roman halls, divers of which were converted into churches. In which ſenſe *anoctora* amount to much the ſame with BASILICÆ.

ANOCYSTI, in *Natural Hiſtory*, the name of one of the ſubdiviſions of the ECHINUS genus, in the arrangement of Klein and other naturaliſts; conſiſting of ſuch as have the vent at the top of the ſhell, and all the tentacula ſimple, (ano verticali, tentaculis undique ſimplicibus). This is the firſt of the three principal diviſions of the echini in the Linnæan ſyſtem, by Gmelin; the ſecond is BRISSI of Müller, in which the vent is ſituated at the bottom of the ſhell, and the mouth deſtitute of tentacula; the third is SPATANGI of Müller, having the vent on the ſide, and the mouth furniſhed with pencilled tentacula. Each of theſe diviſions are again ſubdivided according to the ſhape of the ſhell. See ECHINUS.

ANODA, in *Botany*. See SIDA.

In Gmelin's edition of Linnæus, *anoda* is a genus of the *monadelphia polyandria* claſs and order; the characters of

which are, that the *calyx* is ſimple, ſemiquinquefid, permanent, and very much dilated by the ripe fruit; and the *capſule* is many-celled, above hemiſpherical, beneath ſtellate-plane, with ſingle-ſeeded cells. There are three ſpecies. 1. A. *dilleniana*, with triangular leaves, the lower crenated, the upper obſoletely crenated and petiolated, with peduncles axillary, ſingle-flowered, and very long. 2. A. *haſtata*, ſida crilata, with cordated, angulate leaves; the upper elongated and hadated, with very long, axillary, and ſingle-flowered peduncles. 3. A. *triloba*, with the inferior leaves cordated, ſomewhat angulate and crenated; the upper trilobed, with axillary, ſolitary, very long, and ſingle-flowered peduncles.

ANODYNE, derived from the privative α, and ὀδυναω, *doleo, to be in pain*, in *Phyſic*, is underſtood of ſuch remedies, as calm and aſſuage pain. It is now generally employed for thoſe medicines which relieve pain by diminiſhing or deſtroying ſenſibility; and in this ſenſe, the general term is allowable.

Anodynes are of two kinds; the firſt proper, called alſo *paregorics*. The ſecond ſpurious, or improper, which rather ſtupefy than alleviate; acting only by inducing a ſtupor, drowſineſs, or ſleep. Theſe are more properly called *narcotics*, *hypnotics*, or *opiates*.

The true *anodynes* are applied externally to the part affected. Such, among the claſs of ſimples, are the onion, lily, root of mallows, leaves of violets, elder, &c. Camphor is ſaid to be the beſt anodyne in nervous caſes, and at the decline of fevers.

Anodynes ſhould not be given without great caution, nor on a full ſtomach, nor in dropſies. Hemlock procures eaſe and ſleep, without cauſing that head-ach next morning, uſually complained of after taking opium. If the pulſe be ſtrong, a larger doſe is ſafe; if weak, a leſs doſe muſt be given.

We have alſo certain compound medicines in the ſhops, prepared with this intention, and called by this name. Such is the *anodyne liniment*, commonly called *anodyne balſam*, prepared in the following manner: take of opium one ounce, white Caſtile ſoap four ounces, camphor two ounces, eſſential oil of roſemary half an ounce, and rectified ſpirit of wine two pounds; digeſt the opium and ſoap in the ſpirit for three days; then to the ſtrained liquor add the camphor and oil, diligently ſhaking the veſſel. It is recommended not only for procuring eaſe in the moſt racking extremities of pain, but alſo for aſſiſting in diſcharging the peccant matters that occaſioned it. This balſam is much the ſame with the modern *opodeldoc*. A ready way of preparing an uſeful, ſafe, and efficacious *anodyne*, is as follows: take half an ounce of opium, diſſolve it in a gentle heat in three ounces of water, ſtrain the ſolution, and evaporate it to a dry ſubſtance; grind this to powder in a glaſs mortar with twice the quantity of loaf-ſugar, and you have an excellent preparation of opium, to be given three or four grains for a doſe. Shaw's Lect. p. 233.

By diſſolving the opium thus in water, we get rid, not only of its groſs and foul parts, but alſo of its reſinous, which are found much more pernicious than the reſt; and by dividing its parts afterwards with ſugar, the medicine is rendered more uniform, reſoluble, and miſcible with animal fluids.

But however opium is prepared, it ſtill muſt be acknowledged, that it retains qualities that make it little leſs than a poiſon in a very large doſe; whence it were much to be wiſhed ſomething could be found that would be more innocent, and yet anſwer the ſame purpoſe. And this camphor and nitre will do on many, though not on all occaſions.

An *anodyne* ointment may be prepared, by mixing ten drams of olive oil, half an ounce of yellow wax, and one dram of crude opium. Opium, thus externally applied, will in ſome degree produce the ſame effect, as when it is uſed under the form of anodyne balſam, in which ſtate it produces effects more immediately; but under this form, its effects are more permanent. The preſent ointment alſo furniſhes an uſeful dreſſing for ſores attended with ſevere pain. For Hoffman's anodyne, ſee LIQUOR *Mineralis Anodynus*.

ANOINTED. See CHRIST, and MESSIAH.

ANOINTERS, in *Eccleſiaſtical Hiſtory*, a religious ſect formerly ſubſiſting in ſome parts of England, ſo called from the ceremony they uſed in anointing all perſons before they admitted them into their church. They founded their opinion of anointing upon the fifth of James, verſes 14 and 15. See Plott's Oxfordſh. 208.

ANOINTING, *a term uſed by painters*. It implies their method of reſtoring the effect of the colours, after the oil has been drained out of them, by the abſorption of the ground of the picture, or the former coat or layer of colours, whilſt they were drying, termed improperly the ſinking of the colours. This anointing is performed by means of varniſh, oil, or both together, rubbed in with an hard hogs hair tool. Beſides reſtoring the appearance of the colours, it has another effect; that of diſpoſing the picture to receive with advantage the future touches of the bruſh or pencil. When the anointing is newly laid on, it promotes ſoftneſs and union; and when almoſt, but not perfectly dry, it diſpoſes the picture to receive ſmart or crank touches. Some painters have been more liberal in the quantity of varniſh, &c. in anointing than may be judicious; too much oil ſhould not be applied to the more brilliant and lighter parts of pictures; nor ſhould japanners' gold-ſize be introduced in anointing, unleſs with great caution.

Without an application of this nature, it would be almoſt impoſſible for the painter of delicate works to proceed with any degree of certainty. The beſt mixture for this purpoſe, is an equal quantity of ſtrong drying oil and maſtich varniſh united. This will retain its clammy nature long enough for the purpoſe of the artiſt, while he covers with paint the anointed portion.

Thoſe who proceed more ſlowly with the pencil than is uſual, will do well to uſe a little *fat* linſeed oil with the mixture we have mentioned, which will not ſo ſoon grow hard or dry. Gerrard Laireſſe, whoſe pictures retain their colours, has recommended this mixture with fat oil, upon retouching pictures; and this in a plentiful manner, in order that the picture may not require varniſhing. On the contrary, Mr. Bardwell recommends the anointing as neceſſary, but that almoſt the whole ſhould be wiped off with an old ſilk handkerchief, before the paint is applied to the picture. The glazing colours ſhould in general be applied with a liberal uſe of the anointing mixture; and thoſe colours which are uſed in the ſcumbling of pictures ſhould be employed more ſparingly. See GLAZING and SCUMBLING. Titian appears to have proceeded in this manner with his pictures, and to have thus produced his moſt admirable effects.

ANOLE, in *Zoology*, the name of a ſpecies of lizard common in the Weſt Indies, about houſes and plantations. It is of the ſize of the common lizard of Europe, but its head is longer; its ſkin is of a yellowiſh colour, and its back variegated with green, blue, and grey lines running from the neck to the tail. They creep into holes for the night, and there make a continual and very diſagreeable noiſe; in the day time, they are always in motion.

ANOLYMPIADES, in *Antiquity*, a name given by the Eleans to thoſe Olympic games which had been celebrated under

under the direction of the Piſæans and Arcadians. The Eleans claimed the ſole right of managing the Olympic games, in which they ſometimes met with competitors. The hundred and fourth Olympiad was celebrated by order of the Arcadians, by whom the Eleans were at that time reduced very low; this, as well as thoſe managed by the inhabitants of Piſa, they called *ανολυμπιαδας*, unlawful Olympiads, and left them out of their annals, wherein the names of the victors, and other occurrences, were regiſtered. Potter, Arch. Græc.

ANOMALA, in *Conchology*, a ſpecies of PATELLA, in the family "integerrimæ abſque vertice mucronato." It is a coarſe, brown, orbicular ſhell, with the vertex ſubmarginal; and inhabits the deeps of the Norway ſeas. Müll. This ſhell is minute and rough, with fine elevated dots; ſometimes of a cinereous colour, and blue beneath. The animal conſiſts of two reddiſh, tough, twiſted maſſes, which are fringed the whole length; the fringes are yellow, compoſed of rigid hairs, and connected with the reſt of the body by a blue tendon; the ovaries are ramoſe, and orange; the eggs globoſe. It is uncertain whether this ſhell belongs to the patella genus or not. Müll. Gmelin.

ANOMALISTICAL *Year*, in *Aſtronomy*, called alſo *periodical year*, is the ſpace of time in which the earth paſſes through her orbit.

The anomaliſtical, or common year, is ſomewhat longer than the tropical year; by reaſon of the PRECESSION of the equinox. The apſes of all the planets have a ſimilar progreſſive motion; whence they take a longer time in arriving at the aphelion, which has advanced a little, than in attaining to the ſame fixed ſtar. *E. G.* The tropical revolution of the ſun, with reſpect to the equinox, is $365^d\ 5^h\ 48'\ 45''$; but the ſidereal revolution, or return to the ſame fixed ſtar, is $365^d\ 6^h\ 9'\ 10\frac{1}{2}''$; and the anomaliſtic revolution is $365^d\ 6^h\ 15'\ 20''$, becauſe the ſun's apogee advances each year $65\frac{1}{2}''$ with reſpect to the equinoxes; and the ſun cannot arrive at the apogee till he has paſſed over $65\frac{1}{2}''$ more than the revolution of the year anſwering to the equinoxes. To find the anomaliſtic revolution, uſe this proportion: As the whole ſecular motion of a planet, *minus* the motion of its aphelion, is to 100 years, or 3155760000 ſeconds, ſo is 360° to the duration of the anomaliſtic revolution.

ANOMALOUS, *irregular*, ſomething that deviates from the ordinary rule and method of other things of the ſame kind.

The word is not compounded of the privative *α* and *νομος*, *law*, as is uſually imagined; for whence, on ſuch ſuppoſition, ſhould the laſt ſyllable *al*, ariſe? But it comes from the Greek *ανωμαλης*, *uneven*, *rough*, *irregular*, formed of the privative *α* and *ομαλος*, *plain*, *even*.

ANOMALOUS *verbs*, in *Grammar*, are ſuch as are irregular in their conjugations; deviating from the rules or formulas obſerved by others.

There are anomalous verbs, or irregular inflexions of verbs, in all languages. In the Engliſh, the chief irregularity of our anomalous verbs lies in the formation of the preter tenſe, and paſſive participle; though this only holds of the native Teutonic or Saxon words, and not of the foreign words, borrowed from the Latin, French, &c.

The principal irregularity ariſes from the quickneſs of our pronunciation, whereby we change the conſonant *d* into *t*, cutting off the regular ending *ed*.

Thus for *mixed*, we write *mixt* or *mix'd*; for *dwelled*, *dwelt*, or *dwell'd*; for *ſnatched*, *ſnatcht*, &c. But this property is rather of the nature of a contraction than an irregularity; and is complained of by ſome of our politer writers as an abuſe, to the diſadvantage of our language, tending to diſfigure it, and turn a tenth part of our ſmoothеſt words into cluſters of conſonants; which is the more inexcuſable, becauſe our want of vowels has been the general complaint of the beſt writers.

Another irregularity relates to the preter tenſe, and paſſive participle. Thus *give*, if it were regular, or formed according to the rule, would make *gived*, in the preter tenſe, and the paſſive participle; whereas it makes *gave* in the preter tenſe, and *given* in the paſſive participle.

ANOMALY, in *Grammar*, denotes an irregularity in the accidents of a word, whereby it deviates from the common rules of paradigms, whereby other words of the like kind are governed.

ANOMALY, in *Aſtronomy*, is an irregularity in the motion of a planet, whereby it deviates from the *aphelion* or *apogee*, or the angular diſtance of a planet from the APHELION or APOGEE; that is, the angle formed by the line of the apſides, and another line drawn through the planet.

Kepler diſtinguiſhes three kinds of *anomaly*; *mean*, *eccentric*, and *true*.

ANOMALY, *mean*, or *ſimple*, in the *Ancient Aſtronomy*, is the diſtance of a planet's mean place from the apogee, which Ptolemy calls the angle of mean motion.

In the modern aſtronomy, it is the time in which a planet, deſcribing an ellipſe APQ (*Plate* I. *Aſtronomy*, *fig.* 9.), round the ſun in the focus, moves from its aphelion A, to the mean place or point of its orbit P; or, it is the angular diſtance of the planet at a given time from the aphelion, ſuppoſing that it had moved uniformly with its mean angular velocity.

Hence, as the elliptic area ASP, is proportional to the time in which the planet deſcribes the arc AP; the area may repreſent the mean anomaly. Or thus, the area ASN, found by drawing a line IP through the planet's place, perpendicular to the line of the apſides AQ, till it cuts the circle AVQ, and drawing the line SN, may repreſent the mean anomaly; for this area is every where proportional to the former area ASP, as is demonſtrated by Dr. Gregory, Phil. Tranſ. N° 447. Or, if ST be drawn perpendicular to the radius NC produced, then the mean anomaly will be proportional to ST + the circular arc AN, as Keil has demonſtrated in his "Aſtronomical Lectures," Lect. II. Hence, if ND be taken equal to ST, the arc AD, or the angle ACD, will be the mean anomaly for practical purpoſes, expreſſed in the degrees of a circle; the number of thoſe degrees being to 360°, as the elliptic trilineal area ASP, is to the whole area of the ellipſe; and the degrees of mean anomaly are thoſe contained in the arc AD, or angle ACD.

ANOMALY *of the eccentric*, or *of the centre*, in the *Modern Aſtronomy*, is an arc AK, of the eccentric circle (*fig.* 9.), included between the aphelion A, and a right line NI, drawn through the centre of the planet P, perpendicularly to the line of the apſides AQ; or, it is the angle ACN at the centre of the circle. Hence the eccentric anomaly is to the mean anomaly, as AN to AN + ST; or, as AN to AD; or, as the angle ACN to the angle ACD.

In the *Ancient Aſtronomy*, it is an arc of the zodiac, terminated by the line of the apſides, and the line of the mean motion of the centre. See the methods of finding the *anomaly of the eccentric*, in Phil. Tranſ. N° 447.

ANOMALY, *true*, or *equated*, is the angle at the ſun ASP, under which a planet's diſtance AP from the aphelion appears; or, it is the angle or area, taken proportional to the time in which the planet moves from the mean place P, to its aphelion A; or, in other words, it is the angle formed by

the radius vector, or line SP, drawn from the ſun to the planet, with the line of the apſides.

Hence, in the ſun's motion, it will be the diſtance of his true place from the apogee.

The true *anomaly* being given, the mean one is eaſily found. But it is much more difficult to find the *true* anomaly from the *mean* anomaly given, at leaſt by any direct proceſs. Kepler, who firſt propoſed this problem, and from whom it is called "Kepler's Problem," could not find a direct method of reſolving it, and therefore uſed an indirect one, by the rule of falſe poſition; as may be ſeen in Kepler's Epitom. Aſtron. Copern. p. 695. See alſo Wolfius's Elem. Aſtron. apud Oper. § 692, &c. tom. iii. p. 47. For the angle ASP, which is the true anomaly, being given, the point P will be given, and conſequently the proportion of the area ASP to the whole ellipſe, or of the mean anomaly to 360°. For the further illuſtration of this ſubject, let a body move uniformly in the circle from A to D with the mean angular velocity of the body in the ellipſe, whilſt the body moves in the ellipſe from A to P; then, from what has been above ſtated, the angle ACD is the *mean*, and the angle ASP the *true* anomaly; and the difference of theſe two angles is called the equation of the planet's centre, or PROSTHAPHERESIS. Let p = the periodic time in the ellipſe or circle (the periodic times being ſuppoſed equal), and t = the time of deſcribing AP or AD; then, as the bodies in the ellipſe and circle deſcribe equal areas in equal times, about S and C reſpectively, we have the area ADC : area of the circle :: $t : p$, and area of the ellipſe : area ASP :: $p : t$; alſo the area of the circle : area of the ellipſe :: area ASN : area ASP; conſequently the area ADC : area ASP :: area ASN : area ASP, and hence ADC = ASN; from both which, let the area ACN, which is common, be taken away, and the area DCN = SNC; but DCN = $\frac{1}{2}$DN × CN, and SNC = $\frac{1}{2}$ST × CN; therefore ST = DN. Now if t be given, the arc AD will be given; for as the body in the circle moves uniformly, we have $p : t$ :: 360° : AD. Thus we always find the mean anomaly at any given time, provided that the time be known when the body was in the aphelion; hence, by finding ST or ND, we ſhall know the angle NCA, called the *eccentric* anomaly, from whence, by one proportion, we ſhall be able to find the angle ASP the *true* anomaly. The problem is therefore reduced to this; to find a triangle CST, ſuch, that the angle C + the degrees of an arc equal to ST may be equal to the given angle ACD. This may be expeditiouſly done by trial in the following manner, given by M. de la Caille in his Aſtronomy. Find what arc of the circumference of the circle ADQE is equal to CA, by ſaying, 355 : 113 :: 180° : 57° 17′ 44″, 8 the number of degrees of an arc equal in length to the radius CA: hence CA : CS :: 57° 17′ 44″, 8 : the degrees of an arc equal to CS. Aſſume, therefore, the angle SCT, multiply its ſine into the degrees in CS, and add it to the angle SCT, and if it equal the given angle ACD, the ſuppoſition was right; if not, add or ſubtract the difference to or from the firſt ſuppoſition, according as the reſult is leſs or greater than ACD, and repeat the operation, and in a very few trials you will obtain the accurate value of the angle SCT. The degrees in ST may be moſt readily obtained by adding the logarithm of CS to the logarithm of the ſine of the angle SCT, and ſubtracting 10 from the index, and the remainder will be the logarithm of the degrees of ST.

Having found the value of AN, or of the angle ACN, the *eccentric* anomaly, we may proceed to find the angle ASP, or the *true* anomaly.

Let v be the other focus, and put AC = 1; then by Euclid. b. ii. prop. 12. $\overline{SP^2 - Pv^2} = \overline{vS^2 + 2vS \times vI} = \overline{vS + 2vI} \times vS = 2Cv + 2vI \times 2SC = 2CI \times 2SC$; hence $SP + Pv : 2CI :: 2SC : SP - Pv$; or $2 : 2CI :: 2SC : \overline{SP - 2} - SP$, or $1 : CI :: SC : SP - 1$; hence $SP = 1 + CS \times CI = 1 + CS \times$ cof. ACN. By plain trigonometry, $\frac{1 - \text{cof. ASP}}{1 + \text{cof. ASP}} = \overline{\text{tang. } \frac{1}{2}\text{ASP}}^2$. See Mauduit's Trig. or Crackelt's Tranſl. ch. i. Th. 6. But SP, or $1 + CS \times$ cof. ACN : rad. = 1 :: SI, or CS + CI, or CS + cof. ACN : cof. ASP = $\frac{\text{CS} + \text{cof. ACN}}{1 + \text{CS} \times \text{cof. ACN}}$.

Hence $\overline{\text{tang. } \frac{1}{2}\text{ASP}}^2 \left(= \frac{1 - \text{cof. ASP}}{1 + \text{cof. ASP}}\right) =$

$$\frac{1 + \text{CS} \times \text{cof. ACN} - \text{CS} - \text{cof. ACN}}{1 + \text{CS} \times \text{cof. ACN} + \text{CS} + \text{cof. ACN}} =$$

$$\frac{1 - \text{CS} + \text{cof. ACN} \times \overline{\text{CS} - 1}}{1 + \text{CS} + \text{cof. ACN} \times \overline{\text{CS} + 1}} = \frac{\text{SQ} - \text{cof. ACN} \times \text{SQ}}{\text{SA} + \text{cof. ACN} \times \text{SA}} =$$

$$\frac{1 - \text{cof. ACN}}{1 + \text{cof. ACN}} \times \frac{\text{SQ}}{\text{SA}} = \text{(by the above theorem in Trigon.)}$$

$\overline{\text{tang. } \frac{1}{2}\text{ACN}}^2 \times \frac{\text{SQ}}{\text{SA}}$; therefore $\sqrt{\text{SA}} : \sqrt{\text{SQ}}$ :: tang. $\frac{1}{2}$ACN : tang. $\frac{1}{2}$ASP; conſequently, as ACN is known, we obtain ASP the *true* anomaly. *E. G.* Required the true place of Mercury on Auguſt 26, 1740, at noon, the equation of the centre, and its diſtance from the ſun. By M. de la Caille's Aſtronomy, Mercury was in its aphelion on Auguſt the 9th at 6^h 37′. Hence, on Auguſt the 26th, it had paſſed its aphelion 16^d 17^h 23′; therefore, 87^d 23^h 15′ 32″ (the time of one revolution): 16^d 17^h 23′ :: 360° : 68° 26′ 28″, the arc AD, or mean anomaly. Now (according to this author), CA : CS :: 1011276 : 211165 :: 57° 17′ 44″, 8 : 11° 57′ 50″ = 43070″, the value of CS reduced to the arc of a circle, the log. of which is 4.6341749. Alſo, 68° 26′ 28″ = 246388″. Aſſume the angle SCT to be 60° = 216000″, and the operation to find the angle ACN will ſtand thus:

4.6341749			
9.9375306	log. of	-	216000 = a
4.5717955	-	-	37300
			253300
			246388
			6912 = b
4.6341749			
9.9287987	-	-	209088 = $a - b$ = 58° 4′ 48″ = c
4.5629736	-	-	36557
			245645
			246388
			743 = d
4.6341749			
9.9297694	-	-	209831 = $c + d$ = 58° 17′ 11″ = e
4.5639443	-	-	36639
			246470
			246388
			82 = f

4.6341749		
9.9296626	- -	$209749 = e - f = 58° 15' 49'' = g$
4.5638375	- -	36630
		256379
		246388
		$9 = b$

Hence, as the difference between the value deduced from the assumption and the true value is now diminished about 9 times every operation, the next difference would be 1″; if, therefore, we add b to g, and then subtract 1″, we get 58° 15′ 57″ for the true value of the angle ACN, the *eccentric* anomaly. Hence we may find the true anomaly ASP from the proportion above given, by logarithms, in the following manner:

Log. tang. 29° 7′ 58″½ ($\frac{1}{2}$ACN) - - -	9.7461246
$\frac{1}{2}$ Log. SQ = CA − CS = 1011276 − 211165	2.9515751
	12.6976997
$\frac{1}{2}$ Log. SA = CA + CS = 1011276 + 211165 = 122441 - - - - - - -	3.0436141
Log. tang. 24° 16′ 15″ ($\frac{1}{2}$ASP) - -	9.6540856

Hence the *true* anomaly is 48° 32′ 30″. Since the aphelion A was in 8ˢ 13° 54′ 30″, the true place of Mercury was 10ˢ 2° 27′. And hence 68° 26′ 28″ − 48° 32′ 30″ = 19° 53′ 58″, the *equation of the centre*. Also SP = 1 + CS × cos. ACN = 1, 16983 the distance of Mercury from the sun, the radius of the circle, or the mean distance of the planet, being unity.

As the bodies at D and P are supposed to have departed from A at the same time, and will coincide again at Q, ADQ and APQ being performed in half the time of a revolution; and as at A the planet moves with its least angular velocity, therefore from A to Q, or in the first six signs of anomaly, the angle ACD will be greater than ASP, or the *mean* will be greater than the *true* anomaly; but from Q to A, or in the last six signs, as the planet at Q moves with its greatest angular velocity, the *true* will be greater than the *mean* anomaly. When the eccentricity, and consequently the angle NCD, is very small, as in the orbits of Venus and the earth, ND, considered as very nearly a straight line, will be equal and parallel to ST; in which case SD is parallel to CN, and consequently the angle NCD = CDS. In the triangle DCS, the two sides DC and CS, and the included angle DCS, the supplement of DCA, are known; and hence we can find the angle CDS or DCN. If DCN be not greater than 1½°, the conclusion will be accurate to a second. When the angle DCN is not very small, M. Cassini, in his "Elements of Astronomy," p. 144, has given the following method of finding it: draw Dz perpendicular to ST, and Tz is the sine of the arc DN; consequently Sz is the difference between the arc DN and its sine, or between the arc of the angle CDS and its sine; compute, therefore, the angle CDS, and from a table shewing the difference between the arcs of a circle and their sines, to a given radius, take the difference between the arc and its sine; say SD : Sz :: rad. : sine SDz, which subtract from the angle SDC, and you have the angle zDC, or the alternate angle DCN. The rest of the operation is the same as before.

E. G. To find the *true* anomaly of Mercury, the *mean* being 60°. Let the mean distance of Mercury be 100000, and the eccentricity CS will be 20878, according to Cassini; hence, in the triangle DCS, DC = 100000, CS = 20878, and the angle DCS = 120°; therefore DC = 111905, and the angle SDC = 9° 17′ 52″, corresponding to which, in such a table as that just mentioned, will be the value of Sz = 7120; hence, 111905 : 71 :: rad. : sine of SDz = 2′ 11″, which, subtracted from 9° 17′ 52″, leaves 9° 15′ 41″ for the angle DCN, which, subtracted from 60°, leaves 50° 44′ 19″ for the angle NCA. Hence,

Log. tang. 25° 22′ 9″ - - - - -	9.6759392
$\frac{1}{2}$ Log. SQ = 79122 - - - - -	2.449.486
	12.125087 8
$\frac{1}{2}$ Log. SA = 120878 - - -	2.5411738
Log. tang. 20° 59′ 18″ - - - - -	9.5839140

Consequently the true anomaly is 41° 58′ 36″; and the equation of the centre is 18° 1′ 24″.

The first geometrical solution of Kepler's problem, was that of Dr. Wallis, by means of the protracted cycloid; which was also effected in a similar manner by Sir Isaac Newton, Principia, lib. i. prop. 31. But these methods being unfit for the purpose of the practical astronomer, many approximations have been given by various series; of these, several have been proposed by Sir Isaac Newton in his "Fragmenta Epistolarum," p. 26; and also in the scholium to the proposition above-mentioned, which is the best, as it is adapted not only to the planets, but also to the comets, whose orbits are very eccentric. Dr. Gregory, in his "Astron." lib. iii. has also given the solution by a series; as well as M. Reyneau, in his "Analyse Demontrée," p. 713, &c. The method ascribed by some writers to Dr. Seth Ward, professor of astronomy at Oxford, and published in his "Astronomia Geometrica," in 1654, though M. de la Lande observes, that it is given both by Ward and Mercator to Bullialdus, is less accurate than such as have been already given in this article; and yet it may serve, in many cases, as an useful approximation. He assumed (*fig.* 10.) the angular velocity about the other focus v to be uniform, which is not strictly true, and therefore made it represent the mean anomaly. Produce vP, and take $Pr = PS$; then in the triangle Svr, $rv + vS : rv - vS ::$ tang. $\frac{1}{2}\overline{vSr + vrS}$: tang. $\frac{1}{2}\overline{vSr - vrS}$; but $\frac{1}{2}\overline{rv + vS} = \frac{1}{2}AQ + \frac{1}{2}vS = AS$, and $\frac{1}{2}\overline{rv - vS} = \frac{1}{2}AQ - \frac{1}{2}vS = SQ$; also tang. $\frac{1}{2}\overline{vSr + vrS}$ = tang. $\frac{1}{2}$ AvP, and $\frac{1}{2}\overline{vSr - vrS} =$ (as $Pr = PS$) $\frac{1}{2}\overline{vSr - PSr} = \frac{1}{2}$ASP. Hence the aphelion distance : the perihelion distance :: tang. of ½ the *mean* anomaly : tang. ½ *true* anomaly. This is called "the simple elliptic hypothesis," and was used by Dr. Halley in constructing his "Tabula pro expediendo calculo æquationis centri Lunæ." This method is not sufficiently accurate, when the orbit is very eccentric, as in that of the planet Mars, which Bullialdus has shewn in his defence of the "Philolaic Astron." against Dr. Ward. However, when Newton's correction is made, as in the scholium above-mentioned, and the problem resolved according to Ward's hypothesis, Sir Isaac affirms, that, even in the orbit of Mars, there will scarce ever be an error of more than one second.

Although the indirect methods above given, are in general the best for practice, we shall here subjoin the direct method of Dr. Keill, as the most simple, and because it may frequently be applied to advantage. Let the arc ND (*fig.* 9.) = y, e = the sine of AD, f = the cosine, SC = g. Then by trigonometry, the sine of NA $= y - \frac{y^3}{2.3} +$ &c. and cosine $= 1 - \frac{y^2}{2} + \frac{y^4}{2.3.4} -$ &c. hence the sine of AN $= e -$

fy

$f = 1 - \frac{e^2}{2} + \frac{e^4}{2.3.4}$ - &c. Alfo rad. = 1 : fin. AN or ∠ SCT :: SC = g : ST or ND or $y = ge - gfy - \frac{gey^2}{2} + \frac{gfy^3}{3} + \frac{gey^4}{2.3.4}$ − &c. hence $ge = y + gfy + \frac{gey^2}{2} - \frac{gfy^3}{2.3} - \frac{gey^4}{2.3.4}$ + &c. Put $ge = z$, $1 + gf = a$, $\frac{ge}{2} = b$, $\frac{gf}{2.3} = c$, $\frac{ge}{2.3.4} = d$, &c. hence $z = ay + by^2 - cy^3 - dy^4$ + &c. and by the reverfion of feries, $y = \frac{z}{a} - \frac{bz^2}{a^3} + \frac{2b^2 - ac}{a^5} \times z^3 - \frac{5ab^2 - 5abc + a^2 d}{a^7} \times z^4$ &c. but $b = \frac{ge}{2} = \frac{z}{2}$, $d = \frac{z}{2.3.4}$, &c. therefore $y = \frac{z}{a} - \frac{z^3}{2a^3} + \frac{cz^3}{a^4} - \frac{5cz^5}{2a^6}$ &c. If the arc AN be greater than 90° and lefs than 270°, f becomes negative, and therefore gf or c will be negative; hence $y = \frac{z}{a} - \frac{z^3}{2a^3} - \frac{cz^3}{a^4} + \frac{5cz^5}{2a^6}$ &c. Now to reduce the value of y into degrees, we know that an arc equal to radius, or unity, is equal to 57.29578 degrees = r; hence 1 : r :: $\frac{z}{a} - \frac{z^3}{2a^3} + \frac{cz^3}{a^4}$ − &c. : the degrees of the arc $y = \frac{rz}{a} - \frac{rz^3}{2a^3} + \frac{rcz^3}{a^4}$ − &c. For the orbit of the earth, the firft term will be fufficient, not differing from the truth the ten thoufandth part of a degree. In other cafes it may be neceffary to take more terms.

Ex. Let the eccentricity of the earth's orbit be 0.01691, the mean diftance being = 1, and the mean anomaly 30°; to find the true anomaly.

Log. of g - - - -	8.2281436
Log. fin. of e = 30° - -	9.6989700
Log. of r - - - -	1.7581226
Log. of rge, or rz - -	9.6852362
Log. of a - - - -	0.0063137
Log. of $\frac{rz}{a}$ - - - -	9.6789225 - - the

natural number correfponding to which, being a decimal, is 0°, 47744 = 28′ 38″ = y, which is true to a fecond; therefore AN = 29° 31′ 22″; hence

Log. tan. 14° 45′ 41″ -	9.4207651
½ Log. SQ = 98309 -	2.4962966
	11.9170617
½ Log. SA = 101691 -	2.5031412
Log. tan. 14° 32′ 25″ - -	9.4139205

Hence the *true* anomaly is 29° 4′ 50″; confequently the equation of the centre is 55′ 10″. See Keill's Aftronomical Lectures, Lecture xxii. Vince's Aftronomy, vol. i. p. 104—112.

ANOMIA, in *Conchology*, the name of an extenfive genus of bivalves, of which fome of the foffil fpecies were firft defcribed by Columna, as conchæ rariores anomiæ. The name *anomia* was retained by Woodward in his arrangement of foffil fhells; after which three of the recent fpecies were figured and defcribed by Gualteri, in his new genus terebratula; but Linnæus adopted the name Columna had given to the foffil kinds in preference to terebratula; and it has been in general adhered to by later conchologifts, in defcribing the recent as well as foffil kinds of this family of fhells.

The genus anomia is concifely defined by fome authors as a fhell inequivalve, one valve gibbous towards the beak, the other flat, and perforated near the hinge. The character in the Syftema Naturæ, is the fhell inequivalve, one valve being flattifh, and the other gibbous at the bafe, and one of them ufually perforated near the bafe; the hinge has a linear prominent cicatrix, and a lateral tooth within on the margin of the flat valve, and there are two bony rays for the bafe of the animal. The animal, which had been very imperfectly known, is defcribed by Gmelin, from which it appears to be of a new genus; the body is thin and flender, emarginated, and ciliated or fringed; the hairs affixed to the upper valve; and it has two arms, which are linear and longer than the body. Some conchologifts feparate the foffil kinds from thofe which are found in a recent ftate. Linnæus, and after him, Gmelin, arrange them together in the following order: craniolaris, pectinata, ephippium, cepa, electrica, fquamula, patelliformis, fcobinata, aurita, retufa, gryphus, pecten, ftriatula, truncata, reticularis, plicatella, crifpa, lacunofa, pubefcens, fareta, caput ferpentis, terebratula, angulata, hyfterita, biloba, placenta, fella, fpinofa, aculeata, muricata, fquama, punctata, undulata, capenfis, detruncata, fanguinolenta, vitrea, cranium, dorfata, pfittacea, tridentata, fpondylodes, ventricofa, gryphoides, flexuofa, rugofa, cylindrica, nucleus, avenacea, & fandalium, which fee refpectively.

ANOMOEANS, Anomoei, in *Church Hiftory*, a fect of Chriftians who denied any fimilitude between the effence of the Father and that of the Son. See Trinity.

The word is compofed of the privative α, and ομοιος, *fimilar, refembling*; q. d. *different, diffimilar*.

Anomœans was the name whereby the pure Arians were diftinguifhed in the fourth century, becaufe they not only denied the confubftantiality of the Word, but even afferted, that he was of a nature different from that of the Father; in contradiftinction to the Semi-Arians, who indeed denied the confubftantiality of the Word, but who owned, at the fame time, that he was like the Father. The Semi-Arians condemned the Anomœans in the council of Seleucia; and the Anomœans condemned the Semi-Arians in the council of Conftantinople and Antioch, erafing the word ομοιος, *like*, out of the formula of Rimini and that of Conftantinople.

ANOMORHOMBOIDA, in *Natural Hiftory*, the name of a genus of fpars.

The word is derived from ανωμαλος, *irregular*; and ρομβοιδης, a *rhomboidal figure*.

The bodies of this genus are pellucid cryftalline fpars of no determinate regular external form, but always breaking into regularly rhomboidal maffes; eafily fiffile, and compofed of plates running both horizontally and perpendicularly through the maffes, but cleaving more readily and evenly in an horizontal than in a perpendicular direction; the plates being ever compofed of irregular arrangements or rhomboidal concretions.

Of this genus there are five known fpecies, which have all, in fome degree, the double refraction of the ifland cryftal.

ANONA, in *Botany*. See Achras, Annona, Chrisophyllum, Cratæva, and Sloanea.

ANONIS, fee Glycine, Hedisarum, Ononis, and Sophora.

ANONIUM, in *Ancient Geography*, a town of the northern part of Italy, belonging to the Euganians, to the weft of Venetia.

ANONUS *Fons*, a fountain of Laconia, according to Pauſanias, ſituate near mount Taygeta.

ANONYMA, in *Conchology*, a ſpecies of OSTREA. The ſhell is rather oblong, with narrow ſcaly rays; the interſtices broad, with perpendicular lines; and the ears with perpendicular wrinkles. Liſt. Gmelin. It is variegated with angular ſtreaks and ſpots.

ANONYMOS. See CHELONE.

ANONYMOUS, formed of the privative *α*, and *ονομα*, *name*, ſomething that is nameleſs, or to which no name is affixed.

The term is chiefly applied to books which do not expreſs their author's name, and to authors whoſe names are unknown. Decker, advocate of the imperial chamber of Spires, and Placcius of Hamburg, have given treatiſes of anonymous books. Burc. Gotth. Struvius treats of the learned men who have endeavoured to inveſtigate the authors of anonymous books.

ANONYMOUS, in *Anatomy*, a name ſometimes given to parts newly diſcovered, or firſt taken notice of.

ANONYMOUS is alſo an appellation anciently given to the ſecond cartilage of the throat, by later writers, called *cricoides*, or *annuliformis*.

ANONYMOUS, in *Commerce*. Partnerſhips in trade in France are ſtyled anonymous, when they are not carried on under any particular name, but wherein each of the partners trades viſibly on his own account, and in his own name; after which all the partners give one another an account of their profit or loſs in trade. Theſe ſorts of partnerſhips are concealed, and known only to the parties themſelves.

ANONYMOUS *partnerſhips in trade*, are alſo in France ſuch wherein perſons of fortune and quality depoſit ſums of money, in order to ſhare the profits and loſs. To this end thoſe who furniſh the capital have no trouble in carrying on the trade, nor do their names appear to be any way intereſted therein.

ANONYMOUS, in *Law*. The ſending *anonymous* letters, or letters with a fictitious name, demanding money, &c. or threatening, without any demand, to kill any of the king's ſubjects, or to fire their houſes, out-houſes, barns, or ricks, is felony by the BLACK *Act*, 9 Geo. I. cap. 22. Amended by ſtatute 27 Geo. II. cap. 15. This offence was formerly high treaſon by the ſtatute 8 Hen. 5. c. 6.

ANOPOEA, in *Ancient Geography*, a mountain of Greece, being part of the chain of mountains, called Oeta. A ſmall paſs in this mountain formed a communication between Theſſaly and the country of the Epicnemidian Locrians.

ANOPOLIS, an appellation given to the town of Arcades in the iſle of Crete. Steph. Byz.

ANOPSHEER, in *Geography*, a town of Hindoſtan, in the province of Oude, 50 miles eaſt-ſouth-eaſt of Delhi. N. lat. 28° 20′. E. long. 78° 38′.

ANOREXY, ANOREXIA, in *Medicine*, loſs of appetite, or loathing of food.

The word is compounded of the privative *α*, and *ορεγω*, *appeto, I deſire*.

Anorexia is ſeldom an idiopathic diſeaſe, but a frequent attendant on many.

Cauſes.—It is preſent, in ſome degree, in all febrile complaints, and then uſually attended by a furr on the upper ſurface of the tongue, which commonly indicates its intenſity; for, as the furr diſappears, the appetite returns. It occurs in jaundice; and accompanies a weakneſs in the organs ſubſervient to digeſtion and chylification. Perſons addicted to the abuſe of ſpirituous liquors are ſeldom free from it. The ſight of any ſhocking accident, diſtreſſing news, depreſſing paſſions, or the being preſent at any ſurgical operation, will often aboliſh the appetite of a perſon, even when longing for his dinner.

A ſymptom depending, on ſo many cauſes, muſt require conſiderable diverſity in the

Treatment.—When it is ſymptomatic of other diſeaſes, the cure cannot be effected without that of the original complaint. When it ariſes from the habit of drinking ſpirits, taking opium, tobacco, or any other poiſon, the cuſtom muſt be relinquiſhed, and the digeſtive organs invigorated by ſtomachics. See DYSPEPSIA.

ANOSMIA, denotes a diminution or abolition of the ſenſe of ſmell. It is either organic, owing to a diſeaſe in the membrane lining the internal parts of the noſtrils, and varying according to the nature of the diſeaſe; or atonic, without any evident diſeaſe of the membrane of the noſe. See SMELLING.

ANOSSI, CARCAUSSI, or ANDROBEIZAHA, in *Geography*, a province of Madagaſcar, ſituate in S. lat. 23° 18′; and extending from the province of Manatengha to the river Mandrerei in 26°. This province is watered by ſeveral rivers, that run into the Franchere, Ramevate, or Immour, which riſes in the mountain Manghage, and diſcharges itſelf into the ſea, in S. lat. 25° 18′, two ſmall leagues from Port Dauphin. At its mouth is formed a lake, called Amboue, half a league wide, and of ſufficient depth for any ſhip. Crocodiles breed in this river, and in every other in the iſland. The cape, which is half a league diſtant from the mouth of the Franchere, is called by the French St. Romain, and by the negroes, Cape Ranevate, or Hehoale. The coaſt beyond this cape forms a bay, in the middle of which the land runs out in a peninſula, to the north of which lies Fort Dauphin, and over againſt it Port Dauphin: this bay is called by the French Dauphin Bay; and it is convenient for ſhipping and boats, which may ride here very ſafely. This province includes ſeveral iſlands and peninſulas along the coaſt. The country is beautiful, and fertile in paſtures for cattle, abounds in fruit-trees, and, if carefully cultivated, would afford every neceſſary of life. It is ſurrounded by high mountains, and diverſified by numerous hillocks and fruitful plains. The moſt remarkable towns are Franchere, Imanhal, Cocombes, Andravoule, Ambonnettanha, Maromamou, Imours, Marufoutouts, and Fananghaa, beſides ſeveral villages and hamlets throughout the country. The mountains are covered with wood and ſhrubs; but about four leagues diſtant from Fort Dauphin, the adjacent hills are quite deſtitute of trees. The inhabitants of the province are whites and negroes. The whites form three eſtates, or different degrees; and are diſtinguiſhed by the names of Rohandrians, Anacandrians, and Ondzatſi; the negroes are alſo ſubdivided into four claſſes, *viz.* Voadziri, Lohavohits, Ontſoa, and Ondeves. Theſe people have neither religion nor temple; they keep up a cuſtom of immolating beaſts on particular occaſions, in ſickneſs, on planting yams or rice, on the circumciſion of children, declarations of war, firſt entry into new-built houſes, and on the funerals of their parents. They offer the firſt born-beaſt to the devil and to God, naming the devil firſt in this manner, "Dianbilis Aminan-habare, or lord-devil and God." The country ſeems to have been originally inhabited by negroes; and the whites took poſſeſſion of it about 200 years ago; but they were ſubdued by the French. In 1642, Capt. Rivault obtained leave from Cardinal Richelieu to eſtabliſh a colony here; and the French, who, after ſome oppoſition, ſettled here, built Fort Dauphin, which is advantageouſly ſituated, as it is ſheltered from dangerous winds, and its entrance is convenient for all ſorts of ſhipping. The natives, however, after ſome years of tranquillity and ſocial intercourſe, became jealous of the French, and formed a conſpiracy to cut off all the French in

one

one day, which they carried into effect. The Fort Dauphin, which was erected in 1644, was accidentally deſtroyed by fire in 1656, but it was ſoon after repaired; and its garriſon is thus enabled to carry on frequent wars with the natives. Mod. Un. Hiſt. vol. xi. p. 397, &c. See MADAGASCAR.

ANOTTA, in *Botany*. See BIXA.

ANOTTA *Bay*, in *Geography*, a bay on the north coaſt of the iſland of Jamaica. N. lat. 18° 19'. W. long. 76° 33'.

ANOUPEC, the name of a range of mountains in the Birman empire, between Ava and Arracan.

ANOUT. See ANHOLT.

ANPITS, in the *Military Art*, in ſome *Middle Age Writers*, denotes a breaſt-work, anſwering to what is otherwiſe called *barbacan*.

ANREDERA, in *Botany*, a genus of the *pentandria digynia* claſs and order: the characters of which are, that the *calyx* is bipartite, with the laciniæ carinated at the back; and it has one *ſeed* covered by a membranaceous, compreſſed, and two winged calyx. There is one ſpecies, viz. *andredra ſpicata*.

ANSA, or AUSA, in *Geography*, a river which paſſes by Aquilea, in the country of Friuli; and runs into the Adriatic, between Grado and Marano.

ANSÆ, ANSES, in *Aſtronomy*, thoſe apparently prominent parts of the planet Saturn's ring, diſcovered in its opening, and appearing like handles to the body of that planet. The Latin word literally ſignifies *handles*, or *ears*, of divers utenſils.

ANSANI, GIOVANI, in *Biography*. See GIOVANI.

ANSARS, or ANSARIANS, in *Geography*, a people of Syria, employed in cultivation; and called in that country by the plural name Anſaria; in Deliſle's maps, Enſyrians; and in thoſe of D'Anville, Naſſaris. The territory which theſe people occupy, is that chain of mountains which extends from Antakia to the rivulet called Nahr-el-Kabir, or the great river. The hiſtory of their origin, though little known, is inſtructive. The following account is given in the words of a writer (Aſſemani, Biblioth. Orient.), who has drawn his materials from the beſt authorities. "In the year of the Greeks, 1202 (A. D. 891.), there lived, at the village of Naſar, in the environs of Koufa, an old man, who, from his faſtings, his continual prayers, and his poverty, paſſed for a ſaint: ſeveral of the common people declaring themſelves his partiſans, he ſelected from among them twelve diſciples to propagate his doctrine. But the magiſtrate of the place, alarmed at his proceedings, ſeized the old man, and confined him in priſon. In this reverſe of fortune, his ſituation excited the pity of a girl who was ſlave to the gaoler, and ſhe determined to give him his liberty. An opportunity ſoon offered to effect her deſign. One day, when the gaoler was gone to bed intoxicated, and in a profound ſleep, ſhe gently took the keys from under his pillow, and, after opening the door to the old man, returned them to their place unperceived by her maſter: the next day, when the gaoler went to viſit his priſoner, he was extremely aſtoniſhed at finding he had made his eſcape; and the more ſo, ſince he could perceive no marks of violence. He therefore judiciouſly concluded he had been delivered by an angel, and eagerly ſpread the report, to avoid the reprehenſion he merited; the old man, on the other hand, aſſerted the ſame thing to his diſciples, and preached his doctrines with more earneſtneſs than ever. He even wrote a book, in which, among other things, he ſays: 'I, ſuch a one, of the village of Naſar, have ſeen Chriſt, who is the word of God, who is Ahmad, ſon of Mohammad, ſon of Hanafa, of the race of Ali; who alſo is Gabriel; and he ſaid to me: Thou art he who readeth with underſtanding; thou art the man who ſpeaketh truth; thou art the camel which preſerveth the faithful from wrath; thou art the beaſt which carrieth the burden; thou art the Holy Spirit, and John the ſon of Zachary; go, and preach to men that they make four genuflexions in praying; two before the riſing of the ſun, and two before his ſetting, turning their faces towards Jeruſalem; and let them ſay three times, God Almighty, God moſt high, God moſt great; let them obſerve only the ſecond and third feſtival; let them faſt but two days annually; let them not waſh the prepuce, nor drink beer, but as much wine as they think proper; and, laſtly, let them abſtain from the fleſh of carnivorous animals.' This old man, paſſing into Syria, propagated his opinions among the lower orders of the country people, numbers of whom believed in him. And, after a few years, he went away, and nobody ever knew what became of him."

Such was the origin of the Anſarians, who are, for the moſt part, inhabitants of the mountains before mentioned. They are divided into ſeveral tribes or ſects; ſuch as the Shamſia, or adorers of the ſun; the Kelbia, or worſhippers of the dog; and the Kadmouſia, who pay a particular homage to that part in woman which correſponds to the priapus; and who hold nocturnal aſſemblies, in which, it is ſaid, after certain diſcourſes, they extinguiſh the light, and indulge promiſcuous luſt. Many of the Anſarians believe in the metempſychoſis; others reject the immortality of the ſoul; and, in general, ſuch are the anarchy and ignorance that prevail among them, they adopt any opinions which they think proper, following the ſect they like beſt, and frequently attaching themſelves to none.

Their country is divided into three principal diſtricts, farmed by the chiefs called Mokaddamin. Their tribute is paid to the pacha of Tripoli, from whom they annually receive their title. Their mountains are, in general, not ſo ſteep as Lebanon, and, conſequently, are better adapted to cultivation: but they are alſo more expoſed to the Turks; and hence it happens, that, with greater plenty of corn, tobacco, wines, and olives, they are more thinly inhabited than thoſe of their neighbours the Maronites and the Druzes. Volney's Travels in Egypt and Syria, vol. ii. § 1. p. 1—8.

ANSARIUM, in the *Civil Law*, a duty impoſed on all proviſions carried in veſſels with *anſæ*. This was otherwiſe called *anſurium*, and the collectors of it *anſuri*.

ANSATUM *Telum*, according to ſome, denotes a dart or javelin, with an *amentum* faſtened to it.

Others rather take the *anſæ* of a javelin to be thoſe two eminences about the middle of the *cuſpis*, or point, which hinders the weapon from piercing through the whole body. The Tartars are obliged to put their names to their arrows, that the hand which ſhoots them may be known. When Philip of Macedon was wounded at the ſiege of a certain town, theſe words were found on the javelin, "After has given this mortal wound to Philip."

ANSATUS, in *Conchology*, a ſpecies of MUREX. It is brown, tranverſely ſtriated; ſpire ſharp-pointed; whorls convex, diſtant, and knotty at the baſe; beak long. Gmelin. The length of this ſhell is about five inches and an half, and the ſtriæ are large and ſmall alternately.

ANSAUVILLERS, in *Geography*, a town of France, in the department of the Oiſe, and chief place of a canton, in the diſtrict of Breteuil, five miles ſouth-ſouth-eaſt of Breteuil.

ANSCHARIUS, in *Biography*, biſhop of Hamburgh and Bremen, was born in 801, in France, at Corbia, in the dioceſe of Amiens. He was recommended by the emperor Louis as apoſtolic miſſionary to Harold king of Denmark, who had been lately converted to the Chriſtian faith; and by his preaching he made many proſelytes among the Danes. Under the authority of Olave, king of Sweden, he undertook the inſtruction of his ſubjects in the Chriſtian religion,

religion, but with leſs ſucceſs. By the council held at Aix-la-Chapelle, in 832, an epiſcopal ſee was inſtituted at Hamburgh, and Anſcharius was its firſt biſhop. When his church was burnt by the Normans, in 845, the ſee of Bremen was added to that of Hamburgh; and Anſcharius removed to Bremen, where he reſided till his death, in 865. He wrote the life of Willihad, the firſt biſhop of Bremen; and his own life written by Mabillon, is reprinted by Fabricius, in his "Memoires pour l'Hiſtoire de Hambourgh."

ANSCOTE, in our *Ancient Law Books*, the ſame with *anblote*. See SCOT.

ANSE, in *Geography*, a town of France in the department of the Rhone and Loire, and chief place of a canton in the diſtrict of Villefranche; four leagues north of Lyons.

ANSEL *Weight*, See AUNCEL *weight*.

ANSELM, in *Biography*, archbiſhop of Canterbury, was born at Aouſta in Piedmont, A. D. 1034, of noble and pious parents, who were at great pains to give him a good education. Having loſt his mother Ermengarda when he was about ſeventeen years of age, he abandoned his ſtudies, and indulged his youthful paſſions to ſuch a degree, that his father refuſed to ſee him, or admit him into his houſe, on which he left his native country, and travelled into France. After ſome time, attracted by the fame of Lanfranc, he ſettled at the abbey of Bec, and proſecuted his ſtudies with ſuch ardour under that great maſter, that he ſoon excelled all his fellow ſtudents in learning. In the year 1060, he became a monk of the Benedictine order, and in three years after he ſucceeded Lanfranc, both as prior and teacher of the ſciences; in both which ſtations he acquitted himſelf ſo much to the ſatisfaction of the ſociety, that he was unanimouſly elected abbot on the firſt vacancy, A. D. 1078. The abbey of Bec had ſeveral eſtates in England, which obliged Anſelm ſometimes to viſit this kingdom; and in theſe viſits he gained the friendſhip of ſeveral of the greateſt men. He happened to be here in the year 1093, when William II., in a fit of ſickneſs, was prevailed upon to fill the ſee of Canterbury, which had been kept four years vacant, and nominated him to that high office. After a long and obſtinate oppoſition to his own advancement, in which his ſincerity has been ſuſpected, he was forced into the chamber of the ſick monarch, who, in a very pathetical manner, aſked "Why he endeavoured to ruin him in the next world, which would infallibly follow, in caſe he died before the archbiſhopric was filled?" The abbot ſtill perſiſted in his refuſal, kneeling, weeping, and entreating the prince to change his purpoſe. The paſtoral ſtaff was at length forced into his hand, and he ſuffered himſelf to be inveſted with his office; not, however, before he had obtained a promiſe of the reſtitution of all the lands which were in the ſee in the time of Lanfranc. The temporalities of the archbiſhop being ſecured, Anſelm ſubmitted to do homage to the king, and was conſecrated on the fourth of December 1093. Soon after his conſecration, the king intending to wreſt the duchy of Normandy from his brother Robert, and endeavouring to raiſe what money he could for the purpoſe, Anſelm offered him a voluntary gift of five hundred pounds, which the king thought too ſmall, and refuſed to accept. "I entreat your highneſs," ſaid Anſelm, "to accept the preſent; it will be more honourable in you to receive a leſs ſum with my conſent than to extort a greater by force. If your highneſs allow me the freedom and privilege of my ſtation, my perſon and fortune ſhall be at your ſervice; but if I am treated like a ſlave, I ſhall be obliged to ſtand aloof, and keep my fortune to myſelf." The offer was, however, for the preſent, rejected; and when it was afterwards hinted to Anſelm, that a repetition of it might conciliate the royal favour, he anſwered, "God forbid that I ſhould ſuppoſe my ſovereign's favour may be purchaſed with a ſmall ſum of money, like a horſe at a fair! Perſuade the king not to ſet a price on his favour, but to treat me, on honourable terms, as his ſpiritual father, and I am ready to pay him the duty of a ſubject. As for the five hundred pounds, which he was pleaſed to refuſe, they are given to the poor." The king, upon being informed of what had paſſed, was much diſpleaſed, and declared he would never acknowledge Anſelm for his ghoſtly father; he wanted neither his prayers nor his benedictions, and he might go whither he pleaſed. At another time, when William required from the archbiſhop his quota of men for an expedition againſt Wales, he ſent them out ſo wretchedly equipped, that he threatened him with a proſecution. Anſelm, on his part, conſidered the demand as oppreſſive, treated the king's complaint with ſilent contempt, and demanded the reſtitution of all the revenues of his ſees, and made his appeal to Rome. In oppoſition to the king's expreſs prohibition, but not without repairing to the court of Rome to attempt his juſtification, he left England, and the king inſtantly confiſcated the temporalities of the archbiſhopric.

At Rome, Anſelm was received with great reſpect, as a defender of the rights of the holy ſee, and a meritorious ſufferer in the cauſe of religion. He accompanied the Pope to his country ſeat near Capua, and received from him numerous proofs of friendſhip: but upon their return to Rome the pope's friendſhip for Anſelm was put to a ſevere trial. In conſequence of a letter ſent from Urban II. to William, ſoon after Anſelm's arrival at Rome, demanding his re-inſtatement in all the emoluments and privileges of his ſee, an ambaſſador arrived from England to vindicate the conduct of the king. The ambaſſador was at firſt received with haughtineſs, and was commanded by the pope to return and inform his maſter, that unleſs he would hazard the higheſt cenſure of the church, he muſt inſtantly reinſtate Anſelm in the archiepiſcopal rights. Nothwitſtanding this, after ſome ſtruggle between duty and intereſt, the pope accepted a large preſent, and abandoned the cauſe of his friend. Finding himſelf deſerted by the court of Rome, Anſelm left the city in diſguſt, and went to Lyons, where he remained till the death of William Rufus.

Henry I. who, on his acceſſion to the throne, employed every expedient to ſupport the authority which he had uſurped; and being well acquainted with the intereſt which Anſelm's piety and zeal had obtained in the affections of the people, immediately after his coronation recalled their favourite from exile, who landed at Dover, Sept. 23, 1100. A few days after, he was received at Saliſbury by the king with every poſſible mark of reſpect and affection. But this cordiality was not of long continuance. As ſoon as Anſelm was commanded to do homage to the king for the temporalities of his ſee, he returned a flat refuſal, and produced the canon of the late council of Rome in vindication of his conduct; declaring, that if the king inſiſted upon his pretenſions to the homage of the clergy, he could keep no communion with him, but muſt inſtantly leave the kingdom. The king, unwilling to reſign the right of beſtowing eccleſiaſtical benefices, and of receiving the homage of his prelates, but at the ſame time, dreading the departure of the primate, propoſed, or rather ſolicited a truce, till both the parties could ſend ambaſſadors to the pope, to know his final determination: to this Anſelm, at the earneſt entreaty of the nobility, at laſt agreed.

During this interval, Anſelm performed many ſervices for the king. In a ſynod which was ſummoned at Lambeth, he obtained a deciſion in favour of the king's intended marriage with Matilda, although ſhe had already worn the veil, without taking the vows. When the kingdom was invaded

by Robert duke of Normandy, in July 1101, Anſelm contributed more than any man, by his example, his exhortations, and his authority, to keep the nobility ſteady in their attachment to king Henry, and thereby preſerved him on the throne. In return, the king profeſſed great reverence for the wiſdom and ſanctity of Anſelm, and promiſed to pay a due regard to the rights and privileges of the church. But when the dreadful day was over, and the meſſenger from pope Paſchal II. returned with a peremptory negative upon inveſtitures, the conteſt between the king and the archbiſhop was renewed. Henry refuſed not to relinquiſh the important prerogative of granting church preferment within his own dominions, yet deſirous to avoid a rupture with the pope and Anſelm, ſent three biſhops to Rome, while the archbiſhop, on his part, diſpatched two meſſengers to ſubmit the affair to the reconſideration of the pontiff. The pope's letter confirmed the former reſolution, declaring, that the church, and all its revenues, belonged to the ſucceſſors of St. Peter; and that emperors and kings had no right to give the inveſtiture of benefices to the clergy, or to exact homage from them. Some of the arguments adduced in defence of this poſition were either blaſphemy or nonſenſe: "How abominable is it," ſaid he, "for a ſon to beget his father, and a man to create his God? and are not prieſts your fathers and your gods?" But this formal declaration was contradicted by the oral teſtimony of the king's biſhops; who aſſerted, that Paſchal had privately expreſſed to them his acquieſcence in their maſter's claim, but had not given it under his hand, leſt other princes ſhould inſiſt upon the ſame privilege. Anſelm and his meſſengers regarded this ſtory as a deſigned prevarication, prompted by the king: but the firſt time the primate appeared at court, he required him in a peremptory tone to do him homage according to ancient cuſtom, or leave the kingdom; adding, "I will ſuffer no ſubject to live in my dominions who refuſes to do me homage." The archbiſhop boldly replied, "I am prohibited by the canons of the council of Rome to do what you require. I will not leave the kingdom, but ſtay in my province, and perform my duty; and let me ſee who dares to do me any injury." Immediately he left the court, and returned to Canterbury. Soon after, the king granted him permiſſion to make a journey to Rome, in order to learn the pope's final pleaſure. He was attended to the ſea-coaſt by crowds of people of all ranks, whom his auſtere piety and zeal for the church had attached to his intereſt. From Rome the archbiſhop retired to Lyons, and afterwards to his monaſtery at Bec in Normandy. The king, ſtill deſirous of an accommodation, ſent a meſſage to invite Anſelm into England; and upon receiving information that he was ill at the abbey of Bec, went in perſon into Normandy to ſettle every remaining point of difference between them. Anſelm recovered from his indiſpoſition, and embarked for England, where he was received with ſingular expreſſions of a joyful welcome. The queen herſelf even travelled before him on the road, and gave orders for his accommodation.

The popularity of this prelate may be imputed principally to the ſeverity of his manners, and to the zeal with which he oppoſed abuſes, and encouraged ſuperſtitious auſterities among the clergy and laity. He rigorouſly enforced clerical celibacy; and was the firſt who preſcribed this abſurd, unnatural, and miſchievous practice in England. By one canon of a national ſynod, held by him during his diſputes with the monarch, at Weſtminſter, in 1102, it was determined that no prieſt ſhould marry; and thoſe who were already married, were commanded to put away their wives. By another canon, it was decreed that the ſons of prieſts ſhould not be heirs to their father's churches. By a third, marriage is prohibited to thoſe who are within the ſeventh degree of kindred; and the twenty-ſixth canon forbade the worſhip of fountains, which was probably a relict of druidical ſuperſtition. Anſelm was ever a violent oppoſer of all innovations, even in articles of dreſs and ornament; and preached zealouſly againſt the long and curled hair then coming into faſhion; and his authority and eloquence had ſuch influence, that the young men univerſally abandoned that ornament, and appeared in cropt hair, which was recommended to them by the ſermons of the primate. One of his adherents writing to him about this time, concluded his letter by ſaying, that religion was ruined by his abſence; that ſodomy and wearing long hair, which he ſeems to have regarded as equal crimes, were become very common, and nobody had the courage to reprove them.

In a council held at Whitſuntide, A. D. 1108, at which the king and principal clergy, with Anſelm at their head, were preſent, it was reſolved to enforce the canons made ſix years before, relative to the celibacy of the clergy. Ten others were alſo added, by which all prieſts were commanded to put away their wives inſtantly; not to ſuffer them to live on any of the lands belonging to the church; never to ſee them except in caſes of great neceſſity, and in the preſence of two or three witneſſes. Thoſe who put away their wives were ordered to abſtain from maſs for forty days, and to perform certain penances; but thoſe who refuſed to put away their wives were to be excommunicated, and their goods, together with the perſons and goods of their wives, were to be forfeited to the biſhop of the dioceſe. Theſe eccleſiaſtical and wicked decrees afford ſufficient proof, that it was then found no eaſy taſk to diſſolve the natural and virtuous affection that ſubſiſted between the clergy of England and their wives.

One of the laſt diſputes in which Anſelm was engaged, was with Thomas elect of York, who, hoping for the death of the primate, delayed to come to Canterbury to receive conſecration; but he was at length obliged to ſubmit, make the uſual profeſſions of obedience, and render to his ſuperior the accuſtomed homage. This, in fact, is the only material occurence mentioned during the three laſt years of Anſelm's life. This celebrated prelate died at Canterbury on the 20th of April 1109, in the 67th year of his age, and the 16th of his primacy.

The ſuperſtitious reverence which was paid to the memory of Anſelm, and the characteriſtic credulity of the age, are ſhewn in the account of his miracles recorded by John of Saliſbury. He relates, that while he was living, a Flemiſh nobleman was cured of a leproſy by drinking the water in which Anſelm had waſhed his hands in celebrating maſs: that he extinguiſhed fires, calmed tempeſts, and healed diſeaſes, by making the ſign of the croſs: that two ſoldiers were cured of an ague by taſting crumbs fallen from the bread which he had been eating: that by prayer to God, he produced a ſpring of excellent water at the top of a hill for the relief of certain villagers: and that a ſhip in which he ſailed, having a large hole in one of her planks, nevertheleſs took in no water as long as the holy man was on board. The ſame author adds, that miracles were wrought at Anſelm's tomb after his death: that one born deaf, dumb, and blind, obtained his hearing, ſpeech, and ſight, by paying his devotions at his tomb: that a ſoldier was cured of the dropſy by winding the ſaint's girdle about his body; and that the ſame girdle was ſucceſsfully applied to the aſſiſtance of women in child-birth.

Without examining the powers of Anſelm as a ſaint, his merit as a man may be fairly eſtimated, if, with great allowance for the narrow prejudices of a monaſtic education, and for principles and habits generated by a debaſing ſyſtem of ſuperſtition, we give him credit for honeſt zeal, and manly reſolution,

reſolution, in ſupport of what he conceived to be the cauſe of religion. Conſidering the period in which he lived, Anſelm was a learned man. He contributed to the introduction of the ſcholaſtic method of writing, in which the ſubtleties of logic were applied to theology. Among his metaphyſical works is a treatiſe on the exiſtence of God, in the manner afterwards reſumed by Des Cartes.

The largeſt edition of his works, which are very numerous, is that publiſhed by Father Gerberon, at Paris, in 1675. It is divided into three parts. The firſt contains dogmatical tracts, entitled, "Monologia." The ſecond contains practical and devotional pieces. The third is compoſed of his letters. See Biog. Brit. Gen. Dict. Hume's and Henry's Hiſt. of Great Britain.

ANSELM'S *art.* See ART.

ANSELM *of Paris*, an Auguſtine monk, was born in 1625, and devoted almoſt his whole life to genealogical and biographical reſearches. His "Palace of Honour, or Hiſtorical Genealogies of the illuſtrious Houſe of France, and of ſeveral noble families of Europe," was publiſhed in French at Paris, in 1647, in two vols. 4to. His "Genealogical and Chronological Hiſtory of the Houſe of France, and of the great Officers of the Crown," was firſt publiſhed at Paris, in 4to. in 1694; but the author, dying this year, did not complete his deſign. Fourni enlarged this work, and republiſhed it in two volumes folio, in 1711; and it has ſince been continued by the Auguſtine fathers, Ange and Simplicien; and in 1726, &c. it was publiſhed in nine volumes folio. Biographers have been much indebted to this collection. Nouv. Dict. Hiſt.

ANSELMUS, *De Janua*, flouriſhed in the thirteenth century. Aſtruc ſuppoſes he was of the faculty of medicine at Montpellier: that he was in repute in his time, is proved by the notice taken of him by Lanfranc, and afterwards by Gui de Chauliac, who recommended his practice in certain caſes; but there are no works now remaining bearing his name.

ANSER, in *Aſtronomy*, a ſmall ſtar, of the fifth or ſixth magnitude, in the Milky Way, between the Swan and Eagle: firſt brought into order by Hevelius.

ANSER *Americanus*. See TOUCAN.

ANSER, in *Natural Hiſtory*, a ſpecies of VIBRIO in the *vermes infuſoria*. It is elliptical, with a long neck and tubercle on the back. Gmelin. This kind is found in water where duck-weeds grow: it is between the vibrio proteus and vibrio falx, and is chiefly diſtinguiſhed by the protuberance on the back. The body is elliptical, round, without any lateral inequality, and full of molecules; the hind part is ſharp and bright, the forepart produced into a bending neck, which is longer than the body; the apex even and whole; blue canals paſſing between the marginal edges, and occupying the whole length of the neck: in one of thoſe canals a vehement deſcent of water to the beginning of the trunk may be perceived. The motion of the body is ſlow, that of the neck is more lively and flexuous, and ſometimes ſpiral. See Adams, Microſ.

ANSER, in *Ornithology*, a ſpecies of ANAS, or duck, called in England the grey-lag, or wild gooſe, and generally admitted as the origin of the domeſtic gooſe. The character of this ſpecies is, bill ſemi-cylindrical; body above cinereous, beneath paler; neck ſtreaked. Linnæus, Gmelin, &c. The length of the bird is uſually about two feet nine inches, breadth five feet, weight ten pounds. The bill is large and elevated, yelloviſh fleſh colour, with the nail white. The head and neck are cinereous, mixed with dirty yellow; neck ſtriated downwards; back and primaries duſky, the laſt tipped with black; ſhafts white; ſecondaries black, edged with white; leſſer coverts duſky, edged with white; breaſt and belly whitiſh, clouded with aſh colour; rump and vent white; middle feathers of the tail duſky, tipped and edged with white; the outmoſt almoſt entirely white; legs fleſh-coloured; claws black. Penn. Arct. Zool. Lath. Gen. Syn. &c.

"This ſpecies," ſays Dr. Latham, "inhabits the fens of England; and it is believed, does not migrate, as in many countries on the continent, as they are not only met with in the ſummer, but alſo known to breed in Lincolnſhire, Cambridgeſhire, and other places: they have ſeven or eight young, which are often taken, and eaſily become tame. They however, unite into flocks during the winter ſeaſon, as numbers are met with together. On the continent they are migratory, changing place in large flocks, often five hundred or more: in this caſe the flock is triangular in ſhape, with one point foremoſt; and as the gooſe which is firſt is tired ſooneſt, it has been ſeen to drop behind, and another to take its place. In very ſmall flocks, however, they are ſometimes ſeen to follow one another in a direct line. Geeſe ſeem to be general inhabitants of the globe: they are met with in Iceland; and on the continent, from Lapland to the Cape of Good Hope; they are frequent in Arabia, Perſia, and China, as well as indigenous to Japan; and on the American continent from Hudſon's bay to South Carolina. Our voyagers meet with them in the Straits of Magellan, Port Egmont in Falkland Iſles, and Terra del Fuego; alſo in New Holland, though not at New Zealand, as we find capt. Cook making the inhabitants a preſent of a pair in order to breed." Gen. Syn.

The ſame author remarks, that the grey-lag gooſe, in a ſtate of domeſtication, varies in colour from the wild ones, though much leſs ſo than either the mallard or cock, being ever found more or leſs verging to grey; though in all caſes the whiteneſs of the vent and upper tail coverts is viſible, and very often thoſe parts are quite white, eſpecially in the males. See GOOSE, *domeſtic*.

ANSERES, in *Ornithology*, the third order in the Linnæan arrangement of birds. The character, according to that author, is, the bill ſmooth, covered with ſkin, and broadeſt towards the tip: feet formed for ſwimming, toes palmated, and connected by a membrane; ſhanks compreſſed and ſhort. The body is fat, and fleſh rather rancid. Theſe live chiefly on the water, and feed on plants, fiſh, frogs, worms, &c. The neſt is generally formed on the ground; the mother takes little care of the young; and they are frequently polygamous.

The birds of this order are divided into two ſections, one having the beak denticulated, or toothed, and the other being deſtitute of theſe teeth: the genera of the firſt ſection are anas, mergus, phaeton, and plotus; and thoſe of the ſecond ſection, rhyncops, diomedea, aptenodya, alca, procellaria, pelecanus, larus, ſterna, and colymbus.

ANSERIFERA, in *Conchology*, a ſpecies of LEPAS. The ſhell is compreſſed, and has five valves, which are ſtriated, and ſeated on a pedicle. Gmelin. This kind inhabits the American and Atlantic ſeas.

ANSERINA, in *Botany*. See POTENTILLA.

ANSERIS, in *Entomology*, a ſpecies of PEDICULUS found on both the wild and tame gooſe; it is filiform, pale, with black dots on the margin. Linnæus, Fabricius, Redi, &c.

ANSERIS, in *Natural Hiſtory*, is alſo a ſpecies of FASCIOLA in the *Vermes inteſtina*. The body is oblong-oval; beneath, two rows of oppoſite papillæ, with approximate pores. Froelick, Gmelin, &c. Found in the rectum of the common gooſe.

ANSERIS is alſo the ſpecific name of a creature in the TÆNIA genus, that infeſts the inteſtines of the domeſtic gooſe. It is minute and very narrow, the anterior part capillary: Goeze and Gmelin.

ANSES. See Ansæ.

ANSIANACTES, in *Geography*, a people of the iſland of Madagaſcar, towards the iſle of St. Mary.

ANSIBARII, or Ansivarii, in *Ancient Geography*, the name of a people of Germany, mentioned by Tacitus. According to this hiſtorian, they were driven, in the time of Nero, from their own territory by the Chauci, and then took poſſeſſion of certain lands, previouſly occupied by the Friſians, which had belonged to the Romans, and uſed as paſture for their horſes and cattle. In this acquiſition, they were conducted by Boiocalus, a perſon of diſtinguiſhed reputation, and of approved fidelity to the Romans. When the Romans demurred in allowing them to poſſeſs theſe lands, Boiocalus pleaded the merit of 50 years ſervice; and he remonſtrated, that the territory was large, and applied to no uſeful purpoſe; that an unhappy people, driven from their own habitations, might be accommodated without encroaching on wide tracts, in which the Roman horſes and cattle might range; that humanity forbade their ſuffering men to periſh, whilſt beaſts were amply provided for; that it was incompatible with religion to devote to deſerts and ſolitude parts of the earth which were deſigned by the gods for the uſe of men; and that ſuch parts as had no poſſeſſor were free and common to all. Then lifting up his eyes to the ſun and other celeſtial luminaries, he aſked them, how they could bear to behold a deſolate ſoil, and if they would not, in juſtice, command the ſea to ſwallow up uſurpers, who thus engroſſed the earth? To this ſpirited remonſtrance, Avitus, the Roman commander, indignantly replied, that the weakeſt muſt ſubmit to the moſt powerful; and that as the gods had entruſted the Romans with ſovereign judgment, they could not permit any other judges to interfere. At the ſame time, lands were privately offered to Boiocalus, in recompence of his long attachment to the Romans. This offer the brave general conſidered as the price of his honour, and as a bribe for betraying his people, and he rejected it with diſdain and indignation, alleging, "We may want a place to live in, but a place to die in we cannot want." Upon this the Anſibarii invited the neighbouring nations into a confederacy againſt the Romans, but they were awed by the Roman generals and their forces; ſo that at length theſe unhappy people, applying in vain for ſettlements in neighbouring territories, were under a neceſſity of making long and various peregrinations, which terminated in their utter deſtruction. Tacit. Annal. lib. xiii. c. 53—57. Theſe people have been known under the other denominations of *Amſivarii*, *Ampſivarii*, and *Ampſicarii*. Some have thought that their name is derived from *Amſer*, the *Ems*, and *boner*, a German word, which ſignifies *to inhabit*.

ANSIKO, or Anziko, called alſo Makoko, in *Geography*, a kingdom of Africa, is bounded on the weſt by the river Umbre, which runs into the Zaire, the kingdom of Wangua and the Amboes, who border on Loango; on the north by ſome deſerts of Nubia; and on the ſouth by the provinces of Congo, called Songo and Sonda. This country has ſeveral mines of copper; it produces a great quantity of ſanders wood, both red and grey; and it abounds with rhinoceroſes, lions, and other wild beaſts. The inhabitants have neither fixed lands nor inheritance; they neither ſow nor reap, but live like the wandering Arabs, and ſubſiſt by plunder and ſlaughter. They are ſaid to be the remains of the Giages, who came originally from Sierra Leona, but being weakened by their marches and battles, they were unable to return, and reduced to the neceſſity of reſiding, principally, in the kingdom of Anſiko, and alſo on the ſouth-eaſt of Angola. In their undertakings and exploits, they are valiant and intrepid, and altogether regardleſs of life. Their language is barbarous, and difficult to be acquired, even by the inhabitants of Congo. Their food is ſaid to be human fleſh, and human bodies are hung up for ſale in their ſhambles. Conceiving that they have an abſolute right to diſpoſe of their ſlaves at pleaſure, their priſoners of war are fattened, killed, and either eaten, or ſold to butchers. It is alſo ſaid, that diſcontented ſlaves offer themſelves for food to their maſters; and that perſons of the neareſt relation feed upon each other without the leaſt horror. They have no graves for the dead, who are devoured as ſoon as they have expired. Perſons of the principal diſtinction wear red and black caps of Portugueſe velvet, and thoſe of inferior condition, of both ſexes, go barefooted, and are naked from the waiſt upwards. In order to preſerve their health, they anoint their bodies with a compoſition of pounded white ſandal-wood and palm oil. The king of Anſiko, or the great Macoco, is eſteemed the moſt powerful monarch of Africa, and his dominion extends over 13 kingdoms. The zimbis, or ſhell fiſhed for at Loango and Angola, is the current coin of the country, and exchanged by the natives for ſlaves from Nubia, and alſo for ſalt, ſilk, glaſs, linens, and other merchandiſes. The arms of theſe people are battle-axes, and ſmall but very ſtrong bows, adorned and ſtrengthened with ſerpents ſkins, and furniſhed with ſtrings made of ſupple and ſlender ſhoots of trees, like reeds, which never break, and ſhort arrows of hard and light wood. In the uſe of their bows and arrows, they are ſo dextrous, that they kill birds flying, and diſcharge as many as 28 arrows from the bow before the firſt falls to the ground. Beſides their bows and battle-axes, they have alſo daggers in ſerpent-ſkin ſcabbards, which they carry in ivory belts. With reſpect to religion, they are idolaters; worſhipping the ſun as their chief deity, whom they repreſent under the form of a man, and the moon under that of a woman; and an infinite number of inferior deities, each man having a peculiar idol to whom he offers ſacrifices, and whom he conſtantly invokes in dangerous enterpriſes. They practiſe circumciſion, but from what motives, whether religious or otherwiſe, it is not known. Theſe barbarous people are much extolled for their ſingular fidelity and loyalty, ſo that they will ſacrifice their lives in defence of their princes, or of their friends and allies. Mod. Un. Hiſt. vol. xiii. p. 265, &c.

ANSLO, or Opslo, a ſea-port town of Norway, in the præfecture of Aggerhuys, upon the bay of Anſlo. See Christiania.

ANSON, George, Lord, in *Biography*, an eminent Engliſh naval commander, was the third ſon of William Anſon, Eſq. of Shuckborough in Staffordſhire. He was born in 1697. The navy being Mr. Anſon's choice, he went early to ſea; and in the year 1716, having paſſed regularly though the inferior ſtations, he was made ſecond lieutenant of his majeſty's ſhip the Hampſhire; and in 1724, he was raiſed to the rank of poſt-captain, and to the command of the Scarborough man of war. Between this time and 1733, he went, with ſhips under his command, three times to South Carolina, where he acquired conſiderable property, and erected a town bearing his name, the country around which has been ever ſince called Anſon County. Between 1738 and 1739, he made a fourth voyage to the coaſt of Guinea and to America, in the courſe of which, by his prudence, he engaged the French to deſiſt from interrupting the Engliſh Guinea trade, without coming to acts of hoſtility.

On the breaking out of the Spaniſh war in 1739, Mr. Anſon was pitched upon as a proper perſon to command a fleet deſtined to attack the Spaniſh ſettlements in the Pacific Ocean. He ſet ſail in September 1740, with a ſquadron of five men of war, a ſloop, and two victualling ſhips. The whole buſineſs of fitting out this expedition had been managed

naged with extreme negligence and incapacity, which rendered the exertion of all the commander's talents neceſſary. After a long and tedious voyage, he arrived at Madeira, thence he proceeded to St. Catherine's on the coaſt of Brazil, and afterwards to St. Julian in Patagonia. In doubling Cape Horn, he experienced prodigious difficulties from ſtorms and tempeſtuous weather: ſome of his fleet were ſeparated from him, of which only a ſmall part ever rejoined him. At length he arrived at the iſland of Juan Fernandes, where he refitted, aſſiſted with his own hands in landing the ſick ſailors, and for the benefit of future navigators, ſowed the ſeeds of a variety of garden vegetables and fruit-trees. Thence he proceeded to the coaſt of Peru, and took the rich town of Paita; which, on the refuſal of the Spaniards to ranſom it, he was obliged, according to the practice of war, to reduce to aſhes. When the Engliſh were about to embark, one of their company was miſſing, who, however, ſoon arrived, and acknowledged, that by taking too copious a doſe of brandy, he had fallen into a profound ſleep, from which he was awakened by the ſcorching heat of the town on fire. Upon opening his eyes, he was amazed to behold on the one hand all the houſes in a blaze, and on the other, the Spaniards and Indians near him. The greatneſs and ſuddenneſs of the terror inſtantly brought him back to a ſtate of ſobriety, and gave him preſence of mind to puſh through the thickeſt of the ſmoke, and thus eſcape the hands of the enemy. This was the only inſtance of neglect of duty through the effects of liquor, which might have been obtained in almoſt every warehouſe in the town. On this coaſt, Commodore Anſon took ſome valuable prizes, on board of which were ſeveral paſſengers of diſtinction of both ſexes; his treatment of whom was ſo honourable, and conſiſtent with the moſt delicate decorum, that it left the moſt favourable impreſſions of himſelf and his country. He afterwards ſailed to the coaſt of Mexico; thence with a view of intercepting the annual Acapulco ſhip, he took his departure acroſs the Pacific Ocean, with his own veſſel the Centurion, and the Glouceſter. In this paſſage the Glouceſter became leaky, and was abandoned; and the united crews, reduced by ſickneſs, with difficulty reached Tinian, one of the Ladrones. Here while the commodore and the greater part of his crew were on ſhore, the Centurion was by a ſtrong gale driven out to ſea; and ſo little proſpect was there of her being able to reach the iſland again, that much labour was ſpent in fitting up a ſmall veſſel found on the iſland, Anſon himſelf taking the axe like a common ſailor. The only occaſion in which marks of emotion broke through the uniform equanimity of his demeanor, was when he received news of the Centurion's coming again in ſight. From Tinian he went to Macao; and in returning from Macao, he took a rich Manilla galleon: but at the moment of victory he had a call for the exertion of all his courage and preſence of mind, in conſequence of a fire which broke out near the Centurion's powder-room, but which his orders, given with all the calmneſs of one converſant with danger in every ſhape, ſoon got under. He ſailed back to Canton with his prize; and there exibited equal dexterity and firmneſs in tranſacting affairs with the Chineſe, and maintaining the rights of his own country. Returning from thence by the Cape of Good Hope, he arrived at Spithead on the 15th of June 1744, having completed the circumnavigation of the globe, and brought back great riches taken from the enemy, though unforeſeen diſaſters had defeated ſome of the principal purpoſes of the enterpriſe. Thus was the expedition finiſhed, after having by its event ſtrongly evinced this important truth, that though prudence, intrepidity, and perſeverance united, are not exempted from the blows of adverſe fortune, yet in a long ſeries of tranſactions, they uſually riſe ſuperior to its power, and in the end rarely fail of proving ſucceſsful.

In a few days after his return, Mr. Anſon was made rear-admiral of the blue; and in a ſhort time after a commiſſioner of the admiralty, and rear admiral of the white; and in the year 1746, vice admiral. During the winter of 1746 and 7, he was appointed to the command of the channel fleet; and in the following May he captured, off Cape Finiſterre, ſix men of war bound from France to the Weſt and Eaſt Indies, laden with warlike ſtores and merchandiſe, and four Eaſt-Indiamen.

By this ſucceſsful enterpriſe, he defeated the pernicious deſigns of two hoſtile expeditions, made a conſiderable addition to the force and wealth of our own kingdom, and thus converted into a public benefit, the intended means of a public calamity. M. St. George, one of the French captains, in alluſion to the names of two ſhips (L'Invincible and La Gloire) which had been taken, ſaid, when he preſented his ſword to the conqueror; "*Monſieur, vous avez vaincu* L'INVINCIBLE, *et* LA GLOIRE *vous ſuit.*"

For this and other important ſervices, he was with great propriety, in the June following, raiſed to the Engliſh peerage by the title of Lord Anſon, baron of Soberton in the county of Southampton. And on the occaſion, his lordſhip made choice of a motto very happily adapted to the dangers he had gone through, and the ſucceſſes he had obtained, NIL DESPERANDUM. On the 25th of April 1748, he married the eldeſt daughter of Lord Hardwicke, at that time lord high chancellor of Great Britain: this lady died without iſſue on the firſt of June 1760.

Lord Anſon had frequently the honour of convoying the late king from England to Holland. The firſt time was in the year 1748; and ever after he conſtantly attended his majeſty on his going abroad, and on his return to this kingdom. In July 1749, his Lordſhip was made vice admiral of Great Britain; in 1751, he was preferred to be firſt commiſſioner of the Admiralty in the room of Lord Sandwich; and in the years 1752 and 1755, he was one of the lords juſtices of the kingdom during his majeſty's abſence. Under him, on the proſpect of a war with France, the ſquadrons were fitted out with great promptitude; and that more ſucceſs did not attend them was owing to accidents. He was expoſed to ſome cenſure in conſequence of the loſs of Minorca at the beginning of the war 1755; and in the following year he reſigned his poſt. On a parliamentary inquiry, however, he, and the perſons with whom he had acted, were acquitted of all blame reſpecting Minorca. In the year 1757, he was again placed at the head of the admiralty board, where he continued during the remainder of his life, which included almoſt all the glorious periods of that war.

The laſt time he commanded a fleet was in 1758, when he covered the expedition againſt the coaſt of France, and kept the enemy's fleet in port. In 1761, he was raiſed to the principal naval dignity, that of admiral and commander in chief of the fleet, for the purpoſe of bringing over the preſent queen of England, whom, after a rough and tedious paſſage, he landed on the 7th of September. In February 1762, he accompanied the queen's brother to Portſmouth to ſhew him the arſenal, and the fleet that was then on the point of ſailing, under Sir George Pocock, for the Havannah. Lord Anſon, in attending the prince, caught a violent cold, under which he languiſhed for three months. At length it ſettled on his lungs, and was the immediate occaſion of his death. Full of honours and reputation, he died at Moor Park, Hertfordſhire, on the 6th of June 1762, leaving his whole property to his brother, Thomas Anſon, Eſq. of Staffordſhire.

Lord Anſon was one of his majeſty's moſt honourable

privy council, an elder brother of the Trinity Houſe, and a governor of the Charter Houſe. He was remarkably aſſiduous at the Admiralty Board, and very ready in making naval diſpoſitions of every kind, and in appropriating the proper ſtrength and proper ſort of ſhips to the different ſervices. Among the various and diſtinguiſhed merits of this eminent perſon, was that of having bred up ſeveral excellent officers, who were afterwards renowned for ſignal ſervices achieved for their country. He may, in general, be ſaid to have been a true friend and liberal patron to men of real merit and capacity in his profeſſion. Till later voyages had multiplied the circumnavigations of the globe, "to have been round the world with commodore Anſon," was eſteemed a great and honourable diſtinction to a ſeaman. Biog. Britan. Gen. Biog. Dict. Walter's Account of Anſon's Voyage.

ANSON, in *Geography*, an interior county of North Carolina in Fayette diſtrict, having Mecklenburgh county to the north, and Bladen and Cumberland counties on the eaſt. It contains 5133 inhabitants, including 828 ſlaves.

ANSON's *Iſle*, the *Buka* of Bouganville, an iſland of the Pacific Ocean, being one of the groupe called SOLOMON *Iſles*. S. lat. 5° 15'. E. long. 153° 30'.

ANSPACH, or ONOLZBACH, a marquiſate or principality of Germany, in the circle of Franconia, bounded by the principality of Bayreuth, and the biſhopric of Bamberg and Wurtzburg. The country is mountainous and ſandy, but in general it is fertile, and produces conſiderable quantities of corn and tobacco, and along the Mayn good wine. It has good paſtures, and the breed of cattle is excellent. The chief mines are thoſe of iron, thoſe of other kinds being neglected. It has ſeveral medicinal ſprings. Anſpach, together with Bayreuth, maintains a population of 320,000 on 2,320 ſquare miles. The principal rivers are the Retzat, Under or Rednitz, the Altmuhl, the Jagſt, the Wornitz, the Tauber, and the Mayn. It has 16 boroughs, and 17 market towns, the principal of which are Anſpach, Swabach, Kornburg, Cadolzburg, Roth, Gunzenhauſen, Waſſertrudingen, Windſbach, Feuchtwang, Creilſheim, Colmberg, and Uffenheim. The reigning margrave of this principality has a ſeat and a voice in the council of the princes of the empire, and is alſo co-ſummonary prince of the circle of Franconia.

ANSPACH, a city of Germany, the capital of the above-mentioned marquiſate, ſituate on the river Retzat, about 13 miles ſouth-weſt of Nuremberg. This city was rebuilt and enlarged in 1710: it has a public library eſtabliſhed in 1738, and a good cabinet of medals and curioſities. N. lat. 49° 14'. E. long. 10° 42'.

ANSPESSADES, or LANSPESSADES, in the *French Military*, a kind of inferior officers in the foot, below the corporals, and yet above the common centinels.

The word is formed of the Italian *lancia ſpezzata*, q. d. *broken lance*; which was occaſioned hence, that they were originally diſbanded *gendarmes*, who, for want of other ſubſiſtence, ſued for a place of ſome diſtinction in the infantry. There are uſually four or five in each company.

ANSTRUTHER, in *Geography*, a ſea port town of Scotland, and a royal borough, ſituate in the eaſtern part of the county of Fife, towards the German ſea. It is divided into two towns, *Eaſter* and *Weſter* (which are royal boroughs) by a ſmall river: the harbour is capable of receiving only ſmall veſſels, employed principally in the fiſhery of the place. N. lat. 56° 12'. Weſt. long. 2 26'.

ANSWER, in *Law*. See REJOINDER.

ANT, in *Entomology*, the common Engliſh name of the *formica* of Linnæus, and ſynonymous with emmet. That deſtructive creature termes fatale is alſo called an ant. See FORMICA, and TERMES.

This is an inſect extremely injurious to paſture lands and gardens; in the former, by throwing up hills, and, in the latter, by feeding on the fruit, &c. The beſt methods of keeping them from trees, are thoſe of having the earth round them conſtantly dug up; and the application of ſawduſt, coal-aſhes, or other matters of the ſame kind, about their roots. The ſame purpoſe may alſo be effected by covering the bottom part of the trees with tar; but as this ſubſtance is prejudicial to trees, night-ſoil may perhaps anſwer better, as it is found to deſtroy them when ſpread upon, or put into the little hills which they throw up. A liquor, prepared by boiling rain water with black ſoap and ſulphur, has lately been made uſe of by M. Tatin, for deſtroying theſe animals, it is ſaid, with conſiderable ſucceſs. Where this liquor is employed, care ſhould, however, be taken that the ground where they inhabit be perfectly ſaturated with it.

ANT-*Bear*, or ANT-*Eater*, in *Zoology*. See MYRMECOPHAGA.

ANT-*Eggs* is a name popularly given to a kind of little white balls found in the banks or neſts of ants, ordinarily ſuppoſed to be the ova of this inſect. Theſe are not properly the eggs of ants, but the young brood in their incipient ſtate; when they appear like vermicles or little worms, wrapped up in a film or ſkin, compoſed of a ſort of ſilk, which they ſpin out of themſelves in the manner of ſilk-worms and caterpilllars. At firſt they appear motionleſs, and after a few days, they manifeſt ſome ſymptoms of flexion and extenſion; then they ſeem yellowiſh and hairy, and in the form of ſmall maggots which they aſſume, they continue to grow till they are almoſt as large as ants. After having paſſed their metamorphoſis, and when they appear in their proper ſhape, they exhibit a black ſpeck near the anus, which Mr. Leewenhoeck and alſo Mr. Gould imagine to be their fæces or digeſted food.

Sir Ed. King opened ſeveral of theſe vulgarly reputed eggs, in ſome of which he found only a maggot in the circumſtances as above deſcribed; while in another, the maggot had begun to put on the ſhape of an ant about the head, having two little yellow ſpecks, where the eyes were to be. And in others, a farther progreſs was obſerved, the included maggot being furniſhed with every thing to complete the ſhape of ant, but wholly tranſparent, the eyes only excepted, which were as black as bugles. Laſtly, in others, he took out every way perfect and complete ants, which immediately crept about among the reſt.

The true ants eggs are the white ſubſtance which, upon opening their ſtanks, appears to the eye like the ſcatterings of fine white ſugar, or ſalt, but very ſoft, and tender. Examined by a microſcope, it is found to conſiſt of ſeveral pure white appearances in diſtinct membranes, all figured like the leſſer ſort of birds eggs, and as clear as a fiſh's bladder. The ſame ſubſtance is found in the bodies of the ants themſelves. This ſpawn, when emitted, they lie in multitudes on, to brood; till in ſome time it is turned into little vermicles, as ſmall as mites, commonly called ant-eggs. See FORMICA.

ANT-*hills* are little hillocks of earth, which the ants throw up for their habitation and the breeding of their young.

Theſe hills are very detrimental to the farmer, depriving him of as much land as the hills cover, which may, in many caſes, be computed at a tenth part or more of his graſs lands; and in ſome places, where negligence has ſuffered them to multiply, almoſt half of it has been rendered uſeleſs in this way. In order to remove nuiſances of this kind in lands, it has been a cuſtom in ſome places at the beginning of winter, and often when the weather was not very cold, to dig up the ant-hills, three or four inches below the ſurface of the ground, and then to cut them in pieces, and ſcatter the fragments about. But this practice only diſſeminates the ants, inſtead of deſtroying them, as they hide

hide themſelves among the roots of the graſs for a little time, and then collect together again upon any little eminence, of which there are generally great numbers ready for their purpoſe; ſuch as the circular ridges round the hollows where the hills ſtood before. It is therefore a much better method to cut the hills entirely off rather lower than the ſurface of the land, and to let them lie whole at a little diſtance with their bottoms upwards; as by this means the ants, which are known to be very tenacious of their abodes, continue in their habitations, until the rains, by running into their holes of communication, and ſtagnating in the hollows formed by the removals of the hills, and the froſts, which now readily penetrate, deſtroy them. If a little foot were ſown on the places, and waſhed in with the rains, it would probably contribute greatly to the effect intended. The hills, when rendered mellow by the froſts, may be broken and diſperſed about the land, or removed for the purpoſe of forming into compoſt with dung, lime, or other ſubſtances. By this method of cutting the hills one other advantage is gained, the land ſoon becomes even and fit for mowing. In wet ſeaſons, heaps of ſandy particles are formed by theſe inſects among the graſs, called by labourers *ſprout-hills*, which quickly take off the edge of the ſcythe. Theſe, which are very light and compreſſible, may be conveniently removed by frequent heavy rolling in the early ſpring months. In the rural economy of Norfolk, a practice of cutting and burning the ant-hills that are formed on graſs land is mentioned by Mr. Marſhall. The proceſs is, to cut them up with a heart-ſhaped ſharp ſpade or ſhovel, in irregular lumps of from ten to fifteen inches diameter, and from two to five or ſix inches thick. Theſe are to be turned the graſs ſide downwards, until the mould ſide is thoroughly dry, and then to be ſet the graſs ſide outwards, until they are dry enough to burn. The fire may be kindled with bruſh wood, and kept ſmothering, by laying the ſods or lumps on gradually, as the fire breaks out, until ten or fifteen loads of aſhes are raiſed in one heap, which the workmen there complete for a ſhilling or eighteen pence each load of aſhes. The places from which the hills have been removed may be ſown with graſs ſeeds. Beſides the deſtruction of the ant, this is a ready, though by no means an economical way of raiſing manure.

But in the ſixteenth volume of the Annals of Agriculture, Mr. Young recommends the method of rolling down the ant-hills, inſtead of cutting them, as the beſt practice; and ſays, that he rode over a large paſture, which he ſhould not have known had ever been infeſted with theſe hills, if he had not been aſſured that it was once covered with them. No other method had been uſed but that of repeated rollings with a very heavy roller.

ANT-*lion*. See FORMICA-*Leo*.

ANT, *muſk*, the name given by Liſter and Ray, to a peculiar ſpecies of ant, which is of the number of the perfumed inſects. It is found on dry banks, and ſo much ſmaller than the common ant, that it needs no other diſtinction. Thoſe of this ſpecies which are without wings are of a yellowiſh colour, and when bruiſed or cruſhed emit a ſharp and acid ſmell, as the common ant does; but thoſe which have wings are coal-black, and theſe, inſtead of the four ſmell of the others, emit a perfume not to be endured for its ſtrength. The ſmell of all the perfumed inſects goes off in keeping; and theſe little creatures, after they have been dead and dry ſome time, are found to ſmell leſs ſtrongly, but much more agreeably. Phil. Tranſ. N° 77, or Abr. vol. ii. p. 792.

ANT, *viſiting*. At Paramaribo, a Dutch colony in the province of Surinam, there are ants which the Portugueſe call *viſiting-ants*; they march in troops; and as ſoon as they appear, all the coffers and cheſts of drawers are laid open, which they clear of rats, mice, and a peculiar ſort of inſect in that country called *cockerlacs*, and of other noxious animals. If any one chance to moleſt them, they fall upon him, and tear in pieces his ſtockings and ſhoes. Their viſits are rare; and they do not ſometimes appear for three years. Templeman's Obſ. vol. i. p. 36.

ANTA, in the *Ancient Architecture*, a ſquare column, or pilaſter, placed at the corners of the walls of temples and other edifices.

Theſe took their name, according to M. Perrault, from the prepoſition *ante*, *before*, becauſe placed before the walls and coins of buildings, to ſecure or ſtrengthen them. The *antæ* ſtood out on the wall, with a projecture equal to one-eighth of their face, provided there were no ornament that had a greater projecture; but it was a rule, that the projecture of the antæ ſhould always equal that of the ornaments.

There are alſo antæ at doors and gates. Feſtus confines their uſe to this laſt place.

Vitruvius calls thoſe that have but two faces out of the wall angular antæ, to diſtinguiſh them from others which have three faces diſengaged, and which are placed at the ends of the walls of porticos. See ANTICUM.

ANTA, or HANTE, in *Geography*, a ſmall kingdom or province on the gold-coaſt of Africa, is bounded on the north by the country of Adom, on the north-eaſt by Mampo, by Axim on the weſt, and on the ſouth and ſouth-eaſt by the ocean. Its extent from eaſt to weſt is about ten leagues, the country is mountainous, and covered by large trees, among which are ſituated many fine villages. Anta was formerly powerful and populous, inhabited by a bold and rapacious people, who greatly annoyed the Europeans by their frequent incurſions; but by continual wars with Adom and other neighbouring diſtricts, they are now enfeebled, and the country is almoſt depopulated. The land is well watered, the vallies are rich and extenſive, and the productions, which are abundant, are rice, the beſt maize, ſugar-canes, yams, and potatoes. This country is the moſt healthy of any along the coaſt; ſo that different writers have obſerved, that the number of deaths here bears no proportion to that in any other of the territories on the coaſt of Guinea. The principal villages of this country are Bourtry or Botro, Boyera or Petre Grand, Pando, Tokorari, which ſurpaſſes all the others in extent and beauty, Sokonda, Anta, and Sama. See the ſeveral articles. The king of Anta has fixed his reſidence four miles from the Dutch fort, as he thus enjoys the protection of the Europeans, and is in ſome meaſure ſecured from the apprehenſions occaſioned by the incurſions of the Adomeſe. Mod. Un. Hiſt. vol. xiii. p. 401, &c.

ANTA, in *Zoology*. See TAPIR.

ANTAB, in *Geography*, a town of Syria, 42 miles ſouth of Aleppo.

ANTACÆUS, in *Ichthyology*, a name firſt given by the Greek writers Ælian and Strabo, to the *ichthycolla piſcis*, the iſinglaſs fiſh, or HUSO; and afterwards by Jonſton and others, not only to this fiſh, but to the common STURGEON.

ANTACHATES is uſed by ſome naturaliſts for a kind of bituminous ſtone of the nature of amber, though of a different colour, which in burning yields a ſmell like myrrh.

ANTACIDS, in the *Materia Medica*, is uſed by ſome writers to denote medicines proper to correct and reſiſt acid humours.

Antacids are chiefly of the alcalious kind.

Under the claſs of *antacids* come, 1. Abſorbents, as chalk, magneſia, cornu cervi uſtum, coral, ſea-ſhells, hæmatites, and ſteel-filings. 2. Obtundents, as oils and fats. 3. Immutants, as lixivious ſalts and ſoaps.

ANTACRIDS denote medicines ſuited to correct acrimony, either in the whole ſyſtem, or in particular parts of it. See ACRIMONY.

ANTÆ, in *Ancient Geography*, a people placed by Procopius and Jornandes near the mouth of the Danube.

ANTÆOPOLIS, ſo called from Antæus, overcome by Hercules, a town of Egypt in the Thebaid, on the eaſt ſide of the Nile; was the capital of the Nome *Antæopolites*, about 32 miles above Panopolis, and about the ſame diſtance below Nicopolis. The Thebaid, after the age of Conſtantine, was divided into two provinces; and Antæopolis became the metropolis of the firſt Thebaid, and had biſhops. This city contained the magnificent temple, which the Egyptians, according to Diodorus Siculus, built in honour of Antæus. No part of it is now remaining but the portico, ſupported by huge columns, and covered with large ſtones, one of which may be diſtinguiſhed, thirty feet long by five wide. The ceiling, painted with gold and azure, has preſerved the liveline's of its colours. The Turks have converted it into a ſtable, where they collect their herds. On the ruins of Antæopolis is now built a miſerable burgh called *Gaua el Kebire*. Savary's Travels, vol. i. p. 560.

ANTÆUS, in *Entomology*, a ſpecies of SCARABÆUS that inhabits America. The thorax has three horns, the middle one the longeſt, and ſimple; head unarmed; wing-caſes very ſmooth. Fabricius, Jablonſky, and Gmelin. The female has no horns.

ANTÆUS, in *Fabulous Hiſtory*, a gigantic king of Libya, ſaid to be the ſon of Neptune and Terra, and of the enormous ſtature of 64 cubits. In his conteſt with Hercules, he was repeatedly overcome, and laid on the ground half dead; but as often as he touched the earth, he obtained aſſiſtance from his mother, and acquired freſh ſtrength. Hercules, therefore, found it neceſſary to raiſe him from the ground, and ſuſpending him in the air, ſqueezed him to death. This Antæus is ſaid to have built the town of Tingis on the ſtraits of Gibraltar, where he was interred. The Greek geographers pretend that this Antæus founded Antæopolis in Upper Egypt; and Diodorus Siculus informs us, that Oſiris aſſigned to him the government of Libya and Ethiopia. But it is not eaſy to determine how the Egyptians ſhould raiſe to the rank of their gods the Grecian Antæus. It is probable, however, that the temple in which Antæus was honoured by the ancient inhabitants of Egypt, was ruined; and that in proceſs of time the Greeks, under the reign of the Ptolemies, ſubſtituted for the worſhip aſſigned to the Egyptian Antæus, that of the giant of the ſame name, ſlain by Hercules.

ANTÆUS, in *Ancient Hiſtory*, was probably the ſame with Atlas; and they are repreſented by ancient writers as two of the firſt kings of Mauritania. They were both the ſons of Neptune, who reigned over Mauritania, Numidia, and a great part of Libya; and they both ruled over a great part of Africa, particularly Tingitania. Hercules defeated and ſlew Antæus, in the war in which he diſpoſſeſſed Atlas of Libya. Atlas and Antæus invaded Egypt, and contended with Hercules in the wars with the gods, and were both vanquiſhed by him. Antæus, as well as Atlas, was famed for his knowledge of the celeſtial ſciences; and from this circumſtance it may reaſonably be inferred, that they were, under different names, the ſame king of Mauritania. Antæus, in his wars with Hercules, commanded an army of Egyptians and Ethiopians, and behaved with great reſolution and fortitude. By means of powerful reinforcements of Libyan troops, he cut off a great number of Hercules's men; but that celebrated commander, having at laſt intercepted a ſtrong body of Mauritanian or Libyan forces, that were ſent to the relief of Antæus, gave him a total overthrow, and put him and the beſt part of his troops to the ſword. This deciſive action put Hercules in poſſeſſion of Libya and Mauritania, and conſequently of all the riches of thoſe kingdoms; and hence aroſe the fable, that Hercules, finding Antæus, a giant of an enormous ſize, with whom he was engaged in ſingle combat, had recourſe to the artifice mentioned in the preceding article for putting him to death. Hence likewiſe may be deduced the fable, intimating that Hercules took the globe of Atlas upon his own ſhoulders, overcame the dragon that guarded the orchards of the Heſperides, and made himſelf maſter of all the golden fruit. The golden apples ſo frequently mentioned by the old mythologiſts, were the treaſures that fell into the hands of Hercules upon the defeat of Antæus; the Greeks giving the oriental word תפוח, *riches*, the ſignification affixed to their own term μῆλα, *apples*. After the moſt diligent and impartial examination of all the different hypotheſes of hiſtorians and chronologers, relating to Atlas and Antæus, there is no one that appears ſo little encumbered with difficulties as that of Sir Iſaac Newton. According to this illuſtrious author, Ammon, the father of Seſac, was the firſt king of Libya, or that vaſt tract extending from the borders of Egypt to the Atlantic Ocean; the conqueſt of which country was effected by Seſac during his father's life. Neptune afterwards excited the Libyans to a rebellion againſt Seſac, and ſlew him; and then invaded Egypt, under the command of Atlas and Antæus, the ſon of Neptune, Seſac's brother and admiral. Not long after, Hercules, the general of Thebais and Ethiopia, for the gods, or great men of Egypt, reduced a ſecond time the whole continent of Libya, having overthrown and ſlain Antæus near a town in Thebais, from that event called Antea, or Antæopolis. Such is the opinion of Sir Iſaac Newton, who endeavours to prove, that the firſt reduction of Libya by Seſac happened a little above a thouſand years before the birth of Chriſt, as the laſt, by Hercules, occurred ſome few years after. Anc. Un. Hiſt. vol. xvi. p. 160.

ANTAGONIST, formed from κατὰ, *againſt*, and ἀγωνίζω, *I contend*, among the *Ancients*, denotes an adverſary in battle. In this ſenſe the word is rather uſed in ſpeaking of ſportive combats, or games, than of ſerious fighting.

ANTAGONIST alſo denotes one of the parties in literary diſputes.

ANTAGONIST *muſcles*, in *Anatomy*, are thoſe which have oppoſite functions. Such are the *flexor* and *extenſor* of any limb, the one of which contracts it, and the other ſtretches it out; and alſo the *abductors* and *adductors*. Solitary muſcles are thoſe without any antagoniſts; as the heart, &c.

ANTALGIC, from κατὰ, and ἄλγος, *pain*, an epithet given by ſome writers to medicines proper for abating pain. In this ſenſe antalgics amount to the ſame with ANODYNES.

ANTALIS, in *Conchology*, the name given by Argenville to the ſpecies of dentalium, called ENTALIS by Linnæus.

ANTALKALINES, in the *Materia Medica*, ſignify medicines ſuited to correct alkaline ſalts, or alkaline matters in the whole body, or in particular parts. Dr. Cullen obſerves (Mat. Med. vol. ii. p. 423.), that no alkaline ſalt, in its ſeparate ſtate, ever exiſts in the blood-veſſels of the living human body. He accordingly explodes the doctrine of Dr. Boerhaave, who treats "De Morbis ex Alkali ſpontaneo," as incorrect and erroneous, and leading to no occaſion for the uſe of antalkalines: and he adds, that the only occurrence requiring them is a very rare one, that of a pure alkali being thrown in by miſtake or accident into the ſtomach; and the means of taking off its irritation by acids is ſufficiently obvious. It is farther to be remarked, that as the alkali, in any noxious quantity, cannot have been introduced without hurting the mouth, fauces, and œſophagus, it is always neceſſary, in ſuch caſes, along with the acids, to employ the large uſe of diluents and demulcents.

ANTAMBA,

ANTAMBA, in *Zoology*, an animal of Madagaſcar, probably the ſame with the engoi of Congo, is a variety of the leopard, as large as a dog, with a round head; and, according to the relations of the negroes, is like a leopard, and devours both men and cattle. It is found only in the moſt deſert parts of the iſland.

ANTANACLASIS, from αντι and αναϰλαω, *repercutio, I ſtrike again*, a figure in *Rhetoric*; whereby the ſame word is repeated, but in a different ſignification—As, "Let the dead bury the dead." "Dum vivimus, vivamus." This figure carries with it a poignancy; and when it appears natural and eaſy, diſcovers a ready turn of thought.

ANTANAGOGE, from αντι, and αναγωγη, *retortion*; a figure in *Rhetoric*, when, not being able to anſwer the accuſation of the adverſary, we return the charge, by loading him with the ſame or other crimes; which is uſually called RECRIMINATION.

ANTANDRO, in *Geography*, a town of Aſiatic Turkey, in the province of Natolia, 12 miles weſt north-weſt of Adramitti.

ANTANDROS, in *Ancient Geography*, a town of Aſia Minor, in Myſia, according to Strabo, who places it on the north ſide of the gulf of Adramyttium. Stephanus Byz. ſays, that the Cimmerians poſſeſſed it during a century. According to Strabo, theſe people, conducted by Lygdamis, made this town their place of arms. Servius ſays, that Antandros was founded by the inhabitants of Andros, after they were driven from their own iſland on account of their ſedition. Others ſay, that the Thracians, having made Polydore a priſoner, obtained this city as the price of his ranſom. Some authors place it at the foot of Mount Ida; and allege, that it gave name to the ſmall chain of mountains extending from Troy to the ſea. See ANDROS.

ANTANII, a people who inhabited Caria.

ANTANISOPHYLLUM, in *Botany*. See BOERHAAVIA.

ANTAPHRODISIAC, from αντι, and Αφροδιτη, *Venus*; an epithet given to medicines which diminiſh the ſemen, and check or extinguiſh the incitements to venery. It is doubtful whether there be any medicines of ſpecific power for this purpoſe; and if there be any which have theſe effects, it is by anſwering particular indications, under the titles of which they ſhould only be mentioned, and not under a general term of no defined operation.

ANTAPOCHA, in the *Civil Law*, denotes one's acknowledgment in writing of money paid, in the way of rent, penſion, intereſt, or the like incumbrance. Such inſtrument, or antapocha, the debtor gives upon making payment to the creditor, to ſerve as a proof of the charge or incumbrance for futurity, and exclude any claim of preſcription againſt the payment of it. The *antapocha* differs from the *apocha*, in that this latter is given by the creditors to the debtor, the former *vice verſa*.

ANTARADUS, in *Ancient Geography*, a town of Syria, commonly called TORTOSA, was ſituated over-againſt the ancient ARADUS, to the right of the river Eleuthera, at a ſmall diſtance from the ſea. In the fourth century, about A. D. 330, it continued to be known by its old name, as appears from the "Itinerarium Hieroſolymitanum;" which, with its other name *Conſtantia*, given to it by its reſtorer Conſtantius, were diſuſed ſome centuries afterwards, in, or perhaps before, the time of the croiſades. Shaw's Trav. p. 266.

ANTARCTIC *Pole* denotes the ſouthern POLE, or end of the earth's axis. The word is compoſed of αντι, *contra*, and αρϰτος, *urſa, bear*; as being oppoſite to the artic pole. The ſtars near the antarctic pole never appear above our horizon.

ANTARCTIC *circle*, is one of the leſſer circles of the ſphere, parallel to the equator, at the diſtance of 23° 30′ from the ſouth pole. It takes its name from its being oppoſite to another circle, parallel likewiſe to the equator, and at the ſame diſtance from the north pole, called the ARCTIC *circle*.

ANTARCTICA, in *Entomology*, a ſpecies of SPHEX, about the ſize of the common waſp. It is black, with ferruginous legs and antennæ. Gmelin. Inhabits the Cape of Good Hope.

ANTARCTICA, in *Ornithology*, a ſpecies of PROCELLARIA that is found within the antarctic circle. It is brown above, beneath bluiſh white; tail white, black at the tip; legs lead colour. Gmelin. This is the antarctic petrel of Forſter and Cook; petrel antarctique, ou damier brun, of Buffon; and petrel brun et blanc of Bongaino. It is about the ſize of a large pigeon, and the length is ſixteen inches, of which the bill is one inch and an half, and is brown with a black tip; the ſecond quill feathers are white, with dark brown tips; the quills are dark brown, with the inner webs of ſome next the body white. Theſe birds have been met with in flights of twenty or more, by navigators, in S. lat. 61° 36′.

ANTARCTICA, is alſo a ſpecies of APTENODYTES, called by Forſter the antarctic pinguin. The beak is black, legs reddiſh, and a black line on the throat. Gmelin.

The length of this bird is twenty-five inches; the weight eleven pounds and an half. Bill nearly three inches in length, black, and the under mandible ſomewhat truncated; irides pale yellow; upper parts of the body black, beneath gloſſy white. Under the chin is a narrow blackiſh ſtreak paſſing backwards towards the hinder part of the head, and ſomewhat bent about the region of the ears. Wings above blue-black, the lower margin and inſide white; tips black. Tail cuneiform; the feathers, or rather briſtles which compoſe it, black, and thirty-two in number. The feet, which are reddiſh, or rather fleſh colour, have the ſoles black. Latham, &c.

This ſpecies inhabits the South Sea, from 48° to the antarctic circle; and is frequently found on the icy mountains and iſlands in thoſe regions, according to Forſter, Ellis, and other naturaliſts and navigators.

ANTARCTICUS, in *Entomology*, a ſpecies of TABANUS that inhabits America. It has four brown ſtripes acroſs the eyes, and the ſhanks of the legs are white. Fabricius and Gmelin.

ANTARES, in *Aſtronomy*, the Scorpion's Heart; a fixed ſtar of the firſt magnitude, in the conſtellation SCORPIO.

ANTASTHMATICS, in the *Materia Medica*, denote medicines that are ſuppoſed to cure aſthma; or, in general, to relieve difficult breathing.

ANTASTROPHE, from αντι, and ϛρεφω, *I turn*; in *Rhetoric*, a ſpecies of ANTEPOSITION.

ANTAVARE, in *Geography*, a province of Madagaſcar, is ſituated to the north of Matatane, in 21° 30′ of S. lat. and bounded by the province and cape of Manouſi. It is watered by the river Mananzari, whoſe ſource is in the mountains of Ambohitſmene, or red mountains, ſituate about 12 leagues farther north-weſt, and which runs ſouth-eaſt and eaſt. Antavare is extremely fertile in rice, yams, bananas, ſugar-canes, and honey, of which wine is made; and it abounds in cattle and goats, and all ſorts of fowls and proviſions. The French diſcovered in this province gold duſt by means of the negroes, who offered it for ſale.

ANTE, in *Geography*, a river of France, which runs into the Dive at Calliboeuf, in the department of the Calvados.

ANTE, a town and port of Africa, in Guinea, three leagues from the cape of Three Points.

ANTEA, or ANTEIS, *Ampus*, in *Ancient Geography*, a town of Gallia Narbonnenſis, almoſt to the north of Forum Voconii. The Roman way from Forum Julii to Reis Apollinaris, paſſed by Antea.

ANTEAMBULONES, from *ante*, *before*, and *ambulo*, *I walk*, in *Antiquity*, a kind of ſtate ſervants, who walked before their maſters to clear the way and keep off the crowd.

The *formula* uſed by theſe was *Date locum domino meo*.

ANTECANIS is uſed, by ſome *Aſtronomers*, to denote the conſtellation otherwiſe called *Canis Minor*, or the ſtar *Procyon*. It is thus denominated as preceding, or being the forerunner of the *Canis Major*, and riſing a little before it.

ANTECEDENT, in the ſchools, ſomething that precedes or goes before another, in reſpect of time or place.

The word is compounded of *ante*, *before*, and *cedere*, *to go*. In which ſenſe it ſtands oppoſed to *ſubſequent*.

ANTECEDENT, in *Grammar*, the word to which a relative refers.

ANTECEDENT, in *Logic*, denotes the firſt propoſition of an *enthymeme*, or of an argument which only conſiſts of two members. In oppoſition to this, the latter is called the *conſequent*.

Thus, in the argument, *cogito, ergo ſum*, *I think, and therefore I exiſt*; *cogito* is the antecedent: being thus called, becauſe it precedes the *ergo*, or the *copula*, of the argument.

ANTECEDENT *of a* RATIO, in *Mathematics*, denotes the firſt term, or that which is compared with the other.

Thus, if the *ratio* be $a : b$, or of a to b, a is ſaid to be the antecedent.

ANTECEDENT *ſigns*, in *Medicine*, are ſuch ſymptoms of diſorder as appear before a diſtemper is ſo formed as to be reducible to any particular claſs, or proper denomination.

ANTECEDENTS, in *Rhetoric*, are ſuch things as being once allowed, others neceſſarily or very probably follow. This is one of the ſixteen topics or common places enumerated by Cicero and Quinctilian.

ANTECEDENT *decree*, in *Theology*, is a decree preceding ſome other decree, or ſome action of the Creator, or the proviſion of action. It is a point much controverted, whether predeſtination be a decree antecedent to faith, or ſubſequent to it.

ANTECEDENT *will*, or *deſire*, is that which precedes ſome other will or deſire, or ſome knowledge or proviſion. Thus ſome divines ſay, God by a ſincere, but antecedent deſire, wills all men to be ſaved; that is, this ſincere deſire of God precedes, and does not ſuppoſe, the knowledge of their faith and repentance.

ANTECEDENT *neceſſity*. See NECESSITY.

ANTECEDENTAL METHOD, in *Mathematics*, is a branch of general geometrical proportion, or univerſal compariſon; and is derived from an examination of the antecedents of ratios, having given conſequents, and a given ſtandard of compariſon, in the various degrees of augmentation and diminution, which they undergo by compoſition and decompoſition. This method was invented by Mr. James Glenie, and publiſhed by him in 1793; and this method, he ſays, he always uſed inſtead of the fluxional and differential methods, and which is totally unconnected with the ideas of motion and time. See the author's treatiſe on the ſubject, and alſo his Doctrine of Univerſal Compariſon, or General Proportion, 1789, upon which it is founded. See CALCULUS, *Antecedental*.

ANTECEDENTIA, among *Aſtronomers*. When a planet appears to move weſtward, contrary to the order or courſe of the ſigns, as from Taurus towards Aries, it is ſaid to move *in antecedentia*.

On the contrary, when it goes eaſtward, or forward, from Aries towards Taurus, it is ſaid to move *in conſequentia*.

ANTECESSOR, one that goes before, or that leads another. See PRECURSOR, PREDECESSOR, &c.

The term is particularly uſed, in ſome univerſities, for a public profeſſor, who teaches or lectures in the civil law.

ANTECESSORS, or ANTECURSORES, in the ancient art of *War*, is an appellation given to a party of horſe, diſpatched before the *agmen* or body of an army, partly by way of intelligence, and partly to chooſe out a proper place for encamping on, as well as the moſt convenient roads for the ſoldiery to travel in. They amount to the ſame with what the Greeks call *prodromi*.

ANTECHAMBER, or ANTICHAMBER, formed of *ante*, *before*, and *camera*, *a chamber*; an outer chamber before the principal chamber of an apartment, where the ſervants wait, and where ſtrangers ſtay, till the perſon to be ſpoken with is at leiſure.

ANTECHRIST. See ANTICHRIST.

ANTECUIA, or ANTEGUA, in *Ancient Geography*, a town of Spain in Bœtica, ſouth-eaſt of Hiſpalis, poſſeſſed; according to Ptolemy, by the Antigones.

ANTECURSORES. See ANTECESSORS.

ANTEDATE, a ſpurious date, prior to the true date of a writing, inſtrument, act, deed, or the like.

Antedates, in *Commerce*, are of a very dangerous conſequence in matters of trade. To *antedate* is to ſet down a falſe date: to date from a day prior to that on which the buſineſs is tranſacted, the note or bill drawn, or letters written, &c.

In France it was formerly the ill cuſtom to have blank orders on the backs of bills of exchange, that is, to indorſe them merely with a name, ſo that they could eaſily be antedated: which in caſe of failures was liable to cauſe very great abuſes. But by the regulations for commerce of 1683, it is ordered that the ſignatures on the backs of bills of exchange ſhall not ſerve for orders, unleſs dated; and antedates are puniſhed as forgery.

ANTEDILUVIAN, or ANTIDILUVIAN, formed of *ante*, *before*, and *diluvium*, *deluge*, ſomething that exiſted or happened before the DELUGE.

Dr. Burnet and Dr. Woodward differ very widely about the Antediluvian world; the former imagines its face and appearance to have been ſmooth, equable, and in all reſpects different from what we now find it to be. The latter, on the contrary, endeavours to prove, that the face of the terraqueous globe before the deluge was the ſame as it is now, *viz.* unequal, diſtinguiſhed into mountains and dales, and having likewiſe a ſea, lakes, and rivers; that this ſea was ſalt, as ours is; was ſubject to tides; and poſſeſſed nearly the ſame ſpace and extent that it now does; and that the *Antediluvian* world was ſtocked with animals, vegetables, minerals, &c. that it had the ſame poſition, in reſpect of the ſun, which ours now hath, its axis not being perpendicular, but inclined, as at preſent, to the plane of the ecliptic; conſequently that there were then the ſame ſucceſſion of weather, and the ſame viciſſitudes of ſeaſons as now. See EARTH.

In the ſenſe of the definition, thoſe generations that exiſted from Adam till Noah's flood, are called *Antediluvians*; and thoſe that have deſcended from Noah to the preſent time, are called *Poſtdiluvians*. Although the regular ſucceſſion of the ſeveral patriarchs from the creation to the deluge, or from Adam to Noah, may be deduced without difficulty from the ſacred writings, it is not ſo eaſy to ſettle the chronology of this period. Moſes has not preciſely marked the time of the various tranſactions that occurred before the

the flood, but he has contented himſelf with merely ſetting down the years of the fathers' age, in which the ſeveral deſcendants of Adam, in the line of Seth, were begotten, and the length of their reſpective lives; and therefore, in this period, nothing more can be done than to aſcertain the years of the lives and deaths of thoſe patriarchs, and the diſtance of time from the creation to the deluge. This, indeed, might eaſily be done, if there were no varieties in the ſeveral copies of the writings of Moſes, to which we have now acceſs, which are the Hebrew, the Samaritan, and the Greek verſion of the Septuagint: but theſe differ conſiderably from one another; and hence learned men, as they have preferred one copy or the other, are much divided in their opinions concerning the firſt ages of the world. In order to enable our readers to judge of the variations of the three copies above mentioned, in this period, we ſhall ſubjoin a table extracted from the Ancient Univerſal Hiſtory, in which the correſponding numbers of each will appear; and we ſhall alſo add thoſe of Joſephus, as they have been corrected by Dr. Wells and Mr. Whiſton; a correction which became indiſpenſable on account of the corruptions that have been introduced into the preſent copies of that hiſtorian.

A Table of the Years of the Antediluvian Patriarchs.

	Their ages at their ſons birth.				Years they lived after the ſons birth.			Length of their lives.		
	Heb.	Sam.	Sept.	Joſ.	Heb.	Sam.	Sept.	Heb.	Sam.	Sept.
Adam,	130	130	230	130	800	800	700	930	930	930
Seth,	105	105	205	105	807	807	707	912	912	912
Enos,	90	90	190	90	815	815	715	905	905	905
Cainan,	70	70	170	70	840	840	740	910	910	910
Mahalaleel,	65	65	165	65	830	830	730	895	895	895
Jared,	162	62	162	62	800	785	800	962	847	962
Enoch,	65	65	165	65	300	300	200	365	365	365
Methuſelah,	187	67	167	187	782	653	802	969	720	969
Lamech,	182	53	188	182	595	600	565	777	653	753
Noah was aged, at the Flood,	600	600	600	600						
To the Flood,	1656	1307	2262	1556						

To this Table it will be neceſſary, in order to explain the conſequence of theſe variations, to add ſeparate chronological tables, ſhewing in what year of his contemporaries the birth and death of each patriarch happened, according to the computation of each of the ſaid three copies.

A Chronological Table of the Years of the Patriarchs, according to the Computation of the Hebrew.

	Years of the world.	Years of Seth.	Years of Enos.	Years of Cainan.	Years of Mahalaleel.	Years of Jared.	Years of Enoch.	Years of Methuſelah.	Years of Lamech.	Years of Noah.
Adam created,	1									
Seth born,	130									
Enos born,	235	105								
Cainan born,	325	195	90							
Mahalaleel born,	395	265	160	70						
Jared born,	460	330	225	135	65					
Enoch born,	622	492	387	297	227	162				
Methuſelah born,	687	557	452	362	292	227	65			
Lamech born,	874	744	639	549	479	414	252	187		
Adam dies,	930	800	695	605	535	470	308	243	56	
Enoch tranſlated,	987	857	752	662	592	527	365	300	113	
Seth dies,	1042	912	807	717	647	582		355	168	
Noah born,	1056		821	731	661	596		369	182	
Enos dies,	1140		905	817	745	680		453	266	84
Cainan dies,	1235			910	840	775		548	361	179
Mahalaleel dies,	1290				895	830		603	416	234
Jared dies	1422					962		735	548	366
Japhet born,	1556							869	682	500
Shem born,	1558							871	684	502
Lamech dies,	1651							964	777	595
Methuſelah dies,	1656		The Flood.					969		600

A Chronological Table of the Years of the Patriarchs, according to the Computation of the Septuagint.

	Years of the world.	Years of Seth.	Years of Enos.	Years of Cainan.	Years of Mahalaleel.	Years of Jared.	Years of Enoch.	Years of Methuſelah.	Years of Lamech.	Years of Noah.
Adam created,	1									
Seth born, -	230	230								
Enos born, -	435	205	205							
Cainan born, -	625	395	190	190						
Mahalaleel born,	795	565	360	170	170					
Adam dies -	930	700	495	305	135	135				
Jared born, -	960	730	525	335	165	165				
Enoch born, -	1122	892	687	497	327	162	162			
Seth dies, -	1142	912	707	517	347	182	182			
Methuſelah born,	1387		852	662	492	327	165	187		
Enos dies,	1340		905	715	545	380	218	200		
Lamech born.	1474			849	679	514	352	248	61	
Enoch tranſlated,	1487			862	692	527	365	375	188	
Cainan dies, -	1535			910	740	575		403	216	28
Noah born,	1662				867	702		635	448	260
Mahalaleel dies,	1690				895	730		875	688	500
Jared dies, -	1922					962		877	690	502
Japhet born, -	2162							940	753	565
Shem born, -	2164							969		594
Lamech dies,	2227									600
Methuſelah dies,	2256									
The Flood, -	2262									

A Chronological Table of the Years of the Patriarchs, according to the Computation of the Samaritan Pentateuch.

	Years of the world.	Years of Seth.	Years of Enos.	Years of Cainan.	Years of Mahalaleel.	Years of Jared.	Years of Enoch.	Years of Methuſelah.	Years of Lamech.	Years of Noah.
Adam created,	1									
Seth born,	130	130								
Enos born, -	235	105	105							
Cainan born, -	325	195	90	90						
Mahalaleel born,	395	265	160	70	70					
Jared born, -	460	330	225	135	65	65				
Enoch born, -	522	392	287	197	127	62	62			
Methuſelah born,	587	457	352	262	192	127	65	65		
Lamech born, -	654	524	419	329	259	194	132	67	67	
Noah born, -	707	577	472	382	312	247	185	120	53	
Enoch tranſlated,	887	757	652	562	497	427	365	300	233	180
Adam dies, -	930	800	695	605	535	470		343	276	323
Seth dies, -	1042	912	807	717	647	582		462	388	335
Enos dies, -	1140		905	815	745	680		553	486	433
Japhet born, -	1207			882	812	747		620	553	500
Shem born, -	1209			884	814	749		622	555	502
Cainan dies, -	1235			910	840	775		648	581	528
Mahalaleel dies,	1290				895	830		703	636	583
Jared, Methuſelah, and Lamech, die	1307			The Flood.		847		720	653	600

To the varieties exhibited in the two laſt tables, others might be added, by admitting the various readings of ſome numbers in the Samaritan and Septuagint; for as to the Hebrew copies, there is here a conſtant agreement among them.

The manuſcript from which the Samaritan Pentateuch was publiſhed, agrees exactly with the Samaritan numbers given by Euſebius. But St. Jerom tells us, that, in his time, there were ſome Samaritan copies which make Methuſelah 187 years old at the birth of Lamech, and Lamech 182 at the birth of Noah, juſt as the Hebrew does. Now if theſe numbers be approved as the true original numbers, the interval from the creation to the flood will be 1556 years; differing from the Hebrew computation but 100 years in the age of Jared at the birth of Enoch: and if this laſt be allowed to be a miſtake of the tranſcriber, by his dropping a number, and writing 62 inſtead of 162, as has been ſuſpected, the Samaritan will be perfectly reconciled with the Hebrew, and all difference between them vaniſh.

Scaliger,

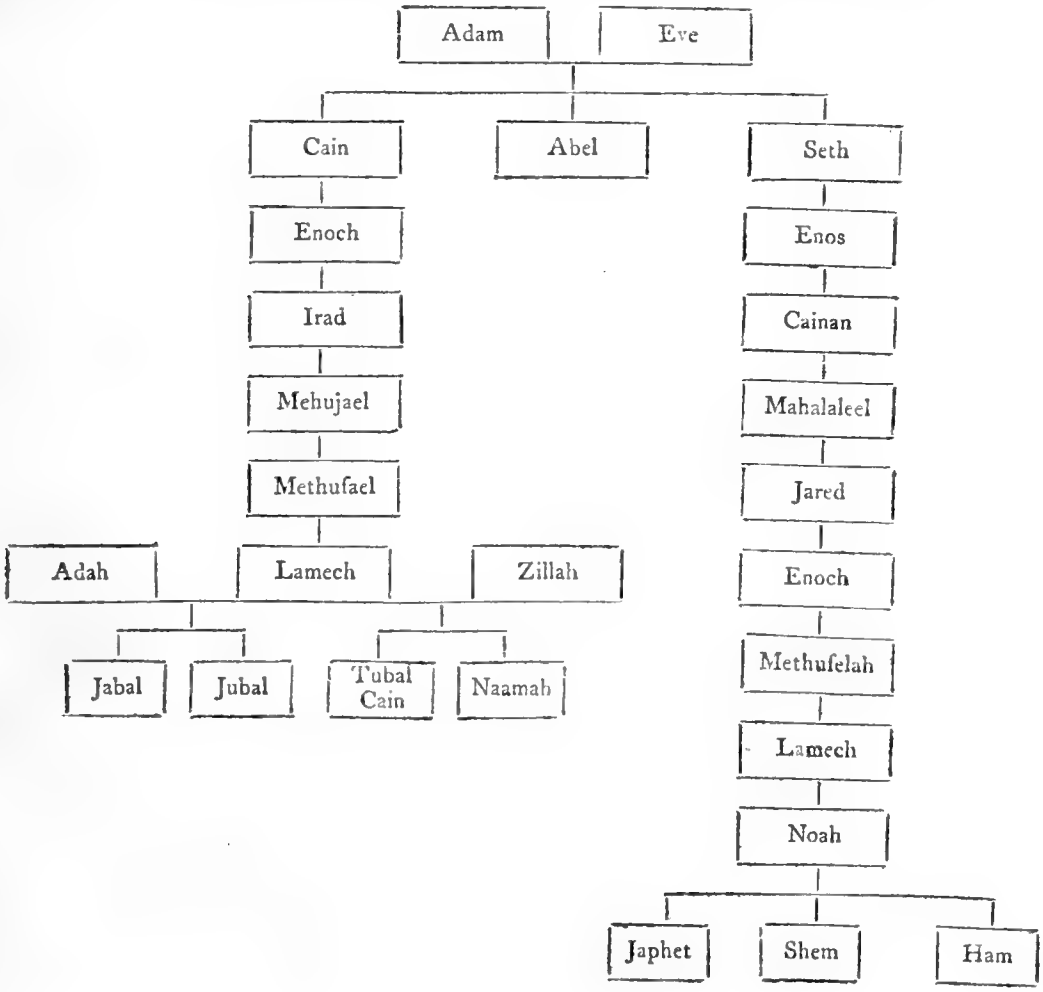
Scaliger, on the authority of an old Samaritan chronicle, having at the end a table of the years of the patriarchs to the time of Moſes, would correct two of the Samaritan numbers in Euſebius; viz. inſtead of 65, the age of Mahalaleel when he begat Jared, he thinks it ſhould be 75; and inſtead of 67, the age of Methuſelah when he begat Lamech, he would have it 77. By which alterations he reckons 20 years more to the flood than Euſebius and the manuſcript; that is, 1327: but as he acknowledges the table whereon he grounds theſe corrections, contains ſome great abſurdities, it ſeems unreaſonable to oppoſe it to the joint authority of Euſebius and the Samaritan manuſcript.

As to the Septuagint, in the common editions of that verſion, the age of Methuſelah at the birth of Lameeh is 167; and conſequently the ſum of this period, according to them, is no more than 2242. But in this caſe Methuſelah will outlive the flood 14 years; and we may well wonder, with Euſebius, where he was preſerved. To obviate this objection, we are told, that, in ſome copies, Methuſelah is ſaid to have lived but 782 (not 802) years after the birth of Lamech, and no more than 949 in all. But the Alexandrian manuſcript entirely takes away the difficulty, by giving the ſame number in this place with the Hebrew.

Pezron is of opinion, that the age of Lamech at the birth of Noah ſhould be but 182, as it is both in the Hebrew and in Joſephus; ſuppoſing, with St. Auſtin, that the preſent number is the error of the ſcribe, who firſt copied the original Septuagint manuſcript in Ptolemy's library. So that he computes 2256 years to the flood. And, if this correction be admitted, and one more mentioned alſo by St. Auſtin, viz. that Lamech lived 595 years after the birth of Noah, and not 565, as in the preſent copies, there will then remain no other difference between the Septuagint and the Hebrew than 600 years added to the ages of the ſix patriarchs when they begat their ſons; and Methuſelah will, conformably to the Hebrew and Samaritan, die in the year of the flood.

The chronology of the learned archbiſhop Uſher has been followed in the calculations of this period; and they may, with very little trouble, be reduced to that of the Samaritan or Septuagint, by thoſe who prefer the accounts of thoſe copies.

As in the courſe of this work we ſhall collect, under ſeparate articles, the leading particulars which ſacred hiſtory has recorded concerning the principal patriarchs, of the Antediluvian world, it is needleſs to enlarge in this place. It will be ſufficient to obſerve, that the whole progeny of Adam, of whom we have any mention in ſcripture, were the deſcendants of Cain and Seth, and the following genealogical table exhibits their ſucceſſion.



Sacred

Sacred hiſtory is chiefly confined to the line of Seth, and affords few particulars concerning that of Cain, ſo that no conjectures can be formed how long he or any of his deſcendants lived. The whole of what we know is, that Lamech, the fifth in deſcent from him, married two wives, Adah and Zillah, which connection furniſhes the firſt known inſtance of polygamy: that by the former he had two ſons, Jabal, who was the firſt that dwelt in tents and fed cattle, and Jubal, the inventor of muſic; and by the other, a ſon named Tubal-Cain, who found out the art of forging and working metals. Zillah likewiſe brought him a daughter named Naamah, who is ſuppoſed to have invented ſpinning and weaving. For other particulars, ſee LAMECH. The poſterity of Cain became in a very great degree degenerate and wicked; whilſt, on the other hand, the deſcendants of Seth were as eminent for their piety and virtue. In proceſs of time, however, or after ſeven generations, according to Joſephus, they alſo became corrupt and profligate; and every kind of wickedneſs overſpread the earth. At length the race of man became incorrigible, and all the means which Providence ordained for awakening and reclaiming them were ineffectual; ſo that it pleaſed God, in juſt diſpleaſure and after ſignal forbearance, to exterminate the whole ſpecies, Noah and his family excepted, by the deluge.

Of the Antediluvian period ſome accounts have been tranſmitted to us by thoſe ancient authors who have recorded the Phœnician, Babylonian, and Egyptian antiquities. Sanchoniatho (who is ſuppoſed by ſome to have been contemporary with Gideon, or with David; whilſt others deny the exiſtence of ſuch a perſon, and conſider his hiſtory as a fiction of Philo Biblius for diſcrediting Joſephus's book againſt Apion) wrote the Phœnician antiquities. His hiſtory commences with the origin of the world and of mankind; but as it was written with a view of apologiſing for idolatry, he deduces the hiſtory, not from Adam in the line of Seth, but in the idolatrous line of Cain, nor does he make the leaſt mention of the deluge. The firſt pair of mortals with whom his hiſtory begins, are called by Philo, his tranſlator, Protogonus and Æon. Their iſſue were denominated Genus and Genea, and they dwelt in Phœnicia. From Genus ſprung Phos, Phur, and Phlox, that is, light, fire, and flame. Theſe found out the method of producing fire by rubbing pieces of wood againſt each other, and taught men its uſe. Their ſons were of enormous height and bulk, and gave to the mountains of which they took poſſeſſion their own names of Caſſius and Libanus, Antilibanus and Brathys. From theſe again, in the fifth generation, proceeded Memrumus and Hypſuranius, who were ſo denominated by their mothers, who lived in a brutal ſtate of proſtitution. Hypſuranius inhabited Tyre, and there invented the art of making huts with reeds and ruſhes, and the papyrus. He quarrelled with his brother Uſous, who was the firſt inventor of a covering for his body, made of the ſkins of wild beaſts; and he alſo made a raft of boughs, and ventured upon it into the ſea. He likewiſe conſecrated two rude ſtones or pillars to fire and wind, and worſhipped them, pouring out to them the blood of ſuch wild beaſts as had been caught in hunting. Afterwards, however, ſtumps of wood and pillars were alſo conſecrated and worſhipped as deities. In the next generation ſucceeded Agreus and Halieus, the inventors of the arts of hunting and fiſhing, from whom the names of huntſmen and fiſhermen were derived. Theſe begot two brothers, who formed the ſeventh generation, and who diſcovered iron and the method of forging it; one of theſe was called Chryſor, the ſame with Hephæſtus or Vulcan, and exerciſed himſelf in words and charms, and divinations: he found out the hook, bait, and fiſhing line, built light boats, and was the firſt man that ſailed; ſo that after his death he was worſhipped as a god, and called Zeus Michius, or Jupiter the engineer; and ſome ſay, that his brothers invented the art of making bricks. From this generation deſcended two brothers, one called Technites, or the Artiſt, and the other Geinus Autochthon, or the home-born man of the earth. Theſe found out the art of mingling ſtubble or ſmall twigs, with the clay of which they made bricks and tiling. One of their poſterity, in the ninth generation, was called Agrus, field, and the other Agrouerus or Agrotes, huſbandman, who had a ſtatue much worſhipped, and a temple carried about by one or more yoke of oxen, in Phœnicia; and among thoſe of Byblus he is called by way of eminence, the greateſt of the gods. Theſe firſt made courtyards about houſes, fences, and caves or cellars. Huſbandmen and ſuch as uſe dogs in hunting, derive their origin from theſe: and they are alſo called Aletæ, and Titans. From theſe ſucceeded, in the 10th generation, Amynus and Magus, who taught men to form villages, and to feed flocks. Of Amynus and Magus were deſcended Miſor and Sydec; and the ſon of Miſor was Taautus or Thoth. The Protogonus and Æon of the Phœnician genealogy, were, without doubt, Adam and Eve; and Miſor, the Mizraim of Moſes. From Protogonus to Miſor, Sanchoniatho reckons 11 generations; and from Adam to Mizraim, Moſes makes 12: ſo that Sanchoniatho falls ſhort of Moſes only by one generation, which is owing to his not having recorded the flood. In this age there was one Eliun, importing in Greek Hypſiſtus, the moſt high; and his wife was named Beruth, who dwelt about Byblus; and by him was begotten one Epigeus, or Autochthon, whom they afterwards called Uranus, heaven. He gave his name to the element which is over us, and on account of its excellent beauty, is called heaven; and he had a ſiſter of the ſame parents, called Ge, the earth, and by reaſon of her beauty, the earth was denominated from her. Hypſiſtus, the father of theſe, being ſlain by wild beaſts, was conſecrated, and his children offered ſacrifices and libations to him. But Uranus, taking the kingdom of his father, married his ſiſter Ge, and had by her four ſons; Hus, who is called Chronus or Saturn; Betylus; Dagon, who is Siton, or the god of corn; and Atlas: but by other wives, Uranus had a numerous iſſue.

The Babylonian antiquities were collected by Beroſus, who was by birth a Chaldæan, and lived in the time of Alexander the Great. He gives a ſeries of ten kings, who reigned in Chaldæa before the flood, and computes their reigns by Sari or decads of years; making the whole ſum 1200, or more accurately, 1199 years, which is a number that offers no violence to the Moſaic chronology. As theſe ten ſucceſſions correſpond to the ten generations that elapſed between the creation and the flood, the firſt king, whoſe name was Alorus, has been ſuppoſed to be the ſame with Adam; and Xiſuthrus, the ſame with Noah. Alorus pretended to dominion by divine right, and maintained that God himſelf had declared him the paſtor of the people; a prerogative that peculiarly belonged to Adam. Alaſparus, the ſecond king, was ſucceeded by Amelon, or Amelarus, of the city of Pantibibla, probably the Sipphara of Ptolemy, and ſuppoſed by Sir Iſaac Newton to be the Sepharvaim of Scripture. After Amenon and Metalarus, who were both of Pantibibla, and the ſucceſſors of Alaſparus, aroſe Daonus, an inhabitant of the ſame city, and a ſhepherd. The ſeventh prince, called Eudereſchus, was of the ſame city; the eighth or ninth were of another city, called Laranchi; and

the

the laſt of theſe; Ohartes or Ardates, was ſucceeded by his ſon Xiſuthrus, in whoſe time the great deluge happened. See DELUGE.

Beroſus aſcribes the origin of the arts and ſciences among the Antediluvians to the following circumſtance. There appeared, ſays he, out of the Red Sea, at a place near the confines of Babylonia, a certain irrational animal, whoſe name was Oannes. His body reſembled that of a fiſh, and beneath his head another grew; his feet were like thoſe of a man, and proceeded from the fiſh's tail, and he had a human voice. This animal converſed with men in the day, and communicated the knowledge of letters, arts, and ſciences; he taught men to dwell together in cities, to erect temples, to introduce laws, to acquire geometry, and to gather ſeeds and fruits; and in ſhort, he imparted to mankind whatever was neceſſary and convenient for a civilized life. When the ſun ſet, this animal, which was of the amphibious kind, retired into the ſea, and ſtayed there during the night. This animal not only delivered his inſtructions by word of mouth, but wrote concerning the origin of things, and of political economy. Other authors have alſo mentioned this Oannes, with ſome trivial difference in their accounts. Hyginus alſo writes, that Euahanes, a name not very different from Oannes, came out of the ſea in Chaldæa, and explained aſtrology. According to Abydenus, a ſecond animal, called Annedotus, and reſembling the demi-god Oannes, aroſe out of the ſea in the reign of Amelon; and in the time of Daonus, four ſuch animals aroſe from the ſea, and their names were Euedocus, Eneugumus, Eneubulus, and Anementus; and under Euedereſchus there appeared another animal, like the former, called Odacon. All theſe explained more particularly what Oannes had delivered in a more ſummary and conciſe manner.

The Egyptians have alſo a ſeries of kings, who, as they pretend, reigned in Egypt before the flood; and their account begins in the ſame year with that of Beroſus. They had an ancient chronicle, extant among them not many centuries ago, which contained 30 dynaſties of princes who ruled in that country, by a ſeries of 113 generations, through an immenſe interval of 36,525 years, during which period Egypt was ſucceſſively governed by three different races, *viz.* the Auritæ, the Meſtræi, and the Egyptians. Manetho, a writer ſomewhat later than Beroſus, and whoſe remains furniſh the ancient Egyptian hiſtory, has not adopted this extravagant number of years, though he has probably been led into errors in chronology by this old chronicle, which nevertheleſs ſome have ſuppoſed to have been a compoſition of later date than his time. This writer begins his hiſtory with 16 dynaſties or reigns of princes; of whom the firſt ſeven were called gods, and the other nine demigods; theſe, he ſays, reigned 1985 years.

The knowledge we are able to deduce from the ſcriptures, the only ſource of authentic intelligence on this ſubject, concerning the religion, arts and ſciences, and policy of the Antediluvians, is very limited and imperfect, and depends more upon conjecture than upon certain concluſions from a detail of facts. Their religious rites, we know, conſiſted of ſacrifices, both of the fruits of the earth and of animals; but it is not agreed, whether the blood and fleſh of the animals, or only their milk and wool were offered. See SACRIFICE. Some have endeavoured to prove, that all the patriarchs from Adam had ſtated places, and both annual and weekly times ſet apart for divine worſhip, and alſo a ſeparate maintenance for the prieſts; but theſe particulars, though they may be true, cannot be proved from the ſcripture. See SABBATH. The arts and ſciences, as we may naturally ſuppoſe, made but ſlow progreſs during the period to which we now refer. It appears that the art of working metals was diſcovered by the laſt generation of the line of Cain, and muſic, which they might have been ſuppoſed to practiſe for their pleaſure, was not brought to any perfection (if indeed it was actually invented) before the ſame generation. Some have ſuppoſed, that the ſcience of aſtronomy was cultivated by the Antediluvians; but this opinion is probably owing to a miſapprehenſion of Joſephus: but if it was known, the progreſs they made in it, or indeed in any other ſcience, was inconſiderable. It has been even doubted, whether or not letters were known before the flood. See LETTERS and WRITING. As to their politics and civil conſtitutions, we can only ſay, that the patriarchal form of government was probably the firſt that was adopted; but this was ſet aſide, when tyranny and oppreſſion began to take place; and this change occurred much ſooner, as we have reaſon to believe, among the race of Cain than that of Seth. Their communities were few, and conſiſted of much larger numbers of people than thoſe which were formed after the flood; and it has been queſtioned, whether after the union of the two great families of Seth and Cain, there was any diſtinction of civil ſocieties, or diverſity of regular governments at all. It is more likely, that all mankind formed one great nation, living in a kind of anarchy, divided into ſeveral diſorderly aſſociations; which was almoſt the natural conſequence of their having but one common language, and muſt have greatly contributed to the general corruption, that could not otherwiſe have ſo univerſally overſpread the Antediluvian world. For this reaſon chiefly, as ſoon as the poſterity of Noah were ſufficiently increaſed, a plurality of tongues was miraculouſly introduced, in order to divide them into diſtinct ſocieties, that they might not be ſo eaſily debauched for the future. See CONFUSION of TONGUES, and DISPERSION.

The Antediluvian world was, probably, ſtocked with a much greater number of inhabitants in proportion to the extent in which we may ſuppoſe it to be habitable than the earth, in its preſent ſtate, is perhaps capable of containing or ſupplying. This increaſe of population ſeems naturally to follow from the great length of their lives, exceeding the preſent ſtandard of life in the proportion of at leaſt ten to one; the Antediluvians muſt, accordingly, in any long ſpace of time, double themſelves, at leaſt, in about the 10th part of the time in which mankind do now double their number; for they began to procreate as early, and left off as late, in proportion, as men do now; and the ſeveral children of the ſame father ſeem to have ſucceeded as quickly one after another as they uſually do at this day; and as many generations, which are but ſucceſſive with us, were contemporary before the flood, the number of people living on the earth at once, would be ſufficiently increaſed to anſwer any defect which might ariſe from other circumſtances not conſidered. So that, if we make a computation on theſe principles, we ſhall find, that there was a conſiderable number of people in the world at the death of Abel, though their father Adam was not then 130 years old, and that the number of mankind before the deluge would eaſily amount to above 100,000 millions, even according to the Samaritan chronology; that is, to 20 times as many as our preſent earth has, in all probability, now upon it, or can well be ſuppoſed capable of maintaining in its preſent conſtitution. It is now generally owned, as the reſult of good obſervations, that mankind double themſelves in about 360 or 370 years; or, allowance being made for all excepted caſes, ſuch as wars, famines, &c. in about 400 years. So that allowing the period for doubling mankind from the creation

creation to the deluge to be ten times ſhorter by reaſon of their ſo much longer lives; if we have a ſeries of 40 numbers, beginning at two, for ſo many God created at firſt, and doubling themſelves in 40, or for convenience, in 41 years, at a mean, or one age with another, till the deluge, we ſhall, in ſome degree, obtain the ſum total of mankind at the deluge, and alſo in the ſeveral ages before that time; though this period of doubling muſt ſtill have been much ſhorter in the earlieſt, and longer in the lateſt times of the interval; which computation Mr. Whiſton, who has furniſhed theſe obſervations has given in the following table.

Number of mankind.	Years of the world.	Years of doubling.	Series.

Mr. Cockburn, in his Treatiſe on the Deluge, has made ſeveral objections to the principles upon which the above table is calculated, for which we muſt refer to the author's own account. This author has computed two tables, exhibiting the increaſe of mankind in the Antediluvian world; the firſt on the ſuppoſition of their doubling themſelves in 50 years, and the other in 40 years, and both beginning at the year 500, when there could not be fewer than 100 married or marriageable perſons deſcended from Adam and Eve.

Years of the World.	Number of Mankind.
500	200
550	400
600	800
650	1,600
700	3,200
750	6,400
800	12,800
850	25,600
900	51,200
950	102,400
1,000	204,800
1,050	409,600
1,100	819,200
1,150	1,638,400
1,200	3,276,800
1,250	6,553,600
1,300	13,107,200
1,350	26,214,400
1,400	52,428,800
1,450	104,857,600
1,500	209,715,200
1,550	419,430,400
1,600	838,860,800
1,650	1,677,721,600
1,700	3,335,443,200
1,750	6,710,886,500
1,800	13,421,772,800
1,850	26,843,545,600
1,900	53,687,091,200
1,950	107,374,182,400
2,000	214,748,364,800
2,050	429,496,729,600

This table is calculated at the long interval of 50 years, that it may appear that even by under-rating the number of mankind, there would be ſo many millions born into the world before the deluge came, that they would be obliged to ſpread themſelves over the face of the earth, though but one half of the ſum total of 429,496 millions had been alive at the time of the deluge; but as the interval here allowed may appear to be too long for the time of doubling, the ſecond is calculated at the interval of 40 years, which comes nearer to the truth of the caſe, though even this may exceed the time of doubling.

1,500	6,710,886,400
1,540	13,421,772,800
1,580	26,843,545,600
1,620	53,687,091,200
1,660	107,374,182,400
1,700	214,748,364,800
1,740	429,496,729,600
1,780	858,993,459,200
1,820	1,717,986,918,400
1,860	3,435,973,836,800
1,900	6,871,947,673,600
1,940	13,743,895,347,200
1,980	27,487,790,694,400
2,020	54,975,581,388,800

The author, allowing for all obſtructions and deficiences in the courſe of nature, and for all caſualties and accidents, reduces the former number to one-half, *viz.* to 27,487,790,694,400, that is, 27 billions, or millions of millions, four hundred and eighty-ſeven thouſand, ſeven hundred and ninety millions, ſix hundred and ninety-four thouſand, and four hundred. This he ſuppoſes to be the whole number of thoſe who were born into the world before the deluge, or during an interval which he ſtates at 2256 years. He then allows for thoſe who died before the deluge, and on this account reduces the above number again to one-half, and ſtates the whole number of mankind alive upon the earth at the time of the deluge to have been no more than 13,743,895,347,200, that is, 13 billions, or millions of millions, ſeven hundred and forty-three thouſand eight hundred and ninety-five millions three hundred and forty-ſeven thouſand and two hundred; a number far exceeding that of the preſent inhabitants of the whole earth. The firſt of the above tables is brought down no lower than to the year 2050, and the ſecond to the year 2020, though there remain by the firſt 206, and by the ſecond 236 years to the flood; the reaſon of which is, that in the laſt 200 years of the world, mankind would not increaſe in any meaſure equal to what they had done in the preceding years, though regularly the increaſe ſhould have been much greater; becauſe violence was then great in the earth, and thouſands, yea millions, might have been cut off by untimely deaths; for which cauſe the deſtruction of the world was determined 120 years before the flood came.

For the longevity of the Antediluvians, and the probable cauſes of it, ſee LONGEVITY.

It has been a queſtion much debated, whether or not fleſh was permitted to be eaten before the deluge. By the permiſſion given expreſsly to Noah for that purpoſe, after the flood, and God's aſſigning vegetables only for food to man, as well as beaſt, at the creation, one would imagine it was not lawful before; yet others have ſuppoſed, that it was included in the general grant of dominion given by God to Adam over the animal creation; and the diſtinction of beaſts into clean and unclean, which was well known before the flood, is alleged as a ſtrong argument on this ſide, and which it is not eaſy to anſwer. On the other hand it is urged, that if fleſh were eaten before the flood, it does not appear that there was any occaſion to renew this grant after it, which grant, ſpecifying diſtinctly animal food, contradiſtinguiſhed from vegetable, reſpected not Adam only, but all his poſterity. It is farther urged, that the diſtinction between clean and unclean, reſpected animals offered in ſacrifice in the Antediluvian world; as appears from this circumſtance, that upon the grant of animal food to him and his deſcendants, which was poſterior in time to the ſacrifice, there is not the leaſt mention of any diſtinction between clean and unclean with reſpect to food, but the contrary. The diſtinction of clean and unclean with regard to food, was introduced by the law of Moſes, and differed from that of ſacrifices; as there were ſeveral creatures clean for food which were not to be offered in ſacrifice. Others contend, that if it be alleged that this diſtinction was uſed proleptically, it is a mere ſubterfuge; and to ſuppoſe it made ſolely to diſtinguiſh what was lawful or unlawful to be ſacrificed, and not what might or might not be eaten, is little better; it being the cuſtom to offer to God ſuch fruits and animals as were fit for food and ſuſtenance, and not ſuch as were of no uſe or benefit to mankind in this reſpect. Shuckford's Connection, &c. vol. i. book i. p. 1—57. Anc. Un. Hiſt. vol. i. p. 21—72.

ANTEJURAMENTUM, from *ante*, *before*, and *juramentum*, *oath*, or PRÆJURAMENTUM, by our anceſtors alſo called *juramentum calumniæ*, in *Law*, an oath which both the accuſer and the accuſed were anciently obliged to make before any trial or purgation. The accuſer was to ſwear that he would proſecute the criminal; and the accuſed was to make oath on the very day that he was to undergo the ordeal, &c. that he was innocent of the fact of which he was charged. If the accuſer failed, the criminal was diſcharged; if the accuſed, he was underſtood to be guilty, and was not to be admitted to purge himſelf by the ordeal.

ANTEJUSTINIANEAN, an appellation ſometimes given to the ancient Roman law, as it ſtood before the time of the emperor Juſtinian.

Tribonian has been often condemned for ſuppreſſing the writings of the Antejuſtinianean lawyers. Schulting, a celebrated profeſſor at Leyden, has a diſſertation on the equity of this cenſure. Fabricius gives a catalogue of the ancient Antejuſtinianean lawyers. Schulting has publiſhed a collection of the Antejuſtinianean writers.

ANTELIA, in *Ancient Geography*, a town of Aſia, in Armenia.

ANTELIUS, or ANTHELIUS, in *Ancient Writers*, denotes an idol placed over the doors of houſes, ſuppoſed to have the guardianſhip, or protection of them.

The word is originally ἀντήλιος, *q. d. againſt the ſun*, as being expoſed to it.

ANTELMI, JOSEPH, in *Biography*, a French writer of Eccleſiaſtical Hiſtory, was a canon of Frejus, in Provence, in the 17th century. He publiſhed, in 1680, a Latin "Diſſertation, Hiſtorical, Chronological, and Critical, on the church of Frejus." He alſo wrote a critical inquiry concerning the author of the creed, commonly called Athanaſius's, with other tracts, abounding with curious reſearch. He died, a victim to immoderate ſtudy, at the age of 49, in the year 1697. Nouv. Dict. Hiſt.

ANTELOPE, ANTILOPE, in *Zoology*, a genus of the *Mammalia Pecora*, in the Linnæan ſyſtem by Gmelin; the characters of which are, that it has concave horns, turned upwards and round, annulated, *i. e.* ſurrounded with prominent rings, or ſpiral and permanent. The lower jaw has eight broad fore-teeth; the upper jaw none; and there are no tuſks in either. To theſe characters Mr. Pennant adds, that the inſide of the ears is marked lengthways with three feathered lines of hair, and that the limbs are of a light and elegant form. The antelope forms an intermediate genus between the deer and the goat; though arranged with the latter by Linnæus, in his former editions, and by ſeveral other naturaliſts: but Gmelin, in imitation of Pennant, Erxleben,

and Pallas, has referred them to a diſtinct genus. In the form of their bodies they agree with deer, and in the texture of their horns, which have a core in them, they reſemble the goats; they have all gall-bladders, diſtinct lachrymal gutters, or pits under the eyes; a plait of the ſkin divided into ſeveral cells in the groins; bruſhes of hair on the knees, and beautiful black eyes. In general their fleſh is excellent, as they feed on the tender ſhoots of trees, though ſome ſpecies have a rank hircine or muſky flavour, which probably reſults from the qualities of the plants on which they feed. None of the numerous ſpecies of this genus are found in America; they are moſtly confined to Aſia and Africa, inhabiting the hotteſt regions of the Old World, or the temperate zones near the Tropics. None of them, except the chamois and ſaiga, are found in Europe. They chiefly inhabit hilly countries, though ſome reſide in the plains; and ſome ſpecies form herds of two or three thouſand, while others keep in ſmall troops of five or ſix. Theſe animals are elegantly formed, active, reſtleſs, timid, ſhy, and aſtoniſhingly ſwift, running with vaſt bounds, and ſpringing or leaping with ſurpriſing elaſticity; they frequently ſtop for a moment in the midſt of their courſe to gaze at their purſuers, and then reſume their flight. The chace of theſe animals is a favourite diverſion among the eaſtern nations; and the accounts that are given of it ſupply ample proofs of the ſwiftneſs of the antelope tribe. The greyhound, the fleeteſt of dogs, is uſually outrun by them; and the ſportſman is obliged to have recourſe to the aid of the falcon, which is trained to the work, for ſeizing on the animal, and impeding its motion, that the dogs may thus have an opportunity of overtaking it. In India and Perſia, a ſort of leopard is made uſe of in the chace; and this animal takes its prey not by ſwiftneſs of foot, but by its aſtoniſhing ſprings, which are ſimilar to thoſe of the antelope; and yet if the leopard ſhould fail in its firſt attempt, the game eſcapes. The fleetneſs of this animal has been proverbial in the country which it inhabited from the earlieſt times: the ſpeed of Aſahel (2 Sam. ii. 18.) is beautifully compared to that of tzebi, which Shaw, in his Travels, tranſlates antelope, and not roe, as it is in our text; and the Gadites were ſaid to be as ſwift as the roes upon the mountains. We may add, that the diſciple reſtored to life at Joppa was ſuppoſed to have been called Tabitha, i. e. Dorcas, or the Antelope, from the beauty of her eyes; and it is ſtill a compariſon in the eaſt; ſo that *aine el ezazel*, or "You have eyes of an antelope," is uſed as the greateſt compliment that can be paid to a fine woman. Authors enumerate 29 ſpecies. 1. *Antilope leucophæa*, blue antelope, with recurved, roundiſh, and annulated horns, and of a bluiſh colour. This is the blauer-bock of Kolben, bouc-chamois of Journal Hiſtorique, and blue antelope of Pennant. It inhabits the country to the north of the Cape of Good Hope; is larger than the fallow deer or buck; its colour, when alive, is a fine blue, of a velvetty appearance, but when dead changes to a bluiſh grey, with a mixture of white; beneath each eye is a large white mark, and the belly is white. This ſpecies, according to Pennant, from the form of the horns, which are ſharp-pointed, taper, and arcuated, bending backwards, and marked with 20 prominent rings; and alſo from the length of the hair, ſeems to connect the goat and antelope kinds. 2. A. *Lerwia*, lerwee, with wrinkled horns, bent backwards, diſtant in the middle, and approaching each other at the baſe and points, having a remarkable tuft of hair on the nape of the neck, and of a reddiſh colour. This is the antelope kob of Erxleben; the kob or little brown cow of Buffon; the fiſh-tail or lerwee of Shaw's Travels; and the Gambian antelope of Pennant. It inhabits Africa, chiefly about the rivers Gambia and Senegal; it is about the ſize of the fallow-deer, and is remarkable for the tuft of hair on the nape of the neck, and for having long bruſhes of hair on the knees of the fore-legs. The horns are ſurrounded with eight or nine rings. 3. A. *Rupicapra*, chamois; ſee CHAMOIS. 4. A. *Dama*; ſee NANGUER. 5. A. *Reduncæ*; ſee NAGOR. 6. A. *Tragocamelus*; ſee BIGGEL and TRAGOCAMELUS. 7. A. *Pitta*; ſee NYLGHAU. 8. A. *Saiga*; ſee SAIGA. 9. A. *Gutturoſa*; ſee TZEIRAN. 10. A. *Subgutturoſa*, Perſian antelope, with horns bent in form of a lyre; the upper parts of the body of a browniſh aſh colour, the under parts pure white, and a yellowiſh white ſtripe along each ſide. It inhabits Perſia between the Caſpian and Euxine ſeas. In ſize and habit it reſembles the roe, lives in large flocks, and ſubſiſts chiefly on the artemiſia pontica; the horns are above 13 inches long, and ſmooth at the points; the throat has at the fore-part a protuberance, and the knees are furniſhed with bruſhes. The female brings forth in May. The fleſh is reckoned very good. 11. A. *Pygarga*, A. dorcas of Pallas; cervicapra of Houttuyn, Linn. ed. Belg.; and ſuggeſted, not without heſitation, by Gmelin to be the koba of Buffon, and mountain antelope of Ruſſel's Aleppo; klipſpringer or ſpring-bock of Sparrman; white-faced antelope of Pennant, with the horns bent like a lyre; the general colour a hoary-red, and a blood-red or bright bay neck, a deep red band along the ſides, white buttocks, and a white face. This ſpecies is about five feet four inches long, and three feet high at the ſhoulders; inhabits the countries to the north of the Cape of Good Hope, runs ſwiftly, bounding from rock to rock, is caught with difficulty, and its fleſh is much eſteemed. The horns bend outwards in the middle, and approach at the points; thoſe of the males have each ſix or ſeven rings on the lower part, and thoſe of the females have no rings. 12. A. *Saltans*, ſpringer antelope, with ſlender horns, twice contorted, and annulated half way, the general colour a pale brown, the cheſt, belly, inſides of the limbs, buttocks, and half way up the back are white, and a broad cheſnut coloured band along the ſides. This animal, if it be different from the preceding ſpecies, with which it agrees in the form of the horns and diſpoſition of the dark-coloured bands, inhabits the Cape of Good Hope. It is rather leſs than a roebuck; and migrates annually from the interior parts of the country, in ſmall herds; continues near the Cape for two or three months, and then retreats towards the north in herds of many thouſands. Herds of many hundred thouſands periodically migrate, in ſeven or eight years, from the north, probably compelled to leave their haunts in the Terra de Natal by the exceſſive drought of that region, and ſpreading over the whole country of Caffraria, which they deſolate, without leaving a blade of graſs. In their migrations, they are attended by lions, hyænas, and other wild beaſts, to which they afford prey. The Hottentots call them the lions' flocks of ſheep. Their fleſh is excellent; and with other antelopes, they furniſh the veniſon of the Cape. From their prodigious bounds, they are denominated ſpring-bocks; and when alarmed, they have the power of expanding the white ſpace about the tail into a circular form, which aſſumes again its linear ſhape when the animal is tranquil. Pennant. Maſſon in Phil. Tranſ. vol. lxvi. p. 310. 13. A. *Dorcas*; ſee DORCAS. 14. A. *Kevella*; ſee KEVEL. 15. A. *Corinna*; ſee CORINE. 16. A. *Bubalis*, the CERVINE *Antilope* of Pennant; which ſee. 17. A. *Koba*; ſee KOBA. 18. A. *Gnu*; ſee GNU. 19. A. *Oryx*; ſee PASAN. 20. A. *Oreotragus*, African antelope, with very ſtraight, tapering, and ſharp-pointed horns, ſlightly wrinkled at the baſes. It inhabits Africa; has a reddiſh head, the upper parts of the body greeniſh-yellow, and the under parts of a whitiſh aſh-colour; the tail is very ſhort.

ſhort. 21. A. *Gazella*, capra bezoardica, or bezoar goat of Syſt. Nat. ed. 12.; Hircus bezoardicus of Briſſon, &c.; animal bezoardicum of Ray; animal ignotum of Geſner; gazella of Belon and Proſper Alpinus; algazel of Pennant and Buffon, with very long, wrinkled, ſlender, upright, tapering, and ſharp pointed horns, which are ſlightly bent inwards at the ends. It inhabits India, Perſia, Egypt, and Ethiopia; runs ſwiftly up hill, but ſlowly on plain ground; is gregarious, and is eaſily tamed; the general colour of the fur is red, with a white breaſt and belly: the real oriental bezoar, of a greeniſh and bluiſh colour, and when recent, of a very powerful aromatic odour, is frequently found in the fourth ſtomach of this ſpecies, chiefly in that of males and full grown animals, and more rarely in the ſtomachs of females or younger individuals. 22. A. *Leucoryx*; ſee LEUCORYX. 23. A. *Orcas*, Indian or elk antelope; ſee COUDOU. 24. A. *Scripta*, or harneſſed antelope; ſee GUIB. 25. A. *Grimmia*, or Guinea, antelope; ſee GRIMM. 26. A. *Pygmæa*, or royal antelope; ſee GUEVEI. 27. A. *Sylvatica*, wood antelope, wood goat, or boſch-bock of Sparrman; with horns ſmooth, ſomewhat ſpirally twiſted, annulated at the baſes, and marked with ſeveral longitudinal ribs, the ends being taper and ſharp pointed. It inhabits chiefly the woods near the Cape of Good Hope, and lives in pairs. It is about three feet high, the upper parts of the body are brown, the forehead white, two white ſpots on each cheek, a large white ſpot under the throat, and another at the bottom of the neck; the breaſt and hinder part of the belly are white, and there are ſeveral white ſpots on the thighs and flanks; the tail is very ſhort, and a ſhort mane runs along the neck and ridge of the back; the whole fur is longiſh and coarſe. The female has no horns. 28. A. *Strepciceros*, or ſtriped antelope; ſee CONDOMA. 29. A. *Cervicapra*, Indian, common, or brown antelope; ſee LIDMEE.

Profeſſor Pallas, in his travels through different provinces of Ruſſia and northern Aſia, has deſcribed the method of *hunting the antelope*, which is the principal amuſement of the Tonguſes, who inhabit the heaths of Daouria beyond the lake Baikal. They chooſe for this purpoſe the level and open tracts, ſituated near a mountain, a river, or a foreſt. In autumn, at which ſeaſon their horſes are moſt vigorous, they form companies of 150 or 200 hunters, all on horſeback, attended by led horſes. Each has a trained dog; and they are armed with bows and arrows. This chace commonly laſts ſeveral days. When arrived at the rendezvous, they ſend before three or four ſharp-ſighted huntſmen to get a view of the game from the heights or mountains; who ſtop to wait for their companions as ſoon as they perceive the antelopes. When the troop comes in ſight, the ſcouts make ſignals to them, or by ſome evolutions of their horſes ſignify the place in which the antelopes feed, and the courſe that muſt be taken in order to come up with them. The troop then breaks into ſeveral diviſions, and the hunters ſeparate to the diſtance of 60 or 80 fathoms from each other, in order to form a great ring. Thoſe on the wings advance towards the paſturage of the herd, and endeavour to conceal themſelves behind the heights till the animals are ſurrounded: the ring then cloſes. When the antelopes, at the approach of the hunters, attempt to eſcape, the men ruſh on them, chaſe them from one party to another, terrifying them with their ſhouts and the whiſtling of their arrows, which, for that purpoſe, are furniſhed with a button of bone, perforated beneath the head. In this manner they kill all that they can reach. This chace is more ſucceſsful when the ſcene of it lies near a river or a mountainous foreſt, as the antelopes or heath-goats never take to the water, though long and furiouſly haraſſed, but rather ſtrive to eſcape by ſudden and vaſt leaps through the troops of their purſuers. They are almoſt equally ſhy of foreſts. They are no ſooner hunted into a wood, than they are ſo bewildered among the trees as not to be able to move a hundred paces, but run their heads againſt every tree, and ſoon fall breathleſs. Pallas, Travels, tom. i. p. 402. tom. iii. p. 204.

ANTELUCAN, from *ante* and *lux*, *light*, in *Eccleſiaſtical Writers*, is applied to things done in the night, or before day. We find frequent mention of the antelucan aſſemblies, *cœtus antelucani*, of the ancient chriſtians in times of perſecution for religious worſhip.

ANTELUDIA, from *ante*, and *ludus*, *game*, in *Antiquity*, a day of ſhow or parade preceding the circenſes, wherein the preparations made for thoſe ſolemnities were expoſed in great form and pomp.

ANTEMETICA, in the *Materia Medica*, denote medicines ſuited to cure a preternatural vomiting.

ANTEMNA, in *Ancient Geography*, a town of Italy to the north or north-eaſt of Rome. Although it was built in the territory of the Sabines, it was founded by a colony from Alba, and compriſed in the diviſion called Ancient Latium. According to Varro, its name, derived from *ante amnem*, denoted its poſition, which Cluvier and M. d'Anville aſſign at the confluence of the Anio and Tiber. Its inhabitants were called *Antemnates*; and in the fourth year of Rome, they contended with the Romans, and were totally vanquiſhed by them, and their city was deſtroyed. They afterwards became citizens of Rome.

ANTEMURALE, from *ante*, and *murus*, *wall*, in *Middle Age Writers*, denotes a kind of outer wall environing the other walls and works of a place, and preventing the too near acceſs of the enemy to them.

This is alſo called by Iſidore, *promurale*, as being *pro munitione muri*, *for the defence of the wall*.

In ſome writers we find it denominated *antepectoralis muris*, in other *anpits*.

ANTEMURALE is alſo uſed to denote any work without-ſide the rampart or wall of the place.

In this ſenſe, antemurale amounts to the ſame with what we otherwiſe call OUTWORK.

ANTEMURALE, is alſo uſed, in *Eccleſiaſtical Writers*, for the veſtibule or entrance of the *preſbyterium*, or BEMA.

ANTENATUS, from *ante*, and *natus*, *born*, is uſed, in ſome *Law Writers*, for the firſt-born, or eldeſt ſon, anſwering to what we call *aiſné*.

ANTENATUS, is alſo ſometimes uſed for a ſon, the iſſue of a former marriage. In which ſenſe, antenatus amounts to the ſame with *privignus*.

ANTENATI, in the modern *Engliſh Hiſtory*, is chiefly underſtood of the ſubjects of Scotland, born before king James the Firſt's acceſſion to the Engliſh crown, and alive after it. In relation to theſe, thoſe who were born after the acceſſion were denominated POSTNATI. The antenati were conſidered as aliens in England, whereas the poſtnati claimed the privilege of natural ſubjects.

ANTENCLEMA, αντιγκλημα, in *Oratory*, is where the whole defence of the perſon accuſed turns on criminating the accuſer. Such is the defence of Oreſtes, or the oration for Milo, *Occiſus eſt ſed latro. Exſectus ſed raptor.* See RECRIMINATION.

ANTENICENE, in *Eccleſiaſtical Writers*, denotes a thing or perſon prior to the firſt council of Nice.

We ſay the antenicene faith, antenicene creeds, antenicene fathers.

ANTENNÆ, in *Entomology*, are thoſe delicate moveable horns with which the anterior part of the heads of inſects are invariably furniſhed. Theſe are peculiar to this order of beings, and are eaſily diſtinguiſhed from the tenta-

culæ of vermes, in being cruſtaceous; and from the palpi of inſects, by their ſituation being nearer the mouth, though not in their number, as naturaliſts formerly imagined, for they are not alſo more numerous than the antennæ (Fundamenta Entomologiæ). The palpi are uſually four in number, as Linnæus mentions; but in moſt lepidopterous inſects, when accurately conſidered, only amount to two; and the ſame may be obſerved of the libellulæ, phalangiæ, and ſeveral others; while, on the contrary, in the cancer, ſcyllarus, aſtacus, gammarus, and ſome other genera, the number of them is ſix. Fabricius. The antennæ in all inſects, or at leaſt with the exception of a few of the apterous kinds that have four, and ſome ſix, rarely exceed two. Both the antennæ and palpi are of the utmoſt conſequence in the ſyſtematic arrangement of inſects, as will be noticed hereafter.

For the want of a more appropriate term in the Engliſh language for the antennæ of inſects, they are ſometimes called the horns, and ſometimes the feelers; the latter of which is by no means applicable, ſince it confounds them with the palpi, which are the true feelers. Of the purpoſes for which nature has deſigned the antennæ we are ignorant: ſome have conjectured, that they are the organs of ſmell or hearing; and others have ſuppoſed they are appropriated to a feeling more delicate than our own, and ſenſible to the leaſt motion or diſturbance in the ambient fluid in which they move. In form and ſize they vary extremely in different inſects, and even generally in the two ſexes of the ſame ſpecies, as is fully exemplified in the phalæna genus.

Andrew John Bladh, a pupil of Linnæus's and author of the paper in the ſeventh volume of Linnæus's Amoenitates Academicæ, called Fundamenta Entomologiæ, characteriſes the different ſtructure of the antennæ of inſects in the following manner.

SETACEÆ, *ſetaceous*, are thoſe which gradually taper towards the point, and reſemble a briſtle.

FILIFORMES, *filiform*, ſuch as are of an uniform thickneſs throughout, like a thread.

MONILIFORMES, *moniliform*, are filiform like the preceding, but conſiſting of a ſeries of round knobs, like a necklace of beads.

CLAVATÆ, *clavated*, club ſhaped, or increaſing gradually from the baſe to the extremity.

CAPITATÆ, *capitated*, club-ſhaped like the former, but the laſt articulation larger than the reſt, and forming a kind of capital or head.

FISSILES are capitatæ, but have the capitulum divided horizontally into three or four laminæ or plates, as in the ſcarabæi, &c.

PERFOLIATÆ are likewiſe capitatæ, but have the capitulum divided horizontally, and connected by a kind of thread that paſſes through their centre.

PECTINATÆ, ſo called from their reſemblance to a comb, though they more properly reſemble a feather, having uſually lateral appendages on both ſides, as in phalænæ, &c.

ARISTATÆ, ſuch a have a lateral hair, which is either naked or furniſhed with leſſer hair, as in ſome muſcæ, &c.

The terms *breviores*, *longiores*, and *mediocres*, are occaſionally employed in ſpeaking of the length of the antennæ, and of courſe imply whether they are ſhorter, longer, or of the ſame length as the body. See ENTOMOLOGY.

ANTENNATOR, a ſpecies of ICHNEUMON that inhabits Cayenne. It is pale yellow, crown, back of the thorax, tail, and tip of the wings black. Fabricius and Gmelin.

ANTENNELLA, a name given by ſome to phalæna lucella *(tinea)* of Gmelin. Vide Wien. Schmetterl. p. 135. n. 19.

ANTENNINA, in *Natural Hiſtory*, a ſpecies of SERTULARIA, having denticles verticillate, in fours, and ſetaceous; veſicles obliquely truncated; ſtems rather ſimple. Linn. Gmelin. This is corallina aſtaci corniculorum aemula of Ray and Petiver. Muſcus marinus fecundus of Dodon. Pempt. &c. Myriophyllum non ramoſum of Ginann. &c. Inhabits European coaſts.

ANTENOR, in *Entomology*, a ſpecies of PAPILIO that inhabits India. Wings tailed; both ſurfaces black with white ſpots; and a marginal row of red lunated ſpots on the poſterior pair. Fabricius. Gmelin. Donovan's Inſects of India, &c.

ANTENOR, in *Ancient Hiſtory*, a Trojan prince, of whom various fabulous narrations are recorded. He is ſuppoſed to have been a ſon of Laomedon, and younger brother of Priam. Homer repreſents him as one of the prudent counſellors who adviſed the reſtoration of Helen, and giving ſatisfaction to the Greeks. Some later writers have charged him with betraying Troy to the enemy. However that be, he was ſpared in the maſſacre: and Virgil in his Æneid has adopted a ſtory concerning him, that, after the deſtruction of Troy, he led a colony of Heneti, a people of Paphlagonia, into Italy, near the mouth of the Po, where expelling the Euganei from their lands, he ſettled in them, and founded Padua. From this emigration the name of the Veneti is ſaid to be derived. The pretended tomb of Antenor, diſcovered in the thirteenth century, is manifeſtly fictitious. His wife Theano, the daughter of Ciſſæus, king of Thrace, was prieſteſs of Minerva. Gen. Biog.

ANTENUPTIAL, ſomething that precedes marriage.

In this ſenſe we ſay, *antenuptial* promiſes, *antenuptial* preſents, *antenuptial* covenants, *antenuptial* fornication, &c. Neoſtadius has a treatiſe, *De Pactis Antenuptialibus*.

ANTEPAGMENTA, or ANTIPAGMENTA, in the *Ancient Architecture*, the jambs of a door, or lintels of a window. The word is uſed for the entire *chambranle*, i. e. the door-caſe or window-frame.

ANTEPENULTIMA, or ANTEPENULTIMATE, in *Grammar*, the third ſyllable of a word, reckoning from the latter end; or the laſt ſyllable except two.

The word is compounded of the prepoſition *ante*, *before*, and *penultima*, *laſt but one*, or *pene ultimam*.

It was upon this ſyllable that the Greeks placed their acute accents, and alſo on the laſt and laſt but one; but they never placed the accent before the antepenultima. See ACCENT. The *Antepenultimate* of a dactyle is always long.

ANTEPILANI, among the *Ancient Romans*, denote the haſtati or principes of a legion.

They are ſuppoſed to be thus called becauſe ranged before the triarii, who were alſo called pilani.

Some will have the word to be a corruption for *antefignani*.

ANTEPILEPTICS, in *Medicine*, denote a quality in remedies, whereby they prevent, diminiſh, or cure epileptic fits.

The practice of claſſing the articles of the materia medica according to the diſeaſes or parts of the body they are ſuppoſed to cure, is unſcientific, and now diſuſed.

There are many medicines which diminiſh irritation in the nervous ſyſtem; ſuch as opium, caſtor, muſk, valerian, ſpiritus ætheris vitr. comp. &c. which for the ſake of abridging medical language, we call ANTISPASMODICS, all which are antepileptics. Many abſurd articles, calculated to excite diſguſt and horror, may be found in old authors, as ſpecifics in this very common and formidable diſeaſe: the human ſkull, ſecundines, and blood; lizards, frogs, and the dung of various animals, rank high in theſe writers: at preſent, the

the metallic ſalts, the calces of metals, and ſome of the vegetable poiſons, together with a ſuitable regimen, are principally relied on. See EPILEPSY.

ANTEPOSITION, from *ante*, and *pono*, *I place*, a grammatical figure, whereby a word which, by the ordinary rules of ſyntax, ought to follow another, comes before it. As when, in Latin, the adjective is put before the ſubſtantive, the verb before the nominative caſe, &c.

Antepoſition ſtands oppoſed to poſtpoſition. One caſe or ſpecies of this figure is called by a particular name, *antaſtrophe*.

ANTEPREDICAMENTS, ANTEPRÆDICAMENTA, in *Logic*, certain previous matters, requiſite to a more eaſy and clear apprehenſion of the doctrine of PREDICAMENTS or CATEGORIES.

Such are definitions of common terms; as equivocals, univocals, &c. See DEFINITION, DIVISION, &c.

They are thus called, becauſe treated by Ariſtotle, before the predicaments: that the thread of the diſcourſe might not afterwards be interrupted.

ANTEQUERA, in *Geography*, a well built town of Spain in the kingdom of Grenada, divided into two parts, the *higher* and the *lower*. The former is ſituated upon a hill much above the reſt, has a fortified caſtle, and is occupied by the nobility; and the latter is in a fertile plain, watered by a number of ſtreams. It has a collegiate church, four pariſhes, fourteen convents of monks, and eight of nuns, and about 13,000 inhabitants. The mountain on which part of the town is ſituated, yields a quantity of ſalt; and at a ſmall diſtance is a fountain of water, which is ſaid to cure the gravel. In the neighbourhood are alſo excellent quarries of ſtone for building. It is 26 miles north-north-weſt from Malaga, and 54 weſt from Grenada. N. lat. 37° 6'. W. long. 4° 40'.

ANTEQUERA is alſo a town of New Spain in America, in the province of Guaxaqua, 30 leagues ſouth-eaſt from Guaxaqua.

ANTERIDES, in the *Ancient Architecture*, denote butreſſes erected to ſupport a wall.

Theſe are ſometimes called *antes*, ſometimes *criſmæ*, and by the Greeks ερισματα.

Anterides anſwer to what the modern builders call counterforts and archbutants; the Italians barbicane, and ſperoni or ſpurs.

ANTERIOR, or ANTERIOUR, formed of the prepoſition, *ante*, *before*; ſomething before another, chiefly in reſpect to place. In which ſenſe the term amounts to the ſame with *prior*, and ſtands oppoſed to *poſterior*.

ANTERIOR *Ramus*. See the article RAMUS.

ANTERNACHA, ANDERNACH, in *Ancient Geography*, a town of Gaul, belonging to the Rupeni, and ſituate at the confluence of the Moſelle and Rhine. See ANDERNACH.

ANTEROS, in *Mythology*, the ſon of Venus and Mars, one of the two Cupids who were the chief of the number. They are placed at the foot of the Venus of Medici. This is repreſented with a heavy ſullen look, agreeably to the poetical deſcription of him, as the cauſe of love's ceaſing. The other was called *Eros*. Ovid. Rem. Amor. V. verſe 549 to 576.

ANTEROTES, a name given by ſome of the ancient writers on gems to a ſpecies of the amethyſt. Some have imagined they meant by it a ſort of opal; but Pliny expreſsly contradicts this, making the *anterotes* the fifth kind of AMETHYST in value. Plinii Hiſt. Nat. lib. xxxviii, ch. 40.

ANTES, in *Architecture*. See ANTA.

ANTESIGNANI in the Roman armies, a kind of ſoldiery poſted before the eagles, and other enſigns of the legions, whence their appellation.

The *anteſignani* ſtand contradiſtinguiſhed from the *ſubſignani*, who were ranged in the ſame line with the enſigns; and from the *poſtſignani*, who were placed behind them. Cæſar and Livy mention the anteſignani as the firſt line, or firſt body, of heavy armed troops. The velites, who uſed to ſkirmiſh before the army, were alſo called anteſignani.

ANTESIGNANI was a denomination given to thoſe inferior officers, called campi doctores, who inſtructed the troops in their exerciſe.

ANTESIGNANUS, PLTER, in *Biography*, an induſtrious grammarian, was born at Rabaſteins in Languedoc, and flouriſhed in the ſixteenth century. He publiſhed a Greek grammar, which paſſed through ſeveral editions, and a treatiſe on univerſal grammar; but his moſt eſteemed publications were his editions of Terence's comedies, in which he took pains to facilitate the learning of the Latin language. The epiſtle to this work was dated at Lyons in 1556. His induſtry alſo appears in his "Thematis Verborum inveſtigandi Ratio," and his "Praxis Præceptorum Linguæ Græcæ," annexed to ſeveral Greek grammars. "Let others," ſays he, "affect the reputation of learning: I honeſtly and truly own, that I have to the utmoſt of my power devoted my labours to the uſeful purpoſe of forming and aſſiſting the ſtudies of boys." Gen. Dict.

ANTESINISTRA, a name given by the augurs to thoſe thunderbolts, or birds, which proceeded from the ſouth and paſſed to the eaſt, and which were thought to afford unfavourable preſages. Virgil calls by this name a crow, Eclog. ix. 15, according to Servius:

"Anteſiniſtra cava monuiſſet ab ilice cornix."

ANTESTARI, in *Roman Antiquity*, denoted to bear witneſs againſt any one who refuſed to make his appearance in the Roman courts of judicature, on the day appointed, and according to the tenor of his bail. The plaintiff finding the defendant after this breach of his engagement, was allowed to carry him into court by force, having firſt aſked any of the perſons preſent to bear witneſs. The perſon aſked to bear witneſs in this caſe expreſſed his conſent by turning his right ear, which was inſtantly taken hold of by the plaintiff, and this was to anſwer the purpoſe of a ſubpœna. The ear was turned upon this occaſion, ſays Pliny, as being the ſeat of memory; and therefore the ceremony was a ſort of admonition to the party to remember his engagement.

ANTESTATURE, in *Fortification*, a ſmall retrenchment, made of paliſadoes, or ſacks of earth ſet up in haſte, to diſpute with the enemy the remainder of a piece of ground part whereof had been already gained.

ANTEVERTA, or ANTEVORTA, and POSTVERTA, or POSTVORTA, in *Mythology*, deities worſhipped among the Romans: the firſt, called alſo *Prorſa*, or *Porrima*, was ſuppoſed to know paſt events, and was invoked to repair injuries that had already occurred; and the ſecond, being acquainted with futurity, was ſupplicated to prevent evils that might happen.

ANTEVIRGILIAN HUSBANDRY. See ANTIVIRGILIAN.

ANTHALIUM, among the *Ancients*, a root growing in dry places, and about the bigneſs of the fruit of the medlar; it was dug up for food, and eſteemed very pleaſant and wholeſome.

ANTHANA,

ANTHANA, or ANTHENA, in *Ancient Geography*, was a city of Peloponneſus, and one of the 100 towns of Laconia, according to Stephanus Byz. It is ſaid to have derived its name from Anthe, the ſon of Neptune, who was killed by Cleomenes, the brother of Leonidas.

ANTHEDON, a town of Bœotia, placed by Pauſanias, and after him by M. d'Anville, a little to the north of Mount Meſſapius, and owing its name to its elevated ſituation. In the midſt of this city was a temple of the Cabiri, and near it the ſacred wood of Ceres, and the temple of Proſerpine, with her ſtatue in white marble; it had alſo a temple and ſtatue of Bacchus. The poet Anthes, who compoſed hymns, was, according to Plutarch, a native of this city. Imperial Greek medals were ſtruck here in honour of Caracalla.

ANTHEDON, or AGRIPPIAS, a town of Paleſtine, in the country of the Philiſtines, upon the borders of the ſea, to the ſouth-weſt of Gaza. Herod gave it the ſecond name in honour of Agrippa, his friend, and the favourite of Auguſtus.

ANTHEIA, a town of Meſſenia, which Homer mentions, and which had been promiſed to Achilles by Agamemnon. In Strabo's time it bore the name of Thuria.

ANTHELA, a town or burgh of Greece, near the ſtraits of Thermopylæ. According to Herodotus (lib. vii. 176), it was near the river Phœnix, and watered by the Aſopus.

ANTHELION, from ἀντι and ἡλιος, *ſun*, in *Phyſics*, ſignifies a mock or ſpurious ſun; and denotes a meteor, not very common, of a luminous appearance, ſomewhat reſembling the ſun, ſeen through clouds, bigger, ſometimes four or five times, than the ſolar diſk. In its moſt refulgent ſtate, it is as yellow as the ſun: but the lucid tract ſurrounding it is of a paler yellow or whitiſh caſt, interſperſed ſometimes with a few reddiſh or ſubfuſcous ſpots. The moſt received opinion relative to the formation of this kind of meteor attributes the phænomenon to a multitude of minute icy or ſnowy particles ſuſpended in the air, and either refracting or reflecting the ſolar rays in ſuch a manner, as to multiply the image of the ſun. But the theory of anthelia, for want of a proper number of obſervations, ſeems not yet to be brought to ſuch a degree of ſatisfaction, as by every lover of phyſiology could be deſired. The inſtances of them are but rare. See Phil. Tranſ. vol. lii. Part. i. N° 16. An. 1761. See HALO and PARHELION.

ANTHELIX, in *Anatomy*, the inner circle of the auricle: thus called from its oppoſition to the outer circuit, called the HELIX.

ANTHELMIA, Indian PINK.

ANTHELMINTICS, in the *Materia Medica*, medicines good to deſtroy worms.

The word is compounded of ἀντι, *contra, againſt*, and ἑλμινθες, *a worm*.

There are two principal kinds of worms which infeſt the human ſtomach and bowels; the flat or tape worm; and worms of various ſizes, which are round, ſomewhat like earth-worms. The former is called TÆNIA, the latter ASCARIS, lumbricus, &c. See Memoirs of Med. Soc. Lond. vol. v.

The preſence of worms in the primæ viæ generally ariſes from weak digeſtion; and therefore the cure of DYSPEPSIA will generally deſtroy the worms. Particular kinds of worms, however, require particular anthelmintics, which will be found under thoſe heads. See ASCARIDES, &c.

Two or three grains of calomel, with one of ſalt of ſteel, taken in treacle, for two or three mornings, and then a briſk purge of rubarb and jalap, ten or fifteen grains of each, is the beſt general *vermifuge*.

ANTHEM, from ἀντι, and ὕμνος, *a hymn*. In our church ſervice, any pſalm or portion of ſcripture, ſet in florid counterpoint, different from chanting in our cathedrals, and from metrical pſalmody in our pariſh-churches, is called an *anthem*, whether for one, two, three, or more voices. Anthems, in our choral ſervice, are diſtinguiſhed by the epithets ſolo, verſe, or full anthems. *Solo anthems* have frequently ſymphonies or ritornels for particular ſtops on the organ. In *verſe-anthems*, there are ſolo parts for voices of different regiſters or compaſs, and different ſides of the choir. A *full anthem* is in conſtant chorus, except at the leading off a fugue, or new point of imitation. *Anthems* for a ſingle voice, in the Romiſh church, are called *motets*. At the latter end of the 17th century and beginning of the laſt, the *motetti* of Baſſani, the maſter of Corelli, were in great favour in England, as well as Italy. In eccleſiaſtical hiſtory, anthems are ſtyled Αντιφωνοι ὕμνοι, from ἀντι, *contra*, and Φωνή, *vox, ſonus*. Antiphonal ſinging implies ſinging from ſide to ſide, alternately, as the pſalms are chanted in our cathedrals. St. Ignatius, a diſciple of the apoſtles, according to Socrates the eccleſiaſtic hiſtorian, was the author of this kind of ſinging in the Greek church, and St. Ambroſe introduced it into the Roman.

There is in the Brit. Muſ. an admirable collection of ſolo, verſe, and full *anthems*, and ſervices, compiled by Dr. Tudway, of Cambridge, for the Earl of Oxford, in ſix huge vols. fol. (N° 7337). Dr. Green began to collect our beſt cathedral muſic from the time of the reformation, to the middle of the laſt century; but he dying before any great progreſs was made in the work, it was carried on with great judgment and ſpirit by his worthy ſcholar and ſucceſſor, Dr. Boyce, and engraved and publiſhed, in a correct and ſplendid manner, in three vols. large fol. 1760, 1768, and 1773. This uſeful publication has been reſumed and carried on ſince the deceaſe of Dr. Boyce, by Drs. Arnold and Dupuis.

The ſolo anthems of Purcell, Drs. Crofts, and Green, are elegantly printed, and in conſtant uſe in our cathedrals. It is hoped that the ſolemn and dignified ſtyle of the fathers of our church muſic, Tallis, Bird, and Gibbon, will long be regarded as a model for our ſervices and full anthems, as that of Paleſtrina continues to be, for the beſt compoſers, *a capella*, in Italy.

Anthems were firſt introduced into the reformed ſervice of the Engliſh church in the beginning of the reign of queen Elizabeth.

ANTHEMIS, in *Botany*, ſuppoſed from ἀνθεω, *floreo*, having an abundance of flowers, a genus of plants of the chamomile kind. Lin. G. 970. Juſſieu 185. Linnæan claſs and order, *ſyngeneſia polygamia ſuperflua*; natural order, *compoſitæ diſcoideæ*, and of the *corymbiferæ* of Juſſieu. Its general characters are, that it has a *calyx* common, hemiſpherical, conſiſting of numerous linear ſubequal ſcales; *corolla* compound radiate; florets in the diſk hermaphrodite and tubular, thoſe in the radius female, and more than five; the former are funnel-ſhaped, five-toothed, erect, the latter ligulate, lanceolate, and ſometimes three-toothed. In the hermaphrodite florets the *filaments* are five, capillary, very ſhort, ſupporting cylindrical tubular *antheræ*. *Germen* oblong, *ſtyle* filiform, *ſtigmata* two, reflex; *ſeeds* ſolitary, receptacle chaffy, convex.

Nineteen ſpecies of this genus are deſcribed, of which five are natives of Britain. 1. A. *cota*, which bears a very large flower, and the *palea* or chaff between the florets is rigid and prickly: it is a native of Spain, growing in ploughed fields; annual. 2. A. *altiſſima*, grows three feet in height; leaves pinnatifid, compound, with pointed teeth: it grows wild

in the ſouth of Europe; annual. 3. A. *maritima*, with ſtems proſtrate, branches ſmooth; leaves pinnate, fleſhy, cut into ſmall teeth; calyx and peduncles pubeſcent; a native of the ſouth of France, and alſo of Britain. 4 A. *tomentoſa*, with ſtems a foot high, one flowered, leaves tomentoſe; the two outer diviſions of the corolla larger than the others: a native of the ſouth of Europe. 5. A. *mixta*, with leaves ſimple, jagged, toothed: a native of France and Italy; annual. 6. A. *alpina*, with leaves tooth-pinnated, entire, linear; ſtem villoſe, one-flowered; florets of the radius ſtriated, three-toothed, See Jacq. Fl. Auſt. vol. v. t. 30: a native of Italy; perennial. 7. A. *chia*, with leaves pinnatifid, jagged, peduncles naked, ſubvilloſe: a native of the Levant. 8. A. *nobilis*, with root perennial, ſtems trailing, hairy; leaves bipinnated, pinnulæ two or three-cleft, pointed, hairy; flowers ſolitary; calyx hairy, with broad, ſhining, membranaceous edges; florets of the circumference ſomewhat elliptical, entire, or with two or three teeth, thoſe of the centre yellow: this is the common chamomile; it grows wild in many parts of England, and flowers in July and Auguſt. See Woodv. Med. Bot. t. 108. 9. A. *arvenſis*, with ſtems erect, much branched; leaves bipinnatifid, hairy; peduncles tomentoſe, terminal, one-flowered; diſk yellow; florets of the radius white, three-toothed; receptacle conical: it is a common annual weed among corn, and therefore called corn-chamomile; it flowers in June and July. See Eng. Bot. 602. 10. A. *auſtriaca*, with ſtems upright, branched, ſcarcely a foot high; leaves bipinnate: flowers ſolitary, diſk yellow, radius white; ſeeds naked: a native of Auſtria. 11. A. *cotula*, with ſtems much branched, ſmooth; leaves bipinnatifid, ſmooth, of a light green colour; diſk of the flower convex, yellow: radial florets white: this, from its ungrateful ſmell, is called ſtinking chamomile, or May-weed; it is very common, and flowers in June and July, annual. Curt. Fl. Lond. faſc. v. t. 61. 12. A. *pyrethrum*, with ſtem ſimple, trailing, ſcarcely a foot high, one-flowered; leaves bipinnated, ſegments linear, pointed: florets at the centre yellow, thoſe of the circumference white, and purple on the under ſide: it is perennial, and flowers in June and July; it is called Spaniſh chamomile, or pellitory of Spain. 13. A. *valentina*, with ſtem branched, leaves pubeſcent, tripinnate, briſtle-ſhaped; calyx villoſe: a native of Spain. Miller, fig. 73. 14. A. *repanda*, with leaves ſimple, alternate, obtuſe; flowers terminal, globoſe: a native of Spain and Portugal. 15. A. *trinervia*, with ſtem erect, ſimple; leaves ſmooth, coloured; peduncles terminal, one-flowered: a native of South America. 16. A. *americana*, with leaves triternate, peduncles terminal, longer than the branch: a native of America. 17. A. *tinctoria*, with ſtem erect, angular, about a foot and a half high; leaves bipinnatifid, ſmooth, laciniæ pointed; flowers of a bright golden colour; ox-eye chamomile: it is a native of Sweden and Germany, and alſo of Britain, flowering in July and Auguſt. See Flor. Dan. t. 741. 18. A. *arabica*, with ſtem upright, proliferous, round, purpliſh; leaves ſingly and doubly pinnatifid; one flower terminates the ſtem; it is large, and of a beautiful golden colour. See Smith, ſpicil. 20. This handſome annual plant is a native of Arabia. 19. A. *odorata*, with leaves pinnatifid at the tip, calyx membranaceous: a native of the Cape of Good Hope, where it was diſcovered by Mr. Maſſon in 1774.

Medicinal Properties. The common chamomile, ſpecies 8, and the pellitory of Spain, ſpecies 12, are both articles of the materia medica, in the London and Edinburgh pharmacopœias. Both the leaves and flowers of the former have a ſtrong, though not ungrateful ſmell, and a very bitter nauſeous taſte; but the latter are preferred, being bitterer, and conſiderably more aromatic. The flowers readily give out their virtues to water, and alſo to rectified ſpirit. They poſſeſs the ſtomachic and tonic qualities uſually aſcribed to ſimple bitters, having very little aſtringency, but a ſtrong, aromatic, penetrating odour, from which they are alſo judged to be carminative, emmenagogue, antiſpaſmodic, and anodyne. They have been ſucceſsfully employed for the cure of intermittents, as well as of fevers of the irregular nervous kind, accompanied with viſceral obſtructions, for which we have the authority of ſir John Pringle. That chamomile flowers have been effectually ſubſtituted for Peruvian bark, we have the teſtimony of ſeveral reſpectable phyſicians, among whom we may notice Dr. Cullen, who recommends them to be given, conjoined with an aſtringent, to prevent their tendency to produce diarrhœa. A watry infuſion of theſe flowers is frequently uſed for the purpoſe of exciting vomiting, or for promoting the operation of emetics. Externally they are directed in the *decoctum pro fomento;* they are alſo ordered in the *decoctum pro enemate.* Murray, ap. Med. vol. i. p. 150. Woodville, Med. Bot. vol. ii. p. 103.

From the aromatic and ſtimulating qualities of the root of the pellitory of Spain, there can be no doubt that it might be found an efficacious remedy, and equally valuable as an internal medicine with many others of this claſs now conſtantly preſcribed. Its uſe, however, has been long confined to that of a maſticatory, for on being chewed or long retained in the mouth, it excites a glowing heat, ſtimulates the excretories of the ſaliva, and thereby produces a diſcharge which has been found to relieve tooth-achs and rheumatic affections of the face; in this way too, it is recommended in lethargic complaints, and paralyſes of the tongue. Woodv. Med. Bot. vol. ii. p. 287.

ANTHEMIS, or ANTHEMUSA, in *Ancient Geography*, one of the names of the iſle of Samos, according to Pliny.

ANTHEMIUS, in *Biography*, and *Hiſtory*, emperor of the weſt, was a native of Conſtantinople, and deſcended from an ancient, illuſtrious, and wealthy family. His name was derived from his grandfather by the mother's ſide, Anthemius, prefect of the eaſt, and the excellent prime miniſter of Theodoſius the younger. Having married Marciana, the only daughter of the emperor Marcian, he was ſucceſſively advanced to the chief dignities, and had ſome claim to the empire itſelf. He was conſul A. D. 455, and afterwards patrician and general, in which office he gained a victory over the Huns on the banks of the Danube. Being nominated by the emperor Leo I. to terminate the interregnum in the weſt, Anthemius left Conſtantinople with a ſplendid retinue, and entered Rome with univerſal acclamations, where he was inaugurated A. D. 467. Soon after this event, he married his daughter to Ricimer, the powerful commander of the barbarians. His government was too feeble to protect Gaul from the inroads of the Viſigoths, who defeated a body of Britiſh troops ſent for by Anthemius to protect his ſubjects, unuſed to military operations. In the diſcord that aroſe between the emperor and Ricimer, the latter fixed his reſidence at Milan, and exerciſed an independent ſovereignty over that part of Italy; and marching with an army of Burgundians and Suevi, brought with him Olybrius, whom he deſtined for the empire. Anthemius, faithfully ſupported by the ſenate and citizens of Rome, reſiſted a ſiege of three months; but at length Ricimer took the capital by ſtorm, and diſcovering Anthemius in his place of concealment, cauſed him to be maſſacred. Anc. Un. Hiſt. vol. xiv. p. 429—433. Gibbon's Hiſt. vol. vi. 193, 194. 217, 218.

ANTHEMIUS, a celebrated architect in the time of Juſtinian, was a native of Tralles in Aſia Minor, and employed by him in the conſtruction of various edifices, and particularly

particularly the church of St. Sophia in Conſtantinople, who on this occaſion formed the deſign, and directed the operations of 10,000 workmen, whoſe payment in pieces of fine ſilver was never delayed beyond the evening. Anthemius was alſo a ſculptor, a mathematician, and an experimental philoſopher. He is ſaid to have ſo well imitated an earthquake, as to frighten out of his houſe one Zeno, a rhetorician, who had offended him. At another time the friends of Zeno, as they ſat at table, were dazzled by the intolerable light which flaſhed in their eyes from the reflecting mirrors of Anthemius. Tzetzes deſcribes the artifice of theſe burning glaſſes, which he had read in a mathematical treatiſe of Anthemius, intitled, "Περὶ παραδόξων μηχαμάτων," Of Wonderful Machines; which treatiſe has been publiſhed, tranſlated, and illuſtrated by M. Dupuys, a ſcholar and a mathematician. Mem. de l'Acad. des Inſcriptions, tom. xvii. p. 302—451. Gibbon's Hiſt. vol. vii. p. 113.

ANTHEMUSIA, in *Ancient Geography*, a town of Aſia, in Meſopotamia, mentioned by Pliny, Strabo, and Tacitus; ſituate to the ſouth-eaſt of Samoſata, and nearly eaſt from Zeugma, and ſeparated by a chain of mountains from Edeſſa to the north-eaſt. An imperial Greek medal of this city was ſtruck in honour of Caracalla.

ANTHENA, a town of the Argolide, in Cynuria.

ANTHERÆ, in *Botany*, a term uſed by ſome authors for the yellow or ruddy globules in the middle of certain flowers, as of lilies, ſaffron, &c.

Some confine the antheræ to the yellowiſh globules in the middle of roſes. Theſe are held more aſtringent than the reſt of the plant.

Others apply the name antheræ to thoſe little tufts or knobs which grow on the tops of the ſtamina of all other flowers; more uſually called APICES.

The anthera or apex of the ſtamen, in the Linnæan ſyſtem, is a principal part of the male organ of generation in plants, and contains within it a fine powder, called *pollen*, or *farina fecundans*, deſtined for the impregnation of the *germen*, and which, when come to maturity, it diſcharges.

ANTHERICUM, ſaid to be derived from Ἄνθος μύκος, i. e. *flower of the hedges*. Lin. G. Pl. n. 422. Gertn. 16. Phalangium, Juſſieu, 52. Claſs, *hexandria monogynia*; natural order of *coronariæ* and of *aſphodeli* of Juſſieu. Its generic characters are as follows: *Calyx* none; *corolla*, petals ſix, oblong, obtuſe, ſpreading; *ſtamina*, filaments ſubulate, erect; *antheræ* ſmall, incumbent, four-furrowed; *piſtillum*, germen obſcurely triangular; *ſtyle* ſimple, of the length of the ſtamina; *ſtigma* obtuſe, triangular; *capſule* ovate, ſmooth, three-furrowed, three-celled, three valved; *ſeeds* numerous, angular. There are more than thirty ſpecies of this genus, many of which are very difficult to aſcertain. The only ſpecies which is a native of Britain is the A. *ſerotinum*, the A. *oſſifragum* and *calyculatum*, being by Dr. Smith now referred to other genera. 1. A. *floribundum*, with leaves flat, ſmooth, linear-lanceolate, acute; ſcape ſimple, raceme many-flowered, cylindric, compact; petals ſpreading; ſtamina ſmooth: a native of the Cape of Good Hope, from whence it was ſent by Mr. F. Maſſon, and introduced into the Royal Garden at Kew, in 1774; it flowers in March and April. 2. A. *ſerotinum*, with root perennial, conſiſting of oblong curved bulbs; ſtem or ſcape erect, ſmooth, round, commonly one-flowered; radical leaves exceeding in height that of the ſtem, ſemicylindrical, nerved, narrow from the baſe, thoſe of the ſtem alternate, ſhort; petals elliptical, equal, nerved, white on the inſide, externally reddiſh; ſtamina ſmooth; it grows on high mountains among rocks in ſeveral parts of Europe: in Britain it has only been found in Wales. Jac. Flor. Auſtr. 5. t. 38. It flowers in June. 3. A. *graecum*, with leaves flat, ſcape ſimple, flowers corymbed, filaments woolly: a native of the Levant. 4. A. *planifolium*, with leaves flat, ſcape and filaments woolly: it is a native of Portugal, flowering in April. 5. A. *revolutum*, curled-flowered anthericum, with leaves flat, ſcape branched, corolla revolute: it is a native of the Cape of Good Hope; and was firſt cultivated here by Mr. Miller, in 1731. 6. A. *ramoſum*, branching anthericum, with leaves linear ſubulate, flat; ſcape branched, peduncles ſolitary, corolla flat, piſtils ſtraight: it is a native of Sweden, Switzerland, Auſtria, the ſouth of France, &c. and was firſt cultivated in England by Gerard, about the year 1597. 7. A. *elatum*, tall anthericum, with leaves flat, ſcape branched; flowers ſcattered, white: it is a native of the Cape of Good Hope, flowering in Auguſt and September. 8. A. *triflorum*, three-flowered anthericum, with leaves channelled, ſword-ſhaped, ſcape ſimple, bracteæ remote, three-flowered: it is a native of the Cape of Good Hope, and introduced into the King's Garden at Kew, in 1782, by George Winch, Eſq. 9. A. *canaliculatum*, channelled anthericum, with leaves rather fleſhy, hairy, ſword-ſhaped-triquetrous, channelled; ſcape ſimple: this is alſo a native of the Cape: it flowers in April. 10. A. *albucoides*, ſtriped flowered anthericum, with leaves linear, channelled, ſmooth, with a cartilaginous edge; ſcape ſimple: a native of the Cape, flowering in Auguſt; it was diſcovered by Mr. F. Maſſon, in 1788. 11. A. *liliago*, graſs leaved anthericum, with leaves flat; ſcape perfectly ſimple; corolla flat; piſtillum bending down. Jac. Hort. i. t. 83. Fl. Dan. t. 616: it is a native of Germany, France, and Denmark; cultivated here, in 1597, by Gerard. 12. A. *liliaſtrum*, Savoy anthericum, with leaves flat; ſcape perfectly ſimple; corolla bell-ſhaped, white; ſtamina bending down: the French call this ſpecies St. Bruno's lily; it grows wild on the mountains of Switzerland and Savoy. 13. A. *ſpirale*, without leaves; ſcape four inches high, filiform, ſpiral, bearing three or four flowers; a native of the Cape. 14. A. *fruteſcens*, ſhrubby anthericum, with leaves fleſhy, columnar; ſtem ſhrubby: a native of the Cape; firſt cultivated in Chelſea garden, in 1702. 15. A. *aloides*, aloe-leaved anthericum, with leaves fleſhy, ſubulate, flattiſh: a native of the Cape; cultivated by Dr. Sherrard, in 1732. 16. A. *aſphodeloides*, glaucous-leaved anthericum, with leaves fleſhy, ſubulate, ſemi-columnar, upright, ſtiff; flowers yellow: a native of the Cape; cultivated by Mr. Miller, in 1759. 17. A. *annuum*, annual anthericum, with leaves fleſhy, ſubulate, columnar; ſcape ſubracemed; flowers yellow: a native of the Cape; cultivated by Mr. Miller, in 1748. 18. A. *hiſpidum*, hairy-leaved anthericum, with leaves fleſhy, compreſſed, rough; flowers white: a native of the Cape, and ſent to the King's Garden at Kew, by Mr. F. Maſſon, in 1774. The preceding five ſpecies have all fleſhy leaves, but thoſe that follow are ſword-ſhaped. 19. A. *calyculatum*, ſee TOFIELDIA. 20. A. *oſſifragum*, See NARTHECIUM. 21. A. *japonicum*, with leaves ſword-ſhaped, convolute, ſmooth; ſcape branched, angular; flowers racemed, nodding: a native of Japan, China, and Java. 22. A. *filiforme*, thread-leaved anthericum, with leaves filiform, rather cylindric, rough; filaments ſmooth; it is perennial, flowering in April: a native of the Cape, and introduced here by Mr. F. Maſſon, in 1774. 23. A. *flexifolium*. 24. A *muricatum*. 25. A. *latifolium*. 26. A. *cauda-felis*. 27. A. *triquetrum*. 28. A. *ciliatum*. 29. A. *falcatum*. 30. A. *contortum*. 31. A. *ſcabrum*. 32. A. *ſquameum*. The above ten ſpecies are all Cape plants, and mentioned in the Supplementum Plantarum, but unknown in this country. They were all but the laſt diſcovered by Thunberg. 33. A. *cirratum*, with leaves lanceolate, flattiſh; ſcape panicled: a native of New Zealand.

34. A.

34. A. *adenanthera*, with leaves linear, enſiform, connate at the baſe; a gland between the filament and anther: a native of New Caledonia.

Propagation and Culture. All the ſpecies except the ſeventeenth are perennial, and are uſually propagated by offsets taken during the ſummer or autumn. Thoſe plants which do not throw out ſuckers freely, may be propagated by ſeeds, ſown in the ſpring or autumn, in a warm ſituation, on a bed of light ſandy earth. When the leaves decay, the roots ſhould be broken up and tranſplanted. If the winter prove ſevere, they ſhould be defended from the cold by covering the bed with ſtraw, or what is better, old tan, from a hot bed. Thus treated, they will be ſtrong enough to flower in one year, and in autumn may be taken up, and planted in the borders of the flower-garden, where they will live ſeveral years, if the roots be well defended from the froſt. Some of the ſpecies, as the 7th, muſt be houſed in winter, or placed under a hot-bed frame, which is to be preferred to a common green-houſe. See Martyn's Miller's Dict.

ANTHERINUS, in *Entomology*, a ſpecies of CRYPTOCEPHALUS, in Gmelin's arrangement. It is black, with two ferruginous bands. This is tenebrio pedicularis of the tenth edition of the Linnæan Syſtema Naturæ, and meloe antherinus of the twelfth edition of the ſame work, and the Fauna Suecica. Fabricius places it in his genus lagria, in the Species Inſectorum: this inſect is very ſmall, lives on flowers, and runs faſt.

ANTHESPHORIA, in *Antiquity*, a feaſt celebrated in Sicily, in honour of Proſerpine. The word is derived from ανθος, *flower*, and φερω, *I carry*, in relation to Pluto's having forced away that goddeſs when ſhe was gathering flowers in the fields. Yet Feſtus does not aſcribe the feaſt to Proſerpine; but ſays it was thus called, becauſe ears of corn were carried on this day to the temples. Antheſphoria ſeems to be the ſame thing with the *floriſertum* of the Latins, and anſwers to the *harveſt-home* among us.

Antheſphoriæ were alſo celebrated in the temple at Argos, in honour of Juno Antheias; according to Pauſanias, in the Corinthiaca.

ANTHESTERIA, was a feaſt celebrated by the Athenians in honour of Bacchus.

The moſt natural derivation of the word is from ανθος, *flos*, *a flower*; it being the cuſtom at this feaſt to offer garlands of flowers to Bacchus.

Some are of opinion it took its name from the month *Antheſterion*, in which it was celebrated. Others pretend, that this was not the name of any particular feaſt, but that all the feaſts of Bacchus were called antheſteria.

The antheſteria laſted three days, the eleventh, twelfth, and thirteenth days of the month; each of which days had a name ſuited to the proper office of the day, and during which the maſters ſerved their ſlaves at table. The firſt day of the feaſt was called πιθοιγια, i. e. opening the veſſels, becauſe on this day they tapped the veſſels, and taſted the wine. The ſecond day they called χοος, *congii*, the name of a meaſure, containing the weight of about ten pounds: on this day they drank the wine prepared the day before. The third day they call χυτροι, *kettles*: on this day they boiled all ſorts of pulſe in kettles; which, however, they were not allowed to taſte, as being all to be offered to Mercury.

ANTHESTERION, in *Ancient Chronology*, the ſixth month of the Athenian year. It contained twenty-nine days, and anſwered to the latter part of our November and beginning of December. Neapolis, a commentator on the Faſti of Ovid, ſays, that it anſwered to the end of February and beginning of March. The Macedonians called it *Deſion* or *Deſion*. In this month the Athenians and other people of Greece celebrated feaſts in honour of the dead.

It had its name from the feſtival ANTHESTERIA kept in it.

ANTHIAS, in *Ichthyology*, a ſpecies of LABRUS, very concifely deſcribed by Gmelin, after Artedi, as being entirely reddiſh, "totus rubeſcens." This is Anthea of Rondel, and according to Cateſby, found in Carolina; it is alſo ſaid to inhabit the ſouth of Europe, and to have the gill covers ſerrated. Some have ſuppoſed this fiſh to be a perch.

ANTHISTIRIA (Ανθιστηρια, *floralia*, an Athenian feſtival obſerved in honour of Bacchus), in *Botany*, an exotic plant, of a graſs-like appearance, belonging to the claſs *polygamia monoecia*, and natural order, *gramina*. The eſſential generic character is, that the *calyx* is cleft at the baſe into four equal diviſions or valves. *Anthiſtiria ciliata* is the only ſpecies of the genus hitherto diſcovered.

ANTHIUS, FLOWERED, in *Mythology*, a ſurname given to Bacchus, at Athens, and alſo Patras in Achaia; becauſe the ſtatues of this god were covered with a robe charged with flowers.

ANTHOCEROS, a ſmall cryptogamious plant, of the order *algæ*. Lin. Gen. 1201. In the *male* flower the *calyx* is ſeſſile, cylindrical, entire; anther very long, ſubulate, two-valved; in the *female*, the *calyx* is cut into ſix diviſions, and contains three ſeeds. 1. A. *punctatus*, with the fronds undivided, indented, dotted: a native of Britain, growing on heaths and moiſt ſhady places. 2. A. *laevis*, with ſmooth, undivided, indented fronds. 3. A. *multifidus*, with bipinnated linear fronds. See Hedwig's Figures and Flor. Dan. 396.

ANTHOINE, NICHOLAS, in *Biography*, was born at Brieu in Lorrain, of Roman Catholic parents, and educated in the college at Luxemburg, and alſo under the Jeſuits at Triers and Cologne. Conceiving a diſlike to the church of Rome, he embraced the Proteſtant religion; and ſuch was his zeal in his new profeſſion, that he endeavoured to proſelyte his relations. In purſuing his theological ſtudies, he became a convert to Judaiſm, and ſolicited the Jews in ſeveral cities to admit him among them as a proſelyte, but his application was ineffectual. Returning to Geneva, he made an external profeſſion of Chriſtianity, but privately performed his devotions as a Jew. He was at length admitted into the miniſtry of the reformed church; and appointed by the ſynod of Burgundy, to be miniſter of the church of Divonne in the country of Gex. Here he was ſuſpected, and became inſane; but upon the recovery of his underſtanding, he was committed to priſon. After ſome time, he was brought to his trial; upon which he avowed himſelf a Jew, and beſought God that he might die in the Jewiſh religion. The reſult was his condemnation by the council, who, in 1632, ſentenced him to be ſtrangled and burnt; and he was executed on the day of his condemnation. His ſentence expreſſed, that "laying aſide all fear of God, he was guilty of apoſtacy and high treaſon, having oppoſed the Holy Trinity, denied our Lord and Saviour Jeſus Chriſt, blaſphemed againſt his holy name, renounced his baptiſm to embrace Judaiſm and circumciſion, and perjured himſelf, which are great and horrid crimes, &c." Anthoine left ſeveral pieces written with his own hand, ſuch as ſeveral prayers, that are ſaid to be compoſed in a ſtrain of great devotion, though he introduces in them no mention of Jeſus Chriſt; a ſmall paper, containing eleven philoſophical objections againſt the Trinity; a confeſſion of his faith in twelve articles, which are as follow, *viz.* that there is only one God, without diſtinction of perſons;—that there is

no other way of ſalvation, without fulfilling the law of Moſes;—that circumciſion is of perpetual obligation, and alſo the ſabbath, and alſo the diſtinction of clean and unclean meats;—that ſacrifices will be reſtored, and the temple and city of Jeruſalem rebuilt;—that the true Meſſiah is to come, and that he will be a glorious, holy, and juſt king, and reſtore the kingdom of Iſrael;—that there is no imputation of Adam's ſin;—that there is no predeſtination, by which God has decreed to ſave ſome perſons and to damn others, but that men ſhall be rewarded and puniſhed according to their actions;—that no perſon can make ſatisfaction for us, but that if we ſin there is room for repentance;—and that the New Teſtament is not agreable to the Old. Gen. Dict.

ANTHOLOGION, a church-book in uſe among the Greeks. It was called ανθολογιον, q.d. *florilegium*, or a collection of flowers. The anthologion is a ſort of breviary or maſs-book, containing the daily offices addreſſed to our Saviour, the Virgin, and the principal ſaints; with other common offices of prophets, apoſtles, martyrs, pontiffs, and confeſſors, according to the Greek rite. See BREVIARY, MASS, and OFFICE.

ANTHOLOGY, ANTHOLOGIA, a diſcourſe or treatiſe of flowers, or of beautiful paſſages from any authors. Thus called from ανθος, *flos*, *a flower*, and λογος, *ſermo*, *diſcourſe*: though others chooſe rather to derive it from ανθος, *flos*, *a flower*, and λεγω, *I gather*; and uſe it to ſignify a collection of flowers.

ANTHOLOGY is frequently uſed for a collection of epigrams of divers Greek poets.

ANTHOLYZA (Ανθος, *a flower*, and λυσσα, *madneſs*), in *Botany*, Lin. Gen. 58. claſs *triandria monogynia*; natural order *enſatæ*; and *irides* of Juſſieu.

Generic Character. *Calyx*, ſpathes two-valved, alternate, imbricated, permanent; *corolla*, petal one, gradually dilated, from the tube into a compreſſed ringent throat; *upper-lip* ſtraight, ſlender, very long, furniſhed with two ſhort diviſions at the baſe; *under-lip* ſhorter, trifid; *ſtamina*, filaments long, ſlender, under the upper lip; antheræ acute; *piſtillum*, germen inferior; ſtyle filiform; ſtigma trifid, capillary, reflex; *per.* capſule roundiſh, three-cornered, three-celled, three-valved; *ſeeds* many, triangular.

Eſſ. generic Character. *Cor.* tubular, irregular, recurved; *capſ.* inferior.

Species. 1. A. *ringens*, narrow-leaved antholyza, with lips of the corolla divaricated, throat compreſſed; it grows two feet high, producing red flowers cut into ſix unequal ſegments, and appearing in June; cultivated by Mr. Miller in 1759. 2. A. *plicata*, plaited-leaved antholyza, with leaves plaited; ſtem branching hirſute; corolla ringent, ſhorter than the ſtamina: a native of the Cape, and diſcovered by Thunberg and Maſſon. 3. A. *cunonia*, ſcarlet-flowerd antholyza, with corolla ſomewhat butterfly-ſhaped, the two outer lobes of the five-parted lip broader and aſcending. Miller, fig. 113. and Bot. Magazine, 343. A native of the Cape and Perſia; cultivated by Miller in 1756; it flowers in May and June. 4. A. *æthiopica*, broad-leaved antholyza, with corolla incurvate; the two alternate lobes of the five-parted lip ſpreading, large, lanceolate: its flowers are ſcarlet, and appear in May and June; cultivated by Mr. Miller in 1759. This and the preceding ſpecies very much reſemble the gladiolus. 5. A. *meriana*, red-flowered antholyza; with corolla funnel-ſhaped; leaves linear ſword-ſhaped: the flowers have long tubes, of a copper colour on the outſide, but of a deeper red within; appearing in April or May. Bot. Magazine, 418. Cultivated by Miller in 1756. See fig. 276, Miller. 6 A. *merianella*, dwarf antholyza, with corolla funnel-ſhaped, leaves linear; the flowers are of a pale red, larger than thoſe of the preceding ſpecies. Curt. Bot. Mag. 441. The ſeeds were brought from the Cape in 1754. Both this and the meriana differ much from all the other ſpecies of antholyza, and ought perhaps to conſtitute another genus. 7. A. *lucidor*, with radical leaves filiform at the baſe, broad, ſubulate, furrowed at the top; ſtem ſimple, leafy, ſpiked, a foot and a half high; flowers oblong, a little bent, purple above, cut into ſix unequal lanceolate parts. This, as well as the other ſix ſpecies, are natives of the Cape of Good Hope.

Propagation and Culture. As theſe are very ornamental plants, much attention has been given to their cultivation. They do not always ripen their ſeeds in this country, and are therefore frequently propagated by offſets, which their bulbous roots ſend forth in great abundance. Miller ſays, "the ſeeds ſhould be ſown ſoon after they are ripe, for if they are kept out of the ground till the following ſpring, they often miſcarry, or at leaſt remain a year in the ground before they grow. If the ſeeds are ſown in pots of light earth, and plunged into an old bed of tan, which has loſt its heat, and ſhaded in the middle of the day in hot weather, the ſeeds will come up the following winter; therefore they muſt be kept covered with glaſſes to ſcreen them from cold, otherwiſe the young plants will be deſtroyed. Theſe may remain in the pots two years, if the plants are not too cloſe, by which time they will have ſtrength enough to be planted each into a ſeparate ſmall pot filled with light earth. The time for tranſplanting theſe roots is in July or Auguſt, when their leaves are decayed. In ſummer, the pots may be placed in the open air, but in winter they muſt be removed and placed under a hot-bed frame, for they are not very tender; but where any damp ariſes, it is very apt to occaſion a mouldineſs upon their leaves. The roots ſhoot up in autumn, and the flowers begin to appear in May; the ſeeds ripen in Auguſt, and ſoon after their leaves and ſtalks decay: the roots may then be taken up, and kept ſix weeks or two months out of the ground, ſo that they may be eaſily tranſported from one country to another at that time." See Martyn's Miller's Dictionary.

ANTHON, in *Geography*. See VILLETTE D'ANTHON.

ANTHONY, FRANCIS, in *Biography*, the ſon of —— Anthony, goldſmith, who held a lucrative place in the Jewel Office under queen Elizabeth, was born in London in the year 1550. After paſſing through the uſual ſteps, he was ſent to Cambridge, where he graduated in the year 1574. Having applied himſelf diligently to the ſtudy of medicine, particularly of chemiſtry, and invented a panacea, which he called Aurum Potabile, he returned to London, and commenced practitioner of phyſic, but without obtaining a licence from the College. He was therefore ſummoned before them, and interdicted practiſing, Goodall ſays, for incapacity; and on his proving refractory, was committed by them to the Compter-priſon. He was, however, ſoon after releaſed, on his ſubmitting to the college, and paying them a fine of five pounds. Two years after, Dr. Taylor and two other members of the college, accuſed him of occaſioning the death of ſundry perſons, to whom he had given his medicine. Againſt this charge he defended himſelf, in 1610, by a work intitled, "Medicinæ Chymicæ et veri Potabilis Auri aſſertio," "by no means (Aikin ſays) devoid of learning and art, although in the preſent ſtate of chemiſtry and medicine, it would be thought deſtitute of ſolidity." This was anſwered by Dr. Matthew Gwynne, in a tract called "Aurum non Aurum, ſive adverſaria in aſſertorem Chymiæ, ſed veræ Medicinæ deſertorem Fran. Anthonium." It is curious to find this

this writer calling upon the king to prohibit the ſale of the medicine, leſt the buſineſs of the phyſician, ſurgeon, and apothecary ſhould be ruined. This at leaſt ſhewed it poſſeſſed conſiderable efficacy. This produced from the inventor, in 1616, an apology in defence of his medicine, written in Engliſh, in which, beſides ſome popular arguments in favour of the idea of an univerſal medicine, there is a large collection of atteſted cures. He had now acquired ſuch a degree of popularity, and ſo many powerful protectors, that the College did not think it prudent, it would ſeem, to proſecute him farther. He is ſaid to have been liberal to the poor, and to have lived hoſpitably in his houſe in Bartholomew-cloſe, where he died, aged 74, on May 26th, 1623. There is a monument erected to him and his ſon John, who ſucceeded him in the ſale of his medicine, in the church of Bartholomew the Great, in London. Charles, his ſecond ſon, removed to the town of Bedford, where he practiſed phyſic with conſiderable reputation and ſucceſs.

ANTHONY, or *Antony*, ST. the firſt inſtitutor of the monaſtic life, was born at Coma, a village of Egypt, in the lower parts of the Thebais, in the year 251 (252, Cave). Some have ſaid, that though born of wealthy parents, he was wholly illiterate; while others affirm, that he could read and write in the Coptic, which was his native tongue. At the age of 18, he was left in poſſeſſion of a large eſtate, which, under the impulſe of a fanatical ſpirit, he ſold, diſtributing the produce of it among the poor, and devoting himſelf to religion in a ſtate of ſolitude and poverty. After a long and painful noviciate among the tombs, and in a ruined tower, he boldly advanced into the deſert, three days' journey to the eaſtward of the Nile, diſcovered a lonely ſpot, which poſſeſſed the advantages of ſhade and water, and fixed his laſt reſidence on Mount Colzim, near the Red Sea; where an ancient monaſtery ſtill preſerves the name and memory of the ſaint. Before his ſettlement at Colzim, and during the perſecution of Maximin, in the year 311, he left his ſolitary retreat, and viſited Alexandria, for the purpoſe of adminiſtering conſolation to thoſe who were ſuffering in the Chriſtian cauſe. During the latter part of his life, in the year 355, he took another journey to this city, at the requeſt of Athanaſius and other Catholic prelates, to aſſiſt them in defending the faith againſt the Arians; where he is ſaid to have ſupported his fame with diſcretion and dignity. Declining to accept an invitation from the emperor Conſtantine to viſit Conſtantinople, he returned to his cell, and there lived to the advanced age of 105 years. The venerable patriarch beheld the numerous progeny, which had been formed by his example and leſſons to that kind of monaſtic ſeclusion and mortification, which ſuperſtition may deem meritorious, but which an enlightened and benevolent philoſophy muſt pronounce abſurd and miſchievous. The prolific colonies of monks multiplied with rapid increaſe on the ſands of Libya, upon the rocks of Thebais, and in the cities of the Nile. To the ſouth of Alexandria, the mountain and adjacent deſert of Nitria were peopled by 5000 anachorets; and the traveller may ſtill inveſtigate the ruins of 50 monaſteries, which were planted in that barren ſoil by the diſciples of Anthony. But "what honour can be due to the memory of the fanatic who laid the foundation of an inſtitution, which has alienated millions of human beings from the firſt duties and the firſt enjoyments of ſociety?" Anthony left his cloak to Athanaſius, and his hair-cloth to two brethren who were with him at his death. Seven letters, written originally in Egyptian, and tranſlated into Latin, abounding more with piety than eloquence, with ſome other pieces, aſcribed to this protomonk, may be found in the "Bibliotheca Patrum." Cave's Hiſt. Lit. vol. i. p. 220. Gibbon's Hiſt. vol. vi. p. 241, &c. See MONK.

ANTHONY, *St. of Hainault*. The order of St. Anthony in Hainault, was inſtituted by Albert, duke of Bavaria and earl of Hainault, Holland, and Zealand, in 1382, on deſigning an expedition againſt the Turks and Moors. The enſign of the order was a collar of gold made like an hermit's girdle; at the centre thereof hung a crutch, and a ſmall bell of gold.

ANTHONY, *St. of Æthiopia*. The order of St. Anthony in Æthiopia. After the death of St. Anthony the hermit, who died in 357, many of his diſciples remaining near Æthiopia, followed his example and manner of life; and their ſucceſſors lived in great auſterity in the deſert, and were called Anchorites till the year 370; when John, emperor of Æthiopia, erected them into a religious order of knighthood, under the title and protection of St. Anthony, patron of his empire. Being thus inſtituted, they received St. Baſil's rule, and lived in monaſteries; their habit was black, with a blue Croſs Tau. Philip VII. ſon to the *Founder*, enlarged their lands and privileges, and added a bordure of gold to the badge of the blue croſs. In Italy, France, and Spain, there was formerly a ſort of monks that had the title of Knights of St. Anthony, which obſerved the rule of St. Auguſtine, and they wore a plain croſs like that in Æthiopia; but the principals of thoſe wore a double St. Anthony's croſs of blue ſatin, the one above the other. Their chief ſeat was at Vienne in Dauphine, of which place the General of the Order bore the title of abbot; the monaſtery being erected, in 1297, in honour of St. Anthony, whoſe body was tranſlated thither from Conſtantinople. The badge of this order was a Croſs flowery azure, the baſe point thereof couped, and the whole edged with gold.

The friars of this order came into England in the reign of king Henry III. and had one houſe at London, and another at Hereford.

It is ſaid that, in ſome places, theſe monks aſſume to themſelves a power of giving, as well as removing the *ignis ſacer*, or ERYSIPELAS; a power which is uſefully employed for keeping the poor people in ſubjection, and extorting alms.

ST. ANTHONY'S *Fire*. See ERYSIPELAS.

ANTHONY, ST. *Iſland of*, in *Geography*, the moſt northern of all the Cape Verd iſlands, lying in N. lat. 18°, and divided from St. Vincent by a clear and navigable channel, about two leagues broad. This iſland ſtretches from north-eaſt to ſouth-weſt, and abounds with high mountains, whoſe tops are conſtantly covered with ſnow, and generally hid in the clouds. On the north ſide is a good road for ſhipping, and a ſupply of freſh ſpring water. The inhabitants are chiefly Negroes, amounting in number to about 500, under the protection of the Portugueſe. The iſland produces a variety of fruits, oranges, lemons, palms, melons, bacovas, pomegranates, and the ſugar-cane. The potatoes and melons are particularly excellent, and much ſought after by mariners.

ANTHONY *Cave's Iſland*, an iſland in the Pacific Ocean. S. lat. 3° 10'. E. long. 152° 50'.

ANTHONY'S *Falls*, ST. lie in the river Miſſiſippi, about ten miles north-weſt of the mouth of St. Pierre river, which joins the Miſſiſippi from the weſt, and are ſituated in N. lat. 44° 50'. They were ſo named by father Louis Hennipin, who travelled into thoſe parts about the year 1680, and was the firſt European ever ſeen there by the natives. The whole river, 250 yards wide, falls perpendicularly above 30 feet, and forms a very agreeable cataract. The rapids below, in the ſpace of about 300 yards, render the deſcent apparently greater, when viewed at a diſtance. In the middle of the falls is a ſmall iſland, about 40 feet ſquare, in which

grow a few hemlock and ſpruce trees. Theſe falls are ſo peculiarly ſituated, that they may be approached without any intervening hill or precipice; and the ſcene around them is uncommonly beautiful. At a little diſtance below the falls is a ſmall iſland, about 1½ acre, on which grow a great number of oak trees, all the branches of which are loaded, at the proper ſeaſon, with the neſts of eagles, where they are ſecure from the attack both of man and beaſt.

ANTHONY's *Kill*, a weſtern water of Hudſon's river; the mouth of which is ſeven miles above that of Mohawk river, with which it likewiſe communicates at the eaſt end of Long Lake.

ANTHONY's *Noſe*, a point of land in the highlands, on Hudſon's river, in the ſtate of New York; from which to Fort Montgomery on the oppoſite ſide, a large boom and chain was extended in the late war, at an expence of 70,000l. ſterling. It was partly deſtroyed by general Clinton in 1777. This is alſo the name of a point of a mountain on the north bank of Mohawk river, about 30 miles above Schenectady. The ſtage road runs about this point.

ANTHOPHYLLUM, in *Natural Hiſtory*, a ſpecies of MADREPORA, found in the Mediterranean. The ſtalk is ſimple and ovate; ſtar terminal, hemiſpherical, and concave, with radiated lamellæ, which are thickeſt at the bottom. Gmelin, Eſper, &c.

ANTHOPHYLLUM, is alſo a name given by Rumpfius to madrepora ramea of Linnæus. *Vide* Anthophyllum faxeum. Rumpf. amb. vi. p. 245.

ANTHORA, in the *Materia Medica*, a medicinal plant, of the *aconite* kind, having yellow flowers, reſembling helmets; growing chiefly on the mountains in Switzerland and Savoy. See ACONITUM.

This is otherwiſe called *antithora*, as being reputed an antidote againſt the *thora*; ſometimes *aconitum ſalutiferum*; in Engliſh, the *helmet-flower*.

The root, *anthoræ radix*, has been chiefly in uſe. It holds a place in the catalogues of the *Materia Medica*, but is not kept at this time in the ſhops. It is of a duſky brown without and whitiſh within, of a warm bitteriſh taſte, and is reputed a cardiac and alexipharmic, much of the ſame qualities with CONTRAYERVA root; on which account ſome alſo denominate it the *German contrayerva*, though it now only obtains in a few officinal compoſitions.

ANTHORISMUS, in *Rhetoric*, denotes a counter definition or deſcription of a thing.

Thus, if a plaintiff urge, that to take any thing away from another, without his knowledge or conſent, is a theft; this is called ὁρος, or definition. If the defendant reply, that to take a thing away from another, without his knowledge or conſent, provided it be done with deſign to return it to him again, is not theft; this is an ἀνθορισμος.

ANTHOS, in its original Greek, ſignifies flower; but by way of excellency is appropriated to roſemary, ſo as to expreſs only that plant.

ANTHOSPERMUM (Ἀνθος and σπερμα, *flower-ſeed*), in *Botany*, Linn. Gen. 1164. Claſs, *polygamia dioecia*; natural order, *ſtellatæ*; and *rubiaceæ*, Juſſ.

Generic Character. MALE. *Calyx*, perianth one-leafed, conical, quadrifid beyond the middle; diviſions ovate-oblong, revolute, obtuſe; *corolla* none; *ſtamina*, filaments four, capillary, erect, the length of the calyx, inſerted into the receptacle; *antheræ* twin, oblong, four-cornered, erect.

FEMALE. *Calyx* and *corolla* as in the male; *piſtillum*, germen inferior, ovate, four-cornered; ſtyles two, recurved; ſtigmata ſimple.

Eſſen. Generic Character. *Calyx* four-parted; *corolla* none; *ſtamina* four; *piſtillum* two; germ. inferior; male and female in the ſame, or a diſtinct plant.

Species. 1. A. *æthiopicum*, amber-tree: it bears male and hermaphrodite flowers on diſtinct plants; a beautiful ever-green ſhrub, with ſmooth poliſhed leaves, which emit a very fragrant odour on being rubbed between the fingers. 2. A. *ciliare*, with root perennial, woody, much branched; leaves ciliated, narrow, lanceolate; flowers axillary, ſeſſile. 3. A. *herbaceum*, with leaves ſix, poliſhed; ſtem herbaceous. This has the appearance of a galium. All theſe ſpecies are natives of the Cape of Good Hope.

Propagation and Culture. All theſe plants may be eaſily propagated by cuttings during the ſummer months: they will take root in a border of light earth, provided they are watered and ſhaded as the ſeaſon may require; or if theſe cuttings are planted in pots, and placed in a moderate hot-bed, they will take root ſooner. Afterwards they ſhould be taken up, and planted in pots filled with light ſandy earth, and expoſed to the open air till October, when they ought to be removed into the conſervatory. See Miller's Dict. by Martyn.

ANTHOXANTHION. See RUMEX *maritimus*.

ANTHOXANTHUM (Ἀνθος and ξανθος, *yellow flower*), Lin. Gen. 42. claſs, *diandria digynia*; natural order, *gramina*, or graſſes.

Generic Character. *Calyx*, glume one-flowered, two-valved; valves ovate, acuminate, concave, the inner one larger; *corolla*, glume one-flowered, two-valved, of the length of the greater valve in the calyx, each valve emitting an awn from the lower part of the back, one of them jointed; *nectary* two-leaved, very ſlender, cylindric; leaflets ſubovate, embracing; *ſtamina*, filaments two, capillary, very long; *antheræ* oblong, forked at both ends; *piſtillum*, germen oblong; ſtyles two, filiform; *ſtigmata* ſimple; *pericarpium*, glume of the corolla grows to the ſeed; ſeed one, pointed at both ends.

Eſſen. generic Character. Glume two-valved, one-flowered; glume of the corolla two-valved, acuminate; ſeed one.

Species. 1. A. *odoratum*, ſweet vernal graſs, with ſpike oblong-ovate; flowers longer than the awn, on ſhort peduncles. This is an early graſs, and grows about a foot high: it may be eaſily diſtinguiſhed from all the other graſſes which are natives of this country, by having only two ſtamina; its fragrance is alſo very remarkable, giving that pleaſant ſmell diſcovered in new-mown hay. See Eng. Botany, 647. 2. A. *indicum*, with ſpike linear; flowers ſeſſile, ſhorter than the awn; culm, or ſtem, a foot high, jointed; leaves broad, ſhort, ſpike very narrow: a native of the Eaſt Indies. 3. A. *crinitum*, with culm high, ſmooth; panicle long, ſpike-ſhaped; with awns long, ſpreading, looſe: a native of New Zealand.

ANTHOXANTHUM *aculeatum*. See CRYPSIS.

ANTHOXANTHUM *paniculatum*. See FESTUCA *ſpadicea*.

ANTHRACIS, in *Natural Hiſtory*, a word uſed for a gem by the ancients, but in ſeveral different ſenſes; all which ſeem evidently to refer to the cat's eye, or *aſteria* kind.

Many of the ancients alſo have called the HÆMATITES, or blood-ſtone, by this name, becauſe of its being of the colour of a burning coal.

ANTHRACOLITE (of Kirwan), in *Mineralogy*. See COAL.

ANTHRACOSIS, in *Surgery*, is a diſeaſe affecting the eye or its appendages, which more commonly bears the appellation of *Anthrax*, *Carbo*, or *Carbuncle*. This diſorder may, however, be ſeated in any other external part of the body; and there is no good reaſon why its name ſhould be altered, when it affects the eye. See CARBUNCLE.

ANTHRAX, in the *Natural Hiſtory of the Ancients*, was a word uſed by the moſt early writers for the ſubſtance we now call pit coal, and *lithanthrax*. Theophraſtus plainly tells us, that the ſubſtance ſtrictly and properly called *anthrax* (for they alſo knew a gem by the ſame name, uſed in a metaphorical ſenſe) was an earthy foſſile ſubſtance, which was broken in pieces to be uſed, and kindled well, and burnt almoſt like wood-coals, and was uſed by the ſmiths. See COAL.

ANTHRAX *Morio*, in *Entomology*, a name given by Scopoli to the muſca morio of Linnæus. *Vide* Scop. ent. Carn. 971.

ANTHRAX, in *Surgery*, a circumſcribed tumour ſeated in the common integuments, and readily becoming gangrenous. For a more particular deſcription of this complaint, ſee CARBUNCLE, which is ſynonymous. The diſtinction which ſome perſons have made between *anthrax* and *carbo* is not founded in nature.

ANTHRENUS, in *Entomology*, a genus of coleopterous inſects in Gmelin's arrangement of the Syſtema Naturæ, comprehending ſeven ſpecies, *viz.* pimpinellæ, ſcrophulariæ, muſcorum verbaſci, vagus, glaber, and fuſcus. The character of the genus is, antennæ clavate; club ſolid; palpi unequal, filiform; maxilla membranaceous, linear, and two-cleft; lip entire.

ANTHRIBUS, a name given by Geoffroy to the Cryptocephalus Crioceris of Gmelin.

ANTHRISCUS, in *Botany*. See CHÆROPHYLLUM and SCANDIX.

ANTHROMETRICA *machina*. See ANTHROPOMETRICA.

ANTHROPODÆMON, in *Ancient Writers*, a demon concealed under the figure or appearance of man.

ANTHROPOGLOTTUS, in *Natural Hiſtory*, ſomething that has a tongue or ſpeech reſembling that of a man.

The parrot kind are denominated anthropoglotti, on account of their broad, thick and muſcular tongues, by which they are enabled to ſpeak, and to roll their meat from ſide to ſide under the edges of their bills.

ANTHROPOGRAPHIA, a deſcription of man; more particularly of the ſtructure of his body, and the parts thereof.

ANTHROPOLATRÆ, in *Eccleſiaſtical Hiſtory*, a title given to the Neſtorians, on account of their believing Chriſt to be a mere man, yet paying him the honour of a God.

ANTHROPOLATRIA, the paying divine worſhip or honours to a man. *Anthropolatria* is ſuppoſed by ſome to have been the moſt ancient ſpecies of IDOLATRY.

ANTHROPOLITES, in *Natural Hiſtory*, a term denoting petrifactions of the human body; as thoſe of quadrupeds are called *zoolites*. See PETRIFACTION.

ANTHROPOLOGY, compounded of ανθρωπος, *man*, and λογος, *diſcourſe*, a diſcourſe or treatiſe upon man, or human nature; conſidered as in a ſound or healthy ſtate.

Anthropology includes the conſideration both of the human body and ſoul, with the laws and effects of their union; as ſenſation, motion, &c.

It is particularly uſed, in *Theology*, for a way of ſpeaking of God after the manner of men; by attributing human parts and paſſions to him; as eyes, hands, ears, anger, joy, &c. We have frequent inſtances of anthropology in holy ſcripture; by which we are only to underſtand the effect, or the thing which God does, as if he had hands, &c.

ANTHROPOMANCY, compounded of ανθρωπος, *man*, and μαντεια, *divination*, a method of divination, performed by inſpecting the *viſcera* of a perſon deceaſed: the emperor Heliogabalus practiſed this method of divination. The ſame is related by Cedrenus and Theodoret of Julian II. who, in his nocturnal ſacrifices and magical operations, deſtroyed a number of young children, for the purpoſe of inſpecting and conſulting their entrails. The Scythians were addicted to this barbarous practice; and Strabo informs us, that it prevailed amongſt the ancient inhabitants of Luſitania.

ANTHROPOMETRIA, a deſcription of the human body, with its ſeveral parts and members, according to the three dimenſions, length, breadth, and thickneſs, both conſidered in themſelves, and comparatively to each other.

ANTHROPOMETRICA *machina*, a name which Sanctorinus gave to his weighing-chair, contrived for meaſuring the quantity of *inſenſible* PERSPIRATION.

ANTHROPOMORPHA, derived from ανθρωπος, *a man* and μορφη, *form*, in the Linnæan ſyſtem of nature, a denomination formerly given to the primates claſs of animals which had the greateſt degree of reſemblance to the human form.

ANTHROPOMORPHITE, formed of ανθρωπος, *man* and μορφη, *ſhape*, in a general ſenſe, one who attributes to God the figure of a man.

ANTHROPOMORPHITES, in *Eccleſiaſtical Hiſtory*, were a ſect of ancient heretics, who, taking every thing ſpoken of God in the ſcriptures in a literal ſenſe, imagined he had real hands, feet, &c. The paſſage they chiefly inſiſted on was that in Geneſis, where it is ſaid, that God made man after his own image.

Even philoſophers, for want of a better acquaintance with metaphyſics, ſeem to have fallen into *anthropomorphiſm*, repreſenting God much after the manner of a human ſoul, without conſidering the difference between a finite and infinite being; limited, and abſolute perfections. Wolfius has laboured hard to avoid this rock, by having the difference ſtill preſent to his mind, and proceeding according to the ancient rule, *Quæ de Deo dicuntur* ανθρωποπαθως, *ea intellige* Θεοπρεπως.

The whole ſect of Stoics held God to be corporeal: and, not to mention Tertullian, Lactantius and others among the fathers, Hobbes and his followers aſſert the ſame among ourſelves. Leibnitz charges ſir Iſaac Newton and his followers with repreſenting God under the conditions of a man; but with what juſtice it would be hard to ſay.

Thoſe who held the contrary, *viz.* that God is incorporeal, and without any bodily form, the anthropomorphites branded by the name of *Origeniſts*, becauſe *Origen* taught how to allegorize thoſe expreſſions.

Epiphanius calls the *Anthropomorphites*, *Audiani*, or *Odiani*, from *Audius*, the ſuppoſed founder of the ſect; who lived about the time of Arius, in Meſopotamia. St. Auguſtine calls them *Vadiani*.

This ſyſtem was revived in the year 930.

ANTHROPOMORPHOUS, ſomething that bears the figure or reſemblance of a man. Naturaliſts give inſtances of anthropomorphous plants, anthropomorphous minerals, &c. Theſe generally come under the claſs of what they call *luſus naturæ*, or monſters.

Anthropomorphous ſtones make a ſpecies of thoſe called figured ſtones.

ANTHROPOMORPHOUS, is an appellation more peculiarly given to MANDRAGORA, or mandrake.

ANTHROPOPATHY, compounded of ανθρωπος, *man*, and παθος, *paſſion*, a figure, expreſſion, or diſcourſe, whereby ſome paſſion is attributed to God, which properly belongs only to man.

Anthropopathy is frequently uſed promiſcuouſly with anthropology; yet, in ſtrictneſs, they ought to be diſtinguiſhed as the genus from the ſpecies. Anthropology may be underſtood of any thing human attributed to God; but

anthro-

anthropopathy, only of human affections, paſſions, ſenſations, &c

ANTHROPOPHAGI, compounded of the Greek ἀνθρωπος, *man*, and φαγω, *edere, to eat*, people who feed on human fleſh.

The Cyclops, the Leſtrygons, and Scylla, are all repreſented in Homer as anthropophagi, or man-eaters; and the female phantoms, Circe and the Syrens, firſt bewitched with a ſhow of pleaſure, and then deſtroyed. This, like the other parts of Homer's poetry, had a foundation in the manners of the times preceding his own. It was ſtill in many places the age ſpoken of by Orpheus:

> "When men devour'd each other like the beaſts,
> Gorging on human fleſh.——"

Some remains of the uſage ſubſiſted much longer, even among the moſt civilized nations, in the practice of offering human ſacrifices.

Hiſtory gives us divers inſtances of perſons driven by exceſs of hunger to eat their own relations. Others commence anthropophagi out of revenge and hatred; there are many inſtances of ſoldiers, who in the heat of battle have been carried to ſuch exceſs of rage, as to tear their enemies with their teeth.

The violence of love has ſometimes produced the ſame effect as the exceſs of hatred. The *Tapuii* eat the bodies of their friends and neareſt relations to preſerve them from worms and putrefaction, thinking they do not only hereby afford them an honourable grave, but even a new life, a kind of reviviſication in themſelves. Artemiſia did ſomething like this, when ſhe ſwallowed the aſhes of her dead huſband, Mauſolus. Among the Eſſedonian Scythians, when a man's father died, his neighbours brought him ſeveral beaſts, which they killed, minced, and mixed up with the fleſh of the deceaſed, and made a feaſt.

Among the Maſſageti, when any perſon grew old, they killed him and ate his fleſh: but if the party died of ſickneſs they buried him, eſteeming him unhappy.

Idolatry and ſuperſtition have occaſioned the eating more men, than both love and hatred put together. There are few nations but have offered human victims to their deities; and it was an eſtabliſhed cuſtom to eat part of the ſacrifices they offered.

This practice has prevailed more or leſs in different parts of the globe, in more modern times. The Caribbees uſed to make eunuchs of their children, in order to fatten and eat them. Garcilaſſo de la Vega mentions a people in Peru, who were accuſtomed to fatten and eat the children produced by their female captives, whom they kept as concubines for that purpoſe; and when the mothers had done breeding, they themſelves were killed and eaten. The virtues whereby the Tououpinambos believed they merited Paradiſe, were revenge, and eating abundance of their enemies. Herrera ſpeaks of great markets in China, that were furniſhed wholly with human fleſh for the better ſort of people.

The Jagos, and the ſubjects of the great Macoco, are ſaid to be anthropophagi. This prince is very powerful, having ſeveral kings for his vaſſals; his court is ſo numerous, that there are two hundred men butchered every day to ſupply the table; part of this number are criminals, the reſt ſlaves furniſhed in the nature of tribute. See ANSIKO.

It appears pretty certain from Dr. Hawkeſworth's Account of the voyages to the South Seas, that the inhabitants of the iſland of New Zealand, a country unfurniſhed with the neceſſaries of life, eat the bodies of their enemies. It appears alſo to be very probable, that both the wars and anthropophagia of theſe ſavages take their riſe, and owe their continuance, to irreſiſtible neceſſity, and the dreadful alternative of deſtroying each other by violence, or of periſhing by hunger. See vol. iii. p. 447, and ſeq. and vol. ii. p. 389, &c.

Mr. Marſden, in his account of Sumatra, informs us, that the Battas, a people of that iſland, are anthropophagi. They do not eat human fleſh to ſatisfy hunger, becauſe other food is wanting, or as a gluttonous delicacy, but as a mode of ſhewing their deteſtation of crimes by an ignominious puniſhment, and as an indication of revenge and inſult to their enemies. The objects of this ſavage repaſt are the priſoners taken in war, and offenders convicted and condemned for capital crimes. When ſentence is pronounced, the unhappy object is tied to a ſtake; and when mortally wounded by lances thrown at him by the aſſembled multitude, they ruſh upon him as in a rage, cut pieces from the body with their knives, dip them in a diſh, previouſly prepared, of ſalt and lemon-juice, ſlightly broil them over a fire, and then ſwallow the morſels with a kind of ſavage enthuſiaſm. In ſome caſes, they tear the fleſh from the carcaſe with their mouths. Some ſay that they do not eat the bodies of their enemies ſlain in battle; but though the practice be not general, inſtances of it occaſionally occur.

M. Petit has a learned diſſertation on the nature and manners of the anthropophagi. Among other things, he diſputes whether or not the anthropophagi act contrary to nature? The philoſophers, Diogenes, Chryſippus, and Zeno, followed by the whole body of Stoics, held it a very reaſonable thing for men to eat each other.

According to Sextus Empiricus, the firſt laws were thoſe made to prevent men from eating each other, as had been done till that time. The Greek writers repreſent anthropophagia as univerſal before Orpheus. To ſhew farther, that anthropophagia is not contrary to nature, a modern author urges, that cats, dogs, rabbits, and other animals feed on each other. Pliny, after Ariſtotle, affirms, that ſwans eat each other; and the bees alſo eat their *nymphæ*, which are their young. The Dutch, in Nova Zembla, ſaw bears devour each other; and the like has been obſerved of the fiſh kind: the *tiburones*, according to Ovid, are caught with a hook baited with their own fleſh. Leonardus Floroventius having fed a hog with hog's fleſh, and a dog with dog's fleſh, found a repugnancy in nature to ſuch food; the former loſt all its briſtles; the latter its hair; and the whole body broke out in blotches.

It may be ſaid, that whether the dead body of an enemy be eaten or buried, is a matter perfectly indifferent; but whatever the practice of eating human fleſh may be in itſelf, it certainly is, relatively, and in its conſequences, moſt pernicious. It manifeſtly tends to eradicate a principle, which is the chief ſecurity of human life, and more frequently reſtrains the hand of the murderer, than the ſenſe of duty, or the dread of puniſhment. If even this horrid practice originates from hunger, ſtill it muſt be perpetual from revenge. Death muſt loſe much of its horror among thoſe who are accuſtomed to eat the dead; and where there is little horror at the ſight of death, there muſt be leſs repugnance to murder. See ſome farther obſervations on this ſubject, equally juſt and ingenious, by Dr. Hawkeſworth, *ut ſupra*.

Some carry their reſpect for dead bodies to a great length. M. Petit does not think it lawful for anatomiſts to diſſect human bodies in order to learn their ſtructure, except thoſe of condemned criminals, and ſuch as are denied the rites of burial. The Arabs went farther; notwithſtanding all their curioſity, and deſire to be acquainted with the human ſtructure, they could never be induced to make one diſſection; but were contented to borrow all their knowledge of this kind from the Greek phyſicians.

Some maintain it impoſſible, whatever precaution is uſed, to prevent the ingreſs of the parts of dead bodies with our food and drink. Add, that if we do not feed on our own ſpecies, we feed on plants and animals which derive a great part of their nutriment from us. Whence the impoſſibility of the RESURRECTION of the ſame body has been inferred.

ANTHROPOPHAGIA, the act or habit of eating human fleſh.

This is pretended by ſome to be the effect of a diſeaſe, which leads people affected with it to eat every thing alike. Some chooſe only to conſider it as a ſpecies of PICA.

The annals of Milan furniſh an extraordinary inſtance of anthropophagia. A Milaneſe woman, named Elizabeth, from a depraved appetite, like what women with child, and thoſe whoſe *menſes* are obſtructed, frequently experience, had an invincible inclination to human fleſh, of which ſhe made proviſion by enticing children into her houſe, where ſhe killed and ſalted them; a diſcovery of which having been made, ſhe was broken on the wheel and burnt in 1519.

ANTHROPOSCOPIA, the art of judging or diſcovering a man's character, diſpoſition, paſſions, and inclinations, from the lineaments of his body.

In which ſenſe anthropoſcopia ſeems to be ſomewhat more extenſive than PHYSIOGNOMY, or METOPOSCOPY.

Otto has publiſhed an "*Anthropoſcopia, ſive judicium hominis de homine ex lineamentis externis.*

ANTHROPOSOPHIA, the ſcience of the nature of man, and his ſtructure and compoſition, both internal and external.

In this ſenſe, anthropoſophia amounts to much the ſame with the medical *phyſiology* or *anatomy*.

ANTHROPOTHYSIA, in *Ancient Writers*, denotes the offering of human victims.

The anthropothyſia was a frequent practice among the ancients. Some have imagined that the ſacrifice of Abraham was the firſt inſtance. Many reaſonings and diſquiſitions have been founded on this ſuppoſition; by which the ſeverity of Abraham's trial is thought by ſome to have been ſomewhat exaggerated. Human ſacrifices were in uſe among the Gentiles before that time; practiſed by kings as well as by private perſons; nay by entire nations, as the Egyptians, Phœnicians, Canaanites, &c.

ANTHUMON, in the *Materia Medica of the Ancients*, a name given to the EPITHYMUM, or *dodder*, growing upon THYME.

ANTHUS, in *Ornithology*, a name by which Aldrovand and ſome other authors have called that ſpecies of the OENANTHE LOXIA, called the *chloris* or green finch.

ANTHYLLA, in *Ancient Geography*, a town of Egypt, ſituate, according to Herodotus, in a plain, nearly weſt of the Canopic branch, and north-weſt of Naucratis.

ANTHYLLIS. See ARENARIA, ASPALATHUS, CAMPHOROSMA, CRESSA, EBENUS, POLYCARPON, POLYCNEMUM, SALSOLA, and TEUCRIUM.

ANTHYLLIS *Valentina*. See FRANKENIA.

ANTHYLLIS (Ἀνθυλλις, *floris lanugo*, a downy flower), in *Botany*. Lin. Gen. 864. Juſſ. 355. Gærtn. 145. Claſs, *diadelphia decandria*; natural order of *papilionaceæ* or *leguminoſæ*.

Generic Character. *Calyx*, perianth one-leafed, ovate-oblong, ſwelling, villoſe; the mouth five-toothed, unequal, permanent; *corolla* papilionaceous; banner longer than the wings, the ſides reflex, claw the length of the calyx; wings oblong, ſhorter than the banner; keel compreſſed, of the length of the wings; *ſtamina*, filaments connate, riſing; antheræ ſimple; *piſtillum*, germen oblong; ſtyle ſimple; ſtigma obtuſe; *perianthium*, legume roundiſh, concealed within the calyx, very ſmall, bivalve; *ſeeds* one or two.

Eſſen. generic Character. *Calyx* ſwelling; legume roundiſh, concealed.

Species. 1. A. *tetraphylla*, four-leaved anthyllis or kidney-vetch; with leaves pinnate, with four lobes; flowers lateral: an annual, the ſpontaneous growth of Spain and Italy; it flowers in the open border in July. Curt. Bot. Mag. 108. 2. A. *vulneraria*, kidney vetch, lady's-finger, with leaves pinnate, unequal; head double; root woody, perennial; ſtems decumbent, hairy; leaves lyrato-pinnate; flowers yellow. There is a variety with red flowers: a common native of Britain, flowering in July and Auguſt. This plant is recommended as an excellent paſturage for ſheep. Figured in Eng. Bot. 104, and Flor. Dan. 988. 3. A. *montana*, mountain kidney-vetch, with leaves pinnate, equal; head terminal; flowers oblique; ſtems four to ſix inches high; flowers pale, ſtreaked with a deep purple; they appear early, and the ſeeds ripen in July: a native of the ſouth of Europe. 4. A. *cornicina*, with leaves pinnate, unequal; heads ſolitary; ſtem ſeven or eight inches high; flowers of a pale yellow colour, appearing in May and June: it is a native of Spain, annual. 5. A. *lotoides*, with leaves three-parted; calyces priſmatic, faſcicled, of the length of the legumes, half a foot high; leaves alternate, diſtant; flowers about nine, of a deep ſulphur colour: a native of Spain, annual. 6 A. *Gerardi*, with leaves pinnate, unequal; peduncles lateral, longer than the leaf; heads leafleſs: grows wild on the ſea coaſt of Provence. 7. A. *quinqueflora*, with leaves ternate, linear; head five-flowered; it bears yellow flowers: a native of the Cape of Good Hope. 8. A. *involucrata*, ſub-herbaceous; with leaves ternate, ſtipuled, ſword-ſhaped; flowers in a head, yellow: a native of the Cape. 9. A. *liniſolia*, with leaves ternate, ſeſſile, enſiform; flowers in a head: it riſes eight feet high. 10. A. *barba jovis*, with leaves pinnate, equal, tomentoſe; flowers in a head Miller. t. 41. f. 2. A ſhrub ten or twelve feet high, bearing yellow flowers, which appear in June: a native of France, Spain, Portugal, &c. 11. A. *heterophylla*, with leaves pinnate; floral leaves ternate; a ſmall ſhrub, bearing minute flowers in pairs: a native of Spain and Portugal. 12. A. *viſciflora*, with leaves digitate-pinnate; calyces ſhaggy, viſcous; head of five or ſix flowers, which are yellow: diſcovered at the Cape of Good Hope by Sparrman. 13. A. *cytiſoides*, downy-leaved anthyllis, with leaves ternate, unequal; calyx woolly, lateral; a low ſhrub with yellow flowers, appearing three or four together on the ſides of the branches: a native of Spain and the South of France; cultivated by Miller in 1759. 14. A. *hermanniæ*, lavender-leaved anthyllis, with leaves ternate, ſub-peduncled; calyces naked; a ſhrub five or ſix feet high; flowers yellow, in ſmall cluſters at the ſide of the branches: a native of the moſt ſouthern parts of Europe. 15. A. *erinacea*, prickly anthyllis, a ſpinoſe ſhrub, with ſimple leaves; it ſomewhat reſembles gorſe or whin: a native of Spain and Portugal; cultivated by Miller in 1759. 16. A. *tragacanthoides*, with leaves pinnate, equal, tomentoſe; petioles ſpineſcent; flowers in racemes. It has a ſhrubby ſtem about a ſpan high, and bears purple flowers; a native of Mount Lebanon. 17. A. *indica*, with leaves pinnate, equal, ſmooth, racemes oblong, ſub-terminating; a large ſhrub, with white flowers: it is a native of the mountains of Cochinchina.

Propagation and Culture. Moſt of the herbaceous ſpecies may be propagated by ſeeds, ſown either in the autumn or ſpring in a bed of light earth, and tranſplanted at a proper age in the place where they are to remain. The ſhrubby ſpecies are commonly propagated either by ſeeds or cuttings; if by ſeeds, they ſhould be ſown in the autumn in pots filled with light earth; and placed under a frame in winter, to

protect:

protect them from froſt. The following ſpring the plants will riſe; and when they are ſtrong enough to be removed, they ſhould be each planted in a ſmall pot filled with light earth, and placed in the ſhade till they have taken new root; after which, they may be put along with other hardy exotic plants, in a ſheltered ſituation, till October, when they muſt be removed into ſhelter. See Miller's Gardener's Dict. by Martyn.

ANTHYLLOIDES. See SALSOLA.

ANTHYPNOICA, in the *Materia Medica*, medicines ſuited to diſpel ſleep.

ANTHYPOCHONDRIACA, medicines adapted to the cure of hypocondriaſis.

ANTHYPOMOSIA, in *Ancient Writers*, an oath taken by a proſecutor or accuſer, declaring that the abſence of the party accuſed is not for any juſt cauſe, and therefore demanding that judgment may no longer be delayed on that account.

ANTHYPOPHORA, in *Rhetoric*, a figure whereby we covertly obviate a reaſon or objection.

In this ſenſe anthypophora ſtands oppoſed to *hypophora*, e. gr. if the HYPOPHORA be, grammar is very difficult to obtain; the anthypophora may be, grammar is indeed a little difficult to obtain, but then its uſe is infinite.

ANTI, Ανti, is a prepoſition uſed in compoſition with ſeveral words in Greek, Latin, Engliſh, &c. in different ſenſes. In Engliſh, it ſometimes ſignifies before; as in *antichamber*, a place before the chamber. In which caſe it has the ſame meaning with the Latin *ante*, *before*.

Sometimes, again, it ſignifies *contrary*, or *oppoſite*; and is then derived from ανti, *contra*, *againſt*. In this latter ſenſe, the word makes part of the name of various medicines, to denote ſome peculiar or ſpecific virtue in them againſt certain diſeaſes: ſuch, e. gr. are antivenereals, antiſcorbutics, antinephritics, &c.

The prepoſition is frequently, however, omitted on theſe occaſions, without any alteration of the ſenſe; as in nephritics, arthritics, aſthmatics, &c.

ANTI, in *Matters of Literature*, is a title given to divers pieces written by way of anſwer to others, whoſe names are uſually annexed to the *anti*.

See the *Anti* of M. Baillet; and the *Anti-Baillet* of M. Menage: there are alſo Anti-Menagiana, &c. Cæſar the dictator wrote two books by way of anſwer to what had been objected to him by Cato, which he called *Anti-Catones*; theſe are mentioned by Juvenal, Cicero, &c. Vives aſſures us, he had ſeen Cæſar's Anti-Catones in an ancient library.

ANTIADES, a term uſed by ſome writers for the glandules and kernels, more commonly called TONSILS and ALMONDS *of the ears*.

ANTIADIAPHORISTS, compounded of ανti, *contra*, *againſt*, and αδιαφορος, *indifferent*, oppoſite to the ADIAPHORISTS, a name given in the fourteenth century to the rigid Lutherans, who diſavowed the epiſcopal juriſdiction, and many of the church-ceremonies retained by the moderate LUTHERANS.

ANTIANA, *Sezziu*, in *Ancient Geography*, a town of Pannonia, placed by M. D'Anville north of Teutoburgium.

ANTIBACCHI, an iſland of the Red Sea.

ANTIBACCHIUS, in the *Ancient Poetry*, a foot, conſiſting of three ſyllables; the two firſt of which are long, and the third ſhort.

Such are the words *cāntārĕ*, *vīrtūtĕ*, Ελλῆνες.

It is ſo called, as being contrary to the BACCHIUS, the firſt ſyllable whereof is ſhort, and the two laſt long. Among the ancients, this foot is alſo denominated *Palimbacchius*, and *Saturnius*; and, by ſome, *Propontieus*, and *Theſſalius*. Diom. III. p. 475.

ANTIBARBAROUS, a title given to ſeveral works levelled againſt the uſe of barbarous terms and phraſes, chiefly in the Latin tongue.

Eraſmus, Nizolius, and Cellarius, have publiſhed "Antibarbara." Noltemus has given us a Lexicon "*Antibarbarum*," conſiſting of obſervations made by the grammarians of late ages in relation to the purity and corruption of Latin words. Sixt. Amama has given an "Antibarbarus Biblicus," wherein he pretends to have diſcovered ſeven ſources of the barbariſms which have been introduced in late ages into the BIBLE. Peter du Moulin uſed the title "Antibarbarous" for a book againſt the uſe of an unknown tongue in divine ſervice.

ANTIBARIS, in *Ancient Geography*, a town of Servia, taken by Perigord, general of Manuel, emperor of Conſtantinople, in 1143.

ANTIBES, in *Geography*, a ſea-port town of France, in the department of the Var, and chief place of a canton, in the diſtrict of Graſſe. The place contains 5,270, and the canton 14,171 inhabitants; the territory includes 165 kiliometres and 19 communes. In the firſt ages of Chriſtianity, it was the ſee of a biſhop, but removed by pope Innocent IV. to Graſſe, in 1250, becauſe the piratical Moors of Africa and Spain frequently ſacked the town, and plundered the inhabitants. The harbour is ſmall, nor is the trade conſiderable. N. lat. 43° 5′. E. long. 7° 50′.

ANTIBIBLOS, in the *Civil Law*, an inſtrument or ſignature, whereby the defendant owns he has received the libel, or a copy of it, and notes the day whereon he received it. This is uſually done on the back of the LIBEL.

ANTICADMIA denotes a ſpecies of mineral CADMIA, ſometimes alſo called *pſeudo*-CADMIA.

It takes the denomination anticadmia, not as being oppoſite in quality to the cadmia, but becauſe it is uſed as a ſubſtitute for it.

ANTICACHECTICA, in the *Materia Medica*, medicines adapted to the cure of cachexy.

ANTICARDIUM, in *Anatomy*, &c. that hollow part under the breaſt, juſt againſt the heart, commonly called the pit of the ſtomach; called alſo ſcrobiculus cordis.

The word is compounded of ανti, *contra*, *againſt*, and καρδια, *cor*, *heart*.

ANTICASIUS, in *Ancient Geography*, a mountain oppoſite to Mount Caſius, at no great diſtance from Antioch.

ANTICATARRHAL, an epithet given to medicines preſcribed for catarrhs.

ANTICATEGORIA, in *Oratory*, denotes a recrimination or mutual accuſation; where the two parties charge each other with the ſame crime.

Apollodorus conſiders the anticategoria as two ſeveral cauſes or actions.

ANTICAUSOTICS, among *Phyſicians*, denote medicines againſt burning fevers. In this ſenſe, Juncker has given the deſcription of anticauſotic ſyrup.

ANTICHAMBER; ſee ANTECHAMBER.

ANTICHORUS, in *Botany*; claſs *octandria monogynia*; natural order of *columniferæ* and of *tiliaceæ* of Juſſ. Lin. Gen. Reich. n. 508. Juſſ. 290.

Generic Character. *Calyx*, perianthium four-leaved, very much expanded; leaflets lanceolate, acuminate, deciduous; *corolla*, petals four, obovate, obtuſe, the length of the calyx; *ſtamina*, filaments ſetaceous, erect, ſhorter than the corolla; antheræ roundiſh; *piſtillum*, germen ſuperior, ovate; ſtyle cylindric; ſtigma obtuſe; *pericarpium*, capſule ſubulate, four-

four-celled, four-valved; ſeeds very many, truncated, in four rows.

Eſſential generic character. *Calyx* four-leaved; *petals* four; *capſule* ſuperior, four-celled, four-valved; *ſeeds* very numerous. There is only one ſpecies of this genus, *viz.* A. *depreſſus*, which is a ſmall procumbent annual, not exceeding three or four inches long, with alternate branches, bearing yellow flowers: it is a native of Arabia.

ANTICHRESIS, in the *Civil Law*, a covenant or convention, whereby a perſon borrowing money of another engages or makes over his lands or goods to the creditor, with the uſe and occupation thereof, for the intereſt of the money lent. This covenant was allowed of by the Romans, among whom uſury was prohibited: it was afterwards called MORT-GAGE, to diſtinguiſh it from a ſimple engagement, where the fruits of the ground were not alienated, which was called VIF *gage*.

ANTICHRIST, compounded of ἀντι, *contra*, *againſt*, and χριστος, *Chriſt*, in a general ſenſe, denotes an adverſary of Chriſt, or one who denies that the Meſſiah is come. In this ſenſe, Jews, infidels, &c. may be ſaid to be *Antichriſts*.

The epithet, in the *general* ſenſe of it, is applicable to any power or perſons acting in direct oppoſition to Chriſt or his doctrine. Its *particular* meaning is to be collected from thoſe paſſages of Scripture in which it occurs. Accordingly it may either ſignify one who aſſumes the place and office of Chriſt, or one who maintains a direct enmity and oppoſition to him. See biſhop Hurd's Introd. to the ſtudy of the Prophecies, vol. ii. p. 10.

ANTICHRIST is more particularly uſed for a tyrant who is to reign on earth toward the end of the world: to make the ultimate proof of the elect: and to give a ſignal inſtance of the divine vengeance, before the laſt judgment.

The Bible and the fathers all ſpeak of Antichriſt as a ſingle man; though they alſo aſſure us, that he is to have divers precurſors, or fore-runners. Yet many Proteſtant writers apply to the Romiſh church, and the pope, who is at the head of it, the ſeveral marks and ſignatures of Antichriſt enumerated in the Apocalypſe; which would rather imply Antichriſt to be a corrupt ſociety, or a long ſeries of perſecuting pontiffs, than a ſingle perſon: or, rather, a certain power and government, that may be held for many generations, by a number of individuals ſucceeding one another. The Antichriſt mentioned by the apoſtle John, 1 Ep. ii. 18. and more particularly deſcribed in the book of Revelation, ſeems evidently to be the ſame with the *Man of ſin*, &c. characteriſed by St. Paul in his ſecond Epiſtle to the Theſſalonians, chap. ii. And the whole deſcription literally applies to the exceſſes of papal power. Had the right of private judgment, ſays an excellent writer, been always adopted and maintained, Antichriſt could never have been; and when that ſacred right comes to be univerſally aſſerted, and men follow the voice of their own reaſon and conſciences, Antichriſt can be no more.

A late writer (ſee Kett's Hiſtory, the Interpreter of Prophecy, vol. ii.), after collecting the principal prophecies relating to Antichriſt, infers from them, that a power, ſometimes repreſented as the little horn, the man of ſin, the Antichriſt, the beaſt, the harlot, the ſtar falling from heaven, the falſe prophet, the dragon, or as the operation of falſe teachers, was to be expected to ariſe in the Chriſtian world to perſecute and oppreſs, and delude the diſciples of Chriſt, corrupt the doctrine of the primitive church, enact new laws, and eſtabliſh its dominion over the minds of mankind. He then proceeds to ſhew, from the application of prophecy to hiſtory, and to the remarkable train of events that are *now* (1799) paſſing in the world, how exactly popery, Mahometaniſm, and infidelity correſpond with the character given in Scripture of the power of Antichriſt, which was to prevail a certain time for the eſpecial trial and puniſhment of the corrupted church of Chriſt. Upon this ſyſtem, the different opinions of the proteſtants and papiſts, concerning the power of Antichriſt, derived from partial views of the ſubject, are not wholly incompatible with each other. With reſpect to the commonly received opinion, that the church of Rome is Antichriſt, Mede and Newton, Daubuz and Clarke, Lowman and Hurd, Jurieu, Vitringa, and many other members of the proteſtant churches, who have written upon the ſubject, concur in maintaining, that the prophecies of Daniel, St. Paul, and St. John, point directly to this church. This was likewiſe the opinion of the firſt reformers; and it was the prevalent opinion of Chriſtians, in the earlieſt ages, that Antichriſt would appear ſoon after the fall of the Roman empire. Gregory the Great, in the ſixth century, applied the prophecies concerning the beaſt in the Revelation, the man of ſin, and the apoſtacy from the faith mentioned by St. Paul, to him who ſhould preſume to claim the title of univerſal prieſt, or univerſal biſhop in the Chriſtian church; and yet his immediate ſucceſſor, Boniface III. received from the tyrant Phocas the preciſe title which Gregory had thus cenſured. At the ſynod of Rheims, held in the tenth century, Arnulphus, biſhop of Orleans, appealed to the whole council, whether the biſhop of Rome was not the Antichriſt of the apoſtles, "ſitting in the temple of God," and perfectly correſponding with the deſcription of him given by St. Paul. In the eleventh century, all the characters of Antichriſt ſeemed to be ſo united in the perſon of pope Hildebrand, who took the name of Gregory VII. that Johannes Aventinus, a Romiſh hiſtorian, ſpeaks of it as a ſubject in which the generality of fair, candid, and ingenious writers agreed, that at that time began the reign of Antichriſt. And the Albigenſes and Waldenſes, who may be called the proteſtants of the twelfth and thirteenth centuries, expreſsly aſſerted in their declarations of faith, that the church of Rome was the whore of Babylon.

The papiſts imagine they view in the prophetical picture of Antichriſt, imperial Rome, elated by her victories, exulting in her ſenſuality and her ſpoils, polluted by idolatry, perſecuting the people of God, and finally falling like the firſt Babylon; whilſt a new and holy city, repreſented by their own communion, filled with the ſpotleſs votaries of the Chriſtian faith, riſes out of its ruins, and the victory of the croſs is completed over the temples of paganiſm. This ſcheme has had its able advocates, at the head of whom may be placed Boſſuet biſhop of Meaux, Grotius, and Hammond. Some writers have maintained, that Caligula was Antichriſt; and others have aſſerted the ſame of Nero. But in order to eſtabliſh the reſemblance, they violate the order of time, diſregard the opinions of the primitive Chriſtians, and overlook the appropriate deſcriptions of the apoſtles.

It is obſerved by an ingenious writer, that the term "Antichriſt" is uſed by the apoſtle John, and by no other ſacred writer. He firſt mentioned it in a period which he called "the laſt hour;" and this, ſays he, can admit of no tolerable interpretation, except that of the laſt period of the Jewiſh ſtate, juſt before the deſtruction of Jeruſalem, when the Roman army was actually in Judæa. The apoſtle refers to ſome prophecy of Antichriſt, who ſhould appear before the diſſolution of the Jewiſh ſtate; "Ye have heard," from the goſpels of Matthew, Mark, and Luke, "that Jeſus, ſitting

with his disciples, of whom I was one, on the mount of Olives, foretold the destruction of Jerusalem, and said, "When ye shall see Jerusalem compassed with armies, then know that the desolation foretold by Daniel is nigh; and then false Christs shall arise, to seduce, if it were possible, even the elect." Matt. xxiv. Mark, xiii. Luke, xxi. "Ye have heard that Antichrist shall come. Even *now* there *are* many Antichrists; whereby *we know*, that it is the last time." It was natural to ask, who these Antichrists were, and by what mark they who had not the gift of discerning spirits, as the apostles had, might know them? To this reasonable inquiry, the apostle answers by saying, "Every spirit that confesseth not that Jesus Christ is come in the flesh, is not of God; and this is that spirit of Antichrist, whereof you have heard that it should come, and even now already is it in the world." The sense of the apostle seems to be explained by himself in his second epistle, where he again describes an Antichrist. It was a teacher of a *doctrine*: it was a doctrine concerning Christ; but it was not *the doctrine of Christ*, which he himself taught. The doctrine of Christ had in it *both the Father and the Son*; but the doctrine of Antichrist, by not including both, *had not God*; that is, had not a right notion of the *kingdom* of God, either as it had been among the Jews, or as it was to be, after *the coming of Jesus in the flesh*, among both Jews and Gentiles; one dispensation of truth, virtue, and social love throughout the world. If it be inquired further, whence came these Antichrists? The apostle says, they were *none of us*, apostles; they *went out from* us. This must mean, that Antichristian teachers either withdrew from the *apostles*, or from the *doctrine* which they taught. It is too evident, that they did not withdraw from their persons; they followed them; they mixed in their churches; they taught there another gospel; they drew the attention of the people from *virtue*, and fixed it on ceremonies and secular glory. John calls Antichrist a *deceiver*; and by deceit this party prevailed. John foresaw the whole, and pointed out the place where this iniquity would fix its seat, and for ages try to conceal its ignorance and barbarity under such splendid ensigns of secular glory, as never fail to dazzle, to intoxicate, and to enervate mankind. When Rome boasts of her antiquity, she boasts of a true fact. There is a fine expression of Paul to the Galatians, which teaches readers to consider such Antichrists as abortives, exhibiting a sort of unformed Christianity. Robinson's Hist. of Baptism, p. 625.

After the point had been maturely debated at the council of Gap, held in 1603, a resolution was taken thereupon to insert an article in the confession of faith, whereby the pope is formally declared to be Antichrist. Pope Clement VIII. was stung to the life with this decision; and even king Henry IV. of France was not a little mortified, to be thus declared, as he said, an imp of Antichrist.

F. Malvenda, a Spanish Jesuit, has published a large and learned work, *De Antichristo*, in thirteen books. In the first he relates all the opinions of the fathers with regard to Antichrist. In the second, he speaks of the time when he shall appear; and shews, that all the fathers, who supposed Antichrist to be near at hand, judged the world also was near its period. In the third, he discourses of his origin and nation; and shews, that he is to be a Jew, of the tribe of Dan: this he founds on the authority of the fathers, on that passage in Genesis xlix. *Dan shall be a serpent by the way*, &c. on that of Jeremy viii. 16. where it is said, *The armies of Dan shall devour the earth*; and on the Apocalypse, chap. vii. where St. John, enumerating all the tribes of Israel, makes no mention of that of Dan. In the fourth and fifth books, he treats of the signs of Antichrist. In the sixth, of his reign and wars. In the seventh, of his vices. In the eighth, of his doctrine and miracles. In the ninth, of his persecutions; and, in the rest, of the coming of Enoch and Elias, the conversion of the Jews, the reign of Jesus Christ, and the death of *Antichrist*, after his having reigned three years and a half.

Hippolitus, and others, held that the devil himself was the true Antichrist; that he was to be incarnate, and make his appearance in human shape before the consummation of things.

How endless are conjectures! Some of the Jews, we are told, actually took Cromwell for Christ, while some others have laboured to prove him Antichrist himself. Pfaffius assures us he saw a folio Book in the Bodleian library, written on purpose to demonstrate this latter position.

ANTICHRISTIANISM, a state or quality in persons or principles, which denominate them *Antichristian*, or opposite to the kingdom of Christ, and the genius and spirit of his religion.

ANTICHRISTIANS properly denote the followers or worshippers of Antichrist.

ANTICHRISTIANS are more particularly understood of those who set up, or believe in a false Christ, or Messiah.

ANTICHTHON, in its primitive astronomical sense, denotes a kind of globe or earth resembling ours, and like it supposed to be moving round the sun, but invisible to us, because on the opposite side of the sun, that luminary is still exactly interposed between this other earth and ours.

In this sense it is, that Pythagoras and his disciples asserted an antichthon; for which we have the testimonies of Aristotle, Plutarch, &c.

By reason of the perfection of the number ten, they concluded there must be just so many spheres; and as our senses only discover nine, *viz.* the seven planets, the sphere of the fixed stars, and our earth, they imagined a tenth opposite to ours.

Some of the fathers, who endeavoured to accommodate the doctrine of the heathen philosophers to those of Christianity, assert that this Pythagorean earth is no other than the heavens of the righteous.

Thomasius has a dissertation on the Pythagorean antichthon.

ANTICHTHONES, in *Geography*, are those people who inhabit countries diametrically opposite to each other.

The word is compounded of ἀντι, *contra*, and χθων, *terra, earth*. They are sometimes also called, by Latin writers, *entigenæ*.

In which sense, antichthones amount to much the same with what we more usually call *antipodes*.

ANTICHTHONES is also used, in *Ancient Writers*, to denote the inhabitants of contrary hemispheres.

In which sense antichthones differs from *antoeci*, and *antipodes*.

The ancients considered the earth as divided by the equator into two hemispheres, the northern and southern; and all those who inhabited one of those hemispheres, were reputed antichthones to those of the other.

ANTICIMOLIS, or ANTICIMOLIS, in *Ancient Geography*, a small island of the Euxine sea, situate opposite and near to the town of Cimolis or Cinolis, on the northern coast of Paphlagonia, to the east of the mouth of the river Æginetis.

ANTICIPATION, from *ante*, *before*, and *capio*, *I take*, the

the act of preventing, or being before-hand with a perſon or thing; or of doing a thing before the time.

Anticipating a payment, denotes the diſcharging it before it falls due.

ANTICIPATION is alſo uſed, in a *logical* ſenſe, for a preſumption, prejudice, or preconceived opinion.

This is alſo denominated preconception, preſenſation, or inſtinct.

ANTICIPATION, in a medicinal ſenſe, is applied to diſeaſes, wherein ſome of the ſymptoms which regularly belong to ſome future period, appear in the beginning; or the word may be underſtood of thoſe diſeaſes, which having their acceſſes and remiſſions at ſtated hours, gain in point of time, and finiſh their period ſooner than ordinary.

In this ſenſe, *anticipation*, or *anticipated* diſeaſes, by the Greeks called προληπτικοι, ſtand oppoſite to ὑστερητικοι, which come after the time.

ANTICIPATION, in the *Epicurean Philoſophy*, denotes the firſt idea, or definition of a thing, without which we can neither name, think, doubt, or even inquire, concerning it.

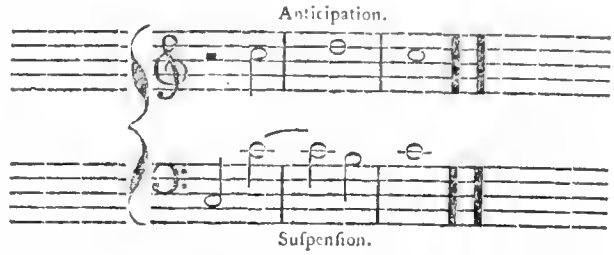
This is otherwiſe denominated PRENOTION.

Anticipation, in this ſenſe, makes the ſecond of Epicurus's criterions of truth.

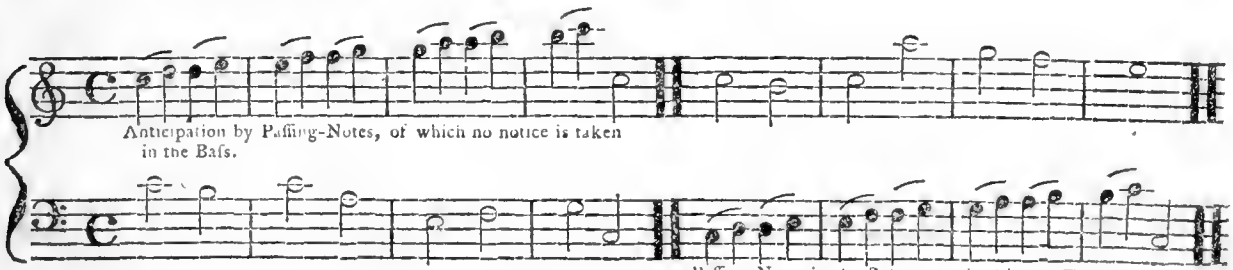
ANTICIPATION is alſo uſed by Shaftſbury, in ſpeaking of painting, to denote the expreſſion of ſome future action, reſolution, or the like.

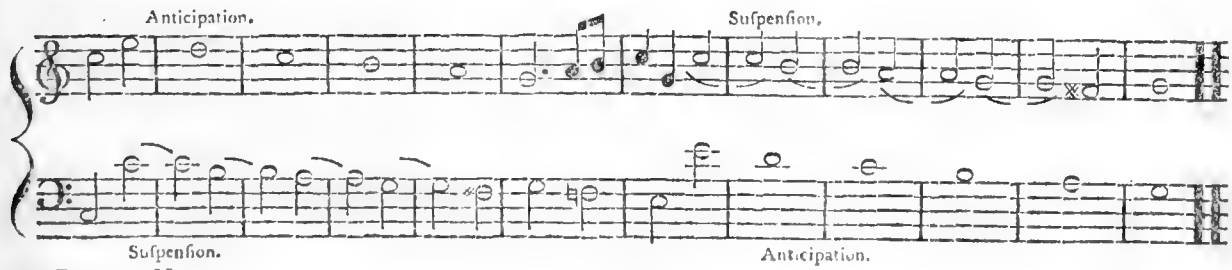
ANTICIPATION. This word, and *ſuſpenſion*, in ſpeaking of diſcords, were firſt uſed as technical terms, in *Muſic*, we believe, by Rameau; and as they are Engliſh words as well as French, they may be uſefully adopted.

A ſound is ſaid to be *anticipated*, when a compoſer wiſhes a note to be heard before its time, in plain counterpoint. The ſame paſſage will explain both theſe terms. *Anticipation* in the treble, requires ſuſpenſion in the baſe, and *è contra*.



There are ſeveral kinds of *anticipation* in muſic: firſt, in paſſing-notes, of which no notice is taken in the baſe; but this muſt be done diatonically, not by diſtant intervals or leaps. Secondly, when the chord is ſtruck on a reſt, before the baſe. Thirdly, in ſerious and fundamental diſcords that are to be regularly prepared and reſolved, the anticipation in the treble is ſtriking the ſecond before it becomes a third, by the deſcent of the baſe. And *anticipation* in the baſe, or inferior parts, is when the baſe riſes before the treble falls; as from the eighth to the ſeventh, or tenth, (octave of the third,) to the ninth. The following are examples, in notation, of the ſeveral kinds of *anticipation*, in treble and baſe. See SUSPENSION.





See PASSING-NOTES.

ANTICIPATION, in *Rhetoric*, a figure otherwiſe called PROLEPSIS.

ANTICK, in *Sculpture* and *Painting*, denotes a fantaſtical compoſure of figures of different natures, ſexes, &c. as men, beaſts, birds, flowers, fiſhes, and even things merely imaginary, or which have no exiſtence in the nature of things.

Antick amounts to much the ſame thing with what the Italians call *grotteſca*, and the French *groteſque*.

ANTICLIMAX, from ανα, and κλιμαξ, *gradation*, in *Rhetoric*, is a figure, whereby the progreſs of a diſcourſe deſcends from great to little, and this is ſometimes rendered peculiarly agreeable by ſuch a concord between the ſenſe and ſounds as may contribute to make diminutions appear ſtill more diminutive. Horace affords a ſtriking example.

"Parturiunt montes, naſcitur ridiculus mus."

ANTICNEMION, from αντι, and κνημη, *tibia*, the *ſhinbone*, in *Anatomy*, denotes the ſhin, or the fore prominent part of the *tibia*.

This is otherwiſe called ακανθα, by the Latins *prima tibia*, or *anterior tibia*, and ſtands oppoſed to the *ſura*, or calf of the leg, ſometimes called *cerea*.

ANTICOLICA, in the *Materia Medica*, medicines ſuited to cure the colic.

ANTICOLIS, in *Ancient Geography*, a people of interior Lybia, according to Ptolemy.

ANTICONDYLI, a people placed by Stephanus Byz. in Bœotia, ſuppoſed by him to be originally Phrygians.

ANTICOSTI, in *Geography*, a barren uninhabited iſland, in the mouth of the river St. Lawrence. This iſland has no harbour, but is covered with wood, and excellent cod is found on the ſhores. N. lat. 49° 10′ to 49° 52′ W. long. 61° 42′ to 64° 4′.

ATICRAGUS, in *Ancient Geography*, a mountain of Lycia.

ANTICTERIC *Spirit*, in *Pharmacy*, is obtained by diſtilling one ounce and a half of ſpirit of turpentine with half a pound of rectified ſpirit of wine, with a gentle heat; and then ſeparating the oil that ſwims above in the receiver from the ſaturated ſpirit, which is to be preſerved for uſe. Some have imagined, that this combination of oil of turpentine with ardent ſpirit will furniſh a ſolvent for biliary calculi. Hence the origin of the name; but though this effect may be produced by a copious application to the calculi in a glaſs veſſel, yet it is not to be expected when the ſpirit reaches them in the courſe of the circulation.

ANTICUM, in *Architecture*, a porch before a door; alſo that part of a temple which is called the outer temple, and lies between the body of the temple and the portico. It is ſometimes called *antæ*.

ANTICUS, *ferratus minor*. See SERRATUS.

ANTICUS, *peronæus*. See PERONÆUS.

ANTICUS, *tibialis*. See TIBIALIS.

ANTICYRA, now ASPRO SPITIA, in *Ancient Geography*, a city in Phocis, in a ſmall iſthmus which joins a peninſula in the gulf of Corinth. Pauſanias ſuppoſes, that this was the city called by Homer Cypariſſa. This place was famous for its hellebore, and was reſorted to by ſick perſons for the benefit of this medicine, which was prepared by an excellent recipe; and hence the adage, "naviget Anticyram," Hor. Pliny relates, that the philoſopher Carneades, and Livius Druſus, tribune of the people, availed themſelves of this remedy. Pauſanias diſtinguiſhes two kinds of hellebore, and ſays that it grew among the rocks which encompaſſed the city. This place was adorned with many ſtatues of braſs. Above the port was a temple conſecrated to Neptune; and this city had gymnaſia, baths, and other curioſities, which Pauſanias has particularly deſcribed. The inhabitants of Anticyra were twice driven from their city; once by Philip, ſon of Amyntas, and a ſecond time by Titus Flamininus, the Roman general, as a puniſhment for their attachment to Philip king of Macedonia. Some traces of the buildings, from which it received its preſent name Aſpro-Spitia, or white houſes, ſtill remain. The port, which is land-locked, is frequented by veſſels for corn.

ANTICYRA was alſo a town of Greece, belonging to Theſſaly, near the mouth of the Sperchius, at an equal diſtance from Mount Oeta and the Maliac gulf. Strabo ſays, that its environs produced better hellebore than that of Anticyra in Phocis, but that the latter was prepared in a better manner.

ANTICYRA was alſo the name of another town belonging to the Weſtern Locrians.

Some writers have mentioned an iſland of this name among thoſe of the Ægean ſea; but as neither Pliny nor Gellius mention its ſituation, there was probably no ſuch iſland.

ANTIDACTYLUS, from αντι, and δακτυλος, *dactyle*, in *Poetry*, a name given by ſome to a kind of poetical foot, which is the reverſe of a dactyl, as conſiſting of three ſyllables, whereof the firſt two are ſhort, and the laſt long.

ANTIDÆMONICI, from αντι, and δαιμων, *dæmon*, in *Eccleſiaſtical Hiſtory*, a ſect who denied the exiſtence of devils or evil ſpirits; alſo all ſpectres, incantations, witchcrafts, &c.

ANTIDALEI, in *Ancient Geography*, a people placed by Pliny in Arabia Felix.

ANTIDESMA, from αντι, and δεσμος, vinculum, excellent for making ropes, in *Botany*, claſs *dioecia pentandria*, Linn. Gen. 1110. Gærtn. 39. *Gen. character*, male; *calyx* p. five-leafed; *leafſtts* oblong, concave, *corolla* none; *ſtamina*, filaments five, capillary, longer than the calyx, equal; *antheræ* roundiſh, ſemibifid. Female, *calyx* as in the male, permanent; *corolla* none; *piſtil* germen ſuperior, ovate; *ſtyle* none; *ſtigmata* five, obtuſe; *perianthium* a drupe roundiſh, one-celled, crowned with the ſtigmata, and having a furrowed ſhell; *ſeed* none. *Species* 1. A. *alexiteria*, a middle-ſized tree, with leaves reſembling thoſe of the lemon, evergreen flowers in racemes; fruit red and acid like the barberry: it is common in Malabar, where its fruit is eſteemed for its pleaſant cooling quality; the bark is uſed for making ropes. 2. A. *acida*, leaves obovate, ſpikes ſolitary, and either axillary, or terminating very ſhort lateral branches. It is a native of the Eaſt Indies. 3. A. *ſcandens*, leaves palmate, ſerrate; ſtem climbing without tendrils; filaments of the male flowers ſhort, terminated by erect antheræ, gaping at the tip. A native of China, near Canton.

ANTIDICOMARIANITES, from αντιδικος, *adverſary*, and Μαρια, *Mary*, in *Eccleſiaſtical Hiſtory*, a ſect of ancient Chriſtians who thought that the Holy Virgin did not preſerve a perpetual virginity, but that ſhe had ſeveral children by Joſeph after our Saviour's birth.

Theſe are otherwiſe called antidicomaritæ; and antidicomarites, and antidicomarianiſts; ſometimes alſo antimariani. The opinion was grounded on ſome expreſſions of our Saviour, wherein he mentions his brothers and his ſiſters; and on that text of St. Matthew, wherein he ſays, that Joſeph knew not Mary till ſhe brought forth her firſt-born ſon.

The antidicomarianites were the diſciples of Helvidius and Jovinian, who appeared in Rome towards the cloſe of the fourth century.

ANTIDINICA, in the *Materia Medica*, medicines ſuited to cure giddineſs.

ANTIDORON, in *Eccleſiaſtical Writers*, a name given by the Greeks to the conſecrated bread, out of which the middle part, marked with a croſs, wherein the conſecration reſides, being taken away by the prieſt, the remainder is diſtributed, after maſs, to the poor.

On the ſides of the antidoron are impreſſed the words, *Jeſus Chriſtus vicit*. The word is formed from δωρον, *donum, a gift*, as being given away *loco muneris*, or *in charity*. The antidoron is alſo called *panis præſanctificatus*.

Some ſuppoſe the antidoron to be diſtributed in lieu of the ſacrament, to ſuch as were prevented from attending in perſon at the celebration; and thence derive the origin of the word, the euchariſt being denominated *doron, gift*, by way of eminence.

ANTIDOSIS, from αντι, and διδωμι, *I give*, in *Antiquity*, denotes an exchange of eſtates, practiſed by the Greeks on certain occaſions with peculiar ceremonies, and firſt inſtituted by Solon.

When a perſon was nominated to an office, the expence of which he was not able to ſupport, he had recourſe to the antidoſis, that is, he was to ſeek ſome other citizen of better ſubſtance than himſelf, who was free from this and other offices; in which caſe the former was excuſed. In caſe the perſon thus ſubſtituted denied himſelf to be the richeſt, they were to exchange eſtates, after this manner: the doors of their houſes were cloſe ſhut up and ſealed, that nothing might be conveyed away; then both took an oath to make a faithful diſcovery of all their effects, except what lay in the ſilver mines, which by the law was excuſed from all impoſts: accordingly, within three days, a full diſcovery and exchange of eſtates were made. Potter, Archeol. lib. i. cap. 15.

ANTIDOTARY is uſed by ſome writers for what we more uſually call a DISPENSATORY.

We have *antidotaries* extant of ſeveral authors, as thoſe of Nicolaus, Meuſe, Myrepſus, Rhaſis, &c.

ANTIDOTE, a remedy taken either to prevent or cure ſome contagious, malignant, or other dangerous diſeaſe. The word is borrowed from αντι, *againſt*, and διδωμι, *I give*, as being ſomething given againſt poiſon, either by way of cure or preſervative.

ANTIDOTE, is alſo uſed to ſignify a medicine taken to prevent the ill effects of ſome other; for inſtance, poiſon.

In which ſenſe the word has the ſame ſignification with alexipharmic, alexiterial, and counterpoiſon.

The Indian phyſic conſiſts much in the uſe of antidotes, *viz.* the root *mungo*, and the viper ſtone; both held ſovereign againſt the bite of the *cobras de capello*, and other venomous creatures.

ANTIDOTE is alſo uſed, in a more general ſenſe, for any compounded medicine.

In which ſenſe, Peter Damian ſpeaks of a perſon who in his whole life never took an antidote.

ANTIDOTE is alſo uſed in a leſs proper ſenſe for any remedy againſt any diſeaſe, chiefly if it be inveterate, and ariſe from ſome ulcer or abſceſs.

ANTIDOTE is alſo uſed for a perpetual form of medicines, otherwiſe called *opiates*, or more properly CONFECTIONS.

ANTIDOTE is alſo *myſtically* applied to the philoſopher's ſtone.

ANTIENT. See ANCIENT.

ANTIDYSENTERICA, in the *Materia Medica*, medicines ſuited to cure dyſentery.

ANTIETAM CREEK, in *Geography*, a creek of America in Maryland, riſes by ſeveral branches in Pennſylvania, and empties into Potowmac river, three miles ſouth-ſouth-eaſt from Sharpſburgh. Elizabeth and Frank's towns ſtand on this creek; and it has alſo a number of mills and forges.

ANTIFEBRILIA, in the *Materia Medica*, medicines ſuited to cure fever.

ANTIGARECA, in *Geography*, an iſland near the weſt coaſt of the peninſula of India, in the tract called "the Pirate's Coaſt;" 10 leagues north of Gheria.

ANTIGENIDES, in *Biography*, a famous muſician of antiquity, was, according to Suidas, a native of Thebes in Bœotia, and the ſon of Satyrus, a celebrated flute-player, who, as we are informed by Ælian, was ſo charmed with the lectures of Ariſton, that, upon retiring from them, he ſaid, "If I do not break my flute, I hope I ſhall have my head cut off." Antigenides, after the example, and by means of the inſtructions of his father, and alſo of Philoxenus, became eminent in the ſame art; and is ſaid to have brought it to a greater degree of perfection than any muſician of his time. Suidas ſays, that he was flute-player in ordinary to Philoxenus, and that he accompanied him in the muſical airs which he had ſet to his own verſes. He had alſo diſciples of the firſt claſs who were attached to himſelf; and he was careſſed by the moſt celebrated princes. Pericles invited him to Athens, and committed his nephew, Alcibiades, to his tuition in the art of flute-playing. According to Athenæus, Antigenides played upon this inſtrument at the nuptials of Iphicrates, when that Athenian general eſpouſed the daughter of Cotys, king of Thrace; and Plutarch aſcribes to him the power of tranſporting Alexander to ſuch a degree, by his performance of the Harmatian air, at a banquet, that he ſeized his arms, and was on the point of attacking his gueſts. Highly, however, as he was eſteemed, he regarded public favour as a precarious poſſeſſion, and was never elated by the applauſe of the multitude. He endeavoured to inſpire his diſciples with the ſame ſentiments; and to this purpoſe he is ſaid to have conſoled an eminent performer, who received little applauſe from his audience, by ſaying, "the next time you play, it ſhall be *to me and the Muſes*." Antigenides was ſo fully perſuaded of the bad taſte of the common people, that one day, hearing at a diſtance a violent burſt of applauſe to a player on the flute, he ſaid, "there muſt be ſomething very bad in that man's performance, or thoſe people would not be ſo laviſh of their approbation." Antigenides was the author of many novelties on the flute. He increaſed the number of holes, which extended the compaſs of the inſtrument; and, probably rendered its tones more flexible, and capable of greater variety. This muſician had great occaſion for flutes upon which he could eaſily expreſs minute intervals and inflexions of ſound; ſince, according to Apuleius, he played upon them in all the modes; the Æolian and the Ionian, the one remarkable for ſimplicity, and the other for variety; the plaintive Lydian; the Phrygian, conſecrated to religious ceremonies; and the Dorian, ſuitable to warriors. His innovations extended even to the robe of the performer; and he is ſaid to have been the firſt who appeared in public with delicate Mileſian ſlippers, and a robe of ſaffron colour, called "crocoton." Plutarch has preſerved a bon-mot of Epaminondas, relative to Antigenides. This general, upon being informed, in order to alarm him, that the Athenians had ſent troops into the Peloponneſus, equipped entirely with new arms, aſked, "whether Antigenides was diſturbed when he ſaw new

flutes

flutes in the hands of "Tells?" who was a bad performer. Burney's Hift. of Muſic, vol. i. p. 418—422.

ANTIGNANA, in *Geography*, a town of Iſtria, two miles and a half north-north eaſt of Pedena.

ANTIGOCA, or ANTIGONIA, a town of European Turkey, 6 miles ſouth of Janiſſa.

ANTIGONE, daughter of Œdipus and Jocaſta, is celebrated by the ancient tragedians as a model of filial and fraternal virtue. She accompanied her father in the voluntary exile to which he was condemned, and conducted him in his wanderings after he had loſt his ſight; and when her brother Polynices was killed in the fatal war of Thebes, ſhe ventured to counteract the inhuman order of Creon, and to pay funeral honours to his expoſed corpſe. The tyrant commanded her, for this offence, to be ſtarved to death in priſon; but ſhe eluded his barbarous ſentence, by ſtrangling herſelf to death; and Hæmon, the ſon of Creon, who was her lover, killed himſelf upon her lifeleſs body. Gen. Biog.

ANTIGONE, in *Fabulous Hiſtory*, the daughter of Laomedon, boaſted of being more beautiful than Juno; and was transformed by this goddeſs into a ſtork.

ANTIGONE, in *Ornithology*, a ſpecies of ARDEA. The head is naked, collar papillous, and red; body cinereous; primary quill feathers black. Linnæus, Gmelin, &c. This is the Indian crane of Latham, and grus orientalis indica of Briſſon and Klein. According to Pennant and Latham, it inhabits the Mongolian deſerts; from whence it migrates into that part of the Ruſſian dominions which lies beyond Lake Baikal, keeping chiefly within the plains below the rivers Onon and Arſun, which is the weſtern extremity of the Gobean plain.

This bird is larger than the common crane, being in height five feet; the bill is of a greeniſh yellow, duſky at the tip; irides bright reddiſh hazel; crown of the head bare and white; on each ſide of the head, about the ears, is a bare white ſpot; the reſt of the head, and a ſmall part of the neck, covered with a fine red ſkin, and is alſo deſtitute of feathers; the plumage of the bird is aſh-colour, lighteſt about the neck; the quills are black; tail and ſecondaries aſh-colour; thoſe neareſt the body are pointed at the ends, longer than the quills, and hang over them; the legs and bare ſpace above the knee are red; the claws white; the middle and outer toe connected by a membrane as far as the firſt joint. Lath. Gen. Syn. v. p. 38.

There is a variety of this ſpecies found alſo in the Eaſt Indies, β grus torquata, and grue à collier of Buffon, which is four feet three inches and an half in length; bill long and black; the head and neck, for above half its length, are almoſt naked, being covered with a reddiſh-white down; round the middle of the neck is a collar of red; the lower part of the neck, and reſt of the body, bluiſh aſh-colour; on the rump is a tuft of flowing feathers, which hang over the ends of the wings and tail, as in the common crane; the tail is black, legs duſky.

ANTIGONEA, *in Ancient Geography*, a city of Macedonia in Mygdonia, founded, according to Stephanus Byz., by Antigonus, the ſon of Gonatas. This was alſo the name of a city of Epirus, placed by Steph. Byz. in Chaonia, and by M. d'Anville ſouth-eaſt of Apollonia, and near Celydnus. Another, in Arcadia, was founded on the ruins of the ancient Mantinea, and this name had ſuperſeded the other by the adulation of the Greeks, who gave it the name of King Antigonus.

ANTIGONIA, a city of Troas, probably the ſame with that which was called Alexandria. This name was alſo given, according to Strabo, to Nicæa, a city of Bithynia. Antigonia was alſo a city of Syria, upon the Orontes. Diodorus Siculus informs us, that it was built by Antigonus, and that it was 170 ſtadia in circuit, and that it was deſigned for the reſidence of the governors of Egypt and of Syria; but when Seleucia was built, he deſtroyed Antigonia, and removed the inhabitants to this city. There was alſo a city of the ſame name in Aſia Minor, in the vicinity of Cyzicus, or rather a fortreſs, about 50 ſtadia from the ſea. Antigonia was alſo an iſland of the Thracian Boſphorus, now called *Iſola del principe*. This was alſo the name of a city of Macedonia, in the Chalcidic territory, in the Thermaic gulf, now the gulf of Theſſalonica. It is called Antigoca.

ANTIGONIA, in *Geography*, an iſland of the Portugueſe, in the Æthiopic gulf, near that of St. Thomas, called by them *Ilha da principe*.

ANTIGONIS, in *Antient Geography*, a country of Greece, in Attica.

ANTIGONUS, in *Ancient Hiſtory* and *Biography*, one of Alexander's chief generals, was the ſon of Philip, a Macedonian nobleman. Upon the diviſion of the Macedonian empire, after the death of Alexander, Pamphylia, Lycia, and Phrygia Major were aſſigned to him; but Perdiccas, who aſſumed regal power, and who derided the talents and high ſpirit of Antigonus, determined to take him off; and with this view formed and encouraged various accuſations againſt him. Antigonus, whilſt he appeared to ſubmit to Perdiccas, and prepare for his trial, retired with his ſon Demetrius into Greece, in order to avoid the danger that threatened him, and put himſelf under the protection of Antipater and Craterus. After the death of Perdiccas, when the provinces were again divided by Antipater, Lycaonia was added to thoſe which Antigonus had originally poſſeſſed; and he was appointed to the command of the troops that were deſtined to act againſt Eumenes, who was now reputed a public enemy. Eumenes was at firſt totally routed, through the treachery of Apollonides, general of his horſe; and compelled to retire into the caſtle of Nora, which was ſituated on an inacceſſible rock, and very ſtrongly fortified. The place was inveſted by Antigonus, but he ſoon found that it was impoſſible to reduce it by force; and he therefore contented himſelf with erecting a ſtrong wall about it, and leaving a ſufficient number of troops to guard it, and marched againſt Alcetas and Attalus, who had raiſed a conſiderable force for the ſuccour of Eumenes. Having taken the one and reduced the other to the alternative of ſurrendering or deſtroying himſelf, which latter mode of eſcape he preferred; their troops were diſperſed, and Antigonus had leiſure to concert thoſe plans of ambition which he determined to accompliſh. Upon receiving the news of the death of Antipater, he reſolved to ſeize Aſia. In order to facilitate the execution of his projects, he removed all the governors of provinces who were not in his intereſt, and endeavoured to ſecure friends in whoſe conſtancy and valour he might confide. With this view, he ſolicited the concurrence of Eumenes; but this faithful commander having contrived to make his eſcape from the caſtle of Nora, aſſembled an army, and was appointed the royal general in Aſia. After ſeveral advantages which he gained over the army of Antigonus, he was at length delivered by treachery to his enemy, and put to death. Having thus removed the principal obſtacle to his progreſs, he ſoon vanquiſhed leſſer difficulties; and making himſelf maſter of the immenſe treaſures of Suſa, he marched forward to Babylon, of which Seleucus was governor. Seleucus eſcaped, and entered

entered into a league with Ptolemy, Lyſimachus, and Caſſander, in order to reduce the power of Antigonus, and ſecure themſelves in their poſſeſſions; but in the mean while Antigonus ſeized the provinces of Syria and Phœnicia. In conſequence of a diverſion given by Caſſander to his arms, Ptolemy recovered Syria, and defeated Demetrius, his ſon, who had been ſent to oppoſe him. Antigonus, however, who was then in Phrygia, hearing of this diſaſter, haſtened his march over mount Taurus to join his ſon, and recovered all the provinees which he had loſt. Emboldened by his ſucceſs, he formed a deſign of ſubduing the Nabath Arabs, who inhabited the deſerts bordering on Judæa. To this ſervice his general Athenæus was appointed; but after having ſurpriſed Petra, and poſſeſſed himſelf of its treaſures, he was followed by the Arabs; and his whole army, indulging themſelves in their imagined ſecurity, was cut off, with the exception only of 60 horſe, who made their eſcape. Upon this Antigonus ſent his ſon Demetrius againſt the Arabs, but he could only ſucceed ſo far as to bring them to a kind of compoſition, with which he was obliged to be ſatisfied, and to return. He was afterwards ſent againſt Seleucus, who had recovered the province of Babylon, but which he was now obliged again to abandon; and the reſult of this expedition was, that the confederates made a treaty with Antigonus, and ſurrendered to him the poſſeſſion of the whole of Aſia, upon condition that the Greek cities ſhould remain free. The treaty was ſoon broken; and Ptolemy made a deſcent in Leſſer Aſia, and ſome of the iſlands of the Archipelago, which was at firſt ſucceſsful; but he was defeated in a ſea-fight by Demetrius, who took the iſland of Cyprus, and alſo a great number of priſoners. Such was the effect of theſe ſucceſſes on the mind of Antigonus that he aſſumed the title of king, and conferred the ſame on his ſon; and from this period (ante Chriſt. 306) properly commence his reign in Aſia, and alſo the reigns of Ptolemy in Egypt, and thoſe of the other captains of Alexander in their reſpective territories. Antigonus now formed the deſign of driving Ptolemy out of his Egyptian dominions, and for this purpoſe he prepared a powerful army and fleet, putting himſelf at the head of the former, and committing the command of the latter to his ſon Demetrius. This expedition, however, proved unſucceſsful, and the deſign was abandoned. The reduction of Rhodes was the next object to which the attention of Antigonus was directed; but the enterpriſe was difficult of execution; and Demetrius having made a favourable treaty with the inhabitants, obeyed the ſummons which he received to aſſiſt the Athenians againſt Caſſander. This was followed by a new confederacy on the part of Caſſander, Seleucus, and Lyſimachus, againſt Antigonus and his ſon; and in order to reſiſt it, they combined their forces, and marched with a powerful army to Phrygia. Here they met Seleucus and Lyſimachus with a force nearly equal; and there enſued the deciſive battle of Ipſus, of the event of which Antigonus ſeemed to have ſome preſentiment; for in the proſpect of it he appeared thoughtful and melancholy, and was frequently ſilent; and, contrary to his uſual manner, was ſlow in his reſolutions, conſulted much with Demetrius, and as he was reviewing his troops, recommended him to the officers as his ſucceſſor. His uſual confidence, therefore, ſeems to have forſaken him. On the morning of the battle, as he was riſing from a fall with ſome difficulty, he exclaimed, "Immortal gods! grant me victory, if it be your will; but if not, let me fall in battle, and not ſurvive my fading glory." Whilſt the battle was advancing, the king was deſerted by a number of traitors, who went over to the enemy; and at length he was overpowered by a ſhower of arrows, and thus terminated his life in the 84th year of his age, ante Chriſt. 301.

The character of Antigonus was that of a ſoldier of fortune, brave, active, ſagacious, of inſatiable ambition and avarice, and too heedleſs of the means by which theſe paſſions were gratified. He had alſo other better qualities; and towards the cloſe of his life he became more mild and tolerant, and endeavoured by good will to retain the ſubjects whom he had acquired by force. In all private concerns he was ſtrictly juſt; and to his brother, who wiſhed him to hear in his cabinet a cauſe in which he was a party, he replied, "No, my dear brother; I will hear it in the open court of juſtice, becauſe I mean to do juſtice." Concerning the weight and duties of his office, he frequently uttered philoſophical ſentiments; and when addreſſed by Hermodotus, a Greek poet, and one of his flatterers, with the title of a god, and the offſpring of the ſun, he remarked, that his chamberlain well knew the contrary. At another time, when he was complimented upon his recovery from ſickneſs, he ſaid, "This diſeaſe was ſent to appriſe me, that being a mortal, I ſhould not graſp at any thing above a mortal." As an apology for his extortion, to which he was urged by his exigence, and when he was reminded that Alexander acted differently, "True," ſaid he; "Alexander reaped Aſia, and I only glean it." With regard to his domeſtic conduct, and the harmony with which he lived with his wife and family, Antigonus was peculiarly diſtinguiſhed: and ſuch was his affectionate confidence in his ſon Demetrius, that, though he was a youth of ſplendid talents and conſiderable ambition, he admitted him as an aſſociate both in his title and government; and Demetrius approved himſelf not only the dutiful ſon, but the loyal ſubject and attached friend. Anc. Un. Hiſt. vol. vii. p. 443—479. vol. viii. p. 1.—7.

Antigonus Gonatas, ſo called from the place of his birth, was the ſon of Demetrius Poliorcetes, and grandſon of the preceeding Antigonus, and diſtinguiſhed by his prudence and mildneſs more than by his valour. His hereditary claims to the dominions of Demetrius, which comprehended ſeveral cities of Greece and the kingdom of Macedon, involved him in various conteſts, in which he alternately ſucceeded and was defeated. After the death of Soſthenes, and the evacuation of Macedon by the Gauls, he aſſerted his claim, which he had before done without effect againſt Ptolemy Ceraunus; but on this occaſion he was oppoſed by Antiochus Soter; the event of the conteſt was favonrable, and he was reſtored to his poſſeſſions. He afterwards eſtabliſhed himſelf by defeating the Gauls, who made an irruption into his kingdom; but was himſelf expelled by Pyrrhus, king of Epirus. He afterwards recovered a great part of Macedon; and followed Pyrrhus to the neighbourhood of Argos. But the inhabitants wiſhed neither of the contending princes to enter their city. Pyrrhus acquieſced, and at the ſame time challenged Antigonus to determine the conteſt by ſingle combat. To this challenge Antigonus replied, "That in making war, he uſed not only arms, but time; and that if Pyrrhus was weary of life, there were many ways to death, which lay directly before him." Pyrrhus, in a conflict that enſued, was ſlain: and when the ſon of Antigonus brought the head of the vanquiſhed prince to his father in triumph, Antigonus thruſt his ſon from him with diſdain; "Barbarous wretch!" ſays he, "doſt thou think, that he whoſe grandfather was thus ſlain, and whoſe father died a captive, ſhould rejoice at ſuch a ſight?" Then covering the head with his robe, he bedewed it with his tears, and ordered the body to be ſought, and burned with all the funeral

ral honours due to a king. When Helenus, the ſon of Pyrrhus, was brought to him by the ſame ſon, who had treated his captive kindly; "Well, my ſon," ſaid Antigonus, "this is better than you did before; however, you have done leſs than your duty ſtill, becauſe you have ſuffered a perſon of his quality to approach me in that thread-bare coat, which is not a diſgrace to him, but to our victory." Having entertained Helenus with reſpect, and comforted him for the loſs of his father, he ſet him at liberty. He alſo extended his favour to the principal officers in the army of Pyrrhus, and incorporated the troops they commanded in his own. In the cloſing years of his life and reign he governed his ſubjects in Macedonia, recovered to him from the Gauls by his ſon Demetrius, in peace; and enlarged his authority, and conciliated the attachment of the people both to himſelf and to his deſcendants. On occaſion of the ſiege of Thebes, in the earlier period of his life, he remonſtrated with his father on account of the loſs of ſo many lives for an object ſo inconſiderable. Nevertheleſs, he was eminently diſtinguiſhed by filial affection and reſpect to his father; for when he was made priſoner by Seleucus, he offered himſelf as hoſtage to procure his liberty; and not ſucceeding, wore deep mourning, and declined participating in any feſtivities, while his father remained in priſon; and on the news of his death, he prepared a fleet, with which he ſailed to meet his aſhes, which he received with the utmoſt ſenſibility and reſpect. One of the leaſt honourable tranſactions of his life, was his gaining poſſeſſion of the citadel of Corinth by means of a ſtratagem, the ſucceſs of which threw him into a phrenzy of joy; and of the power which he acquired by this event, he made uſe in augmenting his dominions in Greece, and ſupporting the petty tyrants againſt the free ſtates. The Achæans, under their illuſtrious chief Aratus, vigorouſly oppoſed him, and at length recovered Corinth; but Antigonus, indiſpoſed to war, purſued his courſe of artful and peaceable policy. After a reign of 34 years, and having attained the age of above 80 years, he died, ante Chriſt. 343, and was ſucceeded by his ſon Demetrius II. Anc. Un. Hiſt. vol. viii. p. 53—62.

Antigonus Doson, q. d. *will give*, ſo called becauſe he was more ready to promiſe than to perform, ſucceeded his brother Demetrius II., whoſe widow he married, in the throne of Macedon; and was diſtinguiſhed by his great talents in maintaining peace at home, and proſecuting war abroad; by his reputation for juſtice; by clemency towards his enemies; and by affability and kindneſs towards his friends. The Achæans invited him into Greece, to aid them in counteracting the power of Cleomenes, king of Sparta, who was himſelf aſſiſted by the Ætolians. The citadel of Corinth was put into his hands; and Aratus, who was now become a friend to the Macedonians, was diſtinguiſhed by his reſpectful attention. Whilſt the greater part of his army was abſent, he declined an engagement with Cleomenes; but as ſoon as his forces arrived, he totally defeated him at Seleſia; and by this victory, became maſter of the hitherto unconquered city of Sparta, which, however, he treated with great lenity, and left free. He then made a precipitate march back into Macedonia, in order to reſiſt the Illyrians, who had, during his abſence, invaded that kingdom. In his return, he reſtored the little republic of Tegea; and arriving at Argos, during the celebration of the Nemæan games, he received many teſtimonies of reſpect from the Grecian ſtates. The deliverance of his country coſt him his life; for in a battle with the Illyrians, though victory was deciſive and complete in favour of the Macedonians, the king fell a ſacrifice, not to the ſword of the enemy, but to the exertion he uſed in ſtraining his voice during the engagement, and to a ſpitting of blood that was the conſequence of this exertion. This ſoon terminated in his death, ante Chriſt. 221. Having, died, as he had lived, in the ſervice of his country, he appointed for his ſucceſſor Philip, his brother's ſon, to whom he had acted the part of a kind and faithful guardian. Anc. Un. Hiſt. vol. viii. p. 63—66.

Antigonus, king of the Jews, the ſon of Ariſtobulus II., was eſtabliſhed on the throne of Judæa by the aſſiſtance of the Parthians. Soon after his acceſſion, he cauſed the ears of his uncle Hyrcan, the high prieſt, to be cut off, that he might be incapacitated for the office; but Herod, who had betrothed, and afterwards married, Mariamne, the grand-daughter of Hyrcan, invaded Jeruſalem, and at length, after a ſiege of ſix months, took it by ſtorm. With this event, which happened ante Chriſt. 37, ended the reign of the Aſmoneans, which had continued 129 years, from Judas Maccabæus to Antigonus, the laſt male of that race who bore the regal title. Soſius, governor of Syria, who commanded the Roman forces, and who had aſſiſted Herod on this occaſion, having preſented a crown of gold to the temple, left Jeruſalem, and conveyed Antigonus in chains to Antony; by whom he was, at the earneſt ſolicitations of Herod, put to a ſhameful death in the third year of his reign. Anc. Un. Hiſt. vol. iii. p. 159.

Antigonus Carystius, a philoſopher and hiſtorian, flouriſhed under the Ptolemies Lagus and Philadelphus, about 300 years before Chriſt. He wrote ſeveral lives of philoſophers, an heroic poem, entitled, "Antipater," mentioned by Athenæus, and other works; but none are extant, except Ἱστοριων παραδοξων Συναγωγη, a collection of wonderful ſtories concerning animals and other natural bodies, compiled from various authors. This work was firſt publiſhed by Xylander, with a Latin verſion, at Baſil, in 568, 8vo.; and reprinted at Leyden, by Meurſius, in 619, 4to. Fabric. Bib. Græc. lib. iii. c. 27. § 8. tom. ii. 672.

Antigonus Sochæus, a Jew, was born at Socho, on the borders of Judæa, flouriſhed in the time of Eleazer the high prieſt, about 300 years before Chriſt, and was a diſciple of Simeon the Juſt. Offended at the innovations, which were introduced by the patrons of the traditionary inſtitutions, and particularly at the pretenſions which were made to meritorious works of ſupererogation, by which men hoped to eſtabliſh a title to extraordinary temporal rewards, he ſtrenuouſly maintained and taught, that men ought to ſerve God, not like ſlaves for hire, but from a pure and diſintereſted principle of virtue. This refined doctrine, oppoſed by Antigonus merely to the expectation of a temporal recompence for works of religion and charity, was miſinterpreted by his followers, and extended to the rewards of a future life; and particularly by Sadoc and Baithoſus, two of his diſciples, who taught that no future recompence was to be expected, and conſequently that there would be no reſurrection of the dead. This doctrine they taught to their followers; and hence aroſe, about 200 years before Chriſt, the ſect of the Baithoſæi, or Sadducees. Brucker, Hiſt. Philoſ. by Enfield, vol. ii. p. 172.

ANTIGRAPHE, from αντι, and γραφω, *I write*, in *Antiquity*, denotes a law ſuit about kindred, whereby a perſon claimed relation to ſuch or ſuch a family.

The *antigraphe* appears to have been the ſame with παραχαταβολη.

ANTIGRAPHUS, in *Antiquity*, an officer of Athens, who kept a counterpart of the *apodecti*, or chief treaſurer's accounts,

accounts, to prevent miſtakes, and keep them from being falſified. Potter Arch. lib. i. c. 14.

ANTIGRAPHUS is alſo uſed, in *Middle Age Writers*, for a ſecretary or chancellor. He is thus called, according to the old gloſſariſts, on account of his writing anſwers to the letters ſent to his maſter. The antigraphus is ſometimes alſo called *archigraphus*; and his dignity *antigraphia*, or *archigraphia*. Du-Cange.

ANTIGRAPHUS is alſo uſed in Iſidorus for one of the notes of ſentences, which is placed with a dot to denote a diverſity of ſenſe in tranſlations.

ANTIGRAPHUS is alſo applied, in *Eccleſiaſtical Writers*, to an ABBREVIATOR of the papal letters. In which ſenſe the word is uſed by pope Gregory the Great in his Regiſter.

Of late days, the office of *antigraphus* conſiſts in making minutes of bulls from the petitions agreed to by his holineſs, and renewing the BULLS after engroſſing.

ANTIGUA, called alſo ANTEGO, in *Geography*, one of the Antilles or Caribbee iſlands, belonging to Britain, and lying about 20 leagues eaſt from St. Chriſtopher's, and 10 north-eaſt from Montſerrat; and being about 50 miles in circumference, is reckoned the largeſt of all our Leeward iſlands. It contains 59,838 acres of land, of which about 34,000 are appropriated to the growth of ſugar, and paſturage annexed; its other principal ſtaples are cotton-wool and tobacco; and in favourable years it furniſhes great quantities of proviſions. Antigua was one of the Caribbee iſlands diſcovered by Colon, in his ſecond voyage, and is ſaid to have been planted by the Engliſh in 1632. The firſt regular grant of it was made by Charles II. about 1663, to William lord Willoughby of Parham. The French were maſters of this iſland for a few years, but in 1668 it was reſtored to the Engliſh by the treaty of Breda. It owes its chief proſperity to the attention of colonel Chriſtopher Codrington, who, in 1674, removed from Barbadoes to Antigua; and having been appointed captain-general and governor of all the Leeward Iſlands, made this the ſeat of his government. He applied his knowledge in ſugar-planting with ſuch good effect and ſucceſs, that others, animated by his example, and aſſiſted by his advice and encouragement, adventured in the ſame line of cultivation. The climate of Antigua is hotter than that of Barbadoes, and ſo ſubject to hurricanes, that if it were not for the convenience of its ſituation and harbours, it would probably be uncultivated and deſert. Its ſoil is of two different kinds; the one, a black mould on a ſubſtratum of clay, which is naturally rich, and in favourable ſeaſons, when unchecked by the droughts to which the iſland is ſubject, very productive. The other is a ſtiff clay on a ſubſtratum of marl; leſs fertile than the former, and abounding with a kind of graſs which is not capable of being eradicated, ſo that many eſtates once profitable, are now covered with it, and ſo impoveriſhed, as to become either paſture land or utterly abandoned. Excluſively of ſuch deſerted land, and ſuch part of the iſland that is altogether unimproveable, the whole of it may be ſaid to be under cultivation. It is not eaſy to aſcertain an average return of the crops; becauſe they vary to ſuch a degree, that the quantity of ſugar exported from this iſland in ſome years is five times greater than in others. In 1779, were ſhipped 3,382 hogſheads, and 579 tierces, and in 1782 the crop was 15,102 hogſheads, and 1,603 tierces. Mr. B. Edwards is of opinion, that the iſland has progreſſively decreaſed both in produce and in white population. It appears from the returns to government in 1774, that the white inhabitants of all ages and ſexes were 2,590, and the enſlaved negroes 37,808; and 17,000 hogſheads of ſugar of 16 cwt. are reckoned a good ſaving crop; which is about a hogſhead of ſugar per acre for each acre that is cut.

Antigua is dvided into ſix pariſhes and 11 diſtricts, and contains ſix towns and villages: *viz.* St. John's, the capital, Parham, Falmouth, Willoughby Bay, Old Road, and James Fort, of which the two firſt are legal ports of entry. No iſland in that part of the world can boaſt of ſo many excellent harbours; the principal of which are Engliſh harbour and St. John's, both well fortified; and at the former, the Britiſh government has eſtabliſhed a royal navy-yard and arſenal, and conveniencies for careening ſhips of war. The governor of the Leeward Iſlands is generally ſtationary at Antigua; in hearing and determining cauſes from the other iſlands, he preſides alone; but in cauſes ariſing in Antigua, he is aſſiſted by his council; and by an act of aſſembly of this iſland, confirmed by the crown, the preſident, and a certain number of the council may determine chancery cauſes, during the abſence of the governor-general. The other courts of this iſland are a court of king's bench, a court of common pleas, and a court of exchequer. The legiſlature of Antigua is compoſed of the commander in chief, a council of 12 members, and an aſſembly of 25. This legiſlature preſented the firſt example of the melioration of the criminal law, reſpecting negro ſlaves, by giving the accuſed party the benefit of a trial by jury; and allowing, in the caſe of capital conviction, four days between the time of ſentence and execution. The military eſtabliſhment generally conſiſts of two regiments of infantry, and two of foot militia, beſides the force raiſed in the iſland. The Moravians have been active in their endeavours to enlighten the minds of the negroes, and to lead them into the knowledge of religious truth; and the number of converted negro ſlaves under the care of the brethren, at the end of the year 1787, was 5,465. St. John's lies in N. lat. 17° 4′ 30″. W. long. 62° 9′. Edwards's Weſt Indies, vol. i. p. 437—455.

ANTIGUGLER, is a crooked tube of metal, ſo bent as eaſily to be introduced into the necks of bottles, and uſed in decanting liquors, without diſturbing them. For this purpoſe the bottle ſhould be a little inclined, and about half a ſpoonful of the liquor poured out, ſo as to admit an equal quantity of air; let one end of the bent tube be ſtopped with the finger, whilſt the other is thruſt into the body of the liquor near to the bubble of air already admitted. When the finger is taken off, the bottle will have vent, and the liquor will run out ſteadily and undiſturbed. See SIPHON.

ANTIHECTICS, in the *Materia Medica*, remedies againſt hectical diſorders.

ANTIHECTICUM *Poterii*, in *Pharmacy*, a celebrated chemical preparation, made of equal quantities of tin and chalybeated regulus of antimony, by melting them in a large crucible, and putting to them, by little and little, three times the quantity of nitre: the detonation being over, the whole is to be waſhed with warm water till no ſaltneſs remains.

This was formerly eſteemed a very penetrating medicine, making way into the minuteſt paſſages, and ſearching even the nervous cells; whence its uſe in hectic diſorders, from which it derives its name. It was accordingly recommended in heavineſs of the head, giddineſs, and dimneſs of ſight, from whence proceed apoplexies, and epilepſies; and in all affections and foulneſſes of the viſcera of the lower belly; and alſo in the jaundice, dropſies, and all kinds of cachexies. Quincy adds, that there is ſcarcely a preparation in the chemical pharmacy of greater efficacy in moſt obſtinate chronic diſtempers. But Neumann obſerves, that it has no claim to

antihectic virtues, nor indeed to any ſalutary operation; and it is now generally diſregarded. See Neumann's Chem. Works, p. 89, and 138.

It is alſo called *antimonium diaphoreticum joviale*. There are divers methods of preparing it, given by Wedelius, Etmuller, &c. A learned author ſpeaks of it as fatal to conſumptive perſons. Junker ſays of it, that in hectic fever, it is rather injurious than ſalutary. Gmelin's Apparatus Medic. vol. i. p. 235.

ANTILEGOMENA, in *Scripture Criticiſm*, an expreſſion denoting doubtful, but acknowledged by moſt to be genuine, one of the three claſſes into which Euſebius has diſtributed the books of the New Teſtament; the other two are homologoumena, *i. e.* of undoubted authority, and notha or ſpurious. To this claſs he refers the epiſtles aſcribed to James and Jude, the ſecond of Peter, with the ſecond and third of John, whether they were written by the evangeliſt, or by another perſon of the ſame name. He is of opinion that theſe books may be received as genuine productions of the Apoſtolic age, even if they were not written by the evangeliſts. Euſeb. Eccl. Hiſt. lib. iii. c. 2.

ANTILEXIS, from αντιλεγω, *I contradict*, in *Antiquity*, denotes a new trial granted in the Athenian judicatories, where judgment had before paſſed againſt a party for non-appearance.

ANTILIBANUS, in *Ancient Geography*, a chain of mountains in Cœlo-Syria, which ran parallel to the other chain denominated Libanus, and both extended from ſouth to north. Antilibanus was to the eaſt, and commenced nearly to the north of Upper Galilee, from which it was ſeparated by mount Hermon, and reached almoſt to Heliopolis, where it terminated; and thus a diſtinction is eſtabliſhed between Libanus and Antilibanus, though the ſcriptures call them both by the ſame common name, Lebanon. The long valley that was ſituated between theſe two chains of mountains was called Cœlo-Syria. Theſe mountains are now inhabited by thoſe ſemi-chriſtians called Druſes. The Jordan has its ſource in theſe mountains.

ANTILLARUM, in *Conchology*, a ſpecies of NERITA, very frequent on the ſhores of the Antilles iſlands. The ſhell is ſub-globoſe and black; within white, grooved, and ſtriated; vertex obtuſe; and both pillar and outer lip rugoſe and denticulated. Gmelin.

ANTILLARUM, in *Ornithology*, a ſpecies of FALCO, deſcribed in L'Hiſtoire des Antilles, tom. ii. p. 252, under the name of Manſfenny, after Buffon; and likewiſe called le faucon des Antilles by Briſſon, Orn. i. p. 361. This is the falco Antillarum of Gmelin, who ſays it is brown, crown black, and belly white; and Manſfenny of Latham, who characteriſes it ſpecifically as having the body totally brown. This bird has the ſhape and plumage of an eagle, but is ſmaller, being not much bigger than a falcon, and has legs and claws double the ſize in proportion to thoſe of the falcon tribe. It is found in the Antilles or Caribbee iſlands, and feeds on ſmall birds, ſnakes, lizards, &c.

ANTILLES, in *Geography*, a denomination differently applied by various geographers. The term is applied by Hoffman (Lexic. Univ.), to the Windward or Charibbæan iſlands only; and he ſays, "dicuntur Antilæ Americæ quaſi *ante* inſulas Americæ, nempe *ante* majores inſulas ſinûs Mexicani". Rochfort and Du Tertre explain the word nearly in the ſame manner; whilſt M. D'Anville applies the name to thoſe iſlands only which are *anti-inſulæ*, or more immediately *oppoſed to*, or ſituated againſt the continent. Thus he terms Cuba, Hiſpaniola, Jamaica, and Porto-Rico, the *Great Antiles*; and the ſmall iſlands of Aruba, Curaçoa, Bonair, and Margarita, and ſome others near the coaſt of Caraccas on the ſouthern peninſula, *the leſs*; altogether excluding the Charibbæan iſlands. The Spaniſh hiſtorians plainly prove, that the word *Antilia* was applied to Hiſpaniola and Cuba, before the diſcovery either of the Windward iſlands, or any part of the American continent. This appears from a paſſage in the firſt book of the firſt decad of Peter Martyr, bearing date from the court of Spain, Nov. 1493, eight months only after Columbus's return from his firſt expedition: "Ophiram inſulam ſeſe reperiſſe refert, ſed coſmographorum tractu diligenter conſiderato, *Antiliæ* inſulæ ſunt illæ et adjacentes aliæ; hanc Hiſpaniolam appellavit, &c." The cluſter of iſlands, denominated the Antilles, is uſually divided into Great and Small. They lie from 18 to 24 degrees of N. lat. and are by many geographers diſtinguiſhed into Windward and Leeward iſlands; and they lie in the form of a bow, ſtretching from the coaſt of Florida north to that of Brazil ſouth. The Greater Antilles have uſually been made to comprehend Cuba, Hiſpaniola, Jamaica, and Porto-Rico; and the Leſs to include Aruba, Curaçoa, Bonair, Margarita, and ſome others near the coaſt of Terra Firma. See each under its proper head. See alſo CARIBBEES.

If we examine, ſays M. Buffon, the poſition of the Antilles, beginning with the iſland of Trinidad, which is the ſouthernmoſt, it is impoſſible to doubt but that Trinidad, Tobago, the Grenades, St. Vincent, Martinico, Marigalante, Antiguæ, Barbadoes, and all the adjacent iſles, once formed a chain of mountains, which extended from ſouth to north, like Newfoundland, and the country of the Eſquimaux. The direction alſo of the Antilles from eaſt to weſt, if we begin with Barbadoes, and paſs on to St. Bartholomew, Porto-Rico, St. Domingo, and Cuba, is nearly the ſame with the coaſts of Cape Briton, Arcadia, and New England. All theſe iſlands lie ſo contiguous, that they may be regarded as a continued belt of land, and as the moſt elevated parts of a country now occupied by the ſea. Theſe iſlands, therefore, he conſiders as relics of ancient continents, that ſeemed to unite the old continent with America. Buffon's Works, by Smellie, vol. i. p. 316., vol. ix. p. 192.

ANTILLON, in *Geography*, a town of Spain, in Navarre, five leagues from Balbaſtro.

ANTILOCHUS, in *Entomology*, a ſpecies of PAPILIO that inhabits North America. The wings are tailed, and yellow both above and beneath, with black bands and margin; tail white, and as long as the wings. Linnæus, Fabricius, &c. This is papilio caudatis maximus ſtriis umbriſque nigris of Petiver muſ. p. 50. n. 505.

ANTILOGARITHM, the COMPLEMENT of the LOGARITHM of a ſine, tangent, or ſecant; and it is found by beginning at the left hand, and ſubtracting each figure from 9, and the laſt figure from 10.

ANTILOGY, αντιλογια, q. d. *contrary ſaying*, a contradiction between two expreſſions or paſſages in an author.

Tirinus has publiſhed a large index of the ſeeming *antilogies* in the BIBLE, i. e. texts which apparently contradict each other, but which are all explained and reconciled by him, in his comments on the Bible. Dom. Magri, a Malteſe of the Oratory in Italy, has attempted the like; but he has done little more than rehearſe what occurs of that kind in the principal commentators.

ANTILOIMICA, in the *Materia Medica*, medicines which preſerve againſt the plague.

ANTILOPE, in *Entomology*, a ſpecies of LUCANUS that inhabits Africa, and is deſcribed in the Stockh. Tranſ. 1787. The jaws are exſerted, and bimarginated on the interior ſide; upper margin two-toothed, lower margin five-toothed. Swederus, Gmelin: found in Sierra Leona; it is brown, and rather ſmooth.

ANTI-

ANTILOPE, in *Zoology*, See ANTELOPE.

ANTILUTHERANS, in *Eccleſiaſtical Hiſtory*, a ſect or party among the ancient reformers, who maintained opinions, chiefly in relation to the euchariſt, different from thoſe of Luther.

Such were Caroloſtadius and his followers, called alſo *Sacramentarians*; and thoſe of Zuinglius, denominated *Zuinglians*.

The ſect of Antilutherans, at firſt confined within narrow bounds, in a few years time ſubdivided into ſix or ſeven inferior ſects; and ere long into an infinite number, more variouſly denominated.

ANTILYSSUS *pulvis*, in *Medicine*, is compoſed of equal parts of the LICHEN *cinereus terreſtris*, & *piper niger*. It is reckoned uſeful in preventing the RABIES *canina*. Phil. Tranſ. N° 448.

The pulvis antilyſſus of Hill, compoſed of half a ſcruple of alum, half an ounce of chalk, three drams of bole-armoniac, one dram of the root of helenium, and ſix drops of oil of aniſeed, is commended by Heyſham for preventing hydrophobia. Med. and Philoſ. Com. Edinb. vol. i. p. i. Lond. 1777-8.

ANTIMACHUS, in *Biography*, a name applied to three Greek poets, of whom the moſt celebrated was the ſon of Hipparchus, a native either of Claros or the neighbouring Colophon, who flouriſhed in the 93d Olympiad, about 408 years before Chriſt. He was reckoned one of the ſix moſt famous Greek poets; and he is ranked by Quinctilian next to Homer, at a great diſtance, in heroic poetry. His great work was a "Thebaid," or an epic poem on the war of Thebes. It is ſaid that it conſiſted, before the ſeven chiefs were brought to the ſiege, of 24 books; and at a public recital of his piece, all his auditors, except one, deſerted him: but this one was Plato; and Antimachus declared, that he would read on, as Plato alone was equal to the whole audience. When his fame was almoſt forgotten, the emperor Adrian endeavoured to revive it, and to give him the priority to Homer; but a Roman emperor could not do this. Antimachus wrote a poem to Lyde, ſuppoſed to be either his wife or his miſtreſs, the celebrity of which may be inferred from the mention of it by Ovid:

"Nec tantum Clario Lyde dilecta poetæ."
"More lov'd than Lyde by the Clarian bard."

Nothing of this writer has reached modern times. Voſſius, Gen. Biog.

ANTIMACHUS, in *Entomology*, a ſpecies of PAPILIO that inhabits Africa. The wings are indented, long, and black; interior pair ſpotted with rufous; diſk of the poſterior pair rufous, radiated, and marked with black ſpots. Fabricius, &c.

ANTIMACO, MARK ANTONY, in *Biography*, a learned Italian, was born at Mantua about the year 1473. He ſpent five years at Greece in the ſtudy of the Greek language; and on his return opened a ſchool at Mantua for the ſtudy of this language and of polite literature, which became famous. He purſued the ſame employment at Ferrara, where he died in 1552. Antimaco tranſlated ſeveral pieces from the Greek, which were printed at Baſil in 1540, together with an oration in praiſe of Grecian literature. He alſo wrote Latin poems. Tiraboſchi, Gen. Biog.

ANTIMENSIUM, a kind of conſecrated table-cloth, occaſionally uſed in the Greek church, in places where there is no proper altar.

F. Goar obſerves, that in regard the Greeks had but few conſecrated churches, and that conſcrated altars are not things eaſy to be removed; that church has, for many ages, made uſe of certain conſecrated ſtuffs, or linens, called antimenſia, to ſerve the purpoſes thereof.

ANTIMENSIUM, in the *Greek Church*, anſwers to the *altare portabile*, or portable altar, in the Latin church. They are both only of late invention, though Habertus would have them as old as St. Baſil. But Durant and Bona do not pretend to find them in any author before the time of Gregory and Charlemagne.

ANTIMENSIA is alſo applied to other tables, uſed in offices of religion, beſides thoſe whereon the euchariſt is adminiſtered: ſuch, e. gr. are thoſe whereon the hoſt is expoſed, &c. The origin of the antimenſia is deſcribed by Meurſius: when the biſhop had conſecrated a church, the cloth which had been ſpread on the ground, and over the communion-table, was torn in pieces, and diſtributed among the prieſts, who carried each a fragment away, to ſerve to cover their tables in their churches and chapels. Not that it was neceſſary that ſuch cloths ſhould be laid on all tables, but only on thoſe which either were not conſecrated, or at leaſt whoſe conſecration was doubted of.

ANTIMENSIUS, an ancient officer in the Greek church, whoſe buſineſs it was to introduce and place the communicants at the euchariſt.

Some have imagined that he had the care of the *antimenſia*. But this rather belonged to the office of great *ſceuophylax*. He is otherwiſe called chief of the *antimenſii*.

ANTIMERIA, from αντι, and μερος, *a part*, in *Grammar*, a figure whereby one part of ſpeech is uſed for another: e. gr. *velle ſuum cuique eſt*; for *voluntas ſui cuique eſt*; alſo *populus late rex* for *populus late regnans*.

ANTIMERIA, in a more reſtrained ſenſe, is a figure whereby the noun is repeated inſtead of the pronoun.

The antimeria is frequent in the Hebrew, and is ſometimes retained in our verſion of the Old Teſtament; accordingly, e. gr. *Hear my voice, ye wives of Lamech*, for *my wives*. Gen. ch. iv. ver. 23.

ANTIMETABOLE, in *Rhetoric*, a figure which ſets two things in oppoſition to each other.

The word is compounded of αντι, *againſt*, and μεταβολη, from μεταβαλλω, *I ſhift*, or *transfer*; i. e. a ſhifting, or ſetting two things over againſt each other.

This figure is twice exemplified in an apophthegm of Muſonius; which, on account of its excellence, is called *aureum monitum*, the golden maxim or precept:

Ἀν τὶ πράξῃς καλὸν μετὰ πόνου, ὁ μὲν πόνος ὀίχεται, τὸ δὲ καλὸν μένει,
Ἀν τὶ ποιησῃς αισχρὸν μετὰ ἡδονῆς, τὸ μὲν ἡδὺ ὀίχεται, τὸ δὲ αἰσχρὸν μένει.

In Engliſh thus:

"Allowing the performance of an honourable action to be attended with labour; the labour is ſoon over, but the honour immortal: whereas, ſhould even pleaſure wait on the commiſſion of what is diſhonourable, the pleaſure is ſoon gone, and the diſhonour eternal."

ANTIMETATHESIS, from αντι, and μετατιθημι, *I transfer*, in *Rhetoric*, is the inverſion of the parts or members of an ANTITHESIS. Such is that of Cicero, in Verrem, lib. iv. cap. 52. "Compare this peace with that war; the arrival of this govenor with the victory of that general; his profligate troops with the invincible army of the other; the luxury of the former with the temperance of the latter: you will ſay, that Syracuſe was founded by him who took it; and taken by him, who held it when founded."

ANTIMILO, in *Geography*, a ſmall deſert iſland of the Archipelago, a few miles north-weſt of Milo, and like it appearing volcanic.

ANTIMISIUM, in *Antiquity*, a table placed before the Roman tribunal or judgment-ſeat.

What relation this has to the *antimenſia* in the Greek

church, does not appear. Some writers confound them together as the same thing.

ANTIMONARCHICAL, from αντι and μοναρχικος, μονος, *alone*, and αρχη, *dominion*, something that oppoſes or ſtands againſt monarchy or kingly government.

Antimonarchical is frequently uſed in the ſenſe of republican.

ANTIMONARCHIST, a perſon who maintains antimonarchichal principles.

Buchanan, Milton, Hottoman, Languet, Ludlow, Sidney, and others, are celebrated antimonarchiſts.

ANTIMONARCHOMACHI, from αντιμοναρχος, and μαχη, *conteſt*; *antimonarchomachiſts*, is uſed by ſome political writers to denote maintainers of monarchichal or abſolute power veſted by divine right in the perſons of princes. In which ſenſe, *antimonarchomachi* ſtand oppoſed to *monarchomachi*.

King James the Firſt, Salmaſius, Peter du Moulin, biſhop Bramhall, Albericus Gentilis, Ziegler, William and George Barclay, Bochart, &c. have diſtinguiſhed themſelves in the claſs of monarchomachiſts. Acker has treated profeſſedly of the monarchomachiſts and antimonarchomachiſts.

ANTIMONIALS, in *Medicine*, denote preparations of antimony, or remedies whereof antimony is the baſis or principal ingredient.

Antimonials are chiefly of an emetic tendency; though they may be ſo qualified as to become either cathartic or diaphoretic, or even only alterative. See WARD's *Pill*.

An antimonial cup, made either of glaſs of antimony, or of antimony prepared of ſalt-petre, though a ſubſtance indiſſoluble by the ſtomach, will give a ſtrong cathartic or emetic quality to any liquor poured into it, without any diminution of its own weight.

ANTIMONIATED, ſomething tinged with the qualities, or reſembling the appearances of antimony.

Dr. Woodward ſpeaks of a kind of ſtriated, or antimoniated lead ore.

ANTIMONY, Στιμμι, Στιμμις γυναικειον, Gr. *Stibium Jarbaſon*, Lat. *Spieſſglas*, *Spieſſglanz*, Germ. *Spitſglas*, Swed. *Spidſglas*, Dan. *Piſgotz*, Hung. *Antimoine*, Fr. *Antimonio*, Ital. *Antimonja*, Ruſſ. *Proteus*, *leo ruber*, *plumbum nigrum*, *balneum regis*, *lupus metallorum*, Alchem.

Antimony is a brittle metal, of a brilliant white colour; fuſible at a moderate red heat; and at a higher temperature, with acceſs of air, it exhales a white inodorous vapour. It is ſoluble in nitro-muriatic acid, and precipitable from its ſolution of a white colour by diſtilled water, and of a deep brick-red by ſulphuret of ammonia (volatile liver of ſulphur.)

§ I. *Ores of Antimony.*

The antimonial ores have not as yet been analyſed with ſufficient accuracy to clear up all doubts as to the nature of their contents; an arrangement of them muſt, therefore, as yet principally depend on their external characters. We ſhall follow the example of Weidenmann, Emmerling, &c. in dividing them into ſeveral ſpecies, though probably the whole may be reduced to the native, the ſulphurated, and the oxydated.

Sp. I. Native antimony. *Gediegen ſpieſſglas*, Germ. *Antimonium nativum*, Werner. *Antimoine natif*, & *A. blanche ou arſenicale*, Delille, Hauy, and Born.

Has a light tin-white colour, with an occaſional ſhade of yellow. Occurs maſſive, diſſeminated, or kidney-ſhaped. Is internally of a brilliant metallic luſtre. Its fracture is either ſtrait or curved foliated. The fragments are uſually large or ſmall grained; ſeldom conchoidal. It is ſoft, approaching to half hard, and of conſiderable ſpecific gravity.

It melts with eaſe on charcoal before the blowpipe, exhaling a white arſenical fume, and readily amalgamates with mercury.

By the analyſis of Mengez the younger, it appears to be a native alloy of antimony and arſenic, in the proportion of about 96 of the former to 4 of the latter.

Native antimony is a mineral of very rare occurrence; it was firſt found in 1748, by Schwab, in the ſilver mines of Sahla in Sweden, with a gangue of calcareous ſpar; and has ſince been detected by Sage imbedded in quartz in the mines of Allemont in Dauphiné.

Sp. II. Sulphurated A.—Grey antimonial ore. *Graues ſpieſſglaſerz*, Germ. *Mine d'Antimoine griſe ou ſulfureuſe*, Delille. *Antimoine ſulphuré*, Hauy.

Of this ore there are three varieties, the compact, foliated, and ſtriated.

Var. 1. Compact. *Dichtesgraues ſpieſſglaſerz*, Germ. *Antimonium mineralizatum griſeum denſum*, Werner.

The colour of this is lead grey, paſſing into ſteel-grey, and tarniſhes blue or purple on expoſure to the air. It occurs maſſive or diſſeminated. Is of a metallic luſtre, ſhining or little ſhining. Its fracture is ſmall-grained uneven. It flies, when broken, into irregular blunt-cornered fragments. Is ſoft, gives a bright metallic ſtreak, and is of conſiderable ſpecific gravity.

It melts with great eaſe before the blowpipe, and burns with a blue flame, exhaling a copious white ſulphureous vapour.

It is the ſcarceſt of the ſulphurated antimonial ores, and is found principally with quartz and ſpathoſe iron ore at Braunſdorf in Saxony, Goldkvonach in Bayreuth, Auvergne in France, and Majurka in Hungary.

Var. 2. Foliated. *Blättriges graues ſpieſſglaſerz*, Germ. *Antim. mineraliz. griſeum lamelloſum*, Werner.

This differs from the former variety in the following particulars. Colour, light ſteel-grey. Fracture fine grained foliated, ſp. gr. 4. 36. Occurs in quartz at Braunſdorf, and at Nagyag in Hungary.

Var. 3. Striated. *Strahliges graues ſpieſſglaſerz*, Germ. *Antim. mineraliz. griſ. radiatum*, Werner.

Its colour is light ſteel-grey, paſſing into a blackiſh grey, azure blue, golden yellow, and other ſplendid irideſcent tints. It occurs diſſeminated, or in glandular mamillated and ſtalactitic maſſes or cryſtallized. The primitive form of its cryſtals has not yet been aſcertained. Hauy has ſhewn that they are moſt eaſily and neatly diviſible in one direction only, parallel to their axes; other natural joints are, however, diſcernible by the varying reflection of light from theſe ſurfaces when held before a candle. The only cryſtalline form that has hitherto been determined, is a compreſſed hexahedral priſm, terminated by obtuſe tetrahedral pyramids with trapezoidal ſurfaces (*antimoine ſulfuré ſexoctonal* of Hauy). See cryſtallographical plates, *fig.* 206. Incidence of *n* on *s* 134°; of *l* on *l'* 106° 30'; of *l* on *s* 146°. Born alſo mentions ſpecimens from Hungary and Norway of truncated tetrahedral priſms. The ſurface of the cryſtals is generally marked longitudinally, with delicate ſtriæ, and poſſeſſes much luſtre. The internal luſtre both of the amorphous and cryſtallized kinds is metallic and bright, or little ſhining. Its fracture is ſtriated either broad or narrow, radiating, diverging, or implicated. When broken, it flies into irregular priſmatic, or long granular fragments. Is ſoft and brittle. Specific gravity from 4.13. to 4.51. Its component parts, according to Bergman, are,

74 antimony,
26 ſulphur.

100

The Hungarian antimony alſo contains a ſmall variable proportion of gold.

This is the commoneſt of all the antimonial ores: it is procured at Kremnitz and Telſobanya in Hungary, at Draviza in the Banat, Braunſdorf in Saxony, the Black Foreſt in Swabia, Pereta in Tuſcany, Lubillac in Auvergne, and Cornwall in England; alſo in Spain, Mexico, and Siberia. The ſplendid irideſcent ſpecimens come principally from Hungary.

Sulphurated antimony is ſometimes confounded with oxyd of manganeſe; it may, however, be eaſily diſtinguiſhed by the great eaſe with which it is fuſible even in the flame of a common candle: it differs alſo from native antimony in exhaling, when heated, a ſulphureous, and not an arſenical odour; in being of a darker colour, and leaving a dark grey trace when rubbed on paper.

It is found, for the moſt part, in primitive mountains, in micaceous ſchiſtus, and clay porphyry, mixed with pyrites and oxyds of iron: the gangue is ſulphated barytes in Hungary, but elſewhere, for the moſt part, quartz; alſo, though rarely, chalcedony fluor and calcareous ſpar.

Sp. III. Plumoſe antimony. *Federerz, ſilber federerz*, Germ. *Mine d'argent griſe antimoniale*, Deliſle. *Antimoine ſulphuré argentifere*, Hauy. *Antimonium plumoſum mineralizatum argentiferum*, Born. *Antimonium mineralizat. griſeum plumoſum*, Werner.

The colour of plumoſe antimony is ſteel-grey, paſſing into greyiſh black, lead, or ſmoak grey: by expoſure to the air, it tarniſhes to an irideſcent blue or yellow. It occurs in ſlender minute capillary cryſtals inveſting the ſurface of quartz and other minerals with a delicate brittle down or wool: the cryſtals are ſometimes ſcarcely viſible to the naked eye, and ſo implicated with each other, as to appear like an amorphous cruſt. According to Deliſle, the form of the cryſtals is that of a compreſſed hexahedral priſm, terminated by dihedral ſummits with pentagonal faces; the longitudinal ſtriæ, however, are generally ſo ſtrongly marked as to obſcure the ſides of the priſm. Its luſtre is ſemi-metallic, more or leſs glimmering. The fracture is confuſedly fibrous, and the fragments are indeterminate. It is brittle: ſp. grav. 3.57. Before the blowpipe it emits a ſmoke that depoſits a white and yellow powder on the charcoal, and the reſiduum then melts into a black ſlag. No accurate analyſis has yet been made of it; but, according to Bergman, it conſiſts of antimony, iron, arſenic, ſulphur, and ſometimes ſilver.

This ſubſtance is ranked by many mineralogiſts among the ſilver ores; but improperly, as the proportion of ſilver is caſual and variable, and never exceeds $3\frac{1}{2}$ or 4 per cent.

It is met with in the Saxon mines, eſpecially that of Himmelfurſt near Freyberg; alſo at Stollberg in the Hartz, and Schemnitz in Hungary.

Sp. IV. Red antimony. *Rothes ſpieſſglaſerz*, Germ. *Soufre doré natif ſtrié*, et *Kermes mineral natif*, Deliſle. *Antimoine hydroſulfuré*, Hauy. *Antimonium auripigmento mineralizatum*, Cronſtedt. *Antimonium mineralizatum rubrum*, Werner.

The colour of red antimony is a deep crimſon approaching to blood red, ſometimes, though ſeldom, clouded with irideſcent blue. It occurs generally in minute ſhort hair, or needle-form cryſtals, radiating or implicated: ſometimes alſo it is found maſſive or diſſeminated. Its luſtre is vitreous, little ſhining. Its fracture is fine, and irregularly diverging fibrous. It is opaque, brittle but ſomewhat elaſtic: ſp. grav. 4. to 4.7.

Before the blowpipe it melts eaſily and evaporates, exhaling a ſlight ſulphureous odour.

The only mineral with which it is liable to be confounded is the red ſilky oxyd of copper: this laſt, however, is of a brighter colour, and diſſolves with effervescence in nitrous acid, giving it a green tinge; the red antimony, on the contrary, is not diſſolved, but becomes covered with a whitiſh cruſt. No accurate analyſis has yet been made of this ore; from its colour it was formerly ſuppoſed to contain arſenic and ſulphurated antimony: according to Sage, however, it is a native mineral kermes. Thus much is certain, that it is met with in the crevices, and inveſting the ſurface of the common ſulphurated antimony, and appears to be this in an advanced ſtate of natural decompoſition: the amorphous or maſſive variety is frequently ſtudded with ſmall cryſtals of native ſulphur, in the form of rhomboidal octahedrons.

It is met with at Braunſdorf in Saxony, Malazka and Cremnitz in Hungary, and Allemont in Dauphiné.

Sp. V. White antimony. *Muriated antimony*, Kirwan. *Weiſs Spieſſglaſerz, ſpieſſglanzſpath*, Germ. *Muriate d'antimoine*, Born. *Antimoine oxydé*, Hauy. *Antimonium mineralizatum album*, Werner.

The colour of white antimony paſſes from ſnow-white through greyiſh and yellowiſh white into aſh grey. It is ſeldom found maſſive, often radiating like zeolite, but generally cryſtallized in ſmall and long quadrilateral priſms or rectangular tables, which are accumulated together in bundles or cells. The ſurface of the cryſtals is plain, or longitudinally ſtriated, and bright ſhining or ſpecular. Internally this mineral is much ſhining, or ſhining with a vitreous luſtre paſſing into pearly. Fracture ſtrait foliated. It flies when broken into irregular, not particularly ſharp-cornered fragments. Is tranſlucid, ſoft, brittle, and heavy.

In whole cryſtals it decrepitates before the blowpipe; but when powdered, it melts quietly and without difficulty, giving out a white ſmoak, and by degrees totally evaporates. Between two coals it is reducible to the metallic ſtate.

From the analyſis of Klaproth, it ſeems to conſiſt of antimony and muriatic acid; but the acicular variety from Dauphiné afforded Vauquelin,

86 oxyd of antimony,
3 oxyd of iron and oxyd of antimony,
8 ſilex,
3 loſs.

100

This beautiful, but uncommonly rare foſſil, was firſt diſcovered in 1782, by Mongez the younger, at Allemont in Dauphiné, mixed with native antimony: afterwards, in 1787, by Röſsler at Przibram on the ſurface of galena: it occurs alſo at Malazka in Hungary, with the red and ſulphurated antimony.

Sp. VI. Yellow antimony. *Suppoſed phoſphorated antimony*, Kirwan. *Phoſphate d'Antimoine*, Fr. *Gelb Spieſſglaſerz*, Germ. *Antimonium mineralizatum flavum*, Werner.

The colour of this is orange or wax yellow, or yellowiſh white, paſſing into black when tarniſhed. It occurs in long ſtriated needle-form cryſtals, or quadrilateral tables. It is ſhining, and when black has a metallic luſtre. Is ſoft, flexible, and heavy.

Before the blowpipe it neither flames nor ſmokes, but melts eaſily into a brittle ſlag, containing a ſmall tin-white bead

head of metal. It has not been analyſed. This mineral was firſt diſcovered by Count Raſumawſky, in a vein of ſulphurated antimony at Freigny in Savoy, and has ſince been found at Malazka in Hungary.

Sp. VII. Antimonial ochre. *Spiesglas kalk*, Germ. *Antimonium ochraceum*, Werner.

Its colour is straw or lemon yellow, and yellowiſh grey. Occurs mealive, diſſeminated or investing. Is dull; of a fine earthy fracture; ſoft, brittle, and heavy.

Before the blowpipe it becomes white, volatilizes, but does not melt. It effervesces ſtrongly with borax, and is partially reduced. It has not yet been analyſed, but is ſuppoſed by Karſten to be an oxyd of antimony.

It is found at Brandtorf near Freyberg, and in Hungary, mixed with ſulphurated and red antimony.

Emmerling, vol ii. Wiedenman, Handbuch, &c. Lenz, Verſuch. &c vol. ii. Haüy, Traité de Mineralogie, vol. iv. Delaſſe, Cryſtallographie, vol. iii. Kirwan's Mineralogy, vol. ii.

§ 2. *Aſſay and Analyſis of Antimonial Ores.*

All the antimonial ores are eaſily reducible before the blowpipe on charcoal; and by a continuation of the heat, they exhale a denſe ſmoak of a white or yellowiſh colour, with little or no arſenical odour, and depoſit yellowiſh flowers, or white needleform cryſtals, on the ſurface of the charcoal: theſe appearances are, however, liable to conſiderable modification on account of the variable proportion or lead, arſenic, ſulphur, &c. that are uſually mixed with the antimony. A more certain, therefore, though not ſo expeditious a method of aſcertaining the preſence of this metal, is to reduce 200 grains of the ore to fine powder, and digeſt it in a moderately diluted nitro-muriatic acid, in which the nitrous is not more than one-third of the muriatic part. The clear liquor, after ſlow digeſtion for an hour, is to be decanted and reduced by evaporation to about half its bulk, and then poured into a large quantity of diſtilled water: a copious white precipitate immediately takes place of antimonial oxyd, which when edulcorated and mixed with an equal weight of crude tartar, is to be put into a ſmall lined crucible fitted with a cover, and by a moderate red heat the oxyd will be reduced into a metallic button.

The analyſis of antimonial ores preſents no particular difficulties, except ſuch as are common to all minerals in which arſenic enters. The following are the ſubſtances which have been found mixed with antimony, *viz.* iron, ſilver, lead, copper, arſenic, and ſulphur; to which muſt be added, ſilex and alumine, as compoſing the ſtony gangue, which cannot always be entirely ſeparated previous to analyſis.

(*a*) Let 500 grains of the ore be reduced in an agate mortar to an impalpable powder, and afterwards mixed in a flaſk with 1500 grs. of pure nitrous acid of ſp. gr. 1.25, and 1000 grs. of diſtilled water; digeſt the mixture at a temperature conſiderably leſs than boiling, for an hour, then pour off the clear liquor, and add nitrous acid equal to half the quantity firſt uſed; digeſt this for a few minutes, and add by degrees, during the remainder of the digeſtion, half as much diſtilled water as acid; then pour off the clear liquor, and waſh the reſidue with diſtilled water.

(*b*) Add together the two nitrous ſolutions and the waſhings, and drop in a ſaturated ſolution of muriated ſoda as long as any precipitate takes place, and allow it to ſtand for a few hours; pour off the liquor, and boil the precipitate in a little diſtilled water; filter and edulcorate. Add the waſhings to the liquor.

(*c*) The precipitate (*b*), conſiſting of muriated ſilver, and probably a little arſenic, being dried in a heat juſt inferior to its fuſion, is to be weighed, and reduced in a ſmall crucible by twice its weight of pearlaſh: 75 parts of ſilver denote 100 of muriated ſilver, and if the produce of metal is leſs than that obtained by calculation, the deficiency may be ſet down as arſenic.

(*d*) The nitrous ſolution (*b*), containing a great exceſs of acid, is to be reduced to only a ſlight exceſs by the addition of potaſh or ſoda; and is then to be treated with nitrated barytes for ſulphuric acid: the ſulphat of barytes thus produced, contains the ſulphur of the ore oxygenated by the nitrous acid. This being ſeparated, add a ſaturated ſolution of ſulphated ſoda, as long as any precipitation takes place. This is ſulphated lead.

(*e*) The reſidue of ſolution (*d*), being evaporated to dryneſs, is to be mixed with ſoap, and heated in a ſubliming flaſk, the arſenic will thus be obtained in a metallic ſtate.

(*f*) Upon the inſoluble reſidue (*a*) digeſt two or three ounces of nitro-muriatic acid, compoſed of nitrous acid 1, muriatic acid 5, water 3. By this the antimony, iron, and copper will be diſſolved, together with a little alumine and ſilex. Separate this from the undiſſolved reſidue, and pour the liquor into three or four times its quantity of diſtilled water, and the oxyd of antimony will be precipitated. Separate this by filtration, waſh, and add the waſhings to the other liquor: 130 parts of oxyd of antimony well dried denote 100 of metal.

(*g*) Evaporate the fluid (*f*) to a ſmall bulk, and ſuperſaturate it with cauſtic ammoniac, the iron and earths will be precipitated, and the copper will be held in ſolution, giving it a blue colour. Separate the precipitate by a filter; and add ſulphuric acid to the ammoniacal liquor till it becomes acidulous, then precipitate the copper by a bar of clean iron.

(*h*) The precipitate (*g*) being digeſted with a little cauſtic potaſh, the ſilex and alumine will diſſolve, leaving the oxyd of iron behind.

(*i*) The undiſſolved reſidue of (*f*) being dried and weighed, is to be ignited to drive off the ſulphur, the quantity of which is denoted by the loſs of weight after ignition. What remains is earth and a few atoms of metallic oxyd, which being fuſed with black flux, will reduce the oxyd, and render the earths ſoluble in water.

(*k*) The ſulphated lead (*d*) is to be reduced by fuſion with tartar, and the oxyd of antimony alſo by the ſame method: being then weighed ſeparately, as much pure lead is to be added as will make the lead twice the weight of the antimony. The metals being melted together are to be divided into two equal parts, and ſubjected to cupellation; if any ſilver remains, its amount is to be added to that of (*c*). Bergman's Eſſ. Klaproth's Analytical Eſſays. Kirwan's Mineralog. vol. ii.

§ 3. *Reduction of Antimonial Ores.*

The grey or ſulphurated antimony is the only one of this metal that is found in ſufficient abundance for the purpoſes of manufacture, and the treatment that it undergoes is extremely ſimple. The larger pieces of the earthy or ſtony matter of the gangue being firſt picked out, the remainder is coarſely bruiſed, and ſubjected to a low red heat in cloſe veſſels: the ſulphurated metal then melts on account of its very eaſy fuſibility, leaving the impurities behind. This proceſs is uſually performed in a crucible, whoſe bottom, perforated with a number of ſmall holes, is inſerted into another

other crucible. (See Chemiſtry, Plate iv.) A. B. *fig.* 15, or connected with the lower crucible by means of a pipe, *fig.* 16. In each apparatus the ore is put into the upper crucible, which ſerves the purpoſe of a filter, by detaining the ſtony impurities, while the melted metal flows into the lower receptacle. *Fig.* 17, 18, 19, 20, 21, 22, are plans and ſections of the furnaces generally made uſe of. This method, however, of extracting the ore is far from being the moſt economical poſſible, on account of the length of time neceſſary to charge a multitude of crucibles, the expence of replacing thoſe that are broken, and the extra quantity of fuel required when the ore is not in immediate contact with the flame. On this account ſome of the founderies in Hungary and France have altogether diſcarded the crucibles, and melt the antimony in maſs by a reverberatory furnace, taking care to keep the ſurface of the metal covered with charcoal to prevent oxydation. *Fig.* 23 and 24 are a plan and ſection of ſuch a furnace. The rough ore being placed in the bed A, and covered with charcoal, is gradually brought to a ſtate of fuſion; and the plug at B being then withdrawn, the melted metal flows into the receptacle C. *Fig.* 25, 26, repreſent another kind of furnace for the ſame purpoſe made uſe of at Ramée in La Vendée. The ſulphurated antimony thus obtained is remelted, and caſt into loaves or cakes, forming the common or crude antimony of the ſhops.

§ 4. *Regulus of Antimony.*

The ſulphurated ore of the preceding ſection having been long known by the name antimony, the term regulus of antimony was employed to deſignate the pure metal: in the reformed nomenclature, on the other hand, the former of theſe ſubſtances is called ſulphuret of antimony, and the latter ſimply antimony. This ambiguity it is of conſequence to be aware of, and we ſhall endeavour to avoid it as much as poſſible by uſing the term regulus of antimony wherever by ſo doing the ſenſe may be made clearer.

The ſubſtance from which the regulus is prepared, whether in the large way for the purpoſes of commerce, or in the laboratory, is univerſally the native ſulphuret. This conſiſts of antimony and ſulphur in the proportion, according to Bergman, of 74 of the former to 26 of the latter. Numerous methods have been propoſed by different chemiſts for the ſeparation of the metal, all of which may be conveniently arranged under the three following general heads. I. Reduction by roaſting. II. Reduction by ſcorification. III. Reduction by dry parting or precipitation.

I. Reduction by roaſting.

The native ſulphuret of antimony being previouſly ſeparated by fuſion from all earthy impurities, as deſcribed in § 3, is to be pulverized and ſpread thinly on the floor of a reverberatory furnace or muffle, to be freed from its ſulphur by roaſting. At the commencement of the proceſs the fire muſt be managed with particular care, and the temperature ought ſcarcely to be greater than what is neceſſary for the fuſion of tin, otherwiſe the antimony will clog, and even melt, ſo as to require being removed from the fire, and again pulveriſed: as ſoon as the fumes of ſulphur become viſible to the eye, in the form of a light lambent blue flame, it is a proof that the heat is ſufficient; and the ore ſhould now be continually ſtirred with a tobacco-pipe, or any other earthen rod. In a ſhort time the antimony will begin to oxydate, and aſſume a greyiſh earthy appearance; the fire may then be raiſed a little, to haſten the evaporation of the ſulphur; and thus the operator may go on gradually increaſing the heat as the ore will bear it; and continually ſtirring it, ſo as to expoſe freſh ſurfaces to the air. When the ore is moderately red-hot, and ceaſes to give out a ſulphureous vapour (which will not be till after ſome hours), the roaſting is finiſhed. By this means an aſh grey oxyd is obtained; ſtill, however, not entirely free from ſulphur, weighing from 30 to 36 per cent. leſs than the original ſulphuret.

In order to obtain the regulus from this grey oxyd, the common way is to mix it with half its weight of crude tartar, and expoſe it in a covered crucible to a full red-heat; the tartar will thus be decompoſed, its carbonaceous part ſerving to deoxygenate the antimonial oxyd; and its alkaline baſe combining with the ſulphur ſtill contained in the ore, forms ſulphuret of potaſh, by which a portion of antimony is held in ſolution, while the reſt of the regulus, by its ſuperior ſpecific gravity, unites into a maſs at the bottom of the crucible. The quantity of regulus obtained by this means in the large way, is from 66 to 70 per cent. on the oxyd; but the produce depends eſſentially on the accuracy with which the roaſting has been performed: if much ſulphur ſtill remains in the oxyd, a large proportion of the metal will be diſſolved in the ſulphurated alkaline ſcoria. Kunkel's method appears to be more economical, and better in every reſpect: he mixes the roaſted oxyd with oil or fat and a little powdered charcoal, puts the mixture into a crucible to melt, and as ſoon as the regulus begins to ſhew itſelf, injects by degrees ſome powdered nitre, in the proportion of an ounce to a pound of antimony: the matter in thin fuſion being poured out, a pure regulus is obtained in much greater quantity than by the common way. Moſt of the ſulphurated ores, as thoſe of lead and copper, are reduced to the metallic ſtate after roaſting by a ſimple carbonaceous addition, by which means the product of metal is greater than if an alkaline flux was made uſe of, and the whole expence of the flux is ſaved. Induced, therefore, by theſe motives and analogies, a ſeries of experiments was undertaken by Haſſenfratz, Vauquelin, and Buillon la Grange, to obtain the regulus of antimony by cheaper means than the uſe of tartar or nitre. For this purpoſe different parcels of the roaſted grey oxyd were mixed with charcoal powder, with tallow and with pitch, and expoſed in covered crucibles to a reducing heat; being then withdrawn, and the contents of each examined, nothing was found in the crucibles but a little carbonaceous matter, and a few minute globules of antimony, the reſt being evaporated. Some grey oxyd was then mixed with, 1. equal parts of lime, alumine, and ſilex; 2. equal parts of ſulphat of barytes, chalk and clay; 3. with common ſalt; 4. with ſulphat or ſoda; and the materials being ſtrongly heated, they were all found converted into yellow glaſſes, but not a particle of regulus could be perceived. The above four mixtures, with ſome charcoal rubbed up into them, were next treated as before: vitreous ſcoriæ were obtained, but no greater quantity of regulus than when charcoal alone was made uſe of. Laſtly, ſome of the ſame grey oxyd being fluxed with half its weight of tartar, yielded a perfect button of pure antimony. Hence it appears, that potaſh, and probably alkalies in general, exert ſome ſpecific action on antimonial oxyd, which induces it to become much more fixed while converting into regulus, than when mere carbonaceous matter is employed.

II. Reduction by ſcorification.

This, although the moſt expenſive and inaccurate method of procuring the regulus of antimony, is generally preferred in the laboratory to every other on account of its expedition. For this purpoſe the antimonial ſulphuret is reduced to a fine powder,

powder, and mixed with nitre and tartar; a crucible being then made red hot, ſucceſſive ſpoonfuls of the mixture are gradually projected into it till the veſſel is nearly filled; being then covered, and a full red heat applied for half an hour, the contents are either poured out into a greaſed iron cone, or ſuffered to cool in the crucible; a pure regulus is thus obtained, covered with a maſs of ſaline ſcoriæ. In this proceſs the acid of the nitre is decompoſed, and is employed in acidifying the ſulphur and partly oxydating the antimony, while the carbonaceous matter of the tartar ſerves to deoxydate the metal, and in ſome degree alſo to decompoſe the ſulphuric acid; hence the ſcoriæ conſiſt of the potaſh of the nitre and tartar, partly united with ſulphuric acid, forming ſulphat of potaſh, and partly with ſulphur, forming ſulphuret of potaſh, which laſt alſo holds in ſolution a conſiderable proportion of the antimony.

If the quantities of nitre and tartar are large compared with that of the crude antimony, nearly the whole of the metal will be taken up by the ſcoriæ. According to Lemery, ſixteen ounces of ſulphurated antimony, mixed with the ſame weight of nitre and alſo of tartar, yielded no more than five ounces and a half of regulus. Whereas ſixteen ounces of crude antimony, twelve ounces of tartar, and ſix ounces of nitre, afforded ſix ounces and one dram of regulus. The uſual proportions are four parts of crude antimony, with three parts of tartar, and one and a half of nitre. Some adviſe to detonate the nitre and tartar together, before the antimony is added, but this is decidedly a bad way, as the uſe of the nitre is not to alkalize the tartar, but to oxygenate the ſulphur. A greater proportion of regulus than uſual would probably be obtained by mixing the antimony and nitre alone, and not adding the tartar till after the detonation had taken place.

III. Reduction by precipitation.

This is effected by fuſing the antimonial ſulphuret with any other metal whoſe affinity for ſulphur is greater than that of antimony, in which caſe the ſulphur combines with the added metal, while the regulus of antimony collects in a button at the bottom of the crucible. The metals capable of thus decompoſing the ſulphurated antimony are iron, copper, lead, ſilver, and tin, whence originated five varieties of antimonial regulus, known among the alchemiſts by the names of martial, venereal, ſaturnine, lunar, and jovial. As equal parts of theſe metals require different quantities of ſulphur for their ſaturation, a greater or leſs proportion of them is neceſſary for a given weight of crude antimony: thus two parts of this laſt ſubſtance are decompoſed by one part of iron, by two parts of copper, or by four parts of lead.

In order to prepare the martial regulus (for all the others are now became obſolete), a number of formulæ are given by Lemery, Beaumé, and other practical writers, the relative merits of which can only be duly appreciated by a compariſon of the quantity and purity of the regulus with the expence of time, of fuel, and of nitre, required in its preparation. The following are thoſe which ſeem beſt worth notice:

1. Take eight ounces of horſeſhoe nails, and heat them nearly to whiteneſs in a crucible, then add, by degrees, ſixteen ounces of coarſely pulverized antimonial ſulphuret; cover the crucible and keep up the fire; in a few minutes the mixture will be in perfect fuſion, at which time, add little by little, three ounces of nitre, a ſlight detonation will take place, and the whole will be brought to a ſtate of perfect fuſion; then pour it into an iron cone, heated and greaſed, and ſtrike the ſides of it gently as the maſs becomes ſolid to favour the precipitation of the regulus. When cold it will be found to conſiſt of a button of antimony, weighing about ten ounces, covered with an alkaline ferruginous ſcoriæ, from which it is readily ſeparated by a blow with a hammer. This regulus, however, is far from pure, containing both iron and a little ſulphur; it is therefore to be remelted, and mixed while in fuſion with two ounces of crude antimony and three ounces of nitre; after all detonation has ceaſed, pour it into an iron cone as before, and ſeparate the regulus from the ſcoriæ. Remelt the regulus and project upon it by degrees three ounces of nitre. Separate this regulus from the ſcoriæ, and melt it again once more with three ounces of nitre; heat it ſtrongly and rapidly, and pour the whole into a cone; there will be obtained about eight ounces of a beautiful ſtellated regulus, covered with yelloviſh white ſcoriæ. In this proceſs the whole of the materials employed are eighteen ounces of crude antimony, eight ounces of nails, and twelve ounces of nitre; four ſeparate fuſions are required, and the product is eight ounces of regulus.

2. Pulverize and mix together 16 ounces of crude antimony, 12 ounces of tartar, 10 ounces of nitre, and eight ounces of iron filings; project it by degrees into a red hot crucible, a ſtrong detonation will take place, and the maſs will enter into fuſion; keep it at a full heat for a few minutes, and then pour the whole into an iron cone; when cold, there will be found beneath the ſcoriæ a pure ſtellated martial regulus, weighing about ſix ounces.

3. Heat in a crucible till they are white hot, five ounces of horſeſhoe nails, and then add 16 ounces of crude antimony, coarſely pounded; the two will preſently melt down together, and as ſoon as the maſs is in very liquid fuſion, project at ſeveral times one ounce of pulverized nitre; during each projection there will be a detonation, and when the laſt has ceaſed, increaſe the heat for a few minutes, and then take out the crucible and allow it to cool gradually; there will be found at the bottom of the veſſel a perfectly pure martial regulus.

In the reduction of antimonial ſulphuret by iron, the ſucceſs of the experiment depends much upon the temperature; a high heat briſkly applied, and of ſhort continuance, ſo as to bring the whole into very liquid fuſion, is far preferable to an inferior heat of longer continuance: ſince the regulus ſeparates more completely from the ſcoriæ, and the proportion of metal, loſt by evaporation, is not nearly ſo conſiderable.

The antimony obtained by roaſting or ſcorification, by proper care, may be rendered abſolutely pure; but the martial regulus, though purified ſo as to exhibit the ſtellated appearance on its ſurface, which is uſually reckoned characteriſtic of purity, is, in fact, an alloy of antimony and iron; hence it is harder and more difficultly amalgamable than the former; and when reduced to fine powder, is, according to Lemery, attracted by the magnet.

§ 5. *External Characters and Phyſical Properties of Reguline Antimony.*

This metal, when perfectly pure, is of a duſky white colour, between that of tin and iron; it appears to be abſolutely deſtitute of ductility, and may eaſily be reduced in a mortar to a fine powder; it is moderately hard, and may be cut without much difficulty by a common knife. Its fuſibility is not quite ſo great as that of zinc, ſince it requires to be made red hot before it flows. Its ſpecific gravity, according to Bergman, is 6.86; but by the later experiments of Briſſon, amounts to 6.7021. Its fracture is uſually broad foliated, but ſometimes the facets are ſo minute as to give it almoſt a granular appearance; in general the ſlower it is cooled, the broader will be the plates of which it

is compoſed, but this rule is not without its exceptions. Antimony is one of the moſt eaſily cryſtallizable of all metals, and this tendency is ſhewn in a ſtriking manner by the appearance of a radiated ſtar, or of pinnated leaves, like thoſe of fern, with which the convex ſurface of a maſs of antimony that has been allowed to cool ſlowly is generally covered. It was this circumſtance that induced the alchemiſts to pay ſo much attention to antimony; by their heated imaginations every thing ſingular was conſidered as a type or myſterious hint, and thus confounding ſacred with profane, they denominated this appearance, which in truth is only the reſult of a confuſed cryſtallization, the eaſtern ſtar that was to conduct the ſages (themſelves) to the cradle of their king, i. e. to the method of making gold, the king of metals. Theſe rays or branches are merely ſuperficial as Lemery demonſtrated, by making tranſverſe ſections of various maſſes of ſtellated regulus. If a crucible, furniſhed with a plug at the bottom is filled with melted antimony, and the fluid part allowed to run out by withdrawing the plug as ſoon as a cruſt is formed on the ſurface of the metal, there will be found under the cruſt various cryſtalline groups, conſiſting of cubes, of lengthened rectangular parallelepipeds, or ramifications, made up of ſmall octohedrons implanted in each other, and frequently aggregated into a trihedral pyramid, with furrowed ſides. The primitive cryſtalline form of antimony has hitherto eluded the ſagacity of Hauy: it is diviſible at the ſame time parallel to the faces of a regular octohedron, and of a rhomboidal dodecahedron.

§ 6. *Oxyds of Antimony.*

The action of air and moiſture at the uſual temperature upon reguline antimony is ſcarcely perceptible, as it remains a long time without even tarniſhing, and the oxydation is never more than merely ſuperficial. By a low red heat, however, and the contact of air, this metal is gradually converted into a greyiſh white oxyd, volatile at a higher heat, and capable of being more completely oxygenated. When antimony is brought quickly to a bright red heat, and then expoſed to the air, it is rapidly converted into a white oxyd, which being volatile, exhales in the form of a denſe ſmoak from the ſurface of the melted metal, and condenſes in the upper and cooler part of the crucible into beautiful cryſtalline needles of a ſnowy or ſilvery white; which have obtained the name of argentine flowers of antimony, or ſnow of reguline antimony. As this cryſtallized oxyd is not eaſily obtained in a common crucible, we ſhall mention the method of preparing it as given by Beaumé. "Place a wide cylindrical earthenware tube cloſed at one end in a wind furnace, ſo that it ſhall remain in a ſlanting direction, with the open end protruding a little way through a hole or door in the ſide of the furnace; and to prevent the inſide of the tube from being too much cooled, an earthenware ſtopper muſt be prepared to fit looſely into the open mouth of the tube.—The apparatus being properly put together, light the fire, and when the bottom of the tube is red hot, introduce the antimony in ſmall pieces, and cloſe the mouth of the tube with the ſtopper. The metal being melted, will begin in a ſhort time to ſmoak, and the cryſtalline oxyd will be depoſited in the upper part of the tube, from which it may be ſcraped from time to time with a clean iron ſpoon. The firſt portions are generally yellowiſh on account of a ſmall quantity of ſulphur contained in the metal; this, however, is ſoon burnt off, and the ſucceeding flowers are of a pure brilliant argentine white colour." Although antimony is not combuſtible at ſo low a temperature as zinc, yet, at a white heat, with acceſs of air, it burns with a white flame, throwing out copious vapours of white oxyd. Another pretty experiment on the inflammation of antimony, was diſcovered accidentally by Cit. Gillet. Place a ſmall piece of antimony on a bit of charcoal, and fuſe it by the blowpipe; when it is boiling hot, ſhake it gently out ſo that it may fall three or four feet through the air; it preſently divides into a few globules, which immediately take fire, and explode when they reach the ground like fireworks.

The cryſtalline oxyd, like the other white oxyds that we ſhall have occaſion to notice in the next ſection but one, appears to be a ſaturated combination of antimony and oxygen in the proportion, according to Thenard, of 80 of the former to 20 of the latter; in many of its properties it reſembles the metallic acids; it is ſoluble, though but ſparingly, in water, has a decided taſte, forms a cryſtallizable ſalt with potaſh, from which it may be ſeparated by the action of any of the ſtronger mineral acids. When heated by itſelf in a porcelain tube, it may be reduced nearly to the metallic ſtate; the firſt impreſſion of the fire converts it into a yellow oxyd, very eaſily fuſible into glaſs, and containing 0.19 of oxygen; afterwards, as the heat increaſes, it aſſumes a reddiſh brown tint, and holds only 0.16 of oxygen; at length it arrives at the ſtate of black oxyd, wanting only to be deprived of 0.02 of oxygen, to return to the metallic form. Oxyd of antimony, by haſty fuſion in a crucible, is converted into a vitreous maſs, which, when tranſparent, is of a yellowiſh orange colour, and is called *glaſs of antimony*; and when opaque, is of a brown colour, and has hence obtained the name of *liver of antimony*. Theſe preparations, however, muſt not be confounded with the glaſs and liver of antimony, as procured from the ſulphuret of this metal.

§ 7. *Action of Acids on Antimony.*

1. The *ſulphuric acid*, when cold, appears to exert no action on antimony; but when boiling hot, it is decompoſed by this metal, a copious extrication of ſulphureous acid gas takes place, accompanied by violent effervescence; and if the mixture is diſtilled to dryneſs in a retort, a ſmall quantity of ſulphur ſublimes, and a maſs of white antimonial oxyd is at the bottom of the veſſel. When the proceſs is ſtopped ſhort of deſiccation, there remains in the retort a white bulky, ſoft, and moiſt maſs, and this, when waſhed with a little water, occaſions a copious depoſit of white oxyd, while the clear liquor becomes diluted ſulphuric acid, holding in ſolution a ſmall portion of antimony; a larger quantity of water added to this liquor, precipitates what remains of antimonial oxyd. The action of heat alſo has the ſame effect, for while evaporating it becomes turbid without forming cryſtals; the ſame takes place on the mixture of any alkaline ſolution. If the unwaſhed ſulphated oxyd of antimony is mixed with common ſalt and diſtilled, the reſult is oxymuriat, or butter of antimony.

2. *Sulphureous acid*, whether hot or cold, has no effect whatever on reguline antimony; it will, however, decompoſe moſt of the acid ſalts of this metal, eſpecially that formed by muriatic acid. If ſulphureous acid is added to a ſolution of muriated antimony, a white powder is thrown down of an acrid and harſh taſte, which appears to be a true inſoluble ſulphite of antimony, decompoſable with extrication of the ſulphureous acid by the ſulphuric, or by mere heat in cloſe veſſels; the reſidue of this laſt operation is a reddiſh brown matter, ſoluble in fixed alkali, and again precipitable by the muriatic acid in form of kermes or hydroſulphurated oxyd of antimony.

3. *Nitric acid*, eſpecially the yellow, is ſpeedily decompoſed on antimony, even in the cold. During the mutual action of theſe two bodies, a large diſengagement of nitrous gas takes place, and the metal is converted into a white oxyd ſo rapidly, as ſometimes to cauſe actual inflamma-

tion. In its eager abſorption of oxygen, a great analogy ſubſiſts between antimony and tin; for not only the nitric acid, but even the water that is mixed with it, are decompoſed by the antimony; the azot of the former, and the hydrogen of the latter of theſe fluids, combine together during their naſcent ſtate, and produce ammonia, which with the undecompoſed acid, forms nitrated ammonia, the cryſtals of which ſalt, thus unexpectedly occurring, have ſometimes been miſtaken for nitrat of antimony. If the white oxyd, reſulting from this chemical action, is mingled, before it has been waſhed, with lime or cauſtic alkali, ammoniacal gas will be diſengaged. The greateſt part of the antimonial oxyd remains uncombined at the bottom of the veſſel; a very ſmall quantity, however, is taken up by the ſupernatant acid; but even this little is precipitated by water, by evaporation, and by mere ſtanding for a few days. The white nitrous oxyd is fully ſaturated with oxygen, of which it contains, according to Thenard, about 30 per cent. It is conſidered as one of the moſt refractory and irreducible of the metallic oxyds, which it certainly is when treated with the common fluxes; but when rubbed with a little regulus of antimony, and heated in a cloſe veſſel, it becomes in ſucceſſion yellow, orange, brown, and then black; containing only about two per cent. of oxygen, as is related of the argentine flowers in the former ſection.

4. *Muriatic acid*, when aſſiſted by heat, is capable of diſſolving a ſmall proportion of antimony; part of this, however, is again depoſited in the form of a white oxyd as the liquor cools: by evaporation it may be brought to cryſtallize in ſmall acicular deliqueſcent needles. The oxyd of antimony is more eaſily ſoluble in muriatic acid than the metal itſelf, and alſo in greater proportion: it cryſtallizes, according to Monnet, in brilliant plates, like the boracic acid, and is decompoſable by water.

5. The *oxygenated muriatic acid*, when in the form of gas, exerts a very ſtriking action on reguline antimony: if this metal, previouſly reduced to a fine powder, is thrown by ſmall quantities at a time into a vial filled with the acid gas, each parcel will be found to take fire, and burn with a white flame, throwing out, at the ſame time, a number of bright ſparks, and thus forming a moſt beautiful ſhower of fire. The antimony is converted into a white muriated oxyd. The liquid oxymuriatic acid changes the metal into a powdery oxyd, but holds a very ſmall quantity of it in ſolution; no doubt on account of the great proportion of water, which even the moſt concentrated liquid oxymuriatic acid neceſſarily contains. If a ſolution of either the muriat or oxymuriat of antimony be gently evaporated nearly to dryneſs, and afterwards expoſed in a retort to a low ſand heat, a thick oleaginous liquid will come over, that by cooling concretes into a ſoft maſs, called, from its conſiſtence, by the ancient chemiſts, *butter of antimony*; the above, however, is not the actual method of preparing this ſalt in the laboratories; it is more expeditiouſly made by taking advantage of the ſuperior affinity which antimony has over mercury: for this purpoſe ſome reguline antimony is well mixed in a mortar with twice or two and a half times its weight of oxymuriated mercury (corroſive ſublimate); during trituration, much heat is extricated, the evidence of a chemical action between the two ſubſtances: the mixture being put into a wide necked retort, with a ſuitable receiver adapted, is expoſed in a ſand bath to a gentle heat. During the firſt half hour, a ſmall quantity of a clear liquid paſſes into the receiver, which is afterwards followed by a thick liquor that concretes by cooling in the receiver, and often in the neck of the retort into a white maſs; this is the *butter of antimony*. A moderate fire is kept up till nothing more comes over, at which time the receiver is unluted, and emptied of its contents; there remains in the retort fluid mercury with ſome muriated oxyd of antimony. By continuing the diſtillation at a greater heat, the mercury is volatilized, and collected in a liquid ſtate in the receiver. It is to be remarked, however, that there are two objections to this proceſs; the one, that if the mercurial ſalt is in too great proportion, a little of it will riſe with the butter of antimony, and be diſſolved in it; the other objection is, that if too little oxymuriat is uſed, the produce will be much diminiſhed, as a conſiderable proportion of the antimony will be merely in the ſtate of muriated oxyd. The beſt way, therefore, of preparing this ſalt, is to mix the unwaſhed ſulphat of antimony (1. § 7.) with common ſalt and black manganeſe, and diſtil the whole to dryneſs.

The London Pharmacopœia orders the ſublimed muriat to be made thus. Mix together one part of crocus of antimony with two parts of decrepitated ſalt; put the maſs into a glaſs retort, and add one part of ſulphuric acid; then diſtil, and what comes over is butter of antimony.

Butter of antimony, though ſolid at the uſual temperature of the atmoſphere, liqueſies at a very gentle heat, and by ſlow cooling cryſtallizes in large parallelepipeds. It is intenſely cauſtic, deſtroying the organization both of animal and vegetable ſubſtances; by expoſure to the air and light it becomes coloured, and deliquiates into a thick oleaginous fluid. When dropped into diſtilled water, it is for the moſt part decompoſed, and a copious white precipitate is thrown down, which is little elſe than a perfect oxyd of antimony. This, after being waſhed and dried, forms the *powder of* ALGAROTH, or *mercurius vitæ*. The clear liquor ſeparated from the precipitate ſtill holds a little antimonial oxyd in ſolution, as is obvious from a further precipitation taking place on the addition of an alkali.

Scheele has given the following method of preparing powder of algaroth, in an eſſay of his on this very ſubject. To two parts of ſulphurated antimony add three of nitre, and detonate the mixture in a hot crucible; pulveriſe the maſs, and ſtir in one part of this to three of water, with one of ſulphuric acid, and one of common ſalt. Let the whole digeſt together for twelve hours in a ſand bath, and ſtrain it through a cloth; ſeparate the clear liquor, and add to the reſidue more ſalt and diluted ſulphuric acid, which digeſt and filter as before. Mix the two liquors together, and pour them into a large quantity of boiling water; a white precipitate immediately takes place, and this, when waſhed and dried, is the powder of algaroth.

If to any quantity of ſublimed muriat of antimony an equal weight of nitric acid is added, the liquor becomes highly coloured, copious orange-coloured fumes are diſengaged, and a conſiderable degree of heat is excited; after a while, a white magma of oxyd is depoſited. If before the latter effect takes place, the liquor is evaporated to dryneſs, a pure white oxyd remains behind; and this being three times more abſtracted with freſh nitric acid, and afterwards heated moderately red in a crucible, aſſumes the appearance of a pulverulent maſs, white at the ſurface, and roſe-coloured beneath; this being ground in a mortar, ſo that the white and coloured parts may be thoroughly mixed, is known in the ſhops and old pharmacopœias by the name of *bezoar mineral;* and, in fact, is nothing more than a perfect oxyd of antimony, holding, perhaps, a very ſmall portion of the acid.

6. *Nitro-muriatic acid* is the beſt ſolvent of reguline antimony; if the acid is made moderately warm, and the metal put in by ſmall pieces at a time, taking care not to add

add a ſecond till the firſt is completely diſſolved, it may be thus charged with a conſiderable proportion of antimony, only a ſmall part of which is depoſited by cooling. This, however, like all the preceding antimonial ſolutions, is almoſt wholly decompoſed by the addition of diſtilled water. A piece of iron or zinc alſo cauſes a precipitation of a black oxyd (§ 6.), almoſt in the metallic ſtate, which, according to Theuars, when dried at a low temperature, acquires the properties of a pyrophorus, inflaming ſpontaneouſly by contact with the air.

7. The *fluoric*, *boracic*, and *carbonic* acids, have no action on reguline antimony; they are capable, however, of combining with its oxyds, forming ſalts, the particular properties of which have not been examined.

8. The action of all the *metallic acids* on antimony, except the arſenic acid, is wholly unknown: and for this ſee Arseniat *of Antimony*.

9. The *vegetable acids* produce no other effect on metallic antimony, except blackening its ſurface; they diſſolve, however, its oxyds without much difficulty, forming ſalts, a few only of which have been properly examined: theſe we ſhall proceed to particulariſe.

10. The *antimoniated tartar*, or *emetic tartar*, is the moſt important of the combinations of antimony with the vegetable acids. It was firſt prepared by Adrian Mynſicht, in 1631; and from that time to the preſent, has attracted the notice of chemiſts and phyſicians. Bergman, in his admirable eſſay on Emetic Tartar, was the firſt who gave any thing like a conſiſtent account of the rationale, and the various chemical affinities concerned in its preparation; and the ſubject has of late been finally elucidated by the able and ſagacious experiments of Theuars.

The tartareous acid, the acidulous tartrite of potaſh (or cream of tartar), and the tartrite of potaſh (ſoluble tartar, or tartarized tartar), are each capable of diſſolving and combining with oxyd of antimony; an inquiry, therefore, into the chemical properties of emetic tartar, neceſſarily includes the conſideration of the above different menſtrua, and thus renders it a very complicated affair.

Pure tartareous acid and boiling water, digeſted on any of the oxyds of antimony, except that which is ſaturated with oxygen, as the diaphoretic antimony, may be made to take up one-third or one-fourth part of its own weight; and the ſolution, when concentrated by evaporation, and allowed to cool gradually, uſually depoſits a few cryſtalline grains, but is for the moſt part converted into a browniſh gelatinous maſs, which, at a red heat, is charred, and the antimony contained in it is partly extricated in the form of a white ſmoke, and partly reduced to metallic grains.

A ſolution of tartrite of potaſh, at a boiling temperature, takes up at leaſt as much oxyd of antimony as tartareous acid is capable of diſſolving; the liquor becomes ſlightly alkaline, and upon evaporation, yields a number of cryſtalline grains.

A ſolution of tartareous acidulum, or cream of tartar, being boiled with any of the ſimple oxyds, or ſulphurated oxyds of antimony, diſſolves a conſiderable quantity; and by evaporation and cooling, depoſits elongated octahedral cryſtals of emetic tartar.

The taſte of this triple ſalt is ſlightly harſh and metallic; it reddens vegetable blues; it effloreſces in the air, loſes its tranſparency, becomes of a dead white, and is then pulverulent: it requires for its ſolution about 40 times its weight of boiling water, and nearly twice as much at the common temperature. Sulphuric acid precipitates from it a ſulphated oxyd of antimony, leaving the cream of tartar pure; the alkalies, both pure, and carbonated, decompoſe it in part only, a looſe white oxyd being precipitated by the firſt, and by the ſecond, a carbonated oxyd, which, in a ſhort time, cryſtallizes in the form of divergent rays. If either tartareous acid, or tartrite of potaſh, is added to the ſolution of emetic tartar previouſly to pouring in the alkali, there will be no precipitate; for the tartrite of potaſh produced by the alkaline addition, or already exiſting in the fluid, immediately diſſolves the antimonial oxyd; and for the ſame reaſon, a ſimple ſolution of emetic tartar cannot be wholly decompoſed by any quantity of alkali; and hence probably have ariſen the great ſeeming differences in the proportion of its conſtituent parts, as the ſalt has been analyſed by means of a pure alkali, a carbonated alkali, or other re-agents. According to Theuars, the cryſtals of emetic tartar, from whatever antimonial oxyd they are prepared, and whatever has been the proportion of ingredients employed, contain in a given weight preciſely the ſame quantity of antimony, of tartareous acid, of potaſh, and water; and even the degree of oxydation of the metal is alſo invariable. His method of analyſing this ſalt, is firſt to aſcertain its water of cryſtallization, by drying in a heat juſt not ſufficient to decompoſe it; ſecondly, to diſſolve the emetic tartar, and precipitate the antimony by ſulphurated hydrogen; thirdly, to aſcertain the tartareous acid by dropping in acetite of lead; fourthly, to determine the quantity of potaſh by igniting the reſidue, and extracting the alkali by dilute nitrous acid. By a very careful analyſis, conducted in the above manner, he found 100 parts of emetic tartar to contain 38 oxyd of antimony, 34 tartareous acid, 16 potaſh, and 8 water, beſides 4 loſs. But the tartareous acidulum, which ſupplies both the acid and alkali to the emetic tartar, contains 57 tartareous acid, 33 potaſh, and about 10 water and loſs; or 70 tartrite of potaſh, and 20 tartareous acid in exceſs. Hence it follows, that there is a greater exceſs of tartrite of potaſh in cream of tartar over the acid, than exiſts in the emetic tartar; and this exceſs of tartrite of potaſh is found in the mother water, in which the cryſtals of the emetic are decompoſed; when, therefore, the whole is evaporated to dryneſs, as is often the caſe in the preparation of emetic tartar, there is a portion of antimoniated tartrite of potaſh ſuperadded, which, no doubt, modifies its effect, and produces variations, which are unjuſtly charged to the emetic tartar. Another objection to evaporating the whole maſs to dryneſs without ſeparating the cryſtals, is, that the tartrite of lime which exiſts in a variable proportion in all cream of tartar, according to Vauquelin, is alſo mingled with the antimonial ſalt, and weakens its operation. To make, therefore, emetic tartar uniformly of the ſame ſtrength, ſelect an antimonial oxyd ſomewhat below the maximum of oxydation, and digeſt it in a hot ſaturated ſolution of cream of tartar, taking care that the oxyd ſhall be rather more than enough to ſaturate the ſalt (if the grey oxyd from the ſulphuret of antimony is made uſe of, or even the common glaſs of antimony, as theſe are not already ſufficiently oxydated, there will be a decompoſition of water, and a ſmall quantity of kermes will be formed); when the liquor refuſes to take up any more antimony, filter and evaporate till a pellicle begins to be formed; allow the ſolution to cool, and ſelect all the octahedral and tetrahedral cryſtals that are depoſited; waſh them in cold water, and again diſſolve in hot water, and cryſtallize. For the particular formulæ of the different pharmacopœias, ſee § 12.

11. The only remaining antimonial ſalts of any conſequence, are the oxalat and acetite of antimony; and we are as yet acquainted with very few particulars even concerning theſe. The oxalat of antimony is eaſily formed, and concretes into ſmall cryſtalline grains; theſe are ſoluble in wine, giving it an emetic quality; and this preparation has

been uſed by ſome medical men inſtead of the common antimonial wine. The acetite of antimony being known before the diſcovery of emetic tartar, was recommended for the ſame uſes to which the former is now applied, by Angelo Sala. Neither the oxalat, nor the acetite, however, of this metal appear to be poſſeſſed of any ſuperiority over the emetic tartar, and are now, we believe, wholly diſuſed.

§ 8. *Action of Neutral Salts on Antimony.*

Muriat of ſoda is ſaid to be in part, at leaſt, decompoſable by antimony at a red heat; but the experiments on this ſubject are contradictory, and require to be performed afreſh with care and exactneſs.

Sulphat of potaſh (and propably all the alkaline ſulphats), is decompoſed without any difficulty. This was firſt ſhewn by Monnet; he fuſed together in a crucible two parts of ſulphated potaſh, and one of antimony; the metal diſappeared, and he obtained a yellow, ſemi-vitrified maſs, intenſely cauſtic, of antimoniated ſulphuret of potaſh; which, when waſhed with warm water, depoſited, by cooling, a hydroſulphurated oxyd of antimony. The metal, therefore, in this caſe, became oxydated at the expence of the ſulphuric acid; and the ſulphuret of potaſh reſulting from this combined with the metallic oxyd, rendering it partly ſoluble in hot water.

Oxymuriat of potaſh has a very powerful action on antimony, as it has indeed upon all the eaſily combuſtible metals: if equal parts of this ſalt, and antimony previouſly reduced to a fine powder, are mixed together, and ſtruck briſkly on an anvil, or any ſuitable hard body, a remarkably loud and vehement detonation takes place: if the mixture, inſtead of being ſtruck, is poured into ſulphuric acid, or rather if the acid is poured upon the powder, a hiſſing noiſe is produced, red ſparks are emitted, and the metal is converted into an oxyd.

Nitre and *antimony*, in equal parts, or two parts of the former to one of the latter, being thrown into a red-hot crucible, detonate with a vivid flame, the acid of the nitre is decompoſed, and the metal is completely oxygenated. The white maſs remaining in the crucible being pulveriſed and digeſted in hot water, is ſeparated into two parts, one ſoluble, and the other inſoluble: the latter of theſe was formerly conſidered as a pure oxyd of antimony, but Theuars has ſhewn, that it contains about one-fifth of potaſh, intimately united with the oxyd, which appears to act the part of an acid: it was formerly known by the name of *reguline diaphoretic antimony*, but appears, in fact, to be a kind of *antimonite of potaſh*, rendered inſoluble by an exceſs of oxyd; the ſoluble part differs from the other merely in the proportion of its ingredients, being an *antimoniated potaſh*, cryſtallizable and decompoſable, with precipitation of its oxyd, by any of the mineral acids. As, however, this is generally prepared from the ſulphuret of antimony, we ſhall refer the reader for further particulars to the next ſection.

§ 9. *Sulphuret of Antimony—Glaſs of Antimony—Kermes, &c.*

1. Sulphuret of antimony may be prepared artificially, by pulverizing a pound of reguline antimony, and mixing with it eighteen ounces of flowers of ſulphur; this being put into a crucible, and brought to a low red heat, melts into an uniform maſs, of the weight of about two pounds, which, when cold, exhibits a ſtriated appearance, exactly ſimilar to the native grey ſulphuret (§ 3.), and is poſſeſſed of all the ſame phyſical and chemical properties; hence, for cheapneſs ſake, all the preparations from the antimonial ſulphuret are made with the native ore, juſt ſeparated by fuſion from the ſtony and earthy matters that it is mixed with, which is known in commerce by the name of *crude antimony*, or antimony of the ſhops.

2. If the ſulphuret of antimony is expoſed to a red heat, with acceſs of air, moſt of the ſulphur is volatilized, and a ſmall but variable proportion of the metal is carried up at the ſame time: this operation being performed in a melting-pot, ſurmounted by a ſeries of aludels, the vapour as it riſes, is condenſed in the form of a light pulverulent ſubſtance, called *flowers of antimony*. The flowers, at the beginning of the proceſs, are of a greyiſh yellow colour, and conſiſt of ſulphur, with antimony, either in the metallic ſtate, or at leaſt very little oxydated; the next portions are orange-coloured, and thoſe which riſe towards the end of the operation, are almoſt yellow, and conſiſt of little elſe than pure ſulphur. What remains behind at the bottom of the melting-pot is a greyiſh aſh-coloured oxyd, ſtill holding a little ſulphur: among the old chemiſts it was known by the name of *grey calx of antimony*; by the moderns it is called the *grey ſulphurated oxyd* of antimony. It is moſt commonly prepared by ſlow roaſting of the crude antimony in a flat diſh or reverberatory furnace, and the ſulphur and metal that are volatilized with it are allowed to eſcape. See § 4.

3. The grey ſulphurated oxyd, when urged by a ſufficient degree of heat, forms a tranſparent glaſs, poſſeſſing, according to circumſtances, every ſhade of colour from light yellow to the deepeſt hyacinthine red; this is the *glaſs of antimony*, or, according to the modern nomenclature, the *vitreous ſulphurated oxyd* of antimony. In order to prepare this, any quantity of the grey oxyd is put into a crucible, and kept at a full red or low white heat till it enters into perfect fuſion; ſoon after this has taken place, the end of a clean tobacco pipe ſhould be dipped in it; and if the matter that adheres to the pipe is tranſparent, and may be drawn into a thread like common glaſs, it has been heated ſufficiently: the crucible is then to be removed from the fire, and its contents are to be poured on a compact flat ſtone or plate of copper. When the glaſs has become ſolid, it ſhould be removed into a covered veſſel, as it cracks and flies while cooling.

It ſometimes happens in making the glaſs of antimony, that the grey oxyd begins to melt as ſoon as it is red hot, and continues limpid like water, without acquiring the property of drawing into threads like glaſs: at other times, on the contrary, even the long continuance of a white heat will do no more than bring it to a paſty conſiſtence. In the former caſe, the glaſs is of an unuſually deep colour; in the latter of a very light colour. This inequality ariſes from a difference in the grey oxyd; if it has been too little roaſted, it flows with the firſt impreſſion of the heat, but when more completely oxydated and deſulphurated, it proves very refractory: this laſt, however, may be remedied by throwing in a little crude antimony in powder, which will immediately determine its fuſion and vitrification; and in this caſe there are always found at the bottom of the crucible a few grains of very pure regulus of antimony.

If the previous deſulphuration has been very ſlight, the oxydation alſo will have proceeded but a little way; and the glaſs produced, though poſſeſſed of a vitreous fracture, is perfectly opaque, and of a dark liver colour, hence it has obtained the name of *liver of antimony*: the ſame name, however, has been given to a preparation of crude antimony and nitre, which will be mentioned preſently.

4. The action of acids upon the ſulphuret of antimony is upon the whole ſo ſimilar to their action on the regulus, as deſcribed, § 7, that it will only be neceſſary to point out the circumſtances in which they differ. In general, the metallic part of the ſulphuret is more eaſily diſſolved and retained

tained by acids than the mere regulus is, and the ſulphur of the compound is not at all or very little acted upon. The ſulphuric and nitric acids are decompoſed with conſiderable energy, on pulverized ſulphuret of antimony; ſulphureous acid in one caſe, and nitrous gas in the other, being copiouſly diſengaged, the metal is oxydated, and remains intimately mixed, though no longer combined with the ſulphur, very little of it being actually diſſolved by theſe acids. The muriatic acid, even when cold, will decompoſe a large quantity of ſulphuret, during which proceſs there is a conſiderable extrication of ſulphurated hydrogen; if the mixture is heated, the whole of the metal enters into ſolution, leaving the ſulphur at the bottom unaltered; a ſmall portion, however, both of the ſulphur and metallic oxyd is diſſolved in the hydrogen, and eſcapes in a gaſſeous form; for Bergman obſerved, by performing this experiment in a veſſel with a long narrow neck, that the ſulphurated hydrogen, in its paſſage through, depoſited a little kermes, or hydroſulphurated oxyd of antimony. The beſt menſtruum, however, for crude antimony, is a nitro-muriatic acid, compoſed of one part nitric, and three parts muriatic acid; the metallic oxyd is entirely taken up, part of the ſulphur is carried off by the hydrogen gas, another part is acidified and mixes with the other acids, and the remainder, about 26 per cent. is left at the bottom of the veſſel in form of a white powder. In § 7, we have given an account of the original method of preparing the butter of antimony by ſublimation of the regulus with corroſive mercurial muriat: the ſame antimonial ſalt may be obtained by uſing ſulphuret of antimony, but inſtead of obtaining the mercury in a metallic ſtate, it is combined with the ſulphur of the antimony into a violet-coloured maſs, which, at a full red heat ſublimes, and is depoſited in the upper and cooler part of the veſſel, in needle-form cryſtals of cinnabar, hence called *cinnabar of antimony*.

5. The fixed alkalies are capable by the dry way of combining with ſulphurated antimony, forming ſeveral important preparations. If 15 ounces of pulverized crude antimony, 12 ounces of decrepitated ſea ſalt, and 3 ounces of tartar, are mixed together, and fuſed in an earthen crucible, there will be found, on breaking the veſſel when cool, that it contains two ſubſtances; the upper is of a lighter colour than the other, and conſiſts of the ſalt with a little ſulphur; the inferior ſubſtance is very heavy, opaque, of a black colour, and on being broken, exhibits a ſhining vitreous fracture: it has obtained the name of *medicinal regulus*, though improperly, being a ſimple alkalized ſulphuret of antimony, in which the metal is probably uncombined with oxygen, and nearly ſaturated with ſulphur. A ſimilar preparation to this is the *ruby of antimony*, or *magneſia opalina*, differing, however, in containing leſs ſulphur, and in the metal being perhaps more oxydated. It is prepared by mixing equal parts of muriated ſoda (ſea ſalt), nitre, and crude antimony, and fuſing the whole in a crucible; there is a large quantity of ſcoriæ in this as in the former proceſs, and underneath them is a compact vitreous maſs tranſparent in thin ſhivers, and, if well made, of a deep, ſomewhat ſmoak-red colour, and brilliant ſemimetallic luſtre. Neither of theſe preparations is deliqueſcent or ſoluble in water, on account of the ſmall proportion of alkaline ſalt that they contain. By increaſing, however, the doſe of alkali, the maſs becomes ſoluble; thus, if to one part of ſulphurated antimony we add two parts of pure dry pearlaſh, we obtain by fuſion a compact reddiſh-brown maſs of alkaline ſulphuret of antimony, and a little of the metal in its pure reguline ſtate is found at the bottom of the crucible. If the whole of the antimony is required to be diſſolved in the ſulphurated alkali, as is the caſe in the preparation of kermes, it is requiſite to add to the above ingredients about one-twentieth of their weight of ſulphur. Hence it appears, that the ſulphur of the crude antimony is divided between the metal and the antimony, in the compound ratio of their weights and their reſpective affinities for ſulphur, in conſequence of which ſome of the antimony is entirely deſulphurated, and remains in an uncombined ſtate, while the remainder being only partially deſulphurated, unites into one maſs with the ſulphurated alkali. If this alkaline ſulphuret of antimony, coarſely powdered, is boiled in pure water, nearly the whole is held in ſolution as long as the liquor continues hot, ſo that it may be paſſed haſtily through a filter; but in proportion as the liquor cools, a copious precipitation takes place of a bulky, flocculent ſubſtance, whoſe colour is a deep brick-red approaching to that of the kermes inſect, whence it has been called *kermes mineral*: after the depoſition of kermes has ceaſed, the liquor being ſeparated from it by a filter, is of a wine-yellow colour; and upon the addition of any acid, a ſtill further precipitation is brought about, of an orange yellow powder, which is called the *golden ſulphur* of antimony. Kermes may alſo be prepared in the humid way, as was firſt ſhewn by Lemery in the year 1707. Since that period a multitude of proceſſes have been publiſhed by the French chemiſts for the preparation of this ſubſtance; none of them, however, appear to be eſſential improvements of Lemery's original method; and as this has received the high ſanction of the obſervant and accurate Beaumé, we ſhall ſelect it for the uſe of our readers. Put into a clean iron pan five or ſix parts of pure liquid fixed alkali, with fifteen or twenty parts of water; ſet it over the fire to heat, and as ſoon as it has begun to boil, ſtir in ſome well levigated ſulphuret of antimony, equal in weight to one-ſixteenth of the alkali; ſtir the mixture well, and when it has boiled for a minute or two, throw the whole on a filter, ſo that the clear liquor may paſs through while hot; a large quantity of kermes will be depoſited while it cools, which, after being ſeparated from the alkaline ſolution, is to be waſhed firſt in cold, and then in hot water, till the water comes off quite inſipid; the powder being then dried in the ſhade by a gentle heat, and levigated and paſſed through a fine ſieve, is to be kept in a well-cloſed phial for uſe. The alkaline liquor, when it has ceaſed to depoſit kermes, may be made to yield the golden ſulphur, by ſaturating it with dilute ſulphuric acid. In this proceſs by the humid way, as in the other by the dry way, a partition of the ſulphur takes place between the alkali and the metal, by which a portion of this laſt is left undiſſolved in the form of a grey powder; and this, by ſimple fuſion in a crucible, is reduced to a maſs of regulus. According to the French chemiſts, both the kermes and golden ſulphur are *hydroſulphurated oxyds of ſulphuret of antimony*: and Theuars, in his experiments on the antimonial oxyds, has given the following as the reſult of his analyſes of theſe two ſubſtances, *viz.* Kermes mineral contains,

72.760	brown oxyd of antimony,
20.298	ſulphurated hydrogen,
4.156	ſulphur,
97.214	
2.786	loſs.
100.000	

Golden ſulphur contains,

68.3	orange oxyd of antimony,
17.877	ſulphurated hydrogen,
11 to 12	ſulphur.
98.177	

The

The theory concerning their formation is, that the alkaline antimonial fulphuret coming into contact with water, decompofes it; that the oxygen of the water combines with the fulphurated metal, while its hydrogen diffolves fome of the fulphur with which it is in contact, and unites to the fulphurated metallic oxyd in different proportions, according to the different degrees of oxydation of thefe oxyds: that when the antimony is the leaft oxydated, it unites with the greateft quantity of fulphurated hydrogen, and becomes infoluble in alkali, forming the kermes; and, on the other hand, when more oxydated, it unites with lefs fulphurated hydrogen, and remains diffolved in the alkali till precipitated thence by an acid, forming the golden fulphur. Kermes may alfo be made by paffing fulphurated hydrogen through a folution of muriat of antimony; and this among others is adduced as a proof of the kermes containing the metal in an oxydated ftate. Notwithftanding, however, the excellent experiments of Berthollet and Thenars on this fubject, many very ftrong objections may, in our opinion, be urged againft their theory: to enter into them at full length would be inconfiftent with the plan of this work, but we fhall refume the fubject when treating of the *Metallic* Hydrosulphurets.

6. The nature of the preparations refulting from the mutual action of nitre and fulphurated antimony, depends very much on the proportion which the nitre bears to the other ingredient. The nitrous acid is confumed in acidifying the fulphur and oxydating the antimony; and the alkaline bafe of the nitre unites with the fulphur, if any remains, with the fulphuric acid forming fulphat of potafh, and with the metallic oxyd. When the nitre conſiderably exceeds the antimonial fulphuret, as in the preparation of diaphoretic antimony, the fulphur is entirely oxygenated, and partly efcapes in the form of fulphureous acid gas, while the remainder, with part of the alkali, forms fulphat and fulphite of potafh; the metal alfo is completely oxygenated at the expence of the nitre; and the oxyd hence refulting, combines with the potafh in two proportions; that portion which is united to a large quantity of alkali is rendered foluble, and the other remains infoluble. Hence when the refult of the above procefs is lixiviated with hot water, we find diffolved in the liquor, and may obtain, in a cryftalline form, fulphat and fulphite of potafh, fome undecompofed nitre, and antimonite of potafh; the undiffolved refidue, or diaphoretic antimony, conſifts of the perfect oxyd of antimony combined with about a fifth of potafh.

When the nitre and crude antimony are in equal proportions, only part of the fulphur is acidified, and the metal is at a low ftate of oxydation; by the action of warm water the mafs is divided into an infoluble and foluble portion; the firft, called *crocus metallorum*, feems, like the glafs of antimony, to be merely a fulphurated oxyd; the latter conſifts of kermes, of golden fulphur, and fulphat of potafh. For further particulars fee § 12.

§ 10. *Phofphuret of Antimony.*

Pelletier, in his Eſſays on Phofphorus, has given the three following procefſes for combining antimony with that highly inflammable fubftance. 1. To one ounce of regulus of antimony add an equal weight of glafs of phofphorus, and one dram of charcoal; pulverize the whole well together, and fufe the mixture in a covered crucible; the refult is a white metallic mafs of phofphorated antimony, very brittle, with a lamellar fracture, and nearly cubical fragments. When a little piece of it is put upon lighted charcoal, and expofed to the action of the blowpipe, it emits, at the moment of fufion, a faint green flame, and then volatilizes like pure antimony, in the form of white flowers. 2. Equal parts of regulus and glafs of phofphorus furnifh by fufion a metallic mafs, whofe fracture difplays minute facets, and in every other refpect is fimilar to No. 1. 3. A phofphuret of antimony, with the fame properties as the former, may alfo be prepared by projecting on the melted regulus fmall pieces of phofphorus. In this cafe, however, the crucible muft be removed from the fire immediately after the laft portions are thrown in, otherwife by a continuance of the heat it would be all volatilized.

The phofphurets of antimony are not applied to any ufe, and the above are all the facts which we are poffeffed of concerning them.

§ 11. *Alloys of Antimony.*

1. *Antimony with gold.* See Gold.

2. *Antimony with platina.* See Platina.

3. *Antimony with filver.*

According to Lemery, one ounce of reguline antimony and three drams of cupelled filver, being fufed together in a ftrong heat, yielded an alloy of the fame weight as the original materials, and fimilar to common regulus of antimony, but more compact, and not fo brittle. Gellert (Chymie. Metallurg., relates, that 181 grains of filver being fufed with 255 grains of reguline antimony, the alloy was found to have loft during the procefs 115½ grains; the remainder was very brittle, and in colour fimilar to regulus of antimony: its fpecific gravity was = 8.44. But the fp. gr. of the filver being = 9.1, and that of the antimony being = 6.7, the fp. gr. of the alloy, fuppofing the whole lofs of weight to have been antimony, ought to be = 7.96. Therefore the fp. gr. of this alloy is greater than the mean of its conſtituent parts. It is made no ufe of.

4. *Antimony with copper.*

Thefe two metals mixed together in nearly equal proportions, form a hard brittle alloy, of a violet colour internally, which is not very foon affected by expofure to the air. Gellert, having mixed together 314 grains of copper, fp. gr. = 8.7, with 464 grains of reguline antimony, fp. gr. = 6.7, obtained an alloy whofe fp. gr. was = 8.02. During the fufion there was a lofs of 43½ grains; and putting the whole of this to the account of the antimony, the fp. gr. of the alloy ought, by calculation, to have been = 7.49. The fp. gr. therefore of this alloy is greater than the mean of its conſtituent parts. It is made no ufe of.

5. *Antimony with iron.*

The general properties of antimony with a very fmall proportion of iron, or *martial regulus*, may be found above in § 4. Gellert having mixed by fufion 115½ grains of iron, fp. gr. = 8.0 with 173 grains of reguline antimony, obtained an alloy of 63 grains lefs by weight than the materials. It was brittle, of an afh colour, and contained fpecks like ruft of iron. Its fp. gr. was = 6.92. Now fuppofing the lofs of weight to be placed to the account of the iron, the denfity of the alloy ought to be = 7.05; its fp. gr. therefore is lefs than the mean of its ingredients. This alloy was wholly unaffected by a powerful magnet, except one or two particles which appeared to be iron. It is not made any ufe of.

6. *Antimony with mercury.* See Mercury.

7. *Antimony with tin.*

Thefe two metals being mixed together in nearly equal proportions, form a moderately hard, very brilliant, and brittle alloy, capable of receiving an exquifite polifh, and not eafily tarnifhed; it has therefore been occafionally manufactured into fpeculums for telefcopes. Gellert mixed together by fufion 231¾ grains of tin, fp. gr. = 7.36, with 231¼ grains of antimony; 77 grains were loft in the procefs, and the alloy was = 6.94 fp. gr. Suppofing the whole lofs to be

be attributed to the tin, the denſity of the compound ought to be = 7.0; its ſp. gr. is therefore leſs than the mean of its ingredients.

8. *Antimony with lead.*

This is the moſt important of all the alloys of antimony, it being the material of which the common types for printing are made. In proportion as the lead exceeds the other ingredient, will be the ductility of the maſs; and the lead may be hardened, and its fuſibility unimpaired by ſo ſmall a proportion of antimony as not to injure its ductility. Gmelin found that equal parts of the two metals produced a porous brittle alloy; one part antimony, and two lead, afforded a more compact metal, but ſtill brittle; one part antimony and three lead, gave a homogeneous metal ductile under the hammer, and much harder than lead: one part of antimony gave to eight of lead an increaſe of fuſibility, hardneſs and colour, without materially injuring its malleability. According to Gellert, 386½ grains of lead, ſp. gr. 11.7, being fuſed with 333 grains of antimony, experienced a loſs of 101 grains. The alloy was brittle, and preſented a granular ſomewhat ſhining fracture; its ſp. gr. was = 9.17; and even if the whole loſs of weight is attributed to the antimony, the denſity by calculation ought to be = 9.12. The maſs is therefore of a greater ſp. gr. than the mean of its ingredients.

9. *Antimony with zinc.*

Equal parts of the two metals being fuſed together, formed a homogeneous brittle maſs of a light aſh colour; the loſs of weight was about one-ſixth of the whole; as however both theſe metals are very volatile, it is impoſſible to ſay with any certainty what proportion of the loſs is to be attributed to each; the ſp. gr. of the maſs was rather leſs than that of the antimony, which is the lighter of the two. It is not uſed.

10. *Antimony with biſmuth.*

According to Gellert, equal parts of the two metals being fuſed together, loſt $\frac{1}{20}$ of their weight, and produced an alloy of a lighter colour than biſmuth, and very brittle, diſplaying in its fracture a cubical ſtructure like that metal; the ſp. gr. of the maſs was = 8.96; whereas, ſuppoſing the $\frac{1}{20}$ of loſs to have been ſuſtained by the biſmuth, the heavier of the two, its denſity by calculation ought to have been only = 7.94. Not uſed.

Concerning the combination of the other metals with antimony nothing is as yet known, except merely that cobalt unites eaſily with antimony, and manganeſe with great difficulty, and very imperfectly.

§. 12. *The medicinal Virtues, and pharmaceutical Preparations of Antimony.*

This metal affords ſeveral of the moſt valuable articles of the pharmacopœia; and as it has for ſo many years engaged the attention of chemiſts and alchemiſts (of whom a large number have ever been zealous to add to the reſources of the healing art), we poſſeſs an almoſt infinite variety of antimonial preparations, all of them valuable as medicines, all enjoying many virtues in common, but a few out of the number recommending themſelves peculiarly to the medical practitioner from the uniformity of their compoſition, or from a greater tendency to one mode of operation rather than another, whereby particular indications in the cure of diſeaſes may be fulfilled.

The firſt and moſt unqueſtionable operation of antimony on the human body is that of an emetic. This operation appears to be always in direct proportion to the activity of the antimonial in every other reſpect; and it exiſts in the higheſt degree in thoſe preparations that are almoſt too virulent to be given internally with ſafety in common caſes. Antimonials excite to vomit very ſpeedily, and their action is continued on the ſtomach for a conſiderable time; hence they are of a peculiar ſervice, either where any acrid or poiſonous matter has been taken which requires to be ſpeedily and effectually removed; or in ſuch caſes as incipient fever, where, along with the clearing of the firſt paſſages, the phyſician wiſhes to prolong the mechanical action of vomiting, ſo as to induce a relaxation on the ſkin, and complete perſpiration.

The operation of antimony is alſo extended to the inteſtinal canal, and hence it proves conſiderably *purgative*; and this effect takes place, either when the doſe has been greater than neceſſary merely to produce vomiting; or when the ſtomach has eſcaped the action of this powerful mineral. In order to ſecure the purgative, and prevent the emetic operation of antimony, it is adviſable to unite it with ſome of the uſual aperient medicines, whoſe operation it will thus aſſiſt in a conſiderable degree.

Antimony appears to promote almoſt all the excretions, and to quicken and ſtimulate the action of the abſorbent veſſels. It is therefore eminently *diaphoretic* (or promoting perſpiration); *expectorant*, and often *diuretic*. It frequently happens that a ſingle one of the antimonial preparations may be made to produce each of theſe effects by varying the doſe, increaſing it to render it a vigorous emetic or cathartic; and diminiſhing it when the gentle and more gradual operation of a diaphoretic or expectorant is to be ſecured.

A long continued courſe of antimonials, in the mildeſt form, wherein the direct operation of this metal is ſcarcely at any one time to be detected, has been found of eſſential ſervice, both in various obſtinate cutaneous complaints, and to produce that change of conſtitution and ſuppoſed reſolution of internal obſtruction, which entitle a medicine to the (ſomewhat ambiguous) character of *alterative* and *deobſtruent*.

We ſhall now proceed to take notice of thoſe preparations of antimony which are actually in uſe, or which have acquired a certain reputation in medicine.

Antimonium preparatum (Pharm. Lond. & Edin.). This is nothing but the crude antimony or native black ſulphuret, prepared for medicinal uſe ſimply by triture to an impalpable powder, edulcoration with water, and ſubſequent drying. In this native mineral the proportion of the ſulphur to the metallic part is ſo large, as to render it almoſt entirely inert, at leaſt with regard to any ſenſible operation. It is ſometimes, however, though rarely, employed in cutaneous complaints; and formerly it was uſed in the preparation of decoctions of ſarſaparilla, guaiacum, and the other ſudorific woods; a quantity of the mineral being tied up in a looſe cloth, and ſuſpended in the veſſel in which the decoction was preparing; but as ſcarcely the minuteſt portion of the antimony could be diſſolved by this proceſs, it has properly been omitted.

The crude antimony ſtill, however, is retained in veterinary practice; and it may be given to many animals in doſes of ſeveral ounces without any apparent operation.

It is likewiſe the material from which all the other antimonial medicines are prepared, directly or indirectly.

Antimonium vitrefactum (*Pharm. Lond.*), *vitrum antimonii* (*Pharm. Edin.*), Glaſs of antimony.

To prepare this, the crude antimony is roaſted on a tile or other ſhallow veſſel, with a very ſlow fire, and frequent ſtirring, till all the ſulphur is expelled which can be ſeparated in this method. What remains is a grey powder, which is to be melted in a crucible and an intenſe fire into a yellowiſh vitreſcent maſs, to be poured out on a warm copper or iron plate, and when cold reduced to a very fine powder.

powder. This preparation is an oxyd of antimony not at its highest point of oxydation, and ſtill retaining a ſmall portion of ſulphur, which it is impoſſible to ſeparate by mere heat. When well prepared it is pretty uniform in its nature, and is a very violent medicine, operating even in ſmall doſes as a ſtrong emetic and cathartic. It is ſcarcely ever employed internally, but is the baſis of the emetic tartar, and the antimonial wine, in the London Pharmacopœia.

Vitrum antimonii ceratum (Pharm. Edinb.).

Take one ounce of glaſs of antimony in fine powder, add it to one dram of yellow wax melted in an iron veſſel, heat them gently together for a quarter of an hour, with conſtant ſtirring; pour out the maſs when cold, and reduce it to powder.

The glaſs of antimony here incorporates with the wax, and changes its colour from lemon yellow to brown in the proceſs. The wax appears to leſſen in a very great degree the activity of the antimony, ſo that this medicine may be given with ſafety, and has been much recommended in dyſenteries and other bowel complaints. It is rejected from the London pharmacopœia; but retained in thoſe of Edinburgh, Amſterdam, and ſome others.

A great variety of preparations have been made from the crude antimony by the intermedium of nitre. The operation of this ſalt on the metallic ſulphuret when dephlagrated together, is firſt to conſume the ſulphur, and afterwards, if the quantity be ſufficient, to oxydate the metal to the higheſt point. It is remarkable, that the perfect oxyd of antimony, entirely diveſted of ſulphur, and fully ſaturated with oxygen, appears almoſt as inert as the crude ſulphuret of antimony itſelf, whilſt in the intermediate ſtates of deſulphuration, and oxydation, many very active medicines are found.

Of theſe the two following alone are now retained, the firſt with a ſmaller proportion of nitre, the latter fully ſaturated.

Crocus antimonii (Pharm. Lond. & Edin.). Crocus of antimony, alſo called crocus metallorum, ſaffran des metaux, and hepar or liver of antimony, by foreign writers.

To prepare this, take one pound of crude antimony, one pound of nitre, and one ounce of common ſalt, mix them accurately, and project them, a ſpoonful at a time, in a large crucible heated red hot; when the whole is dephlagrated, increaſe the fire ſo as to melt the maſs, and pour it out. When cold it will be found to conſiſt of two parts, the upper a whitiſh ſaline ſcoria, to be ſeparated from the lower, which is the crocus of antimony. This is to be rubbed to a fine powder, and repeatedly waſhed with warm water, till it comes off from the powder quite inſipid.

The crocus of antimony is a very violent emetic and purgative, and is ſeldom employed internally except in farriery. When waſhed it appears to have the greateſt reſemblance to the glaſs of antimony above deſcribed, and it is reſerved for ſimilar purpoſes, that is, as a baſis for the tartar emetic and ſome other of the antimonial preparations.

When prepared in the large way, it would appear that it is not neceſſary to heat the veſſel in which the mixture is fired, the heat excited by the dephlagration being ſufficient to fuſe the whole to the requiſite degree. The whitiſh ſcoriæ here produced conſiſt of ſulphat of potaſh (formed by the potaſh of the nitre and the ſulphuric acid, generated by the dephlagration of the ſulphur), of the ſea-ſalt, and probably of a portion of uncombined alkali, with ſome particles of the metallic ſulphuret that may have eſcaped the action of the nitre.

Antimonium calcinatum (Pharm. Lond.), antimonium uſtum cum nitro (Pharm. Edin.), calx antimonii, or diaphoretic antimony.

This is prepared, according to the London college, by projecting gradually in a hot crucible a mixture of one part of crude antimony with three parts of nitre, raiſing the heat after dephlagration, and continuing it for half an hour; and when cold, pulverizing and edulcorating it.

The Edinburgh college direct one part of the grey powder left after roaſting crude antimony for the glaſs of antimony, to be dephlagrated with only an equal weight of nitre, to be heated for an hour, and afterwards reduced to powder and waſhed till inſipid.

Theſe two preparations are, however, eſſentially the ſame, and conſiſt of the oxyd of antimony left after the ſulphur has been entirely diſſipated by the nitre, itſelf having been oxydated to a high degree by the ſame dephlagration.

As the intention of uſing ſo much nitre in the firſt method is to conſume the whole of the ſulphur as well as to oxydate the metal, it is obvious that a much leſs quantity of this neutral ſalt will be ſufficient where ſo much of the ſulphur has been driven off by roaſting, as is the caſe in the ſecond method. Formerly a diſtinction was made between the pulverized oxyd taken before, or after waſhing; in the firſt inſtance being termed *antimonium diaphoreticum nitratum*; and in the ſecond, *antimonium diaphoreticum lotum*; the former, as it contained an alkaline ſalt, was deliqueſcent to a certain degree, and required to be preſerved in a cloſe veſſel. It is now, however, diſuſed, the *waſhed* alone being retained.

The diaphoretic antimony, owing probably to its high ſtate of oxydation, is mild in its effects, and may be taken in large doſes, without producing ſickneſs or purging. It is naturally white and in a pulverulent ſtate, the antimonial oxyd not being truly vitrified in the proceſs, as it is in the preparation of the crocus of antimony, but only involved in the alkali of the nitre, from which it is ſeparated by waſhing.

The ſeveral waſhings of this ſubſtance contain a mixture of ſulphat of potaſh, with part of the nitre undecompoſed, and the naked alkali, all holding in ſolution a certain quantity of antimonial oxyd.

If this compound liquor is decompoſed by an acid, the metallic oxyd precipitates in the form of a white powder, which has been called the *ceruſſe of antimony*, or *materia perlata*; but if the liquor is merely evaporated to dryneſs, part of the ſalts cryſtallize together with metallic oxyd, and form the *nitrum ſtibiatum*, or *antimoniated nitre of Stahl*. Theſe latter preparations are now in diſuſe.

Some other antimonial medicines have been prepared with different proportions of antimony and nitre, forming oxyds, all of which act in a ſimilar manner upon the human body, but with different degrees of energy. It ſhould ſeem that the middle point with regard to the proportions of antimony and nitre, that is, equal parts of each, furniſhes the moſt active antimonial oxyd, which is the crocus; and the medicinal power ſeems to diminiſh in proportion as either of theſe ingredients is uſed in exceſs. Thus the completely oxydated metal, the diaphoretic antimony, is poſſeſſed of but little activity; and on the other hand, the *crocus antimonii medicinalis*, formed by dephlagrating eight parts of antimony with one of nitre, and conſequently but partially deſulphurated, is equally mild in its operation.

The *crocus antimonii mitior*, the proportions of which are two parts of antimony to one of nitre, is another medicine now in diſuſe, which appears to be more active than the laſt mentioned, but milder than the common crocus.

The

The *emeticum mite antimonii* of Boerhaave is made by employing one part of antimony to two of nitre, and is a mild and ſafe medicine.

Another antimonial oxyd, formerly employed in medicine, is prepared by dephlagrating the *regulus* of antimony with twice or thrice its weight of nitre, and this has alſo been termed by ſome the *ceruſſa antimonii*.

The nitre here, having no ſulphur to engage it, acts entirely on the metal, and reduces it to the ſtate of a perfect oxyd, which, when waſhed, reſembles in every reſpect the waſhed diaphoretic antimony made with the black ſulphuret and three times its weight of nitre. The regulus, however, does not require more than its own weight of nitre for this preparation; all the reſt is ſuperfluous.

Regulus antimonii medicinalis, vel *febrifugum Craanii*, an antimonial remedy much recommended by many of the German phyſicians, and introduced in the former pharmacopœias of Edinburgh, Brandenburg, Straſburg, and others of celebrity, but now diſuſed.

This, which is improperly termed a regulus, is prepared by fuſing together five parts of crude antimony with four of common ſalt and one of ſalt of tartar. On cooling, two ſubſtances are found in the crucible, an upper ſcoria, containing the ſea-ſalt, the alkali, and part of the ſulphur, and the lower, a reddiſh maſs compoſed of the greater part of the metal, deprived of a portion of its ſulphur by means of the alkali, and thus rendered more active as a medicine than the crude antimony. It is this lower reddiſh maſs which is the *medicinal regulus*. The uſe of the common ſalt ſeems to be merely to aſſiſt the fuſion.

Regulus antimonii. The methods of preparing the true regulus of antimony have been already mentioned. This metal uſed formerly to be caſt in the form of a cup, and, owing to its ſlight degree of ſolubility in various menſtrua, a powerful emetic liquor was prepared ſimply by filling the cup with wine, and ſuffering it to ſtand for ſome hours. At the ſame time the cup had loſt ſo little of its weight that it would continue to give the ſame properties to freſh portions of wine for years, or almoſt centuries, without being corroded through.

In like manner the regulus caſt into the form of pills would produce the emetic or purgative operation to any number of perſons in ſucceſſion, and hence they were called *perpetual pills*.

Theſe preparations are now, however, diſcontinued.

Vinum antimonii. (Pharm. Lond.) Inſtead of the regulus, the glaſs of antimony is now employed as the baſis of this medicated wine. One ounce of this, in fine powder, is to be digeſted for twelve days with frequent agitation, in a pint and a half of white Liſbon wine.

This is a very valuable antimonial, principally employed in doſes of from ten to ſixty drops as a diaphoretic. The quantity of the metal taken up by the wine is extremely ſmall, but is liable to vary in proportion to the acidity of this menſtruum, which is one inconvenience attending its uſe.

Vinum antimonii tartariſati. (Pharm. Lond. and Edin.) In the former diſpenſatory it is directed to be made by diſſolving forty grains of emetic tartar in two ounces of boiling water, and afterwards adding eight ounces of white Liſbon wine.

In the latter, twenty-four grains of emetic tartar are ſimply diſſolved in a pint of the wine.

The nature and preparation of the celebrated *kermes mineralis*, or *pulvis carthuſianus*, have been already explained; this is at preſent laid aſide, and in its place the London and Edinburgh pharmacopœias have adopted the precipitate, formed from a liquid ſolution of ſulphuret of antimony in cauſtic alkali, by the addition of an acid, inſtead of by mere cooling, as is the caſe with the kermes: this is the

Sulphur antimonii præcipitatum vel *auratum*, the golden ſulphur of antimony.

To prepare it, boil for three hours two pounds of crude antimony with four pounds of the aqua kali puri (or cauſtic lye), diluted with three pounds of diſtilled water; ſtrain it while hot through a linen cloth, and immediately add gradually dilute vitriolic acid, ſufficient to precipitate the ſulphurated antimony, which is of a fine golden colour. Waſh it well with warm water, and dry in a gentle heat.

The golden ſulphur is of a lighter colour than the kermes, the latter being generally of a brown or brick red. Both of them conſiſt principally of ſulphur, but holding in ſolution a certain quantity of the metal which renders them emetic or purgative when taken in doſes of ſeveral grains. The golden ſulphur is never uſed with a view of acting violently or by any ſenſible operation, but it is employed (often combined with mercury) as a gentle alterative, with a view of keeping up a conſtant perſpirable ſtate of the ſkin, and determining a gentle increaſe to the ſeveral emunctories. Hence its uſe in various obſtinate cutaneous complaints, and other chronical diſorders.

The only ſolutions of antimony in acids employed in medicine are the *muriated antimony*, more commonly known by the name of *butter of antimony*, and the *antimoniated tartrite of potaſh*, or the *tartar emetic*. The chemical nature of each of theſe intereſting preparations has been already deſcribed.

The muriated antimony is much too acrid and violent to be employed for internal purpoſes. It is uſed externally as a cauſtic, eſpecially in farriery. The *powder of algaroth*, or the antimonial oxyd, precipitated from this ſalt by water alone, or by an alkaline ſolution, is uſed by ſeveral chemiſts as the baſis of the emetic tartar.

Antimonium tartariſatum vel *tartarus emeticus. (Pharm. Lond.* and *Edin.)* To prepare this moſt valuable medicine according to the London Pharmacopœia: take one pound and a half of crocus of antimony in fine powder, two pounds of cream of tartar, and two gallons of water, boil them together in a glaſs veſſel for a quarter of an hour, ſtrain the liquor through paper, and ſet it by to cool: the cryſtals that form are the emetic tartar.

The Edinburgh college directs: firſt, to add ſome of the muriated antimony to hot water, holding ſalt of tartar in ſolution, to collect the white precipitate thus formed, and edulcorate it thoroughly: next to add nine drams of this precipitate, and two ounces and a half of cream of tartar, in fine powder, to five pints of water, and to boil the whole till the tartar is diſſolved; afterwards to evaporate the liquor in a glaſs veſſel, till a pellicle appears on its ſurface, and to ſet it by to cryſtallize.

The emetic tartar is by much the moſt valuable of all the antimonial preparations; its compoſition renders it ſufficiently ſoluble in ſimple menſtrua, and as it is almoſt entirely inſipid, and as the requiſite doſe is in all caſes comparatively ſmall, it may be given with great eaſe to children, or wherever there would be a difficulty of getting down bulky medicines. In doſes of from one to about three grains it proves emetic, and often purges even after the ſtomach has been emptied: in ſmaller quantities, or mixed with various other medicines, and eſpecially with thoſe that correct its emetic property, it fulfills the other intentions with which antimonials are given; and with proper precautions it is always ſafe, manageable, and highly to be depended on.

When prepared in the ſame way, it is generally very uniform in its nature, but it is liable to ſome variation, when different antimonial oxyds are uſed; an inconvenience it would be of great importance to prevent.

The laſt of the antimonial medicines that we ſhall mention, is the *pulvis antimonialis (Pharm. Lond.)*, or the *antimonium calcareo-phoſphoratum. (Pharm. Edin.)*

To prepare it. Take equal parts of crude antimony and hartſhorn ſhavings, mix them together, and throw them into a wide iron pan, heated fully red, and ſtir them conſtantly till they acquire an aſh-colour; then take them out, reduce them to powder, fill a coated crucible with it, and lute over the top another crucible, inverted, and with a ſmall hole at the bottom, to ſerve as a cover: then raiſe the fire gradually to a full white heat, and keep it in this ſtate for two hours; when cold, take out the contents, reduce them to a moſt ſubtile powder, and it is the pulvis antimonialis.

This preparation is intended as a ſubſtitute for the JAMES's POWDER, one of the moſt celebrated empiric medicines in this or any other country, the value of which has long been eſtabliſhed by the moſt unequivocal teſtimony. We ſhall refer the reader to this article for an account of the ingenious analyſis made by Dr. Pearſon of this powder, and publiſhed in the Philoſophical Tranſactions, whereby it is proved to be a mixture of an oxyd of antimony with the earth of bones, or calcareous phoſphat; and hence the pulvis antimonialis has been employed as a ſubſtitute.

This preparation is given in doſes of one to five or ſix grains, or even more, and is employed peculiarly in removing general fever, by means of perſpiration. It is never intentionally given in ſuch large doſes as to prove emetic; but it is generally ſuppoſed, that the genuine James's Powder may be taken in larger doſes than the antimonial powder, without exciting ſickneſs.

We may add, that Mr. Chenevix, (in the Philoſophical Tranſactions for 1801) has given the following ingenious method of preparing this medicine in the moiſt way, which removes every cauſe of variation which may take place whenever the oxyd of a metal ſo volatile as antimony is in certain ſtates, is ſubjected to intenſe and long-continued heat. The following is the ſimple proceſs: "Diſſolve together, or ſeparately, in the leaſt poſſible portion of muriatic acid, equal parts of the white oxyd of antimony, formerly called algaroth powder (made by dropping the butter of antimony into water), and of phoſphat of lime; pour this ſolution gradually into diſtilled water, previouſly alkalized by a ſufficient quantity of cauſtic ammonia: a white and abundant precipitate will take place, which, well waſhed and dried, is the propoſed ſubſtitute for James's Powder."

In this proceſs, the antimony and the phoſphat of lime are precipitated from their ſolution in muriatic acid at the ſame inſtant, the former by means both of the ammonia and the water in which it is diſſolved, and the latter merely by this alkali. Hence, the inventor gives the uſeful caution to pour the mixed muriatic ſolutions *into the alkaline liquor*, and not to add the latter to the former; in order that the precipitation of the antimony and the phoſphate of lime may be conſentaneous, and therefore in uniform proportion from firſt to laſt. The muriatic acid ſimply diſſolves phoſphat of lime, and does not decompoſe it, and therefore it is ſeparated unchanged from its ſolution by the ammonia. If it be wiſhed to prepare this powder with a ſtronger doſe of antimony, it is only requiſite to increaſe the proportion of muriated antimony to the muriated calcareous phoſphat, before the precipitation is made.

We ſhall only add to this ſhort review of the various antimonial preparations uſed in pharmacy, that ſeveral other preparations, ſlightly varying from thoſe which we have mentioned, have been at times recommended by ſeveral eminent men, and have had a certain vogue; but it does not appear that any thing further can be expected from any other change in the preparation of antimonial medicines; and thoſe which we already poſſeſs, form ſome of the moſt valuable articles of the Materia Medica.

§ 13. Uſes of Antimony.

The uſes of antimony are not very numerous; it is of high value in medicine, and is employed, in combination with other metals, in the manufacture of printers' types, and ſpecula for teleſcopes. Its oxyds are uſed in colouring glaſs; the ſulphuret is employed in ſcorifying copper and other metals which are found mixed with gold; hence it was called by the alchemiſts *balneum regis*, or *balneum ſolis*.

The native antimony, at firſt, was of ſervice only in the compoſition of paint. Scripture deſcribes it to us as a ſort of paint, with which the women blacken their eye-brows. Jezebel underſtanding that Jehu was to enter Samaria, painted her eyes with antimony, or, according to the Hebrew, "put her eyes in antimony."

At this day the women of Syria, Arabia, and Babylonia, anoint and blacken themſelves about the eyes; and both men and women put black upon their eyes in the deſert, to preſerve them from the heat of the ſun, and the piercing of its rays. M. D'Arvieux tells us, that the Arabian women border their eyes with a black colour made of *tuty*, which the Arabians call *rebel*. They draw a line of this kind of blacking without the corner of their eyes, to make them appear larger. Iſaiah, in his enumeration of the ſeveral ornaments belonging to the daughters of Sion, has not forgot the needles which they made uſe of in painting their eyes and eye-lids: nor has this practice eſcaped the laſh of Juvenal.

> "Ille ſupercilium madida fuligine tinctum
> Obliqua producit acu, pingitque trementes
> Attollens oculos."

Ezekiel, deſcribing the irregularities of the Jewiſh nation, under the idea of a debauched woman, ſays, that ſhe bathed and perfumed herſelf, and that ſhe anointed her eyes with antimony. Job ſhews ſufficiently how much antimony was in eſteem, by calling one of his daughters a veſſel of antimony, or a box to put paint in, *cornu ſtibii*. Tertullian and St. Cyprian have declaimed very warmly againſt this cuſtom of painting the eyes and eye-brows.

ANTINE, in *Biography*, a Benedictine monk, was born at Gonireux, in the dioceſe of Liege, in 1688, and publiſhed ſeveral uſeful works of an hiſtorical kind. In 1736, he publiſhed the five firſt volumes of a new edition of "Du Cange's Gloſſary," with valuable corrections and editions. He alſo beſtowed much pains upon "Bouquet's collection of French Hiſtorians," and on "The Art of verifying Dates," publiſhed in 4to. in 1750, and reprinted, with enlargements, in 1770. Nov. Dict. Hiſt.

ANTINOE, or ANTINOOPOLIS, now called *Enſenè* by the Arabs, in *Ancient Geography*, a city of Upper Egypt, on the eaſt ſide of the Nile, was built near the ruins of Abydus, where the Egyptians worſhipped the god Beſa, and revered his oracles; and became the capital of a nome or prefecture. The oracle of Beſa was famous in the time of Ammianus Marcellinus, who ſays that all the neighbouring people went to conſult him, and aſſembled at a certain period to celebrate feſtivals in his honour. Hence the Arabs call Antinoe the city of the Magi. This city was built in conſequence of a ſhameful paſſion, which ill diſguiſed the appearance of gratitude affected by Adrian, its founder.

This

This prince, renowned for his political and military talents, was, at the ſame time, contemptible on account of his paſſion for Antinous, the perfection of whoſe form is proved by one of the fineſt ſtatues bequeathed to us by antiquity. Adrian, equally ſuperſtitious and depraved in his manners, while he was in Egypt with his court and army, conſulted the oracle of Beſa, which declared, that he was threatened with great danger, unleſs a perſon that was dear to him, and by whom he was beloved, was immolated for his preſervation. Antinous offered himſelf for the victim, and the emperor had the cruelty to accept the ſacrifice. The beautiful and generous Antinous precipitated himſelf from the ſummit of a rock into the Nile, and Adrian thought to efface his ingratitude and infamy by building, in honour of his favourite, whom he likewiſe regarded as his deliverer, a city which, under the name of Antinoe or Antinoopolis, has perpetuated at once his barbarous cruelty, and his criminal paſſion. This city he embelliſhed with all the moſt valuable productions of art. The ſtatues of Antinous were here conſidered as ſacred images; and the emperor not only erected temples in honour of him, but inſtituted games and ſacrifices, and regulated the worſhip that was to be paid to his memory. Savary ſays, that this city was half a league in circumference, and that two principal ſtreets, 45 feet wide, interſecting each other at right angles, traverſed its whole extent. The others were narrower, but equally ſtraight. The two largeſt terminated by four gates, ſome of which ſtill ſubſiſt; the handſomeſt has three vaulted entries; that of the middle is 40 feet high by 22 in width, and 20 thick; the other two are ſmaller. Each of the façades of this edifice is ornamented with four pilaſters in bas relief, the Corinthian capitals of which, with the leaf of the Acanthus, have a conſiderable projection. This beautiful gate was ſurrounded by eight Corinthian columns, of the ſame height with itſelf. One only has eſcaped the ravages of time, and of men; the reſt are either mutilated or deſtroyed; but the pedeſtals remain entire. Beſides this edifice, one diſcovers in different quarters of the town, heaps of rubbiſh, which announce temples or palaces deſtroyed. If we may judge from the diſtances of the pedeſtals along the ſtreets, they were bordered by a colonnade, which formed a portico on each ſide, and allowed the inhabitants to walk ſheltered from the ſun. Beſides theſe embelliſhments, one of the ſquares was ornamented with four large pillars of the Corinthian order, three of which have periſhed, their baſes only remain. The fourth is preſerved, and is about 50 feet high. The ſhaft is compoſed of ſeveral ſtones. On the firſt is carved an ornament of oak leaves. On the pedeſtal is a Greek inſcription, half effaced, which dedicates it to the emperor Alexander Severus.

The veſtiges of the city, ſays Sonnini, excite regret for its deſtruction. The extent of ground, ſtrewed with the moſt beautiful remains of antiquity, threw him into admiration and aſtoniſhment. In the time of Vanſleb and of Paul Lucas, there were exiſting piers of architecture altogether entire, which he could not find. What appeared to him moſt remarkable was a triumphal arch, or magnificent gate, decorated with fluted pillars; its front was 50 yards in length; and he has given a drawing of it. On the other ſide of the mountain which terminates, towards the eaſt, the ſite of the ancient Antinoopolis, are to be diſtinguiſhed many apertures in the rock, which led to grottoes, that were burial-places or catacombs. The moſque of the village which is near the city, the appearance and population of which form ſo ſtriking a contraſt with the ſuperb edifices and elegance of the ancient city built by Adrian, contains a tomb, and the relics of a ſaint, from whom this place has obtained the name of *Sheick Abadé*; and this ſaint, though regarded by the Mahometans as a zealous defender of the koran, was, at the ſame time, claimed by the Chriſtians as one of their biſhops, who enjoyed the painful honour of martyrdom at *Inſiné*. Towards the end of the fourth century, this city is ſaid to have been peopled by Chriſtians. Palladius aſſures us, that it had 12 convents of virgins, and ſeveral others inhabited by monks. It is now occupied by the worſt people and moſt determined banditti and robbers in Egypt. Savary's Letters, vol. i. p. 552. Sonnini's Travels in Upper and Lower Egypt, p. 517.

ANTINOEIA, in *Antiquity*, annual ſacrifices, and quinquennial games, in memory of Antinous the Bithynian. They were inſtituted at the command of Adrian the Roman emperor, at Mantinea in Arcadia, where Antinous was honoured with a temple and divine worſhip. They were alſo celebrated at Argos.

ANTINOMIANS, in *Church Hiſtory*, denote thoſe who maintain the law of no uſe or obligation under the goſpel diſpenſation, or who hold doctrines that clearly ſuperſede the neceſſity of good works and a virtuous life.

The Antinomians took their origin from John Agricola, about the year 1538, who taught that the law is no wiſe neceſſary under the goſpel; that good works do not promote our ſalvation, nor ill ones hinder it; that repentance is not to be preached from the decalogue, but only from the goſpel.

This ſect ſprung up in England, during the protectorate of Oliver Cromwell; and extended their ſyſtem of libertiniſm much farther than Agricola, the diſciple of Luther. Some of their teachers expreſsly maintained, that as the elect cannot fall from grace, nor forfeit the divine favour; the wicked actions they commit are not really ſinful, nor are to be conſidered as inſtances of their violation of the divine law; and that conſequently they have no occaſion either to confeſs their ſins, or to break them off by repentance. According to them, it is one of the eſſential and diſtinctive characters of the elect, that they cannot do any thing which is either diſpleaſing to God, or prohibited by the law.

Luther, Rutherford, Schluſſelburgh, Sedgwick, Gataker, Witſius, Bull, Williams, &c. have written refutations; Criſp, Richardſon, Saltmarſh, &c. defences of the Antinomians; Wigandus, a compariſon between ancient and modern Antinomians.

The doctrine of Agricola was in itſelf obſcure, and perhaps repreſented worſe than it really was, by Luther, who wrote with acrimony againſt him, and firſt ſtyled him and his followers Antinomians. Agricola ſtood on his own defence, and complained, that opinions were imputed to him, which he did not hold. Nicolas Amſdorf fell under the ſame odious name and imputation, and ſeems to have been treated more unfairly than even Agricola himſelf. It is rather hard to charge upon a man all the opinions that may be inferred from things that have haſtily dropped from him, when he himſelf diſavows ſuch inferences.

ANTINOMY, Antinomia, derived from *αντι*, *contra*, and *νομος*, *lex*, a contradiction between two laws, or between two articles of the ſame LAW.

Antinomy, ſometimes alſo ſignifies an oppoſition to all law. Whence a ſect of enthuſiaſts, who are for carrying goſpel liberty above all moral regards, and who ſlight the motives of virtue as inſufficient to ſalvation, are called Antinomians; and ſometimes Anomians.

ANTINOUS, in *Aſtronomy*, a part of the conſtellation Aquila, or the eagle.

ANTINOUS, in *Mythological Hiſtory*, a Bithynian youth,

youth, the favourite of Adrian, and the object of his unnatural and detestable passion. Some have said, that he fell accidentally into the Nile, as he was sailing on that river with the emperor, and was drowned. Dio Cassius assures us, that he was sacrificed in the manner already related under Antinoe. The emperor, whatever was the occasion of his death, bewailed him, says Spartian, with all the tenderness and weakness of a woman lamenting the death of her husband. To soothe in some measure his grief, he desired the Greeks to rank him among the gods, which they accordingly performed; so that in a short time all the Eastern provinces were filled with statues, temples, and chapels, consecrated to this new divinity. It was even pretended, that he uttered oracles; but his answers were commonly thought to have been composed by Adrian. The Astrologers, having discovered, or pretended to discover a new star, gave out that it was Antinous. Adrian caused the body of his beloved catamite to be buried with the utmost magnificence, built a city on the spot, and converted his tomb into a temple, where he was said to work miracles; which we find exposed and ridiculed by the Pagans themselves.

Antinous, in *Sculpture*, a very famous Roman antique statue; originally in the collection of cardinal Alexander Albani: it is at present in the gallery of antiques, in the museum at Paris.

This statue is in marble; it is a standing figure of a young man, entirely naked; the head looks downwards, with a melancholy air; this is in every respect a highly finished and beautiful performance.

There are nearly as many statues of Antinous as of the Venus de Medicis; and they are very similar to each other: the hair is always disposed in the same manner, covering the forehead nearly as low as the eyebrows; and they all resemble one another in conveying a melancholy idea to the mind.

Mr. Richardson supposes that the vast number of these statues may be attributed to the nobility of Rome, who probably might make court to the emperor Adrian, by having statues of his favourite Antinous.

Among the different statues referred to, was one of late in the yard of the palace of the grand duke at Florence. There were two in the Villa Mattei; another in the garden of the Belvidere, found in Adrian's baths by Leo. X. Another fine statue of Parian marble, formerly broken to pieces, but well put together, stood in the Villa of Cassali, on Monte Caelio. The pieces of this statue had been made use of by the Goths to build a wall with, at the demolishing of which, they were found and put together. All the statues of this Villa had been treated in the same manner.

There is also a number of very fine busts of Antinous; among which, was one twice the size of life in the palace Farnese, at Rome; another in the palace Giustiniani; besides many others.

ANTIO, or Anzio, *Cape*, in *Geography*, a promontory of Italy, in the ecclesiastical state, between port Ostia and the gulf of Gaeta. It has a fortified tower, and a convenient port. It takes its name from the ancient *Antium* in its vicinity.

ANTIOCH, in *Ancient Geography*, a city of Syria, was built in memory of his father Antiochus, by Seleucus Nicator, on the river Orontes, about 20 miles from the place where that river empties itself into the Mediterranean; being equally distant from Constantinople and Alexandria in Egypt, or about 700 miles from each. It soon became, and continued to be for many ages, the metropolis of the east, for the Syrian kings, and afterwards the Roman governors, who presided over the affairs of the eastern provinces, chose it for their place of residence; and in the Christian times, it was the see of the chief patriarch of Asia. It ought also to be particularly mentioned, that the disciples of Christ were first called Christians at Antioch, and this Chrysostom specifies as the distinguishing prerogative of this city above all others; and he has celebrated this honour in a distinct homily on Acts XI. Here also the gospel was preached to Grecians who were incorporated into the Christian church. Here also Barnabas and Saul were sent out by the church, under the direction of the Holy Ghost, to travel through Pagan cities, to give light to the Gentiles, and to publish Jesus for salvation to the ends of the earth. We cannot forbear observing, that the Gospel acquires credibility from its having been first taught in the most populous, enlightened, and learned cities, never shunning the public eye, but challenging full examination; and that in those cities it obtained numerous converts by conviction, without the aid of force or fraud. Antioch was particularly honoured by the Jews, on account of the jus civitatis, which Seleucus Nicator had given to them in that city, together with the Greeks and Macedonians; and which, according to Josephus (Ant. lib. xii. c. 13.), they retained in his time. This metropolis of Syria was afterwards known by the name of Tetrapolis, being divided, as it were, into four cities, each of them having its proper wall, besides a common one, which enclosed them all. The first of these cities or quarters was built by Seleucus Nicator; the second by those who repaired thither on its being made the capital of the Syro-Macedonian empire; the third by Seleucus Callinicus; and the fourth by Antiochus Epiphanes. At the distance of about four or five miles was a place called *Daphné*, and reckoned a suburb of Antioch. Here Seleucus planted a grove, and in the midst of it erected a temple, which he consecrated to Apollo and Diana. To this place the inhabitants of Antioch resorted for their pleasures and diversions; and thus it became at last so infamous, that "to live after the manner of Daphné," was used proverbially to express the most voluptuous and dissolute mode of living. Daphné was formerly of such note, that the metropolis was distinguished by it, and denominated *Antioch near Daphné*.

Antioch, though it continued for 1600 years, as Pliny calls it, the queen of the East, was frequently in danger of being overwhelmed by earthquakes to which its situation exposed it, or of being ruined by its enemies. About 144 years before Christ, the disorders and tumults occasioned by the licentious and tyrannical conduct of Demetrius, the sovereign of Syria, terminated in a general revolt of the inhabitants of Antioch; and Demetrius was under a necessity of seeking assistance from Jonathan, one of the Maccabees, for the purpose of chastising the mutineers. Having obtained 3000 men, he resolved to disarm them, and issued orders for this purpose. This measure inflamed their resentment, and produced an insurrection, so that 120,000 men invested the palace in order to kill the king. The Jews flew to disengage him, dispersed the multitude with fire and sword, burnt a great part of the city, and killed or destroyed very nearly 100,000 of the inhabitants. Upon the destruction of the Syrian empire by the Romans, Antioch submitted, and remained for a long time under their dominion. About the year 115, in the reign of the emperor Trajan, Antioch was almost utterly ruined by one of the most dreadful earthquakes which history records. Trajan himself escaped with difficulty, and not altogether unhurt, through a window of the room in which he had retired; and he afterwards contributed largely towards restoring its ancient splendour. In the year 155, it suffered very much by a fire, the damage of which was repaired by Antoninus Pius. Upon the revolt of Avidius Cassius, the Roman

general, about the year 176, the inhabitants of Antioch took part with him, and thus incurred the reſentment of Marcus Aurelius, who iſſued a ſevere decree, forbidding all ſhows and public diverſions, and even the exerciſe of all municipal offices; but upon their repentance he pardoned their offences, reſtored their privileges, and viſited their city before he left the province. In the year 194, they were again deprived of their privileges by the emperor Severus, for joining Niger, and ſubjected, as a mere village, to the authority of Laodicea; but by the intreaties of his ſon Caracalla, then an infant, he mitigated their puniſhment.

Upon the decline of the Roman power, Antioch became an object of contention between the Romans and the nations of the Eaſt; and accordingly, when Sapor, king of Perſia, over-ran Syria and other provinces, the city of Antioch was ſurprited whilſt the idle multitude was fondly gazing on the amuſements of the theatre; its ſplendid buildings, private and public, were either pillaged or deſtroyed; and the numerous inhabitants were put to the ſword, or led away into captivity. This ſack of Antioch is aſſigned, by the deciſive teſtimony of Ammianus Marcellinus, to the reign of Gallienus; though other hiſtorians refer it to that of Valerian, ſome years before. Upon the diviſion of the Roman empire by Conſtantine, in 331, it was afflicted with a very grievous famine, and relieved by the liberality of the emperor, who ſent thither 30,000 buſhels of corn. In 347, Conſtantine II. cauſed a harbour to be erected at Seleucia for the convenience of Antioch, which was executed at a very great expence. It ſuffered from famine in the reign of Julian, and alſo in that of Theodoſius the Great, at which latter period the diſtreſs of famine was aggravated by a plague. On occaſion of a tax impoſed in 387, by Theodoſius, the people were much enraged; and the cruelty of the governor, in reſtraining and puniſhing their ſedition, induced many of them to abandon their dwellings, and to retire with their wives and families to the neighbouring mountains. Some of them, however, returned; and to theſe St. Chryſoſtom preached ſome of thoſe admired homilies now in our poſſeſſion; and theſe homilies are ſaid to have had a great effect in reforming the licentious and diſſolute. Theodoſius, when he heard of this tumult, commanded the city to be deſtroyed, and the inhabitants to be put indiſcriminately to the ſword; but the order was revoked; and he contented himſelf with inflicting a puniſhment ſimilar to that of Severus at a former period. Numbers, however, were condemned; and St. Chryſoſtom interpoſed to obtain for them a reſpite. At laſt a general pardon was obtained, and the city was reſtored to its former privileges. Antioch ſuffered from earthquakes in the years 458 and 526; but when Choſroes, king of Perſia, invaded Syria in 540, the city, diſdaining the offers of an eaſy capitulation, was taken by ſtorm, the inhabitants ſlaughtered with unrelenting fury, and the city itſelf delivered to the flames; thoſe who eſcaped were carried into Perſia, and ſold as ſlaves. Having again recovered, in a great degree, its former ſplendour, it was viſited with an earthquake, A. D. 587, by which 30,000 perſons loſt their lives, and the city was almoſt wholly deſtroyed. In 611, it was ſeized by Choſroes II.; but "the aged metropolis, ſo often overturned by earthquakes and pillaged by the enemy, could ſupply but a ſmall and languid ſtream of treaſure and blood." In 638, Antioch was reduced by the Saracens, and ranſomed with 300,000 pieces of gold: but "the throne of the ſucceſſors of Alexander, the ſeat of the Roman government in the eaſt, which had been decorated by Cæſar with the titles of free, and holy, and inviolate, was degraded, under the yoke of the caliphs, to the ſecondary rank of a provincial town." It was recovered by the Greeks under Nicephorus Phocas and John Zimiſces, in the 10th century, and again reſtored as a permanent and uſeful acceſſion to the Roman empire. But the civil diſſenſions in the empire afforded to the Turks an opportunity of ſeizing upon Antioch, as well as the whole kingdom of Syria; and from them it was taken by the cruſaders, A. D. 1098. In 1262, it was taken by Bibaris, ſultan of Egypt, and then its glory terminated.

Antioch, called by the Arabs *Antakia*, anciently ſo renowned, is now no more than a ruinous town, the houſes of which built with mud and ſtraw, and conſiſting of narrow and miry ſtreets, exhibit every appearance of poverty and wretchedneſs. It is ſituated on the ſouthern bank of the Orontes, at the extremity of an old decayed bridge, and is covered to the ſouth by a mountain, upon the ſlope of which is a wall built by the cruſaders. The diſtance between the preſent town and this mountain may be about 400 yards; and the intervening ſpace is occupied by gardens and heaps of rubbiſh.

Antioch, however, ſeems to be better calculated than Aleppo, which is become the metropolis of theſe eaſtern parts, to be the emporium of the Europeans. By clearing the mouth of the Orontes, which is ſix leagues lower down, boats might be towed up that river, though they could not ſail up, as Pococke has aſſerted, its current being too rapid. The natives, who never knew the name Orontes, call it, on account of the ſwiftneſs of its ſtream, *El-Aaſi*, that is, the rebel. Its breadth at Antioch is about 40 paces. Seven leagues above the town it paſſes by a lake abounding in fiſh, and eſpecially in eels. Many of theſe are ſalted every year; but the quantity is not ſufficient for the numerous faſts of the Greek chriſtians. We no longer hear at Antioch either of the grove of Daphné, or of the voluptuous ſcenes of which it was the theatre.

The walls of each quarter of Antioch, as well as thoſe which ſurrounded the whole, are ſtill remaining; but as the houſes are deſtroyed, the four quarters appear like ſo many incloſed fields.

The plain of Antioch, though the ſoil of it is excellent, is uncultivated, and abandoned to the Turkmans; but the hills on the ſide of the Orontes, particularly oppoſite to Serkin, abound in plantations of figs and olives, vines and mulberry trees, which are planted in quincunx, and exhibit a beautiful landſcape. N. lat. 36° 20′. E. long. 37° 5′. Anc. Un. Hiſt. vol. viii. p. 115. Rollin's Anc. Hiſt. Crevier's Hiſt. of the Roman Emperors. Gibbon's Hiſt. vol. i. p. 438., ii. p. 361., iv. 123. 146., v. 59. 64., vii. 313. 417., viii. 220., ix. 417., x. 90., xi. 64. Volney's Travels in Egypt and Syria, vol. ii. p. 154.

There were many other ancient cities which bore the name *Antiochia*. Stephanus, de Urbibus, and Euſtathius, in Dionyſ. p. 170, enumerate 14; and others, particularly Appianus in Syriacis, mention 16 cities diſtinguiſhed by this appellation. Of theſe we may mention, Antioch of Piſidia, as it was uſually denominated, though it was ſituated in Phrygia, near Piſidia, or in the northern part of Piſidia; this was a Roman colony, and called alſo *Cæſarea*. It is mentioned by Strabo and Ptolemy; and alſo by St. Luke, Acts xiii. 14. Another was of Caria, ſituate on the Meander river, at the confluence of this with the Corſinus, north-weſt of Aphrodiſius. According to Stephan. Byz. it was alſo called Pythopolis, and Nyſia or Nyſa; which, according to Strabo, was near Tralles. This was built by Antiochus, the father of Seleucus, and was a biſhop's ſee. Another was of Cilicia, in that part called Trachea, on the borders of the ſea, at the foot of Mount Cragus. Steph. Byz. is miſtaken in placing this city near the Pyramus, which

which watered Cilicia Campeſtris. There was alſo another town of this name in Cilicia, ſituate on the Sarus, and anciently called Adana; but Antiochus Epiphanes gave it his name, about 171 years before Chriſt. It was famous under the emperor Titus Antoninus, and diſtinguiſhed by honorary titles. The Itineraries place it 27 Roman miles from Tarſus, and 18 miles from Mopſueſtia. Another Antiochia was ſituated in Meſopotamia, at the foot of mount Maſius, according to Strabo, and the ſame with Niſibis. A city of this name is placed by Steph. Byz. between Cœloſyria and Arabia; and Berkelius ſays, it was the ſame with Gadara. Another Antiochia was ſituated in the province of Syria, called Comagene, at the foot of mount Taurus, to the weſt of Samoſata, and at a diſtance from the Euphrates, where Pliny places it. Antiochia was alſo the name of Edeſſa. Pliny places a city of this name in Sittacene, which Hardouin ſuppoſes to be that which Ptolemy calls Apollonia. Another Antiochia was in Margiana, called Alexandria, after the name of its original founder, but re-eſtabliſhed by Antiochus, ſon of Seleucus, who gave it his own name. Antiochia was alſo, according to Pliny, an iſland at the entrance of the Thracian Boſphorus. Stephanus Byz. ſays, that there was alſo a city of this name in Scythia.

ANTIOCHA, in *Entomology*, a ſpecies of PAPILIO that inhabits South America. The wings are black, with two white bands on the anterior pair. Fabricius, Gmelin, &c. Papilio clytia of Cramer is conſidered as a variety β of this ſpecies.

ANTIOCHE, PERTUIS DE, in *Geography*, a channel in the Atlantic, on the French coaſt, near the northern part of the iſland Oleron, and on the ſouthern of the iſle of Rhé.

ANTIOCHETTA, a town of Aſiatic Turkey, on the coaſt of Caramania, and nearly due north from the weſtern end of the iſland of Cyprus. It is a biſhop's ſee. N. lat. 36° 8′. E. long. 32° 15′.

ANTIOCHIA, a town of South America, in the kingdom of Popayan.

ANTIOCHIAN *ſect*, or *academy*, a name given to the fifth academy, or branch of academies.

It took the denomination from its being founded by Antiochus, a philoſopher contemporary with Cicero.

The Antiochian academy ſucceeded the Philonian. As to points of doctrine, the philoſophers of this ſect appear to have reſtored that of the ancient academy, except that in the article of the criterion of truth, Antiochus was really a Stoic, and only nominally an Academic. After his time, the profeſſors of the academic philoſophy were diſperſed by the tumults of war, and the ſchool itſelf was transferred to Rome. See ANTIOCHUS.

ANTIOCHIAN *epocha*, in *Chronology*, a method of computing time from the proclamation of liberty granted the city of Antioch, about the time of the battle of Pharſalia.

ANTIOCHIS, in *Ancient Geography*, a tribe of Greece, in Attica.

ANTIOCHUS SOTER, in *Ancient Hiſtory* and *Biography*, was the ſon of Seleucus Nicator, by Apama, the daughter of Artabazus the Perſian; and took poſſeſſion of the empire of Aſia, on his father's death, and held it for 19 years. He is chiefly recorded in hiſtory on account of his paſſion for Stratonice, his mother-in-law. Fearing to diſcloſe his attachment, he fell into a lingering diſeaſe, which endangered his life. But the affection of his father induced him to employ the celebrated phyſician, Eraſiſtratus, to diſcover the cauſe of his diſorder, and to adminiſter neceſſary relief. The phyſician ſoon perceived, by the changes of his pulſe and countenance whenever Stratonice entered the room, the occaſion of his complaint; and he pretended to the father, that Antiochus was in love with *his* wife, and at the ſame time expreſſed his concern, that his malady admitted of no cure. Seleucus remonſtrated, and ſtrongly urged the phyſician to preſerve the life of his ſon by yielding to his wiſhes. "Would you do ſo (ſaid Eraſiſtratus) provided Stratonice were the object of his affection?"—"Moſt willingly," replied the king.—"The cure then (rejoined Eraſiſtratus) is in your own power:" and when he diſcloſed to him the ſecret. Seleucus fulfilled his promiſe, and reſigned the beautiful Stratonice to his ſon, together with a conſiderable part of his dominions; and cauſed them to be crowned king and queen of Upper Aſia. Upon the death of his father, he ſucceeded to the whole empire, and reſided at Antioch. Having ſurrendered his pretenſions to Macedon in favour of Antigonus Gonatus, on his marrying Phila, the daughter of Stratonice by Seleucus, he afterwards defeated the Gauls, who had ſettled in Lower Aſia, whence he obtained from theſe provinces the title of *Soter*, or *Saviour*. He himſelf was afterwards defeated by Eumenes king of Pergamus; and after this defeat returned to Antioch, where he put one of his ſons to death, for raiſing diſturbances in his abſence; and at the ſame time proclaimed the other, called Antiochus, king of Syria. He died ſoon after in the year before Chriſt 261. Anc. Un. Hiſt. vol viii. p. 125.

ANTIOCHUS THEOS, or *God*; ſo called by the flattery of the Mileſians, for delivering them from Timarchus; was the ſon of the preceding Antiochus by Stratonice, and ſucceeded his father in the ſole poſſeſſion of all his dominions. In the third year of his reign, a bloody war broke out between him and Ptolemy Philadelphus, king of Egypt, on occaſion of an inſult offered to Apame, ſiſter of Antiochus, and widow of Magas king of Cyrene and Lybia. During this war, the Parthians revolted, and putting themſelves under the conduct of Arſaces, drove out the Macedonians; and thus laid the foundation of the Parthian empire, which at length became formidable not only to all the Princes of the Eaſt, but even to the Romans. The Bactrians alſo, under Theodotus, and the other nations in thoſe parts, ſhook off the Macedonian yoke, and elected princes of their own; and thus Antiochus loſt all the provinces of his empire lying beyond the Euphrates. In theſe circumſtances of deſertion and diſtreſs, Antiochus concluded a treaty of peace with Ptolemy, on the condition of divorcing his former wife Laodice, who was his own ſiſter by the father, and marrying Berenice, the daughter of Ptolemy, and ſettling the crown upon the male iſſue of that marriage. The nuptials were ſolemnized with extraordinary magnificence at Seleucia. Within two years after this marriage Ptolemy died, and Antiochus repudiated Berenice, and reſtored Laodice, who embraced this favourable opportunity of ſecuring the ſucceſſion to her ſon. With this view, ſhe cauſed Antiochus to be poiſoned, and employed Artemon, who much reſembled him in his voice and features, to be placed in his bed, the body of her deceaſed huſband being ſecretly conveyed away. To complete this ſtratagem, Artemon ſtrongly recommended his dear Laodice and her children to the lords that viſited him. Accordingly, in the name of Antiochus, ſuppoſed to be ſtill alive, orders were iſſued that all his ſubjects ſhould obey his beloved ſon Seleucus Callinicus, and acknowledge him for their lawful ſovereign. The crown being thus ſecured, the death of the king was publicly declared, and Callinicus, without oppoſition, aſcended the throne. Antiochus died in the year before Chriſt 246, after a reign of 15 years. Laodice finiſhed her infamous career by the murder of Berenice and her ſon. Anc. Un. Hiſt. vol. viii. p. 127.

ANTIOCHUS *the Great*, ſo called on account of his illuſtrious actions, was the ſon of Seleucus Callinicus, and ſucceeded his brother Seleucus Ceraunus, in the year before Chriſt

Chriſt 225. After the troubles with which his reign commenced, and which were terminated peaceably by his activity, his attention was engaged by the revolt of his uncle Achæus, who uſurped the ſovereignty of Aſia Minor; and by a conteſt with Ptolemy Philopator, king of Egypt, for the recovery of Cœloſyria. He firſt reſolved on a war with Ptolemy, which, after ſeveral advantages gained by him, terminated by a defeat in the deciſive battle of Raphia, in the year before Chriſt 217, which obliged him to abandon all his conqueſts, and to withdraw, with the remains of his ſhattered army, to Antioch. The reſult was a negotiation for peace, which Antiochus obtained, on the condition of ſurrendering to Ptolemy the whole of Cœloſyria and Paleſtine. His next object was Achæus, whom he obliged to quit the field, and to ſhut himſelf up in the caſtle of Sardis; but he was at length delivered up by treachery to Antiochus, who, whilſt he compaſſionated the misfortunes of a man to whom he was indebted for his crown, ordered him to be beheaded, and thus put an end to the war of Aſia. Antiochus was now at liberty to purſue his plans for the reduction of thoſe provinces in the eaſt, which had ſhaken off the Syrian yoke. Accordingly he recovered Media and Parthia, and reduced Syringis, the capital of Hyrcania. Arſaces, however, was a formidable enemy; and he therefore made overtures to him for putting an end to the war; the conſequence of which was, that it was agreed by treaty, that Arſaces ſhould hold Parthia and Hyrcania, on condition of his aſſiſting Antiochus to recover the other provinces which had revolted. He alſo, in a ſimilar manner, concluded a peace with Euthydemus king of Bactria. After this pacification, he croſſed Mount Caucaſus, and entered India, where he renewed his alliance with Sophagaſenus king of that country; and having marched through Arachoſia, Drangiana, and Carmania, he returned by Perſia, Babylonia, and Meſopotamia, to Antioch, after a ſucceſsful expedition of ſeven years, and with the ſurname of *Great*, which he had acquired, and which he might have retained, with the reputation annexed to it, till his death, if he had not unfortunately engaged in a war with the Romans.

Soon after the return of Antiochus, Ptolemy Philopator died, and was ſucceeded by his ſon Ptolemy Epiphanes, a child of five years. The youth of the ſovereign of Egypt preſented to the ambitious views of Antiochus objects which were too alluring to be reſiſted. This, he thought, was a favourable opportunity, not only for recovering his loſt provinces, but for ſeeking further aggrandiſement. Accordingly he entered into a treaty with Philip king of Macedon, in virtue of which they were to deprive the infant king of his dominions, and to divide them: Philip was to have Caria, Lybia, Cyrene, and Egypt; and Antiochus all the reſt. Antiochus, having ſettled theſe preliminaries, marched into Cœloſyria and Paleſtine, and ſoon ſubdued them. But it ſo happened, that at this time Scipio had concluded the ſecond Punic war; and the fame of the Romans was every where ſpread. The guardians of the young king, incited by the celebrity of the Roman name, ſent an embaſſy to Rome, imploring the protection of that republic, and offering the guardianſhip of their king, and the regency of the kingdom during his minority. The Romans acceded to the propoſal, and immediately ſignified their compliance to Antiochus and Philip, requiring them to deſiſt from invading the dominions of their pupil, and threatening war upon them for his protection. Ariſtomenes, an old experienced officer, was appointed the young king's miniſter, and he deputed Scopas to levy troops in Ætolia, for the ſervice of his maſter. Theſe troops marched, during the abſence of Antiochus, into Paleſtine and Cœloſyria, in order to recover thoſe provinces; but after ſome ſucceſs, Antiochus returned, defeated Scopas, with the loſs of the greateſt part of his army, and obliged him to ſurrender Sidon, into which he had retired, with the whole garriſon. Antiochus was cordially received by the Jews; and on his approach to Jeruſalem, treated with the utmoſt reſpect and hoſpitality. In return, Antiochus granted them many privileges and favours. Antiochus proceeded from Paleſtine to Aſia Minor; and as he ſailed with a formidable fleet along the coaſt of Cilicia, Pamphylia, Lycia, and Caria, many of the maritime cities of thoſe provinces voluntarily ſubmitted to him. He then ſailed to Epheſus, made himſelf maſter of it, and took up his winter-quarters there. In the mean time Smyrna, Lampſacus, and other Greek cities of Aſia, which at that time enjoyed their liberty, concurred in imploring the protection of the Romans, who were at laſt prevailed upon to exert themſelves in reſtraining the progreſs of Antiochus. But during this embaſſy, Antiochus croſſed the Helleſpont, and ſeized all Thracian Cherſoneſus. The ſuccour which theſe cities ſolicited was delayed, and much time was loſt in ineffectual negotiation; till at length, in the year before Chriſt 195, Hannibal beſought the protection of Antiochus, and engaged him to make war on the Romans. Antiochus ſtrengthened himſelf by new alliances; having married his daughter Cleopatra to Ptolemy king of Egypt; and Antiochis, his ſecond daughter, to Ariarathes king of Cappadocia. After fruitleſs embaſſies between him and the Romans, he formed the fatal reſolution of commencing a war with them. Hoſtilities were mutual, and ſucceſs for ſome time was doubtful; but the fleet of Antiochus having been defeated by that of the Romans, and his troops having been withdrawn from the Helleſpont, the two Scipios, Cornelius and Africanus, found a free paſſage into Aſia. The king was alarmed, and mae propoſals of accommodation to the Romans, which, although very advantageous to them, were rejected. He alſo reſtored, without ranſom, the ſon of Africanus; and the grateful father acknowledged his obligations, by deſiring him not to hazard a battle before his return to the army. But a deciſive engagement took place at Magneſia, in Lower Aſia; Antiochus was completely vanquiſhed, in the year before Chriſt 190: and compelled by the circumſtances to which he was reduced, to ſue for peace. The terms were his giving up all his pretenſions on Europe, limiting his Aſiatic dominions to the country beyond Mount Taurus, and paying the expences of the war. The ſurrender of Hannibal was alſo ſtipulated, but he had made his eſcape. The Syrian monarch did not long ſurvive this humiliation: the manner of his death is not ſo ſatisfactorily aſcertained. Jerom, on the authority of Strabo, ſays, that having plundered the temple of Jupiter Belus, in the province of Elemais, he was ſlain in an inſurrection of the people. Aurelius Victor relates, that he gave himſelf up to every kind of diſſolute pleaſure; and that he was killed at an entertainment by one of his gueſts, whom he had inſulted. He died, however, in the year before Chriſt 187, in the 37th year of his reign, and 52d of his age; and he is highly commended by moſt of the ancient hiſtorians for his humanity, clemency, and liberality. Till the 50th year of his age, his prudence in counſel, and courage in action, were ſuch as to command ſucceſs, and entitle him to the appellation of "Great;" but after that age, he was leſs wiſe and valiant, and leſs proſperous. His conduct in the war with the Romans, the contempt with which he received the wiſe counſels of Hannibal, and the ignominious peace which he was forced to accept, obſcured all the glory of his former expeditions. The prophecies of Daniel, from the 10th verſe of the 11th chapter to the 19th, inclu-

ſive,

cluſive, relate to the actions of this prince, and were all fully accompliſhed. Anc. Un. Hiſt. vol. viii. p. 139—191.

Antiochus Epiphanes, a younger ſon of Antiochus the Great, ſucceeded his brother Seleucus, in the year before Chriſt 176. It was one article of the humiliating treaty of Magneſia, that this prince ſhould be ſent to Rome as a hoſtage; and there he was detained for 13 years, till he was exchanged for his brother's ſon Demetrius. In his way home, his brother Seleucus was poiſoned by Heliodorus, who uſurped the crown. But aided by Eumenes, king of Pergamus, and Attalus that king's brother, he drove out the uſurper, and aſcended the throne. His conduct was fooliſh and extravagant to an extreme degree; and beſides the frantic follies with which he was chargeable, he was addicted to drunkenneſs, ſquandered away large ſums of money in riotous exceſſes; and in his mad frolics, ſcattered handfuls of money among the populace, crying out, "Let him take it to whom fortune gives it." This odd and extravagant conduct, of which many ſingular inſtances are recited, made his ſubjects regard him as a madman; whence, inſtead of "Epiphanes, or the Illuſtrious," the title which he aſſumed on being ſettled on the throne, they uſed to ſtyle him "Epimanes" that is, "the Madman." Soon after his acceſſion, a demand was made by the adminiſtration of Egypt for the reſtoration of Cœloſyria and Paleſtine; and this demand occaſioned a war between the two crowns. Antiochus determined to anticipate the preparations made in Egypt, by a commencement of hoſtilities, and by an actual invaſion of the country; and, at the ſame time, he ſent a ſplendid embaſſy to Rome to juſtify his conduct, and to conciliate the favour of the ſenate. In his firſt expedition, he routed the Egyptians, and wintered at Tyre. In a ſecond campaign, in the year before Chriſt 170, he reduced the whole country, except Alexandria, and gained as much by his clemency as by his arms. On this occaſion, Ptolemy Philometer fell into the hands of the conqueror; and the Alexandrians, conſidering him as loſt to them, placed upon the throne his younger brother Ptolemy Euergetes, called alſo Phyſcon; and made attempts to recover their country from the Syrians. Antiochus was thus induced to make a third expedition into Egypt, and advanced directly to Alexandria, with the deſign of beſieging it. In this danger, Ptolemy Euergetes, and his ſiſter Cleopatra, ſent an ambaſſador to Rome to ſupplicate aſſiſtance. The ſenate determined to give them relief, and accordingly ſent an embaſſy into Egypt for the purpoſe of terminating the war: and the inſtructions of their ambaſſadors were, to order the contending princes to ſuſpend all hoſtilities, and to put an end to the war, on pain of forfeiting the friendſhip and alliance of the Romans. Antiochus, in the mean time, had made a pacification with Philometor, and engaged to reſtore him to the poſſeſſion of his dominions, Peluſium excepted. He then returned to Antioch; but during his abſence, the two royal brothers agreed, under the influence of Cleopatra's mediation, to reign jointly, and to renounce their dependence on Antiochus. This produced a fourth expedition into Egypt; and the Syrian king was haſtily marching towards Alexandria, after having reduced the greateſt part of the country, when he was met by the three Roman deputies. The decree of the ſenate was announced to him, and he deſired ſome time for deliberation. Popilius, one of the deputies, drew a circle with a rod, which he held in his hand, round the king, and informed him that he expected a peremptory anſwer before he left that ring. Antiochus heſitated for a few minutes, and then declared his readineſs to comply with the requiſition of the republic. The three deputies gave him their hands, and Popilius renewed his former familiarity with him. Antiochus was probably not a little exaſperated, though he was obliged to ſubmit; for on his return from Egypt, he viſited Jeruſalem, and with extreme cruelty compelled the Jews to violate the principles of their religion and worſhip at the heathen altars which he had cauſed to be erected. In a former expedition, he had taken Jeruſalem by ſtorm, plundered and defiled the temple, and aboliſhed the Jewiſh ritual. Theſe violences, which are related in the books of the Maccabees, occaſioned the new revolt of Mattathias and his ſons; which for a long time filled that country with bloodſhed, and defied the whole power of Syria.

With a view of further ingratiating himſelf with the Romans, he celebrated their ſubjugation of the kingdom of Macedon under Perſeus, by cauſing games to be exhibited at Daphné near Antioch, with a pomp and magnificence which even in that luxurious part of the world had never before been witneſſed. The king's conduct was ſo extravagant and abſurd on this occaſion, that Tiberius Gracchus, the Roman envoy at his court, informed the ſenate, that they need be under no apprehenſions from any deſign which he could form. Nevertheleſs, on a revolt of Armenia and Perſia, he left part of his army under Lyſias to reduce Judæa, and marched with the reſt againſt Artaxias, the Armenian king, whom he defeated and took priſoner. From Armenia he marched into Perſia, and flew to Elimais, of the immenſe wealth of which he had received information, with a deſign to plunder both the city and the temple. Here he was repulſed with the greateſt ignominy; and mortified at the diſgrace he ſuffered, he withdrew to Ecbatan in Media. But news arriving of the defeat of Nicanor and Timothæus, two of his generals in Judæa, he haſtened towards Babylonia; and was met in his paſſage by two meſſengers, who gave him an account of the defeat of Lyſias, and that the Jews had retaken the temple, thrown down the images and altars which he had erected, and reſtored their former worſhip. Theſe tidings exaſperated him beyond meaſure; and he determined to march in perſon againſt the Jews, and threatened to extirpate the whole nation. He had ſcarcely uttered theſe words, when he was ſeized with an excruciating pain in his bowels, which no remedy could cure or alleviate. He reſolved, however, to proceed, till at length he was obliged to halt at a town called Tabæ, on the confines of Perſia and Babylonia, in the year before Chriſt 165, where he expired, after languiſhing for ſome time in the moſt dreadful agony both of mind and body, in the 12th year of his reign, and 39th of his life. The 11th chapter of Daniel, from the 20th verſe to the end, wholly relates to this Antiochus. Anc. Un. Hiſt. vol. viii. p. 195. 213.

Antiochus Eupator, was the ſon of the preceding, and placed on the throne at the age of 9 years, on the death of his father, by Lyſias; though the deceaſed monarch had appointed Philip, his prime miniſter, for his guardian. Philip retired into Egypt; and Lyſias proſecuted the war with the Jews which Epiphanes had begun; but the large army which he conducted thither was defeated by Judas Maccabæus.

From another expedition into Judæa, and the ſiege of Jeruſalem, he was recalled by the intelligence, that Philip had taken poſſeſſion of Antioch, and ſeized on the government. Lyſias made peace with the Jews; and having marched againſt Philip, defeated him, and put him to death. In the mean time the Roman ſenate had aſſumed the tutelage of the young king, and ſent a commiſſion of guardianſhip into Syria, with orders to burn all the decked ſhips, and diſable the war-elephants. Octavius, who was appointed chief of this commiſſion, and who executed his orders with great inſolence,

ſolence, was killed in a popular tumult at Laodicea; and buried with great pomp by Lyſias, who dreaded the indignation of the ſenate, and ſent ambaſſadors to Rome for his own exculpation. At this time Demetrius, the ſon of Seleucus Philopator, who had the beſt right to the crown, but who was kept at Rome as a hoſtage, contrived to make his eſcape: and arriving in Syria, was received every where by the people as their lawful ſovereign. Lyſias and the inoffenſive Eupator were delivered by their own ſoldiers to Demetrius, who ordered them both to be put to death, in the year before Chriſt 162, after the young prince had reigned between two and three years. The author of the firſt book of the Maccabees ſays, they were taken priſoners by the ſoldiers of Demetrius, and by them put to death, without any orders from Demetrius. Anc. Un. Hiſt. vol. viii. p. 212. 221.

ANTIOCHUS SIDETES, or the *Hunter*, was the ſecond ſon of Demetrius Soter, and ſucceeded to the throne, vacated by his brother Demetrius Nicator, after the expulſion of Tryphon the uſurper, by the intereſt of Cleopatra, the wife of Demetrius, whom he married, and the aſſiſtance of Simon, high prieſt of the Jews, in the year before Chriſt 138. After his acceſſion, he reduced all thoſe cities of Syria which had rendered themſelves independent during the inteſtine troubles. He then made war with the Jews, beſieged Jeruſalem, and compelled Hyrcan, who had ſucceeded his father Simon, to purchaſe a peace, on the condition of paying tribute. He then entered Parthia, with a motley multitude of cooks, ſingers, women, and other miniſters of luxury, much more numerous than his ſoldiers, defeated Phraates, and regained the provinces which he had ſeparated from the Syrian empire. But his troops being diſperſed into diſtant winter-quarters, the oppreſſed people, joined by the Parthians, conſpired to attack them all in one day; and Antiochus, and every man under his command, were deſtroyed. Others ſay, that he could not ſurvive the diſgrace of being vanquiſhed in battle, and that he put an end to his own life. This happened in the ninth year of his reign, before Chriſt 130. Although Antiochus was addicted to intemperance and amuſement, he is repreſented as a prince poſſeſſing many good qualities, a lover of juſtice, and inclined to clemency. Phraates, on viewing his dead body, is ſaid to have exclaimed, "Your wine, Antiochus, and your too great confidence, have brought you to this untimely end. You thought you could have ſwallowed the kingdom of Arſaces in your cups." Anc. Un. Hiſt. vol. viii. p. 242—245.

ANTIOCHUS GRYPUS, or *hook-noſed*, was the ſon of Demetrius Nicator by Cleopatra; and on the death of his brother Seleucus, whom his mother, jealous of her power, cauſed to be murdered, was recalled by her from Athens, where he had been ſent for his education, and proclaimed king of Syria, in the year before Chriſt 123, to the excluſion of Alexander Zebina, who had uſurped the throne, and whom Grypus afterwards put to death. Cleopatra had advanced Grypus to the throne, with a view of reſerving the authority to herſelf, and of allowing him the mere title of king. But when he began to manifeſt an inclination to govern independently of his mother, ſhe determined to transfer the crown to a younger ſon, and to diſpatch this by poiſon. For this purpoſe, ſhe prepared a bowl, and preſented it to the young king on a day when he returned hot and weary from the chace. But as he was forewarned of her purpoſe, he deſired her to take the firſt draught; and on her refuſal, he ſummoned the lords of his court, communicated to them the information he had received, and then ſaid, that the only mode by which ſhe could exculpate herſelf, was to drink what ſhe had prepared for him. She drank, and preſently expired. After her death, Antiochus enjoyed the ſovereignty of Syria for eight years without diſturbance; but there aroſe a rival, viz. Antiochus the Cyzicene, the ſon of Cleopatra by Antiochus Sidetes. The conſequence of this rivalſhip was a civil war, which terminated in the diviſion of the kingdom. Having thus ſettled their difference, they both devoted themſelves to voluptuouſneſs and debauchery, and totally neglected both their private and public concerns. This negligence on their part gave John Hyrcan an opportunity of making conqueſts upon Syria; and the ſubſequent diſagreement of the two brothers afforded occaſion for ſeveral cities to aſſert their independence. At length Grypus was aſſaſſinated by one of his own ſubjects, in the 45th year of his age, in the year before Chriſt 97, after having reigned, according to Joſephus, 29, and according to Porphyrius, 26 years. Cyzicenus, ſome years after, was defeated and ſlain by his nephew Seleucus. Anc. Un. Hiſt. vol. viii. p. 248—253.

ANTIOCHUS, a monk of Seba in Paleſtine, of a very ſuperſtitious complexion, lived towards the beginning of the ſeventh century; and wrote a ſummary of the chriſtian doctrine, intitled "The Pandect of the Holy Scriptures," in 130 homilies. In the preface, he mentions the capture of Jeruſalem by Choſroes, king of Perſia; and relates the cruelties inflicted on the monks of Paleſtine; and in an annexed poem, he laments in doleful ſtrains the loſs of a precious fragment of the true croſs, which, among other ſpoils, was carried away by the Perſians. The work is publiſhed in Greek and Latin, in the additions to the "Bibliotheca Patrum." Fabric. Bib. Grec. l. v. c. 34. § 3. t. ix. p. 260. Moſheim Eccl. Hiſt. vol. ii. p. 174. 179.

ANTIOCHUS, a Stoic philoſopher, was a native of Aſcalon, a diſciple of Carneades, and the laſt preceptor of the Platonic ſchool in Greece. He flouriſhed about 100 years before Chriſt. Cicero (in Brut. et de Nat. Deorum. l. i. c. 7.) mentions him with reſpect as one of his inſtructors, and as the author of an ingenious treatiſe upon the Academic ſect; in which he ſhewed that the Peripatetics and Stoics differed more in words than in real opinion. He alſo maintained, that the doctrines of the Stoics were to be found in the writings of Plato. Cicero alſo profeſſes to admire his eloquence and the politeneſs of his manners; and Lucullus took him as his companion into Aſia and to Rome, in which city he enjoyed the friendſhip of many illuſtrious men. Plutarch (in Lucull.) mentions a treatiſe of his "On the Gods;" and Stephanus Byz. ſays, that he was the ornament of his country, and gives him the appellation of a "ſwan." None of his writings are extant. He reſigned the academic chair in the 175th Olympiad, or in the year before Chriſt 80. Brucker's Hiſt. of Philoſ. by Enfield, vol. i. p. 254.

ANTIOCHUS, was a contemporary with Galen. He is ſaid to have lived nearly an 100 years, and to have enjoyed his faculties to the laſt. This was attributed to an abſtemious and careful regimen, which he adopted as ſoon as he became advanced in years.

ANTIOCHUS, in *Entomology*, a ſpecies of PAPILIO that inhabits China. The wings are entire, roundiſh, black; with a broad yellow-brown band continued acroſs the upper ſurface of all the wings. Fabricius, and Donovan's Inſects of China.

ANTIODONTALGICUS, a new inſect, deſcribed by profeſſor Gerbi, in a ſmall work publiſhed at Florence in 1794; ſo called from its property of allaying the tooth-ach. It is a kind of curculio, and found on a ſpecies of thiſtle, carduus ſpinoſiſſimus, which is perhaps a variety of

the cuicus. Its flowers, when analyſed, gave the acid of ſalts, the muriatic acid, oxalate of lime, extractive matter, and a very little reſin. The inſect eats not only the parenchyma, but alſo the veſſels and fibres of the leaves. It is of a longiſh figure, covered below with ſhort yellow hair, and above with golden, yellow velvetty ſpots. Its corcelet is variegated with ſpecks, and the covering of its wings with ſpecks and ſtripes. It has a ſhort proboſcis, and ſomewhat reſembles the curculio villoſus of Geoffroy. Its larva repreſents a ſort of ichneumon. If 12 or 15 of theſe inſects, in the ſtate of larva, or when come to perfection, be bruiſed and rubbed ſlowly between the forefinger and thumb, until they have loſt their moiſture; and if the painful tooth, where it is hollow, be touched with that finger, the pain ceaſes, ſometimes inſtantaneouſly. A piece of ſhamoy leather will anſwer the ſame purpoſe with the finger. If the gums are inflamed, the remedy is of no avail. Other inſects poſſeſs this property of curing the tooth-ach; ſuch as the carabus ferrugineus of Fabricius; the coccinella ſeptem-punctata, or lady-bird; the chryſomela populi, and the chryſomela ſanguinolenta. This property ſeems to belong to ſeveral kinds of the coleoptera.

ANTIOPA, a ſpecies of PAPILIO that inhabits Europe. The wings are angulated, black, with a whitiſh border. Linn. Faun. Suec. Fabricius, &c. This is papilio maxima nigra, alis utriſque limbo lato albo cinctis of Ray, &c.; and is known by the Engliſh name of Camberwell beauty butterfly. The dark colour of the wings inclines to a rich purple-brown, the external border to yellowiſh; and it has an intermediate black ſtripe, with a row of blueiſh ſpots, and two long yellowiſh ſpots on the anterior margin of the firſt wings. It is produced from a black ſpinous larva, that is marked on the back with a row of ferruginous ſpots, and feeds on the willow. It is remarkable, that the inſects of this ſpecies found in England have the external border of a paler colour than thoſe found in other parts of Europe, though in other reſpects they are perfectly ſimilar. Donovan's Britiſh Inſects, vol. iii. p. 47.

ANTIOPE, in *Fabulous Hiſtory*, the wife of Lycus king of Thebes, who, being deflowered by Jupiter in the form of a ſatyr, brought forth Amphion and Zethus. Another Antiope was queen of the Amazons; and, with the aſſiſtance of the Scythians, invaded the Athenians, but was vanquiſhed by Theſeus.

ANTIOPIA, in *Ancient Geography*, an ancient town of Paleſtine, in the tribe of Naphtali, towards the frontier of Aſer, between Tyr and Bethſaida. It was once a principal city of the Canaanites, but is now reduced to a miſerable village.

ANTIPACHSU, in *Geography*, a ſmall iſland on the coaſt of Epirus, over againſt the gulph of Arta, between Corfu and Cephalonia.

ANTI-PÆDO-BAPTISTS, derived from αντι, *againſt*, παις, παιδος, *child*, and βαπτιζω, *baptize*, whence βαπτισης, is a diſtinguiſhed denomination given to thoſe who object to the baptiſm of infants; becauſe, they ſay, infants are incapable of being inſtructed, and of making that profeſſion of faith which entitles them to this ordinance, and an admiſſion into church communion. See ANABAPTISTS and BAPTISTS.

ANTIPAGMENTS, *Antipagmenta*. See ANTEPAGMENTA.

ANTIPAPINIANUS, αντιπαπινιανος, a title given by the Greek lawyers to the fourth part of the Digeſt, including four books, beginning with the title *De pignoribus*.

This is otherwiſe called *antipapianus*.

The antipapinianus was thus denominated, not as being intended in oppoſition to Papinian, but becauſe it was to ſerve in the ſchools of the civil law in lieu of the books of that lawyer, purſuant to an edict of the emperor Juſtinian; ſo that the antipapinian was ſo far from being a refutation of Papinian, that it was only a ſubſtitute for his writings, which were not ſo proper for the uſe of the younger ſort of ſtudents.

ANTIPARALLELS, in *Geometry*, are thoſe lines which make equal angles with two other lines, but in oppoſite directions. Thus, if AB and AC (*Plate* II. *Geometry, fig.* 27.) be any two lines, and FC and FE be two others interſecting them in ſuch a manner, that the angle B is equal to the angle E, and the angle C equal to the angle D, then BC and DE are antiparallels, with reſpect to AB and AC; and theſe latter are antiparallels with regard to the two former. It is a property of theſe lines, that each pair cuts the other into proportional ſegments, if they be taken alternately, *viz.* AB : AC :: AE : AD :: DB : EC, and FE : FC :: FB : FD :: DE : BC. M. Leibnitz, however, calls thoſe lines antiparallels, which cut two parallels ſo, that the outward angle being added to the inward one, the ſum may be equal to a right angle.

ANTIPARALYTICA, in the *Materia Medica*, medicines ſuited to cure the palſy.

ANTIPARASTASIS, from αντι and παραστασις, of παριστημι, *I exhibit*, in *Rhetoric*, a reply to an opponent, by allowing part of his argument, and denying the reſt, *e. gr.* "you may print whatever you pleaſe, provided the public ſuffer no prejudice from it; but you muſt not, if it does."

ANTIPAROS, in *Geography*, an iſland in the Archipelago, oppoſite to Paros, and ſeparated from it by a ſtrait about ſeven miles wide. This is the ancient *Oliaros*, which was eſtabliſhed by a colony of Sidonians. It is narrow and long, extending in a direction from north-eaſt to ſouth-eaſt; and, according to Tournefort, about 16 miles in circumference; its ſoil is tolerably fertile, and produces for its own ſupply wheat, barley, wine, ſeſamum, and ſome legumes; but the moſt conſiderable production, and that which enables the inhabitants to pay their impoſts, is cotton. What renders Antiparos particularly famous is the grotto, which penetrates into its boſom to a very great depth; and which, according to the relations of the Greeks, communicates beneath the waters with ſome neighbouring iſlands. Magni, an Italian traveller, who firſt diſcovered this ſubterraneous grotto, has given an account of it; Tournefort has alſo deſcribed it with great exactneſs; and M. de Choiſeul Gouffier has given ſome very beautiful drawings of it in his "Voyage Pittoreſque de la Gréce." We firſt find a ruſtic cave, about 30 feet wide, divided by ſome natural pillars; between which the ground ſlopes gently, and then more precipitately to the bottom of the cavern. At laſt the deſcent is by a ladder to the grotto itſelf, which is about 300 fathoms below the ſurface of the earth; and it appears to be about 40 fathoms high, and 50 wide. It is full of large and beautiful ſtalactites, hanging from the roof, and covering the floor. Olivier (Travels, p. 121.) queries, whether it ought to be conſidered as a quarry, from which marble has been extracted for a length of time, or as an immenſe cavity, ſuch as naturally exiſt in moſt calcareous mountains.

ANTIPAS-HEROD. See HEROD.

ANTIPASCHA, in *Eccleſiaſtical Writers*, denotes the firſt Sunday after Eaſter; otherwiſe called DOMINICA *in albis*.

ANTIPATER, in *Hiſtory* and *Biography*, was a native of Idumæa; and, having acquired wealth and influence in the Jewiſh ſtate, joined the phariſees againſt Ariſtobulus the high

high prieſt, in favour of his brother and competitor Hyrcan. He alſo engaged Aretas, the Arabian king, to invade Judæa, where he was ſtrengthened by Hyrcan's party; and totally defeated Ariſtobulus, who was forced to fly into Jeruſalem, and await the event of a cloſe ſiege. In theſe circumſtances Ariſtobulus applied to the Romans for ſuccour; and Scaurus, the Roman general, was induced by a conſiderable bribe to threaten Aretas, and thus to induce him to lead his army out of Judæa. He was afterwards overtaken by Ariſtobulus, and defeated with great ſlaughter. When Pompey arrived in Syria, in the year before Chriſt 63, the two brothers, Ariſtobulus and Hyrcan, appeared before him, and urged their reſpective pleas: but the deciſion was deferred, and Ariſtobulus departed in diſguſt. When Pompey entered Judæa, he ſummoned Ariſtobulus, who had raiſed a conſiderable army, to appear and to anſwer for his conduct; but being diſſatisfied with the terms of conciliation that were propoſed to him, he fled with haſte to Jeruſalem, and was ſoon followed by Pompey, who laid ſiege to the city, and, after an obſtinate reſiſtance, took it. On this occaſion, 12,000 of the beſieged were ſlaughtered by the Romans, beſides many more who died by their own hands. During this horrid ſcene, the prieſts never intermitted the divine ſervice in the temple; and at laſt ſuffered themſelves to be butchered before the altar, with as much meekneſs and conſtancy as the victims they were then offering. Hyrcan was reſtored to the pontifical dignity, with the ſpecious title of prince, though from thenceforth tributary to Rome; but he was wholly diveſted of his regal power, and forbade to reſume either the diadem or royal ſtyle, or to extend his territory beyond the old borders of Judæa. Ariſtobulus and his two ſons, Alexander and Antigonus, together with his two daughters, were taken by Pompey to Rome, as captives to adorn his triumph. The indolence of Hyrcan led him to commit the management of his affairs to Antipater, who artfully contrived to ingratiate himſelf with the Romans, and to promote the aggrandizement of his own family. With theſe views he gave ſucceſſive aſſiſtance to Scaurus, Gabinius, and Caſſius, the Roman generals who commanded in thoſe countries. He alſo facilitated the capture of Peluſium by the ſuccours which he afforded to Julius Cæſar, and he was one of the foremoſt in ſcaling it, when this city was taken by aſſault. Mithridates, in a letter to Cæſar, acknowledged that his ſucceſſes were owing to the co-operation and valour of Antipater; and in recompence of his ſervice, Cæſar gave him conſiderable poſts in the army, and made him procurator or lieutenant of Judæa, and citizen of Rome. Antipater, having accompanied Cæſar to Tyre, where he embarked for Sicily, returned to Jeruſalem, and exerted himſelf in reſtoring the Jewiſh government to its ancient model, and repairing the walls and fortifications. He alſo made his eldeſt ſon Phaſael governor of the metropolis, and appointed his ſecond ſon, Herod, governor of Galilee. This growing power, however, excited the envy and jealouſy of the principal Jews; and at length Malichus, who had been of the ſame party with Antipater, and who had concurred with him in the ſupport of Hyrcan's intereſt, reſolved to take him off by treachery. Antipater, being apprized of his deſign, retired beyond Jordan, and put himſelf in a poſture of defence; but Malichus contrived by various proteſtations to remove his ſuſpicion, and to effect a reconciliation with him; and Antipater, by his intereſt with Marcus, governor of Syria, prevented his being put to death. The jealouſy and envy of Malichus were ſmothered, but not extinguiſhed; and he embraced the firſt convenient opportunity that offered of bribing the butler of the high prieſt to poiſon him with a glaſs of wine, whilſt with an armed force he ſeized upon the government of Jeruſalem. This event happened in the year before Chriſt 43. Anc. Un. Hiſt. vol. iii. p. 127—147.

Antipater, the Macedonian, was a perſon of noble birth, and diſtinguiſhed by his natural talents and excellent education. He was the friend and diſciple of Ariſtotle, learned, and a lover of learning; magnificent in his actions, but plain in his dreſs and behaviour, never varying his habit during the whole time of his government, but appearing like a private perſon when he gave law to kings. Philip of Macedon ſelected him as his miniſter, and confided in him as his friend. "I have ſlept ſoundly," ſaid he; "for Antipater was waking." And Alexander, referring to his plain garb, replied to thoſe who obſerved to him, that all his great officers, except Antipater, wore purple; "True; but Antipater is all purple within." During the abſence of Alexander, on occaſion of his expedition into Aſia, the government of Macedon was given to Antipater; and he was ſupported even againſt the interference of Olympias, Alexander's mother. He alſo maintained the tranquillity of all Greece; and marching with a conſiderable force againſt Agis III. king of Sparta, who had united ſeveral of the Grecian ſtates againſt the Macedonians, he defeated the Spartan king, and by a ſingle action terminated the war.

After the death of Alexander, when the empire was divided by a general council ſummoned by Perdiccas, the government of the European provinces was aſſigned to Antipater, as general of the army in that continent. In conſequence of an edict of Alexander, which directed all the cities of Greece to recall their exiles, Antipater was ſoon engaged in a war, in which the Athenians were particularly active, and in which they were at firſt ſucceſsful; ſo that they compelled him, after a defeat, to retire to Lamia, a ſtrong city, near the field in which their armies had been engaged. But Antipater, receiving aſſiſtance from Aſia, was reſcued from confinement, and the ſiege being raiſed, he was joined by Craterus, and thus enabled to defeat the confederate Greeks. Athens, on his approach, was compelled to ſubmit at diſcretion; and he aboliſhed the popular government there, and eſtabliſhed that of Solon, leaving a Macedonian governor in the place. He alſo ſettled the reſt of the Grecian ſtates on a ſimilar plan of equity and moderation; and ſo much to general ſatisfaction, that he was honoured as the father and protector of Greece. Upon his return to Macedon, he directed his arms, in conjunction with his ſon-in-law Craterus, who had married his daughter Phila, againſt the Ætolians, the only perſons that had refuſed to be comprehended in the peace, and effected their purpoſe. They afterwards entered into a league with Ptolemy, and paſſed over into Aſia, in order to control the power of Perdiccas, who had aſſumed the ſovereignty. But Perdiccas being ſoon after ſlain in Egypt, Antipater was ſent for to the army in Syria, and declared the ſole protector of kings, and inveſted with ſovereign power. Antipater next proceeded to make a new diviſion of the provinces, and then returned to Macedon, his own province, with the kings, leaving the army ſatisfied with his proceedings. Soon after his return to Macedon, he was attacked by a dangerous diſeaſe, which, at his advanced age, left him little hope of life. In his laſt moments he behaved with the ſame firmneſs and the ſame regard to his reputation which he had manifeſted in all the actions of his life. His great offices of protector and governor of Macedon he bequeathed to Polyſperchon, the eldeſt of Alexander's captains then preſent; and his eldeſt ſon, Caſſander, he merely appointed to be a chiliarch or colonel of a thouſand

men. To Polysperchon he gave a council suggested by the experience of his life: "Never, on any account to suffer a woman to interfere in affairs of state." He died at the age of 80, in the year before Christ 318. Anc. Un. Hist. vol. vii. p. 454., vol. viii. p. 16. Rollin's Anc. Hist. vol. iv. p. 374., vol. v. p. 119—151.

ANTIPATER, was bishop of Bostra, an Arabian church, and flourished towards the end of the fifth century. He wrote a refutation of Eusebius's Apology for Origen, fragments of which are preserved in the acts of the second council of Nice. Fabr. Bib. Græc. l. v. c. 34. § 7. t. 9. p. 274.

ANTIPATER, LELIUS COELIUS, a Roman historian, who lived in the time of the Gracchi, was the author of a history of the second Punic war, of which Brutus wrote an abridgment. He is often mentioned by Cicero. The emperor Adrian preferred Antipater to Sallust, probably for the same reason that he preferred Ennius to Virgil, because he was an admirer of the ancient Roman language. Fragments of this historian were published by Riccoboni in 1568, and reprinted with fragments of other historians, by Antony Augustin, at Antwerp, in 1595. Voss. de Hist. Lat. l. i. c. 8.

ANTIPATER of Sidon, or of Tarsus, a stoic philosopher, and also a poet commended by Cicero and Seneca, flourished about the 175th Olympiad, or 80 years before Christ. He was the disciple and successor of Diogenes the Babylonian; and his chief opponent was Carneades.

ANTIPATER, an ancient physician of the sect of the methodists, died, as Galen relates, of a tubercle in his lungs. The tubercle occasioning an intermission of his pulse, which continued several months, Galen, from this circumstance, predicted that his death would be sudden, which accordingly happened.

ANTIPATHES, among the *Ancient Naturalists*, was used to express any stone or gem, which, according to their superstitious ideas of the virtues of gems at that time, was supposed to have a power of resisting the force of enchantments. Pliny mentions a very valuable gem, called by the ancients antipathes for this very reason; and the black coral had the same name on the same account.

ANTIPATHES, in *Natural History*, the name of a genus in the ZOOPHYTA order of VERMES, the character of which, according to the Linnæan system, is, animal growing in the form of a plant; stem within horny, with small spines; base expanded; the outside covered with gelatinous flesh, and numerous polypiferous warts. The species of the genus are, spiralis, ulex, subpinnata, myriophylla, elopecuroides, cupressus, orichalcea, dichotoma, clathrata, fabellum, pennacea, ericoides, and fœniculacea; which see respectively.

ANTIPATHY, compounded of ἀντι, *contra*, *against*, and πάθος, *passion*, in *Physiology*, a natural enmity or aversion of one body to another. In which sense the word stands opposed to SYMPATHY. Such an aversion is commonly said to be between the salamander and the tortoise, the vine and the elm, the toad and the weasel, the sheep and the wolf, the olive and the oak, &c. Phil. Trans. N° 339.

In a more restricted and proper sense, antipathy denotes that natural aversion and detestation which an animated and sensitive being feels with regard to some object that is presented to it, either in reality or in imagination; and the cause of which is mysterious and inexplicable. Such are some of the antipathies mentioned in the last paragraph; and such also is the aversion to which some persons are conscious under the apprehension or at the sight of particular objects, as cats, mice, spiders, serpents, eels, &c. and which produces, whatever be the cause of it, sensible and apparent effects. Many instances of antipathies that have been recorded are, perhaps, no better than fables; and a severe examination would reduce them to the large class of vulgar errors. There are also fictitious aversions, which have no other source besides affectation, and a pretended delicacy of nerves, which is more frequently feigned than real. Of those other antipathies, the existence of which is capable of being ascertained, and which produce sensible and undisputed effect, it is not difficult to assign a cause without recurring, with the Peripatetics, to any occult qualities inherent in bodies. In the credulous period of infancy, with what pains and industry are the minds of children impressed with the sense of the noxious qualities of particular animals, such as serpents and other reptiles; and how easily do they associate the ideas they are thus led to entertain of some objects, with others that resemble them in their visible form or general properties? When an aversion thus imbibed in early life, or in consequence of some trivial act or injury, concurs with a feeble frame and irritable state of the nervous system, it will serve to account, with sufficient satisfaction, for the antipathies of advanced age, without recurring to any occult qualities and latent principles, which are mere names for unknown and unascertained causes of particular effects. The antipathy which some persons have to eels, may be traced to the resemblance which these fishes bear to serpents, and to the dread of these reptiles that has been betimes implanted and cherished. There are other antipathies with regard to food or liquor of any particular kind, which have proceeded from a defective and faulty conduct of indulgent and ill-judging parents in early life, or from some natural unsuitableness to the taste or digestive faculty of children. "To what then are those antipathies of which we have heard so much reducible? Either to legendary tales, or to aversions against objects which we believe dangerous; or to a childish terror of imaginary perils; or to a disrelish, of which the cause is disguised; or to a ridiculous affectation of delicacy; or to an infirmity of the stomach: in a word, to a real or pretended reluctance for things, which are either invested, or supposed to be invested with qualities hurtful to us. Too much care cannot be taken in preventing or regulating the antipathies of children; in familiarising them with objects of every kind; in discovering to them, without emotion, such as are dangerous; in teaching them the means of defence and security, or the methods of escaping their noxious influence; and when the rational powers are matured by age, in reflecting on the nature of those objects which we fear, in ascertaining what has been told concerning their qualities, or in vigorously operating upon our own dispositions to overcome those vain repugnances which we may feel."

Some think that the term antipathy can only be applied to any certain purpose, when used with the restriction of modern philosophers; among whom it signifies no more than a *vis centrifuga*, or repelling power.

ANTIPATHY is sometimes also used in a *moral* sense, to denote a contest between the mind and the body, or between reason and inclination.

ANTIPATHY, in *Painting*, relates wholly to the colouring part of that art, and which may be more properly expressed by *contrast*, *degradation*, &c. Blue and crimson are by mixing changed into purple, as blue and yellow are into green, or red and yellow into an orange colour: these mixtures may be said to be kind to, or to harmonize with each other. If red and green, yellow and purple, or blue and orange colours, be united by admixture, they not only de-

ſtroy the character of the colours, but they alſo deſtroy moſt completely the brilliancy of the ſeveral tints employed. Hence we may ſay, that purple has an antipathy to yellow, green to red, and orange to a blue colour. The union of theſe antipathies degrades the colours more or leſs, according to the proportion in which they are uſed: theſe degradations, however, are of the greateſt uſe in the hands of a ſkilful artiſt, without which his pictures would reſemble the crudeneſs of paintings upon glaſs, rather than be imitations of nature. Although the ſkilful uſe of theſe antipathies prevents a too ſtaring and gaudy effect, yet there is danger on the other hand, if they are not uſed with great judgment and delicacy, that the picture may ſink into coldneſs, inſipidity, and flatneſs. It is upon the knowledge of theſe three colours, blue, red, and yellow, and their proportion to each other as antipathies, that the whole art of colouring depends, which requires more ſtudy and application, and an eye of nicer diſcernment, than may be generally ſuppoſed. The term antipathy can hardly be applied to the arrangement of the parts which compoſe a picture, as the colours of garments, &c. without affectation; the expreſſions in more common uſe convey ideas with leſs ambiguity, ſuch as contraſt, union, harmony, diſcord, &c.; the two laſt, although they are, in ſtrict propriety, muſical terms, yet have been adopted, and very aptly applied by painters, who well underſtood their ſignification as relative to their art, as well as to that of a muſician. We ſhould not have inſerted the term antipathy, as applied at all to painting, but on account of its being found among ſome writers on that art, and that our readers might not be diſappointed when ſeeking its explanation.

ANTIPATRIA, in *Ancient Geography*, a town placed by Pliny in Macedonia, towards the ſouth, in Elymiotis, upon the Celydnus, to the north-weſt of Adrianopolis. Livy, ſpeaking of its capture by the Romans, ſays, that it was ſituated in a narrow defile.

ANTIPATRIS, or *Capharſaba*, formerly called *Capharſalema* (1 Maccab. vii. 31.), a town of Paleſtine, placed by Reland and M. d'Anville in Samaria, to the eaſt of Apollonia, on the ſea-coaſt. It was of little repute till it was rebuilt by Herod the Great in the plain of Capharzaba, which, according to Joſephus, was watry and fit for plants, with a river and a grove encompaſſing the city. It was 18 miles from Jeruſalem, and in the way to Cæſarea Paleſtinæ, (Acts, xxiii. 31.), and within the borders of Samaria and the half tribe of Manaſſeh. Herod called it Antipatris, in honour of his father Antipater.

ANTIPELARGIA, among the *Ancients*, a law, whereby children are obliged to furniſh neceſſaries to their aged parents. The *ciconia*, or ſtork, is a bird famous for the care it takes of its parents when grown old. Hence, in ſome Latin writers, this is rendered *lex ciconiaria*, or the ſtork's law. Paſſavant has publiſhed a diſſertation De Antipelargia, Baſil, 1672, 4to.

ANTIPERISTALTIC, in *Anatomy*, a motion of the inteſtines producing a contrary effect to that which the periſtaltic motion naturally occaſions. The latter, in a ſtate of health, determines the reſidue of the alimentary matter downwards towards the anus; whilſt the former, being the conſequence of diſeaſe, urges the contents of the inteſtines upwards into the ſtomach. See PERISTALTIC *Motion*.

The word is derived from *αντι*, *againſt*, *περι*, *about*, and *σαλτικος*, *that which hath the power of compreſſing*

ANTIPERISTASIS, in *Philoſophy*, the action of two contrary qualities; one whereof is ſuppoſed, by its oppoſition, to excite and heighten the force of the other.

The word is formed of *αντι*, *contra*, *againſt*, and *περιϛαναι*, *to ſtand round*, or *to reſtrain*; q. d. *circumobſiſtentia*, or the reſiſtency againſt any thing that ſurrounds or beſets another.

Antiperiſtaſis is uſually defined, "the oppoſition of a contrary quality, whereby the quality it oppoſes becomes heightened or increaſed: or the action whereby a body attacked by another, collects itſelf, and becomes ſtronger by ſuch oppoſition: or it is an increaſe of the activity of one quality, cauſed by the oppoſition of another."

Thus, cold, ſay the ſchool-philoſophers, on many occaſions, exalts the degree of heat, and dryneſs that of moiſture. Thus it is, ſay they, that quick-lime is ſet on fire by the effuſion of cold water; and ſo water becomes warmer in winter than in ſummer by antiperiſtaſis; and to the ſame cauſe it is owing, that thunder and lightning are excited in the middle region of the air, which is continually cold.

This antiperiſtaſis was a principle of great uſe and extent in the Peripatetic philoſophy.

Mr. Boyle has canvaſſed this doctrine thoroughly, in his Hiſtory of Cold (Works by Birch, vol. ii. p. 659.). It is certain, that *a priori*, or conſidering the reaſon of the thing abſtracted from the experiments alleged to prove an antiperiſtaſis, it appears highly abſurd; ſince, according to the courſe of nature, one contrary ought to deſtroy, not to ſtrengthen another.

In effect, not only reaſon, but experiment alſo, concludes againſt the notion of an antiperiſtaſis: the leading argument urged in behalf of it is, the heating of quick-lime in cold water; now how aſtoniſhing the lazineſs and credulity of mankind, who have ſo long and generally acquieſced in what they might ſo eaſily have found to be falſe! for if, inſtead of cold water, the lime be quenched with hot water, the ebullition will always be far greater than if the liquor were cold.

As to the refreſhing coldneſs which ſubterraneous places afford in ſummer, it may be denied that they are then really colder than in winter; though, if the contrary were allowed, it would not neceſſarily infer an antiperiſtaſis. The ſmoking of waters drawn from deep places in froſty weather, does not neceſſarily infer ſuch water to be warmer than at other times when it does not ſmoke, ſince that effect may proceed, not from the greater warmth of the water, but from the greater coldneſs of the air. For a man's breath in a cold ſummer, or in mild winter weather, becomes very viſible; the cold ambient air ſuddenly condenſing the fuliginous ſteams diſcharged by the lungs; which in warm weather are readily diffuſed in imperceptible particles through the air. See COLD and EFFLUVIA,

ANTIPHARMACA, in the *Materia Medica*, medicines ſuited to reſiſt poiſon.

ANTIPHATES, in *Entomology*, a ſpecies of PAPILIO found in America, and deſcribed by Fabricius, from a ſpecimen in the Britiſh Muſeum. The wings are tailed, white; margin brown, faſciated with white; poſterior pair, beneath yellowiſh at the baſe, and faſciated with black. This is the ſpecific character, to which it is added, that the exterior margin has ſeven white bars; the tail is very much elongated, ovate, and black; the black bands on the baſe of the poſterior wings two in number, and apex of the wings white, with a few black dots.

ANTIPHELLOS, or ANTIPHELLUS, in *Ancient Geography*, a town of Aſia Minor, in Lycia, took its name probably from the town of Phellus, which was ſituated at a ſmall diſtance to the north. The ſmall iſland of Ciſthenes lay oppoſite to it.

ANTIPHERNA, among the ancient Greeks, denoted a kind of ſettlement made on a wife in caſe of ſurviving her huſband, as an equivalent for her dowry.

This

This word ſeems to anſwer to what in our law is called a JOINTURE.

ANTIPHILI, in *Ancient Geography*, a place of Africa in the Mareotid, mentioned by Ptolemy, and alſo by Strabo.

ANTIPHLOGISTICA, in the *Materia Medica*, medicines or remedies ſuited to reſiſt, diminiſh, or cure inflammation, or an inflammatory ſtate of the ſyſtem.

ANTIPHON, in *Biography*, an Athenian orator, was born at Rhamnus in Attica, and hence called the *Rhamnuſian*. He was inſtructed by his father Sophilus in rhetoric, and was deemed not inferior in eloquence to Themiſtocles, Ariſtides, Pericles, or Gorgias, his immediate predeceſſors; and he was preceptor in this art to Thucydides, who mentions him as an eminent orator. Quinctilian (Inſt. l. iii. c. 1.) informs us, that he was the firſt who wrote precepts on oratory; and Ammianus Marcellinus (l. xxx. c. 4.) ſays, that he firſt introduced the practice of pleading for money. Plutarch, as well as Thucydides, repreſent him as an energetic and purſuaſive orator, of fertile invention, and ingenious in adapting himſelf to the prejudices and intereſts of his auditors. Philoſtratus (de Sophiſt. l. 1.) deſcribes him as poſſeſſing peculiar powers for ſoothing the minds of his hearers, and alleviating grief. Plato, however (in his Menexenus) treats his talents with contempt, and makes Socrates employ him in oppoſition to Aſpaſia; but Socrates, it ſhould be remembered, had been inſulted by the ſophiſts, and particularly by Antiphon. His talents, as it is obſerved to his diſhonour, were employed in eſtabliſhing the tyranny of the four hundred in Athens; and, as Plutarch ſays, he was, for this offence, condemned and executed as a traitor, and his body thrown out of the walls of the city, in the firſt year of the 92d Olympiad, or 412 years before Chriſt. Others have given a different account of the manner of his death. Sixty orations under his name were formerly extant, but there now remain only 16; of which the ſubjects are criminatory, for murder or manſlaughter, or defenſive in ſimilar cauſes. Fabricius and other critics think that they are genuine, though their authenticity has been queſtioned by others. They have been edited, with the orations of Æſchines, Lyſias, &c. by Aldus at Rome, in folio, in 1513; by H. Stephens, in 1575; and in 8vo. by Minatus, at Hanau, in 1619. Plutarch. de Vita x. Oratorum, apud op. tom. ii. p. 832. Fabr. Bibl. Græc. l. ii. c. 26. § 2. t. i. p. 884.

ANTIPHONALLY, from ἀντι, *contra*, and φωνη, *voice*, in reſpect of church muſic, imports as much as alternately, or anthem-wiſe.

The Greeks have a method of ſinging *antiphonally*, *antiphonatim*, called by them παραλλαξιακον, wherein two perſons ſing together, and then are ſilent, and ſo on.

ANTIPHONARY, *antiphonarium*, a ſervice book which contained all the invitatories, reſponſories, collects, and whatever elſe was ſaid or ſung in the choir, except the leſſons. This is otherwiſe called *reſponſarium*, from the reſponſes therein contained. The author of the Roman antiphonary was Pope Gregory the Great.

This is a book containing, in Gregorian notes, the anthems and hymns of the Romiſh church. The Abbé Feytou, in correction of Rouſſeau, ſays that the book only which contains the *anthems* is ſtyled the Antiphonarium. When the pſalms and hymns are underſtood to be included, it is called *veſperal*; when it contains the chants of the maſs, it is termed *gradual*. The proceſſional book contains the benediction, ſtation, and proceſſional chants. The funeral chants occupy the *ritual*.

We alſo find mention of nocturnal and diurnal *antiphonaries*, for the uſe of the daily and nightly offices; ſummer and winter *antiphonaries*; alſo *antiphonaries* for country churches, &c. By the provincial conſtitutions of archbiſhop Winchelſea, made at Merton, A. D. 1305, it is required that one of theſe ſhould be found in every church within the province of Canterbury.

The uſe of theſe, and many other popiſh books, was forbidden by the 3d and 4th of Edward VI. c. 10.

ANTIPHONY, ANTIPHONA, the anſwer made by one choir to another, when the pſalm or anthem is ſung alternately between two.

ANTIPHONY, ſometimes denotes a ſpecies of pſalmody, wherein the congregation, being divided into two parts, repeats the pſalms, verſe for verſe, alternately.

In this ſenſe, antiphony ſtands contradiſtinguiſhed from SYMPHONY, where the whole congregation ſings together.

Antiphony differs from *reſponſorium*, becauſe in this latter the verſe is only ſpoken by one perſon, whereas in the former, the verſes are ſung by the two choirs alternately. The original of antiphonal ſinging in the weſtern churches is referred to the time of St. Ambroſe, about the year 374. That father is ſaid to have firſt introduced it into the church of Milan, in imitation of the cuſtom of the eaſtern church, where it appears to be of greater antiquity, though as to the time of its inſtitution, authors are not agreed. It was moſt probably introduced at Antioch.

St. Ignatius, who, according to Socrates (E. H. l. vi. c. 8.), had converſed with the apoſtles, is generally ſuppoſed to have been the firſt who ſuggeſted to the primitive chriſtians in the eaſt the method of ſinging pſalms and hymns alternately, or in dialogue; dividing the ſingers into two bands or choirs, placed on different ſides of the church. Socrates, and ſeveral of the fathers, pretended, that it was revealed to St. Ignatius by a viſion, in which he had ſeen choirs of angels praiſing the Holy Trinity in this manner by ſinging alternate hymns. The cuſtom ſoon prevailed in every place where chriſtianity was eſtabliſhed. But Theodoret (E. H.) l. ii. c. 24.) informs us, that this manner of ſinging was firſt practiſed at Antioch. Suidas, under the word χορος, ſays, that the choirs of churches were, in the time of Conſtantius, the ſon of Conſtantine the Great (who reigned from 337 to 361) and of Flavian, biſhop of Antioch, divided into two parts, who ſung the Pſalms of David alternately; a practice, he adds, that began at Antioch, and was thence diſperſed into all parts of the chriſtian world. Indeed, it ſeems, that many of the primitive chriſtians had not any more ſublime conceptions of the celeſtial employment, or the joys of the bleſſed, than that they were eternally ſinging. The ancient hymn, "Te Deum laudamus," ſtill retained in the church, appears to have furniſhed the poet Dante with a model of the 28th canto of his "*Paradiſo*;" where, under three different hierarchies, conſiſting each of three choirs or choruſes, the heavenly hoſt of cherubim and ſeraphim are ſinging perpetual hoſannahs. Milton has alſo aſſigned them the ſame employment:

"——— Their golden harps they took;
Harps ever tun'd, that glittering by their ſide
Like quivers hung, and with preamble ſweet
Of charming ſymphony they introduce
Their ſacred ſong, and waken raptures high:
No voice exempt, no voice but well could join
Melodious part, ſuch concord is in heaven."

Paradiſe Loſt, book iii.

See Burney's Hiſt. of Muſic, vol. ii. p. 10.

ANTIPHONY is alſo uſed to denote the words given out at the beginning of the pſalm, to which both the choirs are to accommodate their ſinging.

ANTIPHONY, in a more modern ſenſe, denotes a kind of compoſition made of ſeveral verſes extracted out of different pſalms, adapted to expreſs the myſtery ſolemnized on the occaſion.

ANTIPHONA *ad introitum*, that anciently ſung in the introit of the maſs.

ANTIPHONA *invitatoria*, that repeated at the pſalm *Venite exultemus*.

ANTIPHONÆ *majores*, thoſe ſeven uſed to be ſung in the time of Advent, at the Magnificat, and during the ſeven days before Chriſtmas.

ANTIPHONÆ *proceſſionales*, thoſe ſung at proceſſions.

ANTIPHONÆ *rogationes*, thoſe rehearſed at rogations.

ANTIPHRASIS, derived from αντι and φρασις, of φραζω, *I ſpeak*, in *Rhetoric*, a ſort of figurative expreſſion, which has a contrary meaning to what it carries in appearance. Or, a kind of irony, wherein we ſay one thing, and mean the contrary.

Sanctius defines antiphraſis to be a form of irony, whereby we ſay a thing, by denying what we ought rather to affirm it to be: as when we ſay, "it did not diſpleaſe me;" or, "he is no fool;" meaning, "I was pleaſed with it: or "he is a man of ſenſe." On this principle the antiphraſes ought to be ranked among the figures of ſentences, and not among thoſe of words.

It is a common error, to make antiphraſes conſiſt in ſingle words; as when we ſay, that the Parcæ are thus called by antiphraſis, becauſe they ſpare nobody, "PARCÆ, qui nemini parcunt." St. Jerom, in his epiſtle to Riparius againſt Vigilantius, ſays, he ought rather to be called "Dormitantius per antiphraſin," than Vigilantius, becauſe he oppoſed the chriſtians holding wakes at the tombs of the martyrs.

Sanctius holds it improper to call theſe antiphraſes; becauſe *phraſis* is not applicable to a ſingle word, but ſignifies *orationem, aut loquendi modum*.

ANTIPHTHISICA, in the *Materia Medica*, medicines adapted to reſiſt and cure phthiſis or conſumption.

ANTIPHUS, in *Entomology*, a ſpecies of PAPILIO that greatly reſembles P. Polydorus, but is ſtill a diſtinct inſect. The wings are tailed, black on both ſurfaces, with ſeven lunated red ſpots on the poſterior pair. Fabricius, and Donovan's Inſects of India.

ANTIPINO, in *Geography*, a town of Ruſſia, in the province of Saratov on the Volga, 100 miles ſouth of Saratov.

ANTIPLEURITICA, in the *Materia Medica*, medicines ſuited to cure pleuriſy.

ANTIPODAGRICA, medicines ſuited to cure the gout.

ANTIPODES, from αντι, *againſt*, and πους, ποδος, *a foot*, in *Geography*, a relative term, denoting ſuch inhabitants of the earth as live diametrically oppoſite to one another.

The Antipodes are thoſe who live in parallels of latitude equally diſtant from the equator, the one toward the north, the other to the ſouth; and under the ſame meridian, though 180°, or juſt half of that meridian, diſtant from one another.

The Antipodes have nearly the ſame degree of heat and cold; and the ſame length of night and day; but at contrary times: it being midnight with one, when it is noon with the other; and the longeſt day when it is the ſhorteſt with the other.

Again, as the horizon of any place is 90° diſtant from its zenith, the Antipodes have the ſame HORIZON. And hence, when the ſun riſes to one he ſets to the other.

Plato is ſaid to have firſt ſtarted the notion of Antipodes and likewiſe to have given them the name: as he conceived the earth to be of a ſpherical figure, it was eaſy for him to infer, that there muſt be Antipodes.

Many, and particularly Lactantius and Auguſtine, ridiculed the notion. Theſe fathers are ſtrangely perplexed to think how men ſhould hang pendulous in the air, with their feet uppermoſt, as he thought they muſt do in the other hemiſphere.

This perplexity was owing to their not conſidering, that the loweſt point, with regard to the inhabitants of our earth, is the centre; and that the terms *up* and *down* are relative, and merely ſignify farther from or nearer to the centre, to which all heavy bodies gravitate. If we traverſed the globe, we ſhould, in every part of it, have the ſky over our heads, and our feet towards the centre; and we ſhould every where call it *up* over our heads, and *down* under our feet; although the ſame right line which is *down* to us, if continued through and beyond the oppoſite ſide of the earth, would be *up* to the inhabitants on the oppoſite ſide. Our Antipodes may as well imagine, that we ſtand with our heads hanging downwards, as we conceive that this is their pendulous poſition; but if we changed places, we ſhould find that we ſtood equally upright and firm whereever we were. Nay, the fact is, that we, who are now on what we are ready to call the uppermoſt ſide of the earth, and ſo wonder how another, in the ſituation of our Antipodes, can ſtand ſecurely on the undermoſt ſide, with his head hanging downwards, ſhall be carried by the revolution of the earth, in the ſpace of 12 hours, to the ſituation where our antipodes now are, although we ſhall be as far from them as before; and when we arrive there, we ſhall find no difference as to our manner of ſtanding; but we ſhall then ſee the oppoſite half of the heavens, and imagine that they have moved half round the earth.

If we may believe Aventine, Boniface, archbiſhop of Mentz and legate of pope Zachary, the eighth century, declared a biſhop of that time, called Virgilius, heretic, for maintaining that there was ſuch a thing as Antipodes.

But this piece of hiſtory is controverted by the authors of the Mem. de Trevoux: as having been made uſe of, it ſeems, by ſome perſons, to ſhew that the church has been miſtaken in its deciſions.

As to the ſentiments of the primitive Chriſtians with regard to the Antipodes, ſome, rather than admit the concluſions of the philoſophers, abſolutely denied the whole, even the demonſtrations of the geometricians relating to the ſphericity of the earth: which is Lactantius's way. Inſtit. lib. iii. cap. 24. Others only called in queſtion the conjectures of the philoſophers; which is St. Auguſtine's method, De Civit. Dei, lib. xvi. cap. 9. After putting the queſtion, whether there ever were nations of the cyclopes, or pigmies, or of people whoſe feet ſtood outward, &c. he comes to the point of Antipodes, and aſks, "whether the lower part of our earth be inhabited by Antipodes?" He made no doubt of the earth's being round, nor of there being a part diametrically oppoſite to ours, but only diſputes its being really inhabited. And the conſiderations he ſuggeſts for that purpoſe are juſt enough, as that they who aſſerted Antipodes had no hiſtory for it; that the lower part of the earth may be covered with water; and that to place Antipodes there, of a different origin from us (as muſt have been the opinion of the ancients, ſince they thought it impoſſible to go from our world to theirs), is to contradict ſcripture which teaches, that the whole race deſcended from one man. Such are the ſentiments of that father. It may be added, that the Chriſtian fathers were not the only perſons who diſputed the truth of the Antipodes. Epicurus and Lucretius had

had done it before them, at the end of his fifth book, v. 1063, &c. See alſo Plutarch, lib. De Facie in Orbe Lunæ; and Pliny, who relates the opinion, lib. ii. cap. 5.

ANTIPOLIS, in *Ancient Geography*, now ANTIBES, a city of Gaul, near the river Varus, in Narbonenſis Secunda, ſituate on the Mediterranean; built and colonized, according to Strabo, by the Maſſilians, from whoſe authority it was withdrawn by a decree of the Roman ſenate, in the time of Auguſtus. Others ſay, that it was taken by them from the Ligurians of Gaul, called Deciates. It was once very conſiderable, and had a port, a theatre, and many public monuments. See ANTIBES.

ANTIPOPE, a falſe or pretended pope; or one that is, or is pretended to be, irregularly elected in oppoſition to another.

Geddes gives the hiſtory of no leſs than twenty-four ſchiſms in the Romiſh church, cauſed by antipopes; ſome took their riſe from a diverſity of doctrine or belief, which led different parties to elect each their ſeveral pope; but the greater part from dubious controverted rights of election, the fruits of chicane and ambition.

ANTI-PORTICO is uſed by ſome for a veſtibule, or porch, at the entrance of an edifice.

ANTIPRAXIA, from ἀντι and πρασσω, *I perform*, in the *Ancient Phyſic*, denotes a contrariety of functions, temperaments, &c. in different parts of the body; invented to account for that contrariety of ſymptoms which frequently concur in hypochondriac caſes, when, e. gr. the liver is charged with being immoderately hot, and the ſtomach exceſſively cold.

The moderns, particularly Etmuller, refute the notion of an antipraxia, on this principle, that the blood circulating duly through the whole body, warms all the parts, as well the ſtomach as liver proportionably. To which ſome advocates for the ancient ſyſtem object, that this is confounding the preternatural ſtate with the natural.

ANTIPREDICAMENTS, in *Logic*; ſee ANTEPREDICAMENT.

ANTIPROBABILISM, the doctrine or ſyſtem of thoſe who hold it unlawful to follow the leſs probable opinion in oppoſition to the more probable one.

There have been vigorous advocates for antiprobabiliſm; for even among its greateſt enemies, the Jeſuits, F. Gilbert has a treatiſe in favour of antiprobabiliſm, *viz.* "Antiprobabiliſmus, ſeu tractatus theologicus fidelem totius probabiliſmi ſtateram continens," &c. Par. 1703, 4to.

ANTIPROBOLE, in *Rhetoric*, a figure whereby the defendant adopts or admits the charge brought againſt him by the proſecutor.

E. gr. ſuppoſing the proſecutor's προβολὴ to be, "Titus has killed Caius;" the defendant's antiprobole may be, "I have killed him, but undeſignedly."

ANTIPROPEMPTICON, in *Poetry*, a poem wherein a perſon going a journey addreſſes himſelf to his friends. Such is that of Ovid, lib. i. Triſt.

"Cum ſubit illius triſtiſſima noctis imago," &c.

It is oppoſed to PROPEMTICON.

ANTIPROTASIS, in *Rhetoric*, a ſolution of the PROTASIS.

ANTIPSARA, in *Geography*, a ſmall iſland in the Grecian Archipelago, two miles from the iſland of Ipſara.

ANTIPSORA, from ἀντι and ψωρα, *itch*, in *Pharmacy*, remedies proper againſt the itch.

ANTIPTOSIS, a figure in *Grammar*, whereby one caſe is put for another.

The word comes from ἀντι, *pro*, and πτωσις, *caſus*.

ANTIPYRETICA, from ἀντι and πυρ, *fire*, or ANTIPYRETRILIA, among *Phyſicians*, an appellation given to medicines againſt fevers.

ANTIPYRGOS, or ANTIPYRGUS, in *Ancient Geography*, a port of Africa belonging, according to Ptolemy, to Marmorica.

ANTIQUA, in *Entomology*, a ſpecies of PHALÆNA that inhabits Europe. The anterior wings are ferruginous, with a white lunated ſpot in the poſterior angle. Female apterous. Linnæus, Fabricius, &c.

ANTIQUANUS, or rather ANTIGUANUS, in *Ornithology*, a ſpecies of LANIUS, having a long wedge-ſhaped tail; above yellowiſh rufous; beneath white; head, bill, wings, legs, and upper ſide of the tail black. Gmelin. This is the antiguan ſhrike of Latham, and pie-greiſche d'Antigue of Sonnerat. It inhabits Panay, one of the Philippine iſlands, but chiefly about Antigue, one of the provinces thereof. Its ſize is that of the red-backed-ſhrike; bill large and black; the upper mandible very long, and extremely incurvated; irides duſky; head black; back yellowiſh rufous; throat and breaſt white; quills and baſtard wing coverts black; the wings reach only to the beginning of the tail, which is very long and wedge-ſhaped; the two middle feathers are wholly black; the others black above, and reddiſh beneath, with a rufous ſpot at the tip; legs duſky black. Latham.

ANTIQUARE, among Roman lawyers, properly denotes the rejecting of a new law, or refuſing to paſs it.

In which ſenſe, *antiquating* differs from *abrogating*; as the latter imports the annulling of an old law, the former the rejecting of a new one. See A.

ANTIQUARE is alſo uſed for a law's growing obſolete, or into diſuſe, either by age or non obſervance.

ANTIQUARIUM, among the *Ancients*, denoted a place or apartment, wherein their antique monuments were preſerved.

ANTIQUARTIUM is uſed by ſome modern practitioners, for a ſpecific againſt the quartan ague.

Hence ſome call the Jeſuits bark *antiquartium Peruvianum*. Wedelius alſo ſpeaks of an *eſſentia antiquartia*.

The *antiquartan* of Riverius is a preparation of *mercurius dulcis*, *aurum fulminans*, ſulphur of antimony, and ſcammony.

ANTIQUARY, ANTIQUARIUS, a perſon who ſtudies and ſearches after monuments and remains of the ancients; as old medals, books, ſtatues, ſculptures, and inſcriptions: and, in general, all curious pieces that may afford any light into antiquity.

Formerly there were ſeveral other kinds of antiquaries. The LIBRARII, or copyiſts, i. e. thoſe who tranſcribed in fair legible characters, what had been before written in the notes, were called by this name. They were alſo denominated *calligraphi*. They were alſo employed in repairing books injured by age.

In the chief cities of Greece and Italy, there were other perſons of diſtinction, called *antiquaries*, whoſe buſineſs it was to ſhew ſtrangers the antiquities of the place, to explain the ancient inſcriptions, and to give them all the aſſiſtance they could in this way of learning.

This was, doubtleſs, a very curious and uſeful inſtitution, and might well deſerve to be re-eſtabliſhed. Pauſanias calls theſe antiquaries ἐξηγηται. The Sicilians call them *myſtogogi*.

There was an ancient college of antiquaries erected in Ireland by Gilamh Fodhla, 700 years before Chriſt, for the compoſing a hiſtory of that country. And to this, ſay the Iriſh hiſtorians, it is owing that the hiſtory and antiquities of that kingdom may be traced back beyond thoſe of moſt other nations.

Foundations

Foundations of this kind have often been wiſhed for, and ſometimes alſo attempted, in England.

Sir H. Spelman ſpeaks of a ſociety of Antiquaries in his time, to whom his treatiſe of the terms, written in the year 1614, was communicated, he himſelf being one of the number.

The ſociety was founded in 1572, by archbiſhop Parker, Camden, ſir Robert Cotton, Stowe, and others. Application was made, in 1589, to queen Elizabeth for a charter, and a houſe wherein they might hold their meetings, erect a library, and the like. But by the death of that princeſs, their application proved abortive. Her ſucceſſor, king James I. was far from favouring their deſign.

In the year 1717, this ſociety was revived again, ſince which time no interruptions having happened, it is at preſent in a very flouriſhing condition; conſiſting of many learned and ingenious men, of the nobility, gentry, clergy, &c. whoſe buſineſs, as members, is to diſcover the antiquities of their own, as well as thoſe of other nations.

This ſociety was incorporated by the king's charter, in the year 1751, by the name of the Preſident, Council, and Fellows of the Society of Antiquaries of London; their council conſiſts of twenty-one perſons, ten of whom are annually changed: the election of members is by ballot, a certificate ſigned by three or more fellows being previouſly exhibited for ſix ordinary ſucceſſive meetings, except in the caſe of peers, members of the privy council, and judges, who may be propoſed by a ſingle member, and ballotted for the ſame day; and the choice is determined by a majority of two-thirds. Every member pays an admiſſion-fee of five guineas, and two guineas a year, or an additional ſum of twenty-one guineas. They have weekly meetings on Thurſday, from ſeven of the clock in the evening till nine. This ſociety began to publiſh its diſcoveries, &c. in 1770, under the title of "Archæologia."

A ſimilar aſſociation was founded in Edinburgh, in 1780, and received the royal charter in 1783. See SOCIETY.

ANTIQUARY is alſo uſed, by *Ancient Writers*, for the keeper of the antiquarium, or cabinet of antiquities.

This officer is otherwiſe called *archæota*, or *antiquary*, of a king, a prince, a ſtate, or the like.

Henry VIII. gave John Leland the title of his antiquary, a title which, ſays the author of his life, no body ever enjoyed beſides himſelf. But the reſtriction, we ſuppoſe, was only intended to be underſtood in reſpect of the kings of England. M. Schott, we find, had the title of antiquary to the king of Pruſſia; P. Pedruzzi, that of antiquary to the duke of Parma; M. Gallant reſided ſome time in Turkey, under the title of antiquary of the king of France. The univerſity of Oxford have ſtill their antiquary, under the denomination of *cuſtos archivorum*. The kings of Sweden have been at great expences in order to illuſtrate the antiquity of their country, having eſtabliſhed an academy of antiquaries with this ſingle view.

The office of the ancient Iriſh antiquaries was to preſerve the genealogies of the kings of Ireland, to correct the regal tables of ſucceſſion, and deliver down the pedigree of every collateral branch of the royal family.

P. Labbe and Petavius have publiſhed pieces expreſsly concerning the apparatus of antiquaries.

ANTIQUATA, in *Conchology*, a ſpecies of ARCA, that inhabits the Mediterranean, Indian, and American ſeas. The ſhell is obliquely heart-ſhaped, with many unarmed grooves Linnæus, Gmelin, &c. This kind is rather large, white, and covered with a hairy epidermis; a compreſſed prominent angle in the anterior ſlope.

ANTIQUATA, a ſpecies of CHAMA, found in the Atlantic, American, and Indian ſeas. The ſhell is rather heart-ſhaped, grooved longitudinally, and ſtriated tranſverſely. Linnæus. It is ſpotted with brown or ferruginous, and has from nineteen to twenty-two ribs; the margin is dentated; beaks inflected back; and a deep cloſed fiſſure before. Gmelin, &c. Adanſon calls this ſhell *ajar*.

ANTIQUATED, ANTIQUATUS, ſomething obſolete, or grown out of date or uſe.

ANTIQUE, ANTIQUUS, in a general ſenſe, ſomething that is ancient.

ANTIQUE is chiefly uſed among architects, ſculptors, and painters; who apply it to ſuch pieces of buildings, ſculpture, painting, &c. as were made at the time when the arts were in their greateſt perfection among the ancient Greeks and Romans; *viz.* from the age of Alexander the Great to the time of the irruption of the Goths into Italy, under Alaric, in the year 400.

In this ſenſe the word ſtands oppoſed to *modern*. Thus we ſay, an *antique* building, or a building after the *antique*; an *antique* buſt, or bas-relievo; the *antique* manner, taſte, &c.

The ſcience of antiques is alſo called by Spon ARCHÆOGRAPHIA.

Under this is included the knowledge of ancient coins, medals, inſcriptions, buildings, ſtatues, ſculptures, MSS. veſſels, weights, meaſures, &c.

ANTIQUE is ſometimes alſo contra-diſtinguiſhed from *ancient*, which denotes the leſſer degree of antiquity, when the art was not in its utmoſt purity.

Thus *antique architecture* is frequently diſtinguiſhed from *ancient architecture*.

Some writers alſo uſe the compound, ANTIQUO-MODERN, in reſpect of the old Gothic churches, and other buildings, to diſtinguiſh them from thoſe of the Greeks and Romans.

ANTIQUE, more eſpecially applied to *Painting*, deſignates ſuch works of the ancient painters as were produced before the deſtruction of the Roman empire. It appears very certain, that painting was but in an infantile ſtate among the Aſſyrians and Egyptians, as it was and ſtill continues to be among the Perſians and Chineſe, which is known from the accounts we have received, and the ſpecimens which are extant; but it is thought extraordinary, that there ſhould remain any degree of uncertainty with us reſpecting the ſtate of painting among the ancient Greeks and Romans, when it is allowed that ſtatuary, the twin ſiſter-art, ſhould have prevailed in ſo wonderful a degree, as to aſtoniſh the world with the excellent works which were produced by them, and remain the noble monuments of their ſuperior ſkill, the unrivalled objects of admiration, the patterns of imitation, and the ſtandards of excellence. It has, however, been the ſubject of controverſy with reſpect to the degree of excellence to which the ancient painters carried their art; the following obſervations are by ſir Joſhua Reynolds.

"From the various ancient paintings which have come down to us, we may form a judgment with tolerable accuracy of the excellencies and defects of art among the ancients. There can be no doubt, but that the ſame correctneſs of deſign was required from the painter as the ſculptor; and if the ſame good fortune had happened to us in regard to their paintings, to poſſeſs what the ancients themſelves eſteemed their maſter-pieces, which is the caſe in ſculpture, I have no doubt but we ſhould find their figures as correctly drawn as the Laocoon, and probably coloured like Titian. What diſpoſes me to think higher of their colouring than any remains of ancient painting will warrant, is the account which Pliny gives of the mode of operation uſed by Apelles,

that over his finiſhed picture he ſpread a tranſparent liquid like ink, of which the effect was to give brilliancy, and at the ſame time to lower the too great glare of the colour: *Quod abſoluta opera atramento illinebat ita tenui, ut id ipſum reverberatu claritates colorum excitaret.—Et tum ratione magna ne colorum claritas oculorum aciem offenderet.* This paſſage, though it may poſſibly perplex the critics, is a true and artiſt-like deſcription of the effect of glazing or ſcumbling, ſuch as was practiſed by Titian and the reſt of the Venetian painters; this cuſtom, or mode of operation, implies at leaſt a taſte of what the excellence of colouring conſiſts, which does not proceed from fine colours, but true colours; from breaking down thoſe fine colours which would appear too raw, to a deep-toned brightneſs. Perhaps the manner in which Corregio practiſed the art of glazing was ſtill more like that of Apelles, which was only perceptible to thoſe who looked cloſe to the picture, *ad manum intuenti demum appareret;* whereas in Titian, and ſtill more in Baſſan and others his imitators, it was apparent on the ſlighteſt inſpection: artiſts, who may not approve of glazing, muſt ſtill acknowledge, that this practice is not that of ignorance. Another circumſtance that tends to prejudice me in favour of their colouring, is the account we have of ſome of their principal painters uſing but four colours only. I am convinced the fewer, the cleaner will be the effect of thoſe colours, and that four are ſufficient to make every combination required; two colours mixed together will not preſerve the brightneſs of either of them ſingle, nor will three be as bright at two: of this obſervation, ſimple as it is, an artiſt, who wiſhes to colour bright, will know the value. In regard to their power of giving peculiar expreſſion, no correct judgment can be formed; but we cannot well ſuppoſe that men, who were capable of giving that general grandeur of character which ſo eminently diſtinguiſhes their works in ſculpture, were incapable of expreſſing peculiar paſſions. As to the enthuſiaſtic commendations beſtowed upon them by contemporaries, I conſider them as of no weight. The beſt words are always employed to praiſe the beſt works: admiration often proceeds from ignorance of higher excellence. What they appear to have moſt failed in is compoſition, both in regard to the grouping of their figures, and the art of diſpoſing of the light and ſhadow in maſſes. It is apparent that this, which makes ſo conſiderable a part of modern art, was to them totally unknown.

"If the great painters had poſſeſſed this excellence, ſome portion of it would have infallibly been diffuſed, and have been diſcoverable in the works of the inferior ranks of artiſts, ſuch as thoſe whoſe works have come down to us, and which may be conſidered as on the ſame rank with the paintings that ornament our public gardens. Suppoſing our modern pictures of this rank only were preſerved for the inſpection of connoiſſeurs two thouſand years hence, the general principles of compoſition would be ſtill diſcoverable in thoſe pictures; however feebly executed, there would be ſeen an attempt to an union of the figure with its ground, ſome idea of diſpoſing both the figures and the lights in groups. Now, as nothing of this appears in what we have of ancient painting, we may conclude that this part of the art was totally neglected, or more probably unknown.

"They might, however, have produced ſingle figures, which approached perfection both in drawing and colouring; they might excel in ſolo (in the language of muſicians), though they were probably incapable of compoſing a full piece for a concert of different inſtruments." Reynolds's Notes upon Frenoy, note 37, verſe 350.

ANTIQUE, in *Sculpture*, a ſtatue, buſto, baſſo-relievo, or other work, the production of ages prior to the fall of the Roman empire; a term chiefly applied by ſculptors to the works of the ancient Greeks and Romans.

The ſtatues of the ancients were very numerous, chiefly ariſing from their cuſtom of deifying and erecting ſtatues in honour of almoſt all the heroes and celebrated characters among them. But the Romans ſeem to have ſurpaſſed the Greeks in the number of their Gods. "There was no place in Rome," Livy obſerves, "which was not full of gods and ſacrifices;" and for this reaſon, Quartilla ſays, "our country is ſo full of deities, who honour it with their preſence, that it is more eaſy to find a god than a man."

Antique ſculpture is univerſally ſuppoſed to be far ſuperior to the productions of modern times: it is certain, that the beſt antiques greatly ſurpaſs modern ſculpture in general; but it is equally true, that the beſt modern works exceed by far the majority of the ancient. And here it may not be improper to remark, that the different caſts in plaiſter, and ſpecimens in marble which are brought to England from abroad, are carefully ſelected from the maſs of productions; and therefore an Engliſhman is not uſually aware of the deficiencies that are attached to the bulk of the works which remain abroad.

One conſiderable advantage which antiques poſſeſs above modern productions is, that they are in general works of much longer time. It was in many inſtances among the ancients conſidered ſufficient for one ſculptor to have executed four or five ſtatues in the courſe of his life; hence we find, that the moſt celebrated marbles of antiquity are finiſhed to a degree that will bear the cloſeſt inſpection, and will appear equally complete in all the different lights in which they may chance to be placed. Another advantage of the antique above the modern is, that they are the works of artiſts, who were continually in the habit of viewing nature half or quite naked, owing to the ſcanty cloathing of the lower orders of people in the climates of Greece and Italy: the artiſts were able to ſtudy theſe fine examples of nature while in action, as running, wreſtling, boxing, and playing at the ſeveral athletic games and exerciſes of thoſe times; and eſpecially in the gymnaſia or public places, where the youths performed their various feats quite naked. Here all the different motions and beautiful play of the muſcles, together with an amazing variety of poſtures and attitudes, were exhibited to the attentive obſerver; and with a dignity, truth, grace, and expreſſion, that can never be imitated by thoſe mercenary models, that ſell their ignoble nakedneſs to the artiſts in our modern academies. The clothing alſo of thoſe days, being light and ſcanty, did not confine and diſfigure the body, as unfortunately is the caſe in modern times. They had alſo, if report be true, peculiar advantages in the ſtatues of ſome of their goddeſſes; as it has been aſſerted, that even the modeſt women of thoſe days conſidered themſelves honoured by being allowed to ſit as models for a goddeſs: and that in conſequence of this, noblemen of the firſt diſtinction would bring their daughters to the artiſt for that purpoſe; report has alſo gone ſo far as to ſtate, that not leſs than four hundred young women of the firſt rank and greateſt beauty ſtood to the ſculptor who executed the Venus de Medicis.

In many inſtances, the ancients ſeem to have beſtowed as much labour on the ſubordinate parts of their ſtatues as on the principal; hence we very often find the fingers, toes, nails, ears, and hair as highly finiſhed as the face or body; whereas, modern ſculptors in general are apt to beſtow their labour upon the more important parts, to the neglect of the inferior. But in many other inſtances the ancients neglected, to a very inexcuſable degree, what they conceived to be of ſubordinate conſideration: the following remark in one of the lectures of ſir Joſhua Reynolds, is a ſufficient evidence

of this fact. "The ancient ſculptors," ſays he, "neglected to animate the features, even with the general expreſſion of the paſſions. Of this, the group of the boxers is a remarkable inſtance; they are engaged in the moſt animated action with the greateſt ſerenity of countenance;—this frequent deficiency in ancient ſculpture could proceed from nothing but a habit of inattention to what was conſidered as comparatively immaterial."

But it is nevertheleſs proper to remark here, that the ancients in their buſtos, where the face beame the principal object of attention, excelled to a great degree; and undoubtedly ſurpaſs modern ſculptors by far: their treatment of the human countenance, diſplayed in the beauty and dignity of ſome of their heads and buſtos, is beyond deſcription: they were acquainted to the ſmalleſt nicety with the ſeat of every expreſſion, and were perfect maſters of the art of bringing each into full effect.

Simplicity is a great characteriſtic of antique ſculpture in general: this principle is attached not only to the attitudes of their figures, but to the diſpoſition of the drapery, the hair, and every leſſer attribute: ſcarce an inſtance of the *outré* or extravagant is to be found among the finer antiques. But this principle, however beautiful, was often carried too far; and in many inſtances rendered their works ſtiff and unintereſting, which may certainly be conſidered the chief defect of antique ſculpture. The ancients, in order to preſerve dignity and majeſty in the ſtatues of their gods, heroes, emperors, philoſophers, and other great characters, often placed the head and body of the ſtatue in an upright poſition, which in very many inſtances bordered upon ſtiffneſs; and by purpoſely avoiding every trifling turn or angle in the drapery that might tend to deſtroy its ſimplicity, they were ſometimes drawn into the oppoſite error: we therefore find in many inſtances, though each fold may be beautiful in itſelf, that their draperies are compoſed of a continued repetition of long and ſtraight lines.

There is a ſubordinate miſtake attached to many of the beſt as well as to the inferior antique ſtatues; where, in order to ſtrengthen them, the ſtump of a tree, or a piece of rock is introduced, as incorporated with the fleſh of the limb againſt which it is placed; whereas, it is evident that ſome drapery or other diſguiſe ſhould be thrown over the ſupport, to conceal an effect ſo aukward and unnatural.

There was alſo a great degree of falſe taſte among the ancients, manifeſted in their cuſtom of introducing metallic eyes, and working the heads, hands, and feet of ſome of their ſtatues in marble of a different colour from the other parts of the figure; but this miſtake does not belong to their principal and moſt celebrated works.

For ſome account of the chief antique ſtatues, ſee the following articles:

Adonis.	Faunus.	Meleager.
Amazone.	Flora.	Melpomene.
Antinous.	Ganymede.	Mercury.
Antonine Column.	Gladiator.	Narciſſus.
Apollo.	Hercules.	Niobe.
Ariadne.	Juno.	Poppea.
Bacchus.	Jupiter.	Trajan Pillar.
Ceres.	Laocoon.	Torſo.
Cicero.	Livia.	Venus.
Cleopatra.	Marcus Aurelius.	Urania.
Cupid.	Mars.	
Diſcobolus.	Marſyas.	

See alſo SCULPTURE and STATUE.

ANTIQUENSIS, or ANTIGUENSIS, in *Entomology*, a ſpecies of APIS that inhabits the iſlands of Antigua. It is hairy and black; thorax and anterior part of the abdomen yellow. Fabricius and Gmelin.

ANTIQUENSIS, rather ANTIGUENSIS, is alſo a ſpecies of MUTILLA that inhabits Antigua, and is deſcribed by Fabricius and Gmelin. It is red, abdomen black at tip, and ſtreaked with white.

ANTIQUITY, ANTIQUITAS, is uſed to denote the times or ages paſt long ago.

Thus we ſay, the heroes of antiquity, the marks or footſteps of antiquity, monuments of antiquity, &c.

ANTIQUITY is alſo uſed to denote the works or remains of ancient times. See MONUMENT, REMAINS, RUINS, &c.

Thus we ſay, a fine curious piece of antiquity; Italy, France, and England, abound in antiquities.

ANTIQUITY is alſo uſed to denote the great age of a thing, or its duration from times of old.

In this ſenſe we ſay, the antiquity of a kingdom, a cuſtom, or the like; moſt nations lay claim to an antiquity much greater than they can truly warrant. The preſent age may be ſaid to be the antiquity of the world; which was but new in what are commonly called the ancient days, according to the received chronology.

There are great diſputes concerning the antiquity, or age of the world.

Ariſtotle carried it even to eternity; Parmenides, Pythagoras, and the Chaldeans, were of the ſame opinion: but the generality of philoſophers, as well as divines and hiſtorians, have always held an origin of it; though where to fix that origin is the difficulty. The different ſyſtems of the chronology of the Greeks, the Egyptians, the Jews, the Hebrew Text, and the Septuagint verſion of Scaliger, of Pezron, of ſir Iſaac Newton, &c. to ſay nothing of the Chineſe annals, leave the point infinitely embarraſſed.

Dom. Pezron thinks he has merited well of the public by adding 2000 years to the age of the world, which had been taken from it by Scaliger and others; but this did not hinder F. Martianay from entering a proſecution againſt him in the archbiſhop's court of Paris for hereſy. His crime was following the Heathen rather than the Hebrew chronology, in which however he was preceded by the generality of the fathers and primitive writers of the church; among whom it appears to have been a common practice, to make 5500 years between the creation and the incarnation. In reality, the Jews are charged with having corrupted their chronology; by which the moderns have been miſled.

Some have propoſed to trace out the antiquity of the earth, by an obſervation of the ſaltneſs of the ſea; others by obſerving the elevation of the bottom of the ſea, or the growth of its ſtrata. One mark or proof of antiquity has been ſtarted by Rudbeck, which he pretends to have carried to a demonſtration; it is taken from the thickneſs of a certain black cruſt, called in the Swediſh tongue, *mat-iorden* and *ſwart-myllan*, which covers the ſurface of the earth, being formed of a mixture of rotten graſs and other herbs, with duſt and a kind of mud, which the melted ſnow leaves behind it. According to this antiquary, there are at leaſt 500 years requiſite to form an inch thick of this cruſt, which in many places of Sweden is found to be upwards of ſeven inches thick, where urns have been dug up full of bones and aſhes. From whence it follows, according to this author, that it is upwards of 3500 years ſince burning the dead was practiſed in Scandinavia.

Recupero, the hiſtoriographer of Ætna, ſuggeſts an argument in favour of the antiquity of the earth from the ſeveral ſtrata of lava that have iſſued at different times from this mountain. A ſtream of lava, which Diodorus Siculus relates to have burſt out in the time of the ſecond Punic war,

is covered at this day only with a very ſcanty ſoil; and in digging pits and wells, ſeveral ſtrata of lava have been diſcovered with earth to a conſiderable thickneſs over the ſurface of each ſtratum; in one inſtance, ſeven diſtinct ſurfaces of this kind were pierced; and allowing 2000 years for the interval between two eruptions, the lava that compoſed the firſt or loweſt ſtratum, muſt have flowed from the mountain above 14,000 years ago. Brydone's Tour, &c. vol. i. p. 131.

But this argument is very fallacious, becauſe we learn from ſir William Hamilton's remarks on the ſoil of Naples, that ſince the firſt eruption of Veſuvius, which deſtroyed the ancient town of Herculaneum in the year 79, there have been ſix eruptions of lava, forming as many different ſtrata, with veins of good ſoil between them. Phil. Tranſ. vol. lxi. N° 1. See ÆTNA.

There is ſcarce a nation under heaven but lays claim to a greater degree of antiquity than the reſt of its neighbours: the Scythians, the Phrygians, the Chaldeans, Egyptians, Greeks, Chineſe, &c. pretend each to have the honour of being firſt inhabitants of the earth: ſeveral of theſe nations, leſt they ſhould be outſtripped in their pretenſions by any of the reſt, have traced up their origin to ages long before the received account of the creation. Hence the appellations *aborigines*, *indigenæ*, *terrigenæ*, *antelunares*, &c. The Athenians were not aſhamed to pretend to be *autochthones*; and what is moſt remarkable, Socrates himſelf gives them this ridiculous appellation, which, as ſome others of the philoſophers have wiſely obſerved, only put them on a level with ants and graſhoppers. Mem. Acad. Inſcr. tom. vii. p. 498.

The Chaldeans pretend to aſtronomical obſervations of 470,000, or 473,000 years; they mention the preciſe king who reigned over them at the time of the deluge, whoſe name was Xiſuthrus, and attribute to him ſeveral things which we aſcribe to Noah.

The Chaldaic antiquities of Beroſus are loſt, except a few fragments which have been collected by Joſ. Scaliger, and ſince more fully by Fabricius. Annius of Viterbo, a Dominican monk, towards the cloſe of the fifteenth century, would not ſuffer us to want ſuch a treaſure, but officiouſly went to work, and forged a Beroſus out of his own brain, which he publiſhed at Rome in 1498. The monk went farther; and from the ſame mint ſoon after produced Manetho's ſupplement to Beroſus, from the time of Ægyptus king of Egypt, to the origin of the Roman ſtate. The miſchief is, Manetho lived before Beroſus; this anachroniſm alone had ſufficed to betray the cheat.

St. Auguſtine laughs at the folly of the Egyptians, who pretend to obſervations of the ſtars above 100,000 years old; in effect, no people appear to have been warmer in the conteſt for antiquity than thoſe of Egypt. They pretend two periods of time; one ſhorter, during which the throne of Egypt had been filled by men; the other almoſt infinite, wherein gods and demi-gods had worn the crown. From Iſis and Oſiris to Alexander they reckoned a ſpace of 23,000 years, the time before that, while the gods reigned, made 42,984 years more; the whole duration from the beginning of their monarchy amounting to 65,984. De Civ. Dei, lib. xviii. c. 40.

The computation of their dynaſties, as given by Manetho, a writer of their own (of whom we have extracts in Syncellus, taken from Julius Africanus and Euſebius), extends to 5550 years before Alexander's time; and the Egyptian chronicle, cited by the ſame Syncellus, goes farther, reckoning 36,525 years. Diogenes Laertius makes no leſs than 48,863 years from the reign of Vulcan. Yet the Scythians, the Phrygians, the Ethiopians, and ſome others, ſtill inſiſted on their priority to the Egyptians; and in the judgment of many ſeem to have carried their point. Juſtin, after Trogus, gives the precedency to the Scythians; and affirms, that they were always allowed to have been before the Egyptians.

It is no wonder that their catalogues ſhould be ridiculouſly incredible, when the Egyptians made their firſt kings reign 1200 years a-piece; and the Aſſyrians theirs about 4000.

But the Chineſe is eſteemed the moſt ancient monarchy in the univerſe; having cultivated the ſciences from the earlieſt ages, and ſubſiſted at leaſt theſe 4000 years with the ſame laws, manners, and uſages.

Some indeed have called in queſtion the truth and authenticity of the Chineſe annals; yet we find them confirmed, at leaſt as high as 660 years before Chriſt, by the annals of Japan. At worſt, the Chineſe antiquities ſtand on as good a footing as thoſe of either Greece or Rome. Their annaliſts, both for order and chronology, are not inferior to any of thoſe ancients ſo much admired among us; but far ſurpaſs them in point of antiquity, and have a better title to be credited, as having written by public authority, which can be ſaid of few Greek or Roman pieces, except perhaps the Capitoline Marbles, which are not properly a hiſtory.

We have no inconſiderable confirmation of the truth of the Chineſe account, from an ancient obſervation of a grand conjunction of the planets under Chuen-Hio, emperor of China, related by Martinius. That prince lived 2513 years before Chriſt. M. Kirchius has defended the obſervation againſt Caſſini, and ſhewn a conjunction muſt really have happened at the time mentioned by the Chineſe annals.

But the authenticity of this obſervation, and the whole of the Chineſe chronology, has been attacked by an ingenious author, Mr. Coſtar.

Dionyſius Halicarnaſſus has traced the Roman antiquities, Joſephus the Jewiſh antiquities, Beroſus the Chaldaic antiquities, Sanchoniathon the Phœnician antiquities, Manetho and Marſham the Egyptian antiquities.

The Phœnician antiquities of Sanchoniathon are preſerved in part by Euſebius. We have an Engliſh tranſlation of Sanchoniathon, with notes, by biſhop Cumberland, and a continuation from the canon of Eratoſthenes. Lond. 1720, 8vo.

Dionyſius gave his book the title of Roman Antiquities, on account of the curious inquiries he had made concerning the origin of the Romans, by tracing them back to the remoteſt ages. For fidelity as well as inſtruction he is generally preferred to Livy; his accounts are more ample, and his facts deſcribed with more particulars; he gives a full idea of the Roman ceremonies, the worſhip of their gods, ſacrifices, manners, cuſtoms, diſcipline, policy, courts, laws, &c.

To the claſs of ſuppoſititious antiquities belong the Hetrurian antiquities, pretended to have been found by Scornelli near Volaterra; and publiſhed in 1636, by Curtius Inghiramus, who is generally ſuppoſed to have been the forger of them. A great number of fictitious names of ancient authors are cited in this book to give the better face to the cheat; but the ſtyle betrayed it. Allatius and Ernſtius early detected the impoſture. Fabr. Bibl. Lat. lib. iv. cap. 13.

The Britiſh antiquities, before Cæſar's invaſion, are utterly dubious, not to ſay fabulous. Old chronicles ſpeak of Samothes, the ſon of Japhet, as the founder of the Britiſh monarchy; Albion, a deſcendant of Cham, invaded it three hundred years after; and about 600 years after this, Brute, grandſon

grandſon of Æneas, came and took poſſeſſion of the iſland in the year of the world 2880, giving it the name which it ſtill retained when Cæſar made his attempt. This is Geoffry of Monmouth's ſyſtem of the antiquities of the Britiſh nation, which the generality of our hiſtorians admit, for want of a better. It has been defended by A. Thomſon of Queen's College, in the preface to his Engliſh tranſlation of that writer.

It muſt not be forgot that the Iriſh alſo pretend to be the moſt ancient of all nations; they trace their origin without interruption up to Japhet. But the Scots ſtill diſpute their priority with them, holding themſelves to be an elder branch of the Scythians, the firſt of men.

The antiquity of religion has been often urged as a proof of the truth of it. Jews, Gentiles, Chriſtians, Proteſtants, Papiſts, have all in their turns made uſe of the argument from antiquity. It is indeed of the inartificial kind; and comes rather under the denomination of a preſumption than a proof: on the whole, it ſeems to have ſerved the cauſe of error as much, if not more, than that of truth.

ANTIQUITY is more peculiarly uſed to denote the ceremonies, cuſtoms, and uſages, which obtained in ancient times, either with regard to perſons, places, or things.

Antiquities, in this ſenſe, are uſually divided into ſacred, political, military, literary, and domeſtic; ſometimes only into civil and eccleſiaſtical.

ANTIQUITIES, *ſacred*, thoſe relating to the religious worſhip, diſcipline, and belief of ancient times and people. Theſe may be ſubdivided into Heathen, Chriſtian, and Mahometan, &c.

Reland has a treatiſe expreſsly on the ſacred antiquities of the Jews: Struvius on thoſe of the Romans; Lakemacher on thoſe of the Greek; and Stillingfleet on thoſe of the Britiſh churches.

Fabricius has given two plans of a theſaurus or body of antiquities; the one of Hebrew antiquities, after the manner of Grævius and Gronovius: the other of eccleſiaſtical antiquities, divided into twelve books. He gives the names and titles of 156 authors to be included in the firſt, and 101 authors for the ſecond.

ANTIQUITIES, *Chriſtian*, thoſe which relate to the ancient ſtate of the Chriſtian church.

Theſe are the ſame with what we otherwiſe call *eccleſiaſtical antiquities*.

The Magdeburg centuries are looked upon by proteſtants as a library of Chriſtian antiquities.

Mr. Bingham has publiſhed a learned ſyſtem of Chriſtian *antiquities*.

As a principal branch of Chriſtian antiquities, we may reckon,

ANTIQUITIES, *Biblical*, the notices of ancient laws, ceremonies, events, &c. occurring in the ſcriptures.

Theſe make a branch of eccleſiaſtical antiquities, and bear a near relation to the Jewiſh, &c. antiquities.

Some pretend to deduce moſt of the heathen antiquities from the Bible; others, as Spencer, &c. take the contrary courſe, and deduce the antiquities of the Bible from thoſe of heatheniſm.

To interpret Scripture, it is abſolutely neceſſary regard be had to the heathen antiquities alluded to in them, and theſe not only ſuch as are directly aimed at or approved, but alſo ſuch as are purpoſely oppoſed.

Dr. Cave has publiſhed a treatiſe of apoſtolical antiquities, "Antiquitates Apoſtolicæ;" or the Lives, Acts, &c. of the Apoſtles, Evangeliſts, &c. Lond. 1674, fol. 1684, and 1686.

ANTIQUITIES, *civil*, all that belong not to the head of *eccleſiaſtical*.

ANTIQUITIES, *political*, thoſe relating to the origin of ſtates, governments, magiſtrates, and laws.

ANTIQUITIES, *national*, thoſe employed in tracing the origin, ancient actions, uſages, monuments, remains, &c. of ſome nation or people.

Gronovius has given a collection of the chief writers on the Greek antiquities; Rouſe, Pfeiffer, Bos, Brunings, and biſhop Potter, have given ſhorter ſyſtems; the laſt is the beſt eſteemed, though found too ſhort by ſome in what relates to the religion, the gods, vows, and temples of Greece. A ſyſtem of this kind has been lately publiſhed (*viz.* 1801), by Mr. Harwood, in 8vo.

The beſt ſyſtem of Roman antiquities yet extant is that of Roſinus, with Dempſter's notes.

We have compendiums and introductions to the Roman antiquities by Hoepfner, Nieuport, Godwin, Cantelius, Baſil, Kennet, Adam, &c.

Heineccius has given a collection of Roman antiquities for illuſtration of civil law; and Briſſonius another, drawn from the books of the civil law; Gravina's Origines Juris Civilis is excellent on this ſubject.

A body of the writers on the Roman antiquities hath been publiſhed by Grævius, and another of thoſe on the Greek antiquities by Gronovius, both under the titles of Theſauri.

A ſupplement to the former has been publiſhed by Sallengre and Polenus. Danet and Pitiſcus have alſo publiſhed lexicons of the Roman antiquities. Varro's books of Roman antiquities are entirely loſt, excepting ſome fragments, preſerved by St. Auguſtine.

ANTIQUITIES, *parochial*, thoſe confined to the limits of one or more pariſhes, and converſant chiefly in what relates to the tithes, revenues, &c. of the churches.

Dr. Kennet has publiſhed a learned and curious work under the title of "Parochial Antiquities," attempted in the hiſtory of Ambroſden and Burcheſter, and other adjacent parts in the counties of Oxford and Bucks. Oxf. 1695, 4to. See Phil. Tranſ. N° 220.

ANTIQUITIES, *literary*, thoſe relating to matters of learning and ſtudy; a principal branch of theſe, are,

ANTIQUITIES, *academical*, the origins, uſages, &c. of the ancient academies, ſchools, colleges, and other literary ſocieties. Theſe bear a near relation to ſcholaſtic antiquities, and make a branch or diviſion of literary antiquities. Herm. Conringius has given a body of academical antiquities, and Urſinus a treatiſe on the ſcholaſtical antiquities of the Hebrews. Montfaucon, count Caylus, Winckelman, Iken of Bremen, &c. ought to be mentioned as collectors of antiquities of various kinds.

ANTIQUUS, JOHN, in *Biography*, an hiſtorical painter, was born at Groeningen, in 1702, and was inſtructed in the art of painting on glaſs, which he practiſed to the age of 20 years; but being deſirous of learning the art of painting in oil, he ſought improvement in France and Italy, and at Florence was retained in the ſervice of the grand duke for ſix years. At this period, he painted a grand compoſition of the "Fall of the Giants," which, as to diſpoſition and deſign, ſhewed equal judgment and taſte. He made ſeveral journies to Rome, and in every part of Europe through which he travelled, left memorable proofs of his genius and fine execution; and he is ranked among the beſt artiſts of his time. Pilkington.

ANTIQUUS, in *Conchology*, a ſpecies of MUREX. The beak is patulous; ſhell oblong, with eight roundiſh whorls. Linn. and Gmelin. This ſpecies inhabits the northern ſeas

of Europe, and is admitted as a Britiſh ſhell. There are three ſuppoſed varieties of it figured by Seba, Martin, and Lifter: and the murex carinatus of Pennant has been conſidered as an accidental growth of the ſame ſpecies; but the laſt is certainly diſtinct. *Vide* Don. Brit. Shells, p. 119.

The ſhell is from four to ſix inches in length, of a yelloviſh colour, finely cancellated with tranſverſe ſtriæ and longitudinal plaits; it has two or more angular ridges along the whorls, which are tuberculated.

ANTI-RATIONALISTS, a name ſometimes given to divines, who in matters of religion are for humbling reaſon, and making it bend to faith, aſſerting that the abſurdity of a thing is no reaſon for rejecting it.

In this ſenſe, the rigid Calviniſts and adherents to the ſynod of Dort have been denominated anti-rationaliſts, on account of the doctrine of abſolute predeſtination, &c. The Roman Catholics are alſo entitled to the ſame appellation, on account of the doctrine of tranſubſtantation. M. Bayle took ſhelter in the ſyſtem of the anti-rationaliſts, the better to combat the Chriſtian doctrines of the origin of evil, providence, &c. But this, like other offenſive appellations, has been very indiſcriminately applied; it has been uncandidly uſed as a term of reproach; and reaſon, the firſt endowment conferred on mankind by their Creator, though unduly depreciated by ſome, has been extravagantly extolled by others, who have been enabled to extend and improve the exerciſe of it, eſpecially in the province of religion, by the extraordinary communications of a divine revelation.

ANTI-RHODUS, in *Ancient Geography*, a ſmall iſland ſituate within the port of Alexandria, in Egypt, whither Antony retired in deſpair, after the battle of Actium. After the example of Timon the miſanthropiſt, he withdrew from intercourſe with mankind, and called this recluſe habitation *Timonium*.

ANTIRRHEA, in *Botany*. See CUNNINGHAMIA.

ANTIRRHETICUM, from ἀντὶ and ῥέω, *I ſpeak*, in *Literary Hiſtory*, denotes a refutation of ſome book, author, or opinion. In this ſenſe we alſo meet with the word *antirrheſis*.

ANTIRRHINUM, in *Botany* (ἀντὶ, *æqualis*, and ῥὶς, *naſus*. Quod fructu ſit vituli narium ſimile; hence it has been called calves-ſnout); claſs *didynamia angioſpermia*. Linn. Gen. 750. Gærtn. 53. Juſſ. 120. Snap-dragon, or toad flax; natural order, *perſonatæ*.

Generic Character. *Calyx perianth* five parted, permanent; diviſions oblong, the two lower more gaping than the others; *corolla* monopetalous, ringent; tube oblong, gibbous; limb bilabiate; upper lip bifid, reflex on the ſides; lower limb trifid, obtuſe; palate convex, uſually cloſed by a prominency between the lips, ariſing from the under lip; *nectary* at the baſe of the corolla produced downwards, prominent; *ſtamina*, filaments four, two of which are ſhorter; antheræ converging; *piſtillum*, germen roundiſh; ſtyle ſimple, of the length, and in the ſituation of the ſtamina; ſtigma obtuſe; *pericarpium*, capſule roundiſh, two-celled; ſeeds numerous.

Eſſential gen. Character. *Calyx* five-leaved; *corolla* with the baſe produced downwards and nectariferous; *capſule* two-celled.

Fifty-two ſpecies of this plant are deſcribed, only eight of which, according to Dr. Smith, are the ſpontaneous growth of this country.

Species. *Leaves angular. 1. A. *cymbalaria*, ivy-leaved toad-flax; leaves heart-ſhaped, five-lobed, alternate; ſtalks procumbent; the root is perennial, from which iſſue long, decumbent, ſpreading ſtalks, bearing violet-coloured ſmall flowers, with a yellow palate: it is a native of Britain, growing on crevices of rocks and old walls; hence this plant is well adapted for the ornament of rock work; it flowers from June till October. Figured in Curt. Flor. Lond. faſc. i. 45. Eng. Bot. 502. 2. A. *piloſum*, hairy-leaved toad-flax, leaves kidney ſhaped, very hairy, alternate; ſtalks procumbent; the edge of the leaves divided into nine or ten obtuſe crenulate lobes: a native of the Alps. Jac. Obſ. ii. t. 48. 3. A. *elatine*, ſharp-pointed toad-flax, or fluellin, leaves haſtate, alternate; ſtalks procumbent; calyx and leaves hairy; corolla yellow; upper lip purple underneath: a Britiſh annual, growing in fields, and flowering from July till October. Curt. Flor. Lond. faſc. i. 46. Eng. Bot. 692. 4. A. *ſpurium*, round-leaved toad-flax, or fluellin, leaves ovate alternate; ſtalks procumbent; this plant is hairy; the upper lip of the corolla is yellow, the under purple: it is an annual Britiſh plant, growing among corn, and flowering from July till September. Curt Flor. Lond. faſc. iii. 37. Eng. Bot. 691. 5. A. *cirrhoſum*, tendrilled toad-flax, leaves haſtate, alternate; ſtems ſpreading; petioles tendrilled; ſtems filiform, very branching; peduncles axillary, one-flowered; corolla bluiſh, with a whitiſh palate ſpotted with purple; annual: a native of Egypt; introduced in 1777, by Dr. Joſeph. Nich. de Jacquin. Jac. Hort. t. 82. 6. A. *Ægyptiacum*, Egyptian toad-flax, leaves haſtate alternate; ſtem erect, and much branched; this very much reſembles the third ſpecies; it is an annual plant, a native of Egypt.

**Leaves oppoſite. 7. A. *triphyllum*, three-leaved toad-flax, leaves ternate, ovate; an annual plant, riſing with an upright branching ſtalk, more than a foot high; leaves oval, in threes, ſometimes in pairs, flowers yellow, with ſaffron-coloured lips: a native of Sicily; a variety of this has a purple ſtandard and ſpur: this ſpecies has been cultivated here ſince 1640. 8. A. *triornithophorum*, leaves in fours, lanceolate; ſtem erect, branching; flowers peduncled; it grows more than five feet high, bearing large purple flowers: a native of Portugal and America. 9. A. *purpureum*, purple toad-flax, leaves quaternate, linear; ſtem erect, flower-bearing, ſpiked; a perennial plant, riſing two feet high: it is a native of Italy; and cultivated in the Oxford garden, in 1648. Curtis Magaz. 99. 10. A. *verſicolor*, leaves linear-lanceolate; the lower ones ternate; ſtem erect, ſpiked; it reſembles the A. linaria, or common toad-flax, except that the upper lip is whitiſh, and the flowers racemoſe: a native of the ſouth of Europe, and introduced, in 1777, by Monſ. Thouin. Jac. Ic. rar. t. 116. 11. A. *repens*, leaves linear, glaucous, verticillated, or ſcattered; ſtem panicled; calyx ſmooth, of the length of the ſpur; corolla of an aſh-coloured white; under lip ſtreaked with purple: a perennial Britiſh plant, flowering from July till September. 12. A. *monſpeſſulanum*: this, according to Dr. Smith, is the ſame plant as the repens. 13. A. *ſparteum*, branching toad-flax, leaves ſubulate, channelled, fleſhy, the lower ternate; ſtem panicled; corolla very ſmooth; ſtem about a foot high, ſmooth, erect, ſtiff; flowers racemoſe, yellow, with a tinge of red at the palate: a native of Spain, and introduced in 1772, by M. Richard. Curt. Bot. Mag. 200. 14. A. *bipunctatum*, dotted toad-flax, leaves linear, ſmooth, the lower quaternate; ſtem erect, panicled; flowers ſpike-headed; an annual from four to eight inches high, bearing yelloviſh flowers, ſpotted with brown on the lower lip: a native of France and Spain; introduced by M. Thouin in 1777. 15. A. *triſte*, dark-flowered toad-flax, leaves linear, ſcattered, the lower oppoſite: nectary ſubulate; flowers ſubſeſſile; ſtem eight inches long, decumbent; flowers of a dark purple. Curtis Magaz. 74: a native of Spain; introduced in 1727, from Gibraltar, by ſir Charles Wager.

16. A.

16. A. *ſupinum*, procumbent toad-flax, leaves ſubquaternate, linear; ſtalk diffuſed; flowers racemed; ſpur ſtraight: a native of France and Spain; cultivated by Miller, in 1728. 17. A. *arvenſe*, yellow corn toad-flax, leaves ſublinear, lower quaternate; calyx hairy, viſcid; flowers ſpiked; ſtem erect, a ſpan high; the colour of its flowers varies blue and yellow; according to Hudſon, it is a native of Britain. 18. A *pelliſerianum*, violet-coloured toad-flax, ſtem-leaves linear, alternate; root leaves lanceolate, ternate; flowers corymbed; an annual, eight inches high, with purple flowers: a native of France and Italy. 19. A. *ſaxatile*, rock toad-flax; leaves lanceolate-linear, ſcattered villoſe; the inferior quaternate; ſtem decumbent; flowers ſpiked; a perennial, with yellow flowers, having two orange ſpots on the palate: a native of Spain. 20. A. *viſcoſum*, clammy ſnap-dragon, root leaves quaternate, lanceolate; ſtem-leaves linear, alternate; calyx villoſe; about eight inches high: a native of Spain: introduced by M. Thouin, in 1786. 21. A. *multicaule*, many-ſtalked toad-flax; leaves quinate, linear, fleſhy; flowers headed; an annual plant, about a foot high, with ſeveral ſtems, bearing either deep yellow, or ſulphur-coloured flowers: a native of the ſouth of Europe; and cultivated by Miller, in 1731. 22. A. *glaucum*, leaves quaternate, ſubulate, fleſhy; ſtem erect; flowers ſpiked; a ſmall annual, with yellow flowers; ſpurs pale, or ſtreaked with blue; a native of the ſouth of Europe. 23. A. *alpinum*, alpine toad-flax, leaves quaternate, linear-lanceolate, ſea-green; ſtem diffuſe; flowers racemed, ſpur ſtraight; perennial; it has a ſtem about five inches high; flowers of a fine violet-purple colour, and of a deep yellow in the middle. Curtis Mag. 207. A native of the Alps. 24. A. *bicorne*, horned toad flax, leaves oppoſite, ovate-oblong, ſerrate; ſtem erect; flowers racemed; capſules two horned; it grows a foot and a half high, bearing blue flowers, with a yellow mouth: a native of the Cape; and introduced by Mr. F. Maſſon, in 1774; annual. 25. A. *villoſum*, leaves all oppoſite, ovate, villoſe; ſtem ſimple; flowers oppoſite, lateral; a perennial with yellow flowers; introduced by ſir Francis Drake, in 1786; a native of Spain. 26. A. *origaniſolium*, leaves moſtly oppoſite, oblong; flowers alternate; an annual, polymorphous plant, varying with lanceolate leaves. It grows wild on the Pyrenées; it was introduced by Lee and Kennedy, Hammerſmith. 27. A. *pinnatum*, leaves oppoſite, pinnatifid; ſtem erect; flowers racemed: found at the Cape, by Thunberg.

***Leaves alternate. 28. A. *minus*, leaſt toad-flax; leaves moſtly alternate, lanceolate, obtuſe; ſtem very much branched, ſpreading; calyx longer than the ſpur; ſtem erect, branched, villoſe, viſcid; flowers ſmall, violet coloured, with the under-lip white, and palate yellow, growing on axillary peduncles; it is a Britiſh perennial plant; found in corn fields and ſandy paſtures. Curtis, Lond. 541. 29. A. *dalmaticum*, leaves alternate, heart-ſhaped; ſtem claſping; ſtem woody, three feet high; flowers large, yellow, axillary: a native of Crete. 30. A. *hirtum*, leaves lanceolate, ſhaggy; flowers ſpiked; the upper leaf of the calyx largeſt; an annual, riſing with a ſingle ſtalk a foot and a half high; flowers of a pale yellow colour, with dark ſtripes, and deep yellow lips. Miller received the ſeeds of this ſpecies from Madrid. Jac. ic. rar. t. 117. 31. A. *geniſtifolium*, broom-leaved toad-flax, leaves lanceolate acuminate; panicle ſlender, flexuoſe; ſtem erect, much branched, three feet in height; flowers of a bright yellow colour, in looſe ſpikes, and reſemble thoſe of the Linaria (33.); perennial or biennial: a native of Siberia, Auſtria, Switzerland, &c.; cultivated by Dr. Sherard, in 1732. Jacquin Flor. Auſt. t. ii. f. 244. 32. A. *junceum*, ruſh-like toad-flax, leaves linear, alternate; ſtem panicled, ſlender; flowers racemed; upper-lip of the flowers white, with blue ſtreaks; lower a pale yellow: found in Spain; introduced by M. Thouin, in 1780. 33. A. *linaria*, common yellow toad-flax, leaves lanceolate-linear, crowded; ſtem erect, ſpiked; calyx ſmooth, ſhorter than the ſpur: it is a common well-known plant, which, from the colour of its flowers, is vulgarly called *butter and eggs*. Woodv. Med. Bot. ſupp. 221. Eng. Bot. 658. 34. A. *linifolium*, leaves lanceolate, three-nerved; flowers racemed; peduncles diſtant, ſhorter than the bracteæ; flowers yellow; ſpur the length of the flower; it grows wild on the ſea-coaſts of Italy; perennial. 35. A. *chalepenſe*, white-flowered toad-flax, leaves linear-lanceolate, alternate; flowers in racemes; calyx longer than the corolla; ſtem erect; an annual plant, growing two feet high; the flowers are ſmall, white, with long ſpurs, produced ſingly, almoſt extending over the whole branches: a native of Italy; and cultivated in the Oxford garden, in 1680. 36. A. *reflexum*, leaves ovate, ſmooth; peduncles axillary, fruit-bearing, elongate, recurved; ſtem procumbent; this annual plant riſes with filiform procumbent ſtems, ſeven inches high, bearing white flowers, with a yellow mouth, placed on ſolitary peduncles; it grows near Meſſina; and was diſcovered in Barbary, by Brander. 37. A. *pedunculatum*, leaves linear remote; flowers panicled; peduncles longer than the leaf, ſtiff, upright; ſtems ſeven inches high, branching; flowers yellow, ſtreaked with blue: a native of Spain. 38. A. *lagopodioides*, leaves ſcattered, ſoft, recurved at the tip; ſpikes ovate, villoſe; ſtems herbaceous, nearly a foot high; leaves lanceolate-linear; flowers ſmall, yellow with two orange ſpots within the palate: a native of Siberia.

****No leaves. 39. A. *aphyllum*, a capillary ſcape; this is a very ſingular plant, reſembling a kind of moſs (ſplachnum); no part of it produces any leaves: found near the Cape by Thunberg.

*****Corollas gaping, or tail-leſs. 40. A. *majus*, great toad-flax, or ſnap-dragon; flowers without tails, in ſpikes; calyces obtuſe, villoſe; ſtem from one to two feet high; leaves lanceolate or ovate; flowers violet, lower lip white, mouth yellow, ſpur very ſhort pointed: a Britiſh annual, growing in ſandy ground, and flowering from June till Auguſt. Eng. Bot. 129. 41. A. *orontium*, leſſer toad-flax, corolla without a tail; flowers ſubſpiked; calyces digitate, longer than the corolla; ſtem erect, a foot high; leaves lanceolate; corolla a pale purple; lips roſe-coloured; palate yellow; ſpur very ſhort, obtuſe; this much reſembles the preceding ſpecies: it is a Britiſh annual, affecting a ſandy and calcareous ſoil, and flowering from July till Auguſt. Curtis, Lond. iv. 45. 42. A. *papilionaceum*, corolla tailleſs; flowers axillary; calyx papilionaceous; leaves fleſhy; leaves ovate, entire, alternate; calyx five-leaved; upper lip of the corolla bifid, lower trifid: a native of Perſia. 43. A. *aſarina*, heart-leaved toad-flax, corollas without tails; leaves oppoſite, heart-ſhaped, crenate; ſtems procumbent; a low, trailing annual; flowers of a dingy purple colour above; below greeniſh: a native of Italy and the ſouth of France; cultivated in 1669, by Jacob Bobart. 44. A. *molle*, woolly-leaved toad-flax; corollas without tails; leaves oppoſite, ovate, tomentoſe; ſtems procumbent; flowers white villoſe; upper lip ſtreaked with red: a native of Spain; cultivated by Miller, in 1748. 45. A. *unilabiatum*, corollas without tails, furniſhed with two calluſes; leaves alternate, pinnate; ſtem panicled: found near the Cape, by Thunberg.

******Corollas gaping. 46. A. *bellidifolium*, daiſy-leaved toad-flax, root leaves tongue-ſhaped, toothed, marked with lines; ſtem-leaves parted, entire; flowers very ſmall, in a long ſpike, which frequently contains one hundred flowers; it is a biennial or triennial, with a branched ſtem, two feet high: a native of the ſouth of Europe; and cultivated in England, in 1629. 47. A. *Cauadenſe*,

majus, Canada toad-flax, leaves linear, alternate; lower lip of the corolla ſpreading out, flat; an annual, with a filiform ſtem, about a foot high; flowers racemoſe, alternate: a native of Virginia. 48. A. *micranthum*, ſmall-flowered toad-flax, ſtem herbaceous, erect; lower leaves quaternate, upper alternate; flowers very ſmall; ſpur ſhort, interior; an annual, with very ſmall blue flowers, having a white palate; they are axillary, diſtant, ſolitary, terminating the ſtem: a native of Spain, near Madrid. 49. A. *reticulatum*, leaves linear, channelled, ſcattered; thoſe on the radical ſhoots generally in fives; flower-ſtalks ſhorter than the bracteæ; flowers thrice as long as the calyx; ſpur conical, acute, a little curved, twice the length of the peduncle, yellow, ſtreaked; upper lip erect; ſegments acute, divaricate, ſtreaked; before expanſion purple, changing to a blood-red, and afterwards violet-coloured; it is perennial, with herbaceous branched erect ſtems, having its radical ſhoots proſtrate, and producing only one flower on each peduncle placed alternately: diſcovered at Algiers, whence it was ſent to the royal garden at Paris, by profeſſor Deſfontaines. Its ſeeds were tranſmitted to Dr. Smith by M. Thouin; and from theſe ſeeds ſeveral plants were produced, in Chelſea garden, by the care of Mr. Fairbairn. Smith, ic. rar. faſc. i. t. 2. 50. A. *pygmæum*, dwarf toad flax, leaves ſagittate; peduncles capſulaceous; ſtems wand-like, proſtrate; leaves an inch long upon long foot ſtalks; calyx extremely ſmall; flowers yellow, little, each upon ſolitary axillary peduncles. 51. A. *ærugineum*, lower leaves in fours, linear; flowers in racemes; the upper leaflet of the calyx twice as long as the others; it is annual, having ſeveral wand-like ſtems nearly upright, and linear-lanceolate glaucous leaves; flowers in a terminal raceme, which contains about 30 or 40; theſe are yellow, and commonly their lower and upper lips are bluiſh; ſpur of the length of the flower, recurved and variegated above, with violet-coloured ſtreaks; this ſpecies varies into what Linnæus has termed *peloria*, with from one to five ſpurs on different flowers on the ſame plant: it is a native of Spain. 52. A. *hexandrum*, leaves oppoſite, cordato-ovate, ſerrate; peduncles axillary, one-flowered. Flor. Auſt. n. 235. A native of the iſland of Otaheite in the South Seas. The five laſt ſpecies are to be conſidered as new, none of them being noticed by Murray in the fourteenth edition of the "Syſtema Vegetabilium," publiſhed in 1784.

Propagation and Culture. The various ſpecies of ſnap-dragon are raiſed from ſeeds, which may be ſown in April or May, or in Autumn: all the varieties of the 40th ſpecies, ſown late in ſpring, may in July be planted out in borders, where they will flower the following ſpring; or they may be ſown early in the ſpring, for flowering in the autumn of the ſame year; but in this caſe the plants are not ſo likely to withſtand the winter; and if the autumn prove bad, they will not perfect their ſeeds. Any of the perennial ſnap-dragons may be propagated by parting the roots, or by cuttings, which, during the ſummer months, will readily take root. They are all pretty ornaments in a garden, and requiring very little culture, are rendered more acceptable. The antirrhinums are hardy plants, and will in general reſiſt the cold of our winters; but the tenderer ſpecies, or thoſe that are natives of warm climates, ſhould be planted in pots, and removed into ſhelter, or placed under a hot-bed frame during froſty weather. The ſoil and ſituation in which the different ſpecies grow in a wild ſtate, ſhould always be conſidered, and their culture adapted accordingly; a dry gravelly or ſandy ſoil well ſuits the 40th ſpecies and ſeveral others, eſpecially thoſe that are natives of Britain; and ſhould theſe be planted in a rich moiſt ſoil, they become very luxuriant in a ſhort time, but are very liable to rot in autumn or winter. Many of theſe plants are permitted to ſcatter their ſeeds, and thus ſuffered to propagate themſelves, the young plants only requiring thinning where they come up too cloſe, and removing any weeds with which they may be encumbered. See Miller's Dictionary, by Martyn.

The A. *linaria*, or common toad-flax, is the only plant of this genus to which any medicinal virtues have been aſcribed: its leaves, which have a bitteriſh and ſomewhat ſaline taſte, are reported to be diuretic and cathartic; hence they have been recommended in dropſies and other diſorders requiring copious evacuations. This plant has alſo been uſed as a reſolvent in jaundice and other viſceral obſtructions; but it has chiefly been valued as an external application in hæmorrhoidal affections, employed in the various forms of ointment, fomentation, and cataplaſm. An unguentum de linaria is to be found in the Wirtemberg, Brandenburg and Daniſh pharmacopœias. Linnæus (Flor. ſuec.) ſays, this plant is uſed as a poiſon for flies. See Murray, vol. ii. p. 183. Woodville, Med. Bot. vol. iv. p. 25.

ANTIRRHIUM, in *Ancient Geography*, a promontory and ſmall town of Locris, at the entrance of the Corinthian gulf, oppoſite to Rhium, whence its name.

ANTI-SABBATARIANS, a modern religious ſect, who oppoſe the obſervance of the Chriſtian Sabbath.

The great principle of the anti-ſabbatarians is that the Jewiſh Sabbath was only of ceremonial not moral obligation: and conſequently is aboliſhed by the coming of Chriſt. See SABBATH.

ANTISAGOGE, in *Rhetoric*, a figure differing little from that called CONCESSION. The following paſſage from Cicero is an inſtance of it: "Difficilis ratio belli gerendi; at plena fidei, plena pietatis; et ſic dicas, magnus labor, multa pericula proponuntur; at gloria ex his immortalis eſt conſecutura."

ANTI-SCEPTIC, ſomething oppoſed to the reaſonings and ſyſtem of Pyrrhoniſts, or ſceptics.

ANTISCII, compounded of ἀντὶ, *againſt*, and σκιὰ, a *ſhadow*, in *Geography*, denominates people who dwell in the oppoſite hemiſpheres of the earth, and whoſe ſhadows at noon fall in contrary directions.

Thus the people of the north are antiſcii to thoſe of the ſouth. The one project their ſhadows at mid-day towards the arctic pole; and the others towards the antarctic pole.

The antiſcii are very often confounded with the ANTOECI, though the former term is more general than the latter. The antiſcii ſtand contradiſtinguiſhed from *periſcii*, &c.

ANTISCII is ſometimes alſo uſed, among *Aſtrologers*, for two points of the heavens, equally diſtant from the tropics. Thus the ſigns Leo and Taurus are held antiſcii to each other.

ANTISCORBUTICS, in the *Materia Medica*, medicines proper for the cure of the ſcurvy.

ANTISEPTIC, from ἀντὶ, and σηπτὸς, *putrid*, of σήπω, *to putrify*, an appellation given to ſuch ſubſtances as reſiſt PUTREFACTION.

We have ſome curious experiments in relation to antiſeptic ſubſtances by ſir John Pringle, who has aſcertained their ſeveral virtues. Thus, in order to ſettle the antiſeptic virtue of ſalts, he compared it with that of common ſea-ſalt; which being one of the weakeſt, he ſuppoſes equal to unity, and expreſſes the proportional ſtrength of the reſt by higher numbers, as in the following table.

Salts, their antiſeptic virtue.

Sea ſalt	1	Saline mixture	3
Sal Gemmæ	1 +	Nitre	4 +
Tartar vitriolated	2	Salt of hartſhorn	4 +
Spiritus Mindereri	2	Salt of wormwood	4 +
Tartarus Solubilis	2	*Borax*	12 +
Sal diureticus	2 +	Salt of amber	20 +
Crude *Sal Ammoniac*	3	Alum	30 +

In

In this table the proportions are marked in integral numbers; only to ſome there is added the ſign +, to ſhew, that theſe ſalts are poſſeſſed of a ſtronger antiſeptic virtue than the number in the table expreſſes, by ſome fractions; unleſs in the three laſt, where the ſame ſign imports, that the ſalt may be ſtronger by ſome units.

Some reſinous and other ſubſtances even exceed the antiſeptic virtues of the neutral ſalts; thus myrrh, aſſa-fœtida, terra Japonica, and aloes, are at leaſt twelve times more antiſeptic than ſea-ſalt. Two grains of camphor are equivalent to ſixty grains of that ſalt. An infuſion of a few grains of Virginia ſnake-root, in powder, exceeds twelve times its weight of ſea-ſalt. Chamomile flowers have nearly the ſame extraordinary quality. The Jeſuits bark has it alſo. Beſides theſe, pepper, ginger, ſaffron, contrayerva-root, are twelve time more antiſeptic than ſea ſalt. Dried ſage, rhubarb, the root of the wild valerian, mint, angelica, ground ivy, ſena, green-tea, red roſes, wormwood, muſtard, and horſe-radiſh, were likewiſe found more antiſeptic than the ſtandard.

To the claſs of antiſeptic medicines may likewiſe be added fermented liquors, acids, ſpirits, and even thoſe plants called anti-acids, and erroneouſly ſuppoſed haſteners of putrefaction, particularly horſe-radiſh. Now vegetables poſſeſſing this virtue are the more valuable, in that, being uſually free of acrimony, they may be taken in much greater quantities than either ſpirits, acids, reſins, or even the neutral ſalts.

Antiſeptics are preſcribed in all putrid, malignant, and peſtilential caſes. It is to be remarked, however, that different kinds of them are to be given in different diſeaſes, and even in different ſtages of the ſame diſeaſe. Thus, the bark is a ſpecific in a gangrene, when the veſſels are relaxed, and the blood reſolved or diſpoſed to putrefaction; but will fail, if the veſſels are too full, or the blood be too thick. It muſt be confeſſed, however, that inferences drawn from the effects of antiſeptics on dead putreſiable matter, may miſlead us conſiderably in their application to the living human body. The putreſcent tendency of the fluids, ſuppoſed to be preſent in ſcurvy and contagious fevers, cannot be obviated by the moſt powerful antiſeptics alone, but will often yield to ſubſtances ſcarcely antiſeptic in the loweſt degree. On the contrary, gangrene, though generally treated with aſtringents and antiſeptics conjoined, has often been arreſted by animal food and volatile alkali.

From the great antiſeptic virtue of alum, the bark, and other aſtringents, it ſhould ſeem, that aſtriction had no ſmall ſhare in the cure of diſorders termed putrid; and, indeed, the very nature of putrefaction conſiſts in a ſeparation or diſunion of the parts. But as aſtringents are improper to be adminiſtered in many caſes, contrayerva-root, ſnake-root, camphor, &c. may ſupply their place; which, though highly antiſeptic, have very little, or any, of an aſtringent quality. Pringle's Obſ. on the Diſeaſes of the Army. See Dr. Macbride's Eſſay on the reſpective Powers, &c. of Antiſeptics.

Antiseptic *ſubſtances*, in *Agriculture*, are ſuch ſubſtances as have a tendency to reſiſt the putrefaction and decay of animal and vegetable matters, when united with them, either beneath the ſoil or upon its ſurface, and in the dung or compoſt heap. Aluminous and vitriolic ſubſtances are moſtly of this kind; and likewiſe the aſtringent principle of different vegetable matters.

ANTISIGMA, among the *Ancient Grammarians*, ſignifies one of the notes of ſentences affixed to thoſe verſes whoſe order was to be changed.

ANTISPASMODICS, in the *Materia Medica*, are medicines proper for the cure of ſpaſms and convulſions. Heat, eſpecially alternating with cold; æther, wine, ſpirits, opium, balſam of Peru, and the eſſential oils of many vegetables, are the principal articles of this claſs of medicines. Opium excels, for its immediate effects. Peruvian balſam, in many inſtances, produces more laſting benefit than opium, and ſometimes ſucceeds where opium fails. As *antiſpaſmodics*, the eſſential oils differ in this from opium, that they act more on a particular part than on the ſyſtem in general, and have no ſoporific effect. Where the ſtrictures are produced by inanition, and a defect of vital heat, ſpaſms are removed by thoſe medicinal means that reſtore the *vis vitæ*, ſuch as warmth, appropiate food and drink, pure airs, cordials, aromatics, and the cheerful paſſions.

The other *antiſpaſmodics* will be found under the particular diſeaſes, to which they have been applied with the greateſt ſucceſs; ſee Hysteria, Tetanus, Convulsions, &c.

ANTISPASTUS, a poetical foot, conſiſting of four ſyllables, whereof the firſt is ſhort, the ſecond and third long, and the fourth ſhort.

ANTISPODIUM. See Spodium.

ANTISSA, in *Ancient Geography*, was, according to Strabo, in ancient times, an iſland, and thus called, becauſe it was oppoſite to Leſbos, then known by the name of Iſſa; but having offended the Romans, it was depopulated by Labeo, and the inhabitants were tranſplanted to Methymna.

ANTI-STANCARIANS, in *Church Hiſtory*, a ſect of German proteſtants that oppoſed the doctrine of Stancarius, who aſſerted that juſtification was the ſole effect of Chriſt's human nature, excluſive of his divinity.

ANTISTASIS, in *Oratory*, a defence of an action, from the conſideration, that if it had been omitted, worſe would have enſued. This is called by Latin writers *comparativum argumentum*: ſuch e. gr. would be the general's defence, who had made an inglorious capitulation, that without it the whole army muſt have periſhed.

Antistasis, in *Antiquity*, denotes the gibbous part of the liver in the Grecian victims.

ANTISTES, from *ante*, *before*, and *ſto*, *I ſtand*, in *Eccleſiaſtical Writers*, a title uſually given to biſhops, though ſometimes alſo to prieſts or preſbyters. Among the ancient Romans, antiſtes was an appellation given to the chief or firſt orders of the prieſts in the provinces.

In which ſenſe, *antiſtes* ſtands diſtinguiſhed from *patres* and *magiſtri*.—In the more uſual ſenſe, notwithſtanding, *antiſtes* denotes the ſame with *ſacerdos*.

There were alſo females of this quality under the title of *antiſtæ*.

ANTISTHENES, in *Biography*, an Athenian philoſopher, and the founder of the Cynic ſect, was born about the 90th olympiad, or the year before Chriſt 420. His firſt attention was directed to military exploits, and he acquired fame by his valour in the battle of Tanagra. But changing his object, he ſtudied the art of rhetoric under Gorgias, and then proſecuted the attainment of more ſubſtantial wiſdom under Socrates; and ſuch was the ardour of his mind, that though he lived at the Piræum, which was diſtant 40 ſtadia from the city, he was a daily attendant on the inſtructions of this admired preceptor. The virtuous manners of Socrates, and the noble independence of his ſpirit, attracted his notice and eſteem; and he determined to make the character of his teacher the object of his imitation. Whilſt he was a diſciple of Socrates, he diſcovered his propenſity towards ſeverity of manners by the meanneſs of his dreſs, and frequently appeared in a thread-bare and ragged cloak. His maſter perceiving that he took pains to expoſe, rather

rather than to conceal his tattered dreſs, ſaid to him; "Why ſo oſtentatious? through your rags, I ſee your vanity." (Ælian, lib. ix. c. 36.) After the death of Socrates, Antiſthenes, by a ſeaſonable jeſt, haſtened the deſerved puniſhment of his perſecutors, Melitus and Anytas. When ſome young men came from Pontus to Athens for the purpoſe of attending upon Socrates, they were introduced to Anytas by Antiſthenes, who aſſured them, that he far exceeded Socrates in wiſdom. By this ſarcaſtic encomium the reſentment of the Athenians againſt thoſe who had diſgraced their city by the baniſhment of ſo excellent a man, was inflamed; and the conſequence was the ſpeedy exile of Anytas, and the death of Melitus. In the ſchool eſtabliſhed by Antiſthenes, and called Cynoſargum, or the temple of the white dog, he ſedulouſly inculcated, both by precept and example, a rigorous diſcipline. In order to accommodate his manners to his doctrine, he wore a coarſe cloak, ſuffered his beard to grow, and carried a wallet and ſtaff, like a wandering beggar. His diet alſo was of the moſt ſimple kind, and he refrained from every kind of effeminate indulgence. In his diſcourſes, he cenſured the manners of the age with a degree of harſhneſs, which procured him the ſurname of "The Dog." He alſo expreſſed the utmoſt contempt for pleaſure, as the greateſt evil, and declared, that he would rather be mad, than addicted to a voluptuous manner of living. Towards the cloſe of his life, the gloomy caſt of his mind, and the moroſeneſs of his temper, ſo increaſed, as to render him troubleſome to his friends, and an object of ridicule to his enemies. In his laſt illneſs he was fretful and impatient; tired of life, and yet loth to die. When Diogenes, at that time, aſked him, whether he needed a friend, Antiſthenes replied, "where is the friend that can free me from my pain?" Diogenes preſented him with a dagger, ſaying, "Let this free you;" but Antiſthenes anſwered, "I wiſh to be freed from pain, not from life." He paid little reſpect to the gods and to the religion of his country; nevertheleſs, he ſeems to have entertained juſt notions concerning the Supreme Being. In his book, which treats on phyſics, ſays Cicero (De Nat. Deor. lib. i. c. 13.), he obſerves, that "*The Gods of the people are many, but the God of nature is one.*" For the doctrine inculcated by Antiſthenes, ſee CYNICS. The following maxims and apophthegms are aſcribed to him: "As ruſt conſumes iron, ſo doth envy conſume the heart of man." "That ſtate is haſtening to ruin, in which no difference is made between good and bad men." "The harmony of brethren is a ſtronger defence than a wall of braſs." "A wiſe man converſes with the wicked, as a phyſician with the ſick; not to catch the diſeaſe, but to cure it." "A philoſopher gains at leaſt one thing from his manner of life, a power of converſing with himſelf." "The moſt neceſſary part of learning is to unlearn our errors." "The man who is afraid of another, whatever he may think of himſelf, is a ſlave." Antiſthenes being told that a bad man had been praiſing him, ſaid, "What fooliſh thing have I been doing?" He wrote many books, of which Diogenes Laertius has given a long liſt; but none are extant, except two declamations, under the names of Ajax and Ulyſſes, which are publiſhed in the collection of ancient orators by Aldus, in 1513; by H. Stephens, in 1575; and by Canter, with a Latin verſion, as an appendix to his edition of Ariſtides, printed in folio at Baſil, in 1566. Suidas. Fabr. Bibl. Græc. lib. ii. c. 23. §. 32. tom. i. p. 830. Brucker's Hiſt. Phil. by Enf. vol. i. p. 296.

ANTISTITIUM, is a term uſed in ancient chronicles for an abbey or monaſtery.

ANTISTIUS, in *Biography*, a phyſician whoſe name is only known from his having been called on to examine the wounds of Julius Cæſar, after he had been aſſaſſinated in the Capitol, forty-three years before the commencement of the Chriſtian æra.

ANTISTŒCHON, from ἀντὶ, and στοιχον, *letter*, a grammatical figure, whereby one letter is uſed inſtead of another: as *olli* for *illi*. This is otherwiſe called *antiſtichon*, by ſome writers.

ANTISTROPHE, a kind of dance in uſe among the ancients; wherein they ſtepped ſometimes to the right and ſometimes to the left, ſtill doubling their turns or converſions.

The motion towards the left, they called *antiſtrophe*; from ἀντὶ, *againſt*; and στροφὴ, of στρέφω, *I turn*.

It was cuſtomary among the Greeks, on ſome occaſions, to dance round the altars, whilſt they ſung the ſacred hymns, which conſiſted of three ſtanzas, or parts; the firſt of which, called *ſtrophe*, was ſung in turning from eaſt to weſt; the other, named *antiſtrophe*, in returning from weſt to eaſt. Then they ſtood before the altar, and ſung the epode, which was the laſt part of the ſong—Hence,

ANTISTROPHE is alſo uſed in *Lyric Poetry*, in ſpeaking of the ODE, which is uſually divided into the *ſtrophe*, *antiſtrophe*, and *epode*.

The *antiſtrophe* is a kind of echo, or replication to the *ſtrophe*; and the *epode* is a launching out from them both.

ANTISTROPHE is alſo a figure in *Grammar*, whereby two terms or things, mutually dependant one on another, are reciprocally converted. As if one ſhould ſay, "the maſter of the ſervant, and the ſervant of the maſter."

ANTISTROPHE, in *Rhetoric*, the ſame with what is more commonly called EPISTROPHE.

ANTISYLLOGISM, in *Logic*, a ſyllogiſm, which infers a contrary concluſion to that of another SYLLOGISM.

ANTITACTÆ, or ANTITACTICI, in *Antiquity*, a kind of Gnoſtics, who owned that God, the Creator of the univerſe, was good and juſt; but aſſerted, alſo, that one of his creatures had created evil, and had engaged us to follow it, in order to ſet us in oppoſition to God the creator; and that it becomes our duty to oppoſe this author of evil, in order to avenge God of his enemy.

Hence the name; which is derived from ἀντιτάττω, *I oppoſe*.

ANTITAURUS, in *Geography*, a chain of mountains in Cappadocia, paſſing from the ſouth-weſt to the north-eaſt, and extending from mount Taurus to the Euphrates. The inhabitants of the country now call it Rhoam-Taura.

ANTITHENAR, in *Anatomy*, from ἀντὶ, *againſt*, and θέναρ, the *palm of the hand*, is the name given by Riolanus to the muſcle, commonly named in England *abductor indicis manus*, to which refer. Winſlow alſo calls by this name, the *adductor pollicis pedis*, which ſee.

ANTITHESIS, from ἀντιτίθημι, *I oppoſe*, in *Rhetoric*, a ſetting two things together by way of oppoſition to each other, that the different qualities of each may appear the more ſtrongly.

Such is that of Cicero, in the ſecond Catilinarian; "On the one ſide ſtands modeſty, on the other impudence; on the one fidelity, on the other deceit; here piety, there ſacrilege; here continency, there luſt," &c.—Such alſo is that of Auguſtus to ſome ſeditious young men; "Audite juvenes ſenem, quem juvenem ſenes audivere."—Such again is that of Seneca; "Curæ læves loquuntur, ingentes ſtupent." And that of Virgil;

"Flectere ſi nequeo ſuperos, Acheronta movebo."

St. Auguſtine, Seneca, Salvian, and many other ancient

writers, ſeem greatly to affect antitheſes; but among the moderns they are generally deſcried. Deſmaret repreſents them as the favourites of young writers.

ANTITHESIS is ſometimes uſed for controverſy.

In this ſenſe we meet with *antithetic* method, *antithetic* diſcourſes, &c.

ANTITHESIS is alſo a figure in *Grammar*, uſed to the ſame purpoſe with ATISTOECHON.

ANTITHETARIUS, a term occurring in the title of a chapter in the laws of Canutus, but not in the chapter itſelf.

The meaning of the word is, a man who endeavours to diſcharge himſelf of the fact of which he is accuſed, by recriminating, *i. e.* by charging the accuſer with the ſame fact.

ANTITHETON, in *Rhetoric*, a figure wherein contraries are ſet in oppoſition to each other.

Some diſtinguiſh between the *antitheſis* and *antitheton*. Voſſius thinks that in the *antitheton* nouns and verbs are oppoſed; but in the *antitheſis*, epithets only. Others comprehend the *antitheſis* under *antitheton*.

ANTITHORA. See ANTHORA.

ANTITRAGICUS, in *Anatomy*, is a muſcle belonging to the pinna of the external ear. It ariſes from the cartilage below the antitragus, and terminates in its ridge, extending as far forwards as the antihelix.

ANTITRAGUS is a ridge or eminence in the cartilaginous pinna of the external ear. See the article EAR, *external*.

ANTITRAGUS, in *Botany*. See CRYPSIS.

ANTITRINITARIANS, thoſe who deny the Trinity, and teach, that there are not three perſons in the Godhead.

Thus the Samoſatenians, who do not believe the diſtinction of perſons in God; the Arians, who deny the divinity of the Word; and the Macedonians, who deny that of the Holy Spirit; are all properly Antitrinitarians. Among the moderns, Antitrinitarians are particularly underſtood of Socinians, called alſo Unitarians.

The *Bibliotheca Antitrinitariorum*, or *Antitrinitarian* Library, is a poſthumous work of Chriſtopher Sandius, an eminent Antitrinitarian; wherein he gives a liſt, digeſted in order of time, of all the Socinian or modern Antitrinitarian authors, with a brief account of their lives, and a catalogue of their works. See UNITARIAN.

ANTITYPE, a Greek word, properly ſignifying a type or figure correſpondent to ſome other type.

The word antitype occurs twice in the New Teſtament; *viz.* in the Epiſtle to the Hebrews, ix. 24. and in St. Peter, 1 Ep. iii. 21. where its genuine import has been much controverted.—The former ſays, that "Chriſt is not entered into the holy places made with hands, which are αντιτυπα, the figures or antitypes of the true—now to appear in the preſence of God for us."—Now τυπος, as is elſewhere obſerved, ſignifies the pattern by which another thing is made; and as Moſes was obliged to make the tabernacle, and all things in it according to the pattern ſhewed him in the mount; the tabernacle ſo formed was the antitype of what was ſhewn to Moſes: any thing, therefore, formed according to a model, or pattern, is an antitype. Sykes's Paraphraſe in loc. p. 137.

In the latter paſſage, the Apoſtle, ſpeaking of Noah's flood, and the deliverance only of eight perſons in the ark from it, ſays, Ὃ καὶ ἡμας αντιτυπον νυν σωζει βαπτισμα, "baptiſm, being an antitype to that, now ſaves us; not putting away the filth of the fleſh, but the anſwer of a good conſcience towards God," &c. The meaning is, that righteouſneſs, or the anſwer of a good conſcience towards God, now ſaves us by means of the reſurrection of Chriſt, as formerly righteouſneſs ſaved thoſe eight perſons by means of the ark, during the flood. The word antitype, therefore, here ſignifies a general ſimilitude of circumſtances; and the particle ὡ, "whereunto," refers, not to the immediate antecedent, ὑδατος, "water," but to all that precedes.

Some read, as it is in the Alexandrian and ſeveral other approved MSS. inſtead of ὃ, &c. ὃ καὶ ημας, &c. "that which is the antitype doth now ſave us alſo, that is, baptiſm." The term "antitype" ſeems here to ſignify no more than ſome ſimilitude, or reſemblance, in the two things compared. But it may be aſked, what are the two things compared? and in what does the reſemblance conſiſt? Is the water of baptiſm compared to the waters of the flood, or baptiſm itſelf, compared to Noah's ark; or the being ſaved by baptiſm, to being ſaved in the ark? A judicious commentator is of opinion, that the laſt compariſon was deſigned by St. Peter; and that the ſalvation by the ark, in this particular, reſembled our ſalvation by chriſtian baptiſm. For as thoſe righteous perſons, Noah and his family, were ſaved in the ark, from periſhing by the deluge; ſo chriſtian baptiſm, if accompanied with righteouſneſs, or a good conſcience, will, through the reſurrection of Chriſt, ſave chriſtians from periſhing with a wicked world. Benſon on the Epiſtles, in *loc. cit.* vol. ii. p. 260.

ANTITYPE, among the *Ancient Greek Fathers*, and in the Greek *Liturgy*, is alſo applied to the ſymbols of bread and wine in the Sacrament.

Hence it hath been argued, by many proteſtants, that the Greeks do not really believe the doctrine of tranſubſtantiation; becauſe they call the bread and wine *antitypes*, αντιτυπα, q. d. figures, ſimilitudes, and this even after the conſecration.

ANTIVARI, in *Geography*, a town of European Turkey, in Dalmatia, ſituate on the gulf of Venice, oppoſite to Bari, and formerly the ſee of a Greek archbiſhop. But the Turks took it from the Venetians in 1573, and it ſtill remains in their poſſeſſion. It is about eight miles northweſt of Dulcigno, and 38 ſouth-eaſt of Raguſa. N. lat. 42° 25′. E. long. 19° 30′.

ANTIVEDUTO, in *Biography*, an eminent painter of portrait and hiſtory, was born near Rome in 1552; and under the care of Giovanni Dominico Perugino, exhibited ſurpriſing proofs of genius, and became a portrait painter of the higheſt reputation. In the hairs of the head, natural tint of the carnations, and ſtriking reſemblance of the features, he had no ſuperior. He was principally employed by the Medicean family. He had likewiſe a conſiderable talent for hiſtorical painting. He died in 1626. Pilkington.

ANTIVENTRIA, in *Geography*, a name given by the Spaniards to one of their diviſions of Terra Firma in South America. It comprehends the government of St. Martha, the new kingdom of Grenada, and ſome others to the ſouth of Carthagena, as far as the river of the Amazons.

ANTIVIRGILIAN HUSBANDRY, a title by which the drill or horſe-hoeing huſbandry, as improved by Mr. Tull, is ſometimes diſtinguiſhed by writers on agriculture.

ANTIUM, in *Ancient Geography*, now *Capo d'Anzo*, a town of Italy ſouth of Rome, ſituate on a rock near the ſea, but without a harbour, as there was one in the neighbouring hamlet, called *Ceno*. It belonged to the Volſci before it became the poſſeſſion of the Romans, and was for a long time a very ſtrong place. Dionyſius Halicarnaſſenſis, after Demagoras, ſays, that it was founded by a ſon of Circè; others aſcribe its origin to Aſcanius. However that be, the Romans, under the conduct of Numicius, took poſſeſſion of it, A. U. 284; and within two years, ſent a colony thither. The coloniſts and inhabitants were called *Antiates*. Livy (l. viii. c. 14.), and Florus (l. i. c. 11.), informs us, the Romans acquired their firſt reputation in naval affairs againſt

the Antiates; whofe fhips they partly conveyed into the arfenal of Rome, and partly burnt, and with their beaks, or roftra, they adorned the pulpit erected in the forum, hence called *roftra*. Horace refers to a famous temple of Fortune in this place, l. i. od. 35.

"O Diva, gratum quæ regis Antium," &c.

Caligula and Nero were born in this city; and Suetonius fays, that the former propofed to retire thither after he had maffacred the principal perfons of Rome, and the latter affigned it as a place of retreat for the veteran foldiers. Tacitus informs us, that Nero was at Antium, when news was brought to him of the conflagration of Rome, which Suetonius charges upon himfelf. In Chriftian times, Antium became the fee of a bifhop; but it is now extinct.

ANTIXENI, a people of India, who, according to Pliny, lived on the other fide of the Indus.

ANTLER, among *Hunters*, the firft of the pearls that grow about the bur of a deer's horn. There are alfo fur-*antlers*, brow-*antlers*, &c.

ANTLESTORF, in *Geography*, a town of Germany, in the archduchy of Auftria, fix miles eaft of Entzerftorff.

ANTLIA, an ancient machine, fuppofed to be the fame with our pump.

Hence the phrafe, *in antliam condemnari*, according to the critics, denotes a kind of punifhment, whereby criminals were condemned to drain ponds, ditches, or the like.

ANTŒCI, in *Geography*, thofe inhabitants of the earth who live under the fame meridian, and at the fame diftance from the equator; the one toward the north, and the other toward the fouth.

The word is formed of αντι, *contra*, and οικεω, *I inhabit*.—The *Antæci* are contradiftinguifhed from the *Periæci*, and they are frequently confounded with the *Antifcii*.

Hence the *Antæci* have the fame longitude, and equal latitudes, only of a different denomination; and, of courfe, they have precifely the fame hour of the day and night, but oppofite feafons: when it is 12 o'clock in the longeft fummer's day with one, it is 12 o'clock of the fhorteft winter's day with the other; and hence the night of the one is equal to the day of the other.

ANTOING, a town of the Netherlands, in the circle of Hainault, near the Scheldt, 1½ league S. of Tournay. It is the chief place of a canton in the diftrict of Tournay, and department of Jemappe. The place contains 1,567, and the canton 14,849, inhabitants; the territory comprehends 125 kiliometres and 19 communes.

ANTOMOSIA, from αντι and ομοω, *I fwear*, in *Ancient Writers*, an oath taken by both the parties in a criminal accufation; whereby the accufer charges the other with the fact, and the accufed in his turn denies the fame.

In which fenfe, antomofia amounts to the fame with *diomofia*, though fome diftinguifh between the two, reftraining antomofia to the oath of the perfon accufed, whereby he engages to make no other than a fair defence; and diomofia to the profecutor's oath, whereby he fwears that his accufation is juftly founded.

Others will have antomofia properly denote a law-fuit about things to which there are no witneffes, and which can only be decided by the oaths of the parties. Others again will have it to be, where the accufed party alleging ficknefs for his non-appearance, the profecutor takes an oath that the ficknefs is only feigned, upon which the judges proceed to fentence.

ANTONA, in *Ancient Geography*, a name given by Tacitus (Vit. Agricol.) to a Britifh river, concerning which antiquarians are not agreed. Some writers, as Camden, Carte, &c. appropriate the name to the Nan of Northamptonfhire, others to the Wye; and Whitaker (Hift. Manchefter, c. 12.) to the Avon of Warwick. Other writers contend for the Southampton river, to which, according to Camden, the name of Anton was applied, and from which he deduces the appellation of Hante-Seyre for Hampfhire, and Hanton for Southampton.

ANTONACUM, or ANTONNACUM, a town of the Treveri, now Andernach, below Coblentz. See ANDERNACH.

ANTONELLO DA MESSINA, in *Biography*, a painter of hiftory and portrait, was born at Meffina in 1426; and was the firft of the Italian maffers who underftood the art of painting in oil, the fecret having been communicated to him by John Van Eyck of Bruges. In order to obtain it, he vifited Flanders, and fo effectually recommended himfelf to Van Eyck by his affability and ingenuity, as well as by a prefent of fome fine Italian defigns, that Van Eyck difclofed to him the whole myftery; and Antonello foon acquired an eminence almoft equal to that of his inftructor. From a principle of gratitude he continued in Flanders as long as Van Eyck lived; and, after his death, fettled at Venice, where he painted feveral pictures, that were univerfally approved, as the fubjects were well defigned, the figures beautifully drawn, and the whole very delicately finifhed. He communicated the fecret to a painter, named Domenico, from whom Andrew Del Caftagno obtained the knowledge of it; and from him the art of painting in oil gradually became known, and generally practifed through all Italy. He died at Venice at the age of 49. Pilkington.

ANTONGIL Bay, in *Geography*, lies on the eaft fide of the ifland of Madagafcar, in S. lat. 16°, and E. long. 49° 2'.

ANTONIA Tower, or *Fortrefs*, was fituated in Jerufalem, at the N. W. angle of the temple, founded by Hyrcanus, on a fteep hill; and fo elevated, that it commanded the temple. Herod enlarged and fortified it, and gave it the name of Antonia, inftead of Baris, by which it was known when Hyrcanus occupied it, in honour of Marc Antony. It communicated with the temple by an arcade, and when the Romans had poffeffion of the country, they kept a garrifon in this tower; and by commanding the temple from this fort, they were maffers of the city by means of the temple. It was taken by Titus, who thus became maffer of the temple and of the city.

ANTONIAN *Water*, in the *Materia Medica*, the name of a medicinal water of Germany, remarkably pleafant to the tafte, and of fervice in many cafes as a medicine.

This water, if mixed with any acid liquor, raifes a conficerable effervefcence; and, when mixed with Rhenifh wine and fugar, which is a common way of drinking it, makes a great hiffing and bubbling, and becomes turbid and milky. If powder of galls be added to it, it fuffers no change, but remains limpid and colourlefs; whence it is plain that it contains no iron nor vitriol. Syrup of vitriol mixed with it turns the whole green, whence it is plain that it contains an alkali: and if oil of tartar be added to it, it becomes turbid and milky, and precipitates a white fediment; whence it appears that there is either common falt or a calcareous earth in it. If it be expofed fome time to the air in an open veffel, it, like all the other mineral waters, lofes its pungent tafte and pellucidity, becoming turbid and vapid. A quart of it evaporated with a very gentle heat, leaves two fcruples of a very dry fediment, which being feparated by another folution, is found to be one-half of an alkaline falt, and the other a calcareous earth. Oil of vitriol mixed with the falt produces a great effervefcence; and a penetrating fcent arifes like that produced by the mixing of oil of vitriol and common falt. Hence it appears, that thefe waters contain

tain a ſmall portion of an alkaline ſalt, a larger portion of ſea-ſalt, and a yet larger of a calcareous earth, and with theſe a very conſiderable quantity of a ſubtile and penetrating mineral ſpirit.

It is a very temperate water, not too ſtrongly operating either by ſtool or urine; and hence it is a very proper drink for perſons in chronic and in many acute caſes, either alone, or mixed with wine, to ſupply the place of malt liquor, which is proper but in very few illneſſes. A long uſe of it alone may alſo prove of conſiderable ſervice in hypochondriac caſes.

ANTONIANO, Silvio, in *Biography*, a cardinal and learned man of the 16th century, was born at Rome in the year 1540; and, at the early age of 10 years, diſtinguiſhed himſelf by extemporaneous productions in verſe. Having given various proofs of his ſingular talents in this way, he was taken under the protection of the duke of Ferrara, who provided him with excellent maſters to inſtruct him, aſſigned him a penſion, and eſtabliſhed a profeſſorſhip of belles lettres, with which he was honoured at the age of 17 years; and on this occaſion he pronounced ſome orations, which were afterwards publiſhed. When cardinal de Medicis ſucceeded to the popedom, under the name of Pius IV., he ſent for Antoniano to Rome, and made him Latin maſter and ſecretary to his nephew, cardinal Borromeo. He was alſo appointed profeſſor of polite literature in the college at Rome; and diſcharged this office with ſuch reputation, that he had for his auditors not only a prodigious number of people, but even 25 cardinals. He was afterwards choſen rector of the ſame college. At the death of Pius IV., he was choſen ſecretary of the ſacred college by Pius V.; and occupied this poſt for 25 years. Clement VIII. made him ſecretary of the briefs, afterwards his chamberlain, and finally a cardinal. He fell a ſacrifice to intenſe ſtudy, in his 63d year. Antoniano is ſaid to have written with ſuch eaſe and correctneſs, that he never made a blot or eraſure; and his manners were ſo irreproachable, that he is ſaid never to have tranſgreſſed the bounds of the ſtricteſt chaſtity. He left a variety of works both in proſe and verſe; of which the principal are, "De Chriſtiana Puerorum Educatione;" "Diſſertatio de Obſcuritate Solis in Morte Chriſti;" "De Succeſſione Apoſtolica;" "De Stylo Eccleſiaſtico ſeu de conſcribenda Eccleſiaſtica Hiſtoria;" "De Primatu Sancti Petri;" "Lucubrationes in Rhetoricam Ariſtotelis, et in Orationes Ciceronis." It is alſo ſaid that he had a ſhare in the catechiſm of the Council of Trent. Gen. Dict.

ANTONIDES, J. Vander Goes, an eminent Dutch poet, was born of anabaptiſt parents, at Goes in Zealand, in the year 1647. After a tolerable education, he was apprenticed to an apothecary: but the fame of Vondel and ſome other poets of his country, led him to cultivate his natural talent in this way. He began with tranſlations from the beſt Latin writers, and then launched into original compoſition. His tragedy upon the conqueſt of China by the Tartars, intitled "Trazil," was followed by "Bellona in Chains," which was highly applauded by the beſt judges. But his capital work was entitled "Y Stroom," or the River Y, which forms the port of Amſterdam. This recommended him to M. De Buſero, deputy in the college of admiralty, who procured for him the place of ſecretary in that department. Soon after he had been thus raiſed from his obſcure ſituation, he married a clergyman's daughter, who had a taſte for poetry; but abandoning the Muſes, and devoting himſelf to the duties of his office, he ſoon died of a conſumption in the flower of his age, in 1684. He had propoſed, and begun a life of St. Paul, but left only a few fragments of it. His works were publiſhed, in 4to. at Amſterdam, in 1714, under the inſpection of Mr. Hoogſtraten, one of the maſters of the Latin ſchool. Gen. Dict.

ANTONINE Column, in *Architecture* and *Sculpture*. See Column.

ANTONINUS Pius, or *Titus Aurelius Fulvius Boionius Antoninus*, a Roman Emperor, was born at Lanuvium or Lavinium, in the vicinity of Rome, A. D. 86; and deſcended from virtuous and honourable anceſtors at Niſmes in Gaul. Both his grandfathers, and his father, were conſuls. After the death of his father, his education was completed in the houſe of his maternal grandfather, Arrius Antoninus. At an early age he conciliated the affection of all his relations, ſo that when they died, he was diſtinguiſhed by their bequeſts, and became rich; and as he advanced to maturity, he combined, in a very eminent degree, all the virtues of the heart with a gentle and majeſtic countenance, a cultivated underſtanding, a commanding eloquence, and an exemplary conduct. In his ſentiments and actions he was guided by moderation; and he was perfectly free from affectation and vain glory. Having attained the conſulate A. D. 120, he was afterwards one of the four conſulars appointed by Adrian to govern Italy, and became proconſul of Aſia; where, by the mildneſs of his authority, and the affability of his manners, he engaged the affection and attachment of perſons of all ranks and parties. On his return to Rome, he was admitted into the council of Adrian; nor did the emperor purſue any meaſure of conſequence without his advice. He married Anna Fauſtina, the daughter of Annius Verus; and though he was not very happy in his choice, he behaved with ſingular reſpect to the father, comforting him in his old age, and ſupporting him with his arm when he came into the ſenate; and hence it is ſaid, he obtained the ſurname of *Pius*. By this marriage he had two ſons, who died young; and two daughters, one of whom, named Fauſtina, was married to Marcus Aurelius, afterwards emperor. Upon the death of Ælius Verus, Adrian determined upon the adoption of Antoninus; and having overcome his reluctance to undertake ſo great a charge as that of the Roman empire, he declared his nomination in the preſence of a council of the principal ſenators, on the 25th day of February, A. D. 138, and immediately made him his colleague in the proconſular and tribunitian authorities. He alſo cauſed him to adopt the ſon of Verus, an infant of ſeven years of age; and Marcus Annius, afterwards Aurelius, who was about 17 years old. Upon the death of Adrian, July 10, A. D. 138, or, as ſome ſay, A. D. 139, Antoninus ſucceeded to the throne, amidſt the congratulations of the ſenate, and to the univerſal ſatisfaction of the Roman people. His acceſſion was marked by the uſual titles and honours conferred on the Roman emperors; to which the ſenate added that of *Pius*, either from the circumſtance already mentioned, or on account of the reſpect with which he treated the memory of his predeceſſor. Although the pacific reign of Antoninus affords little variety of incident, it is nevertheleſs to be regretted, that we derive our direct information of this reign from a confuſed and obſcure hiſtorian, Capitolinus; the records of Dio Caſſius having been loſt. From the teſtimony of this hiſtorian, however, it appears, that, after his acceſſion to the empire, he purſued the ſame courſe of conduct which he had done whilſt he was a private perſon; fixing the attachment of his friends, and conciliating his enemies; conſulting the ſenate on every tranſaction of importance, and frequently giving an account to the people of all his actions

and negociations. Such was his general conduct, that M. Aurelius was convinced, by his example, that a prince might lead a private life even in a court. He reduced moſt of the impoſts and tributes, and enjoined his collectors to exact them without ſeverity; obſerving, that he rather choſe to be poor, than that his coffers ſhould be filled at the expence of an oppreſſed people. Soon after his acceſſion, he diſtributed the greateſt part of his private eſtate among the indigent citizens; and when the empreſs Fauſtina repined at his liberality, he told her, that a prince ought to have no private intereſt, no private property, and nothing in view but the public welfare. He was udicious in the choice of the governors of provinces; and, it is ſaid, that he never promoted an undeſerving perſon to any employment or honour. The penſions of uſeleſs perſons were aboliſhed, and he alleged, that he could not bear to ſee the ſtate impoveriſhed by thoſe who did it no ſervice, but lived idly upon the labours of others. But though he was ſparing of the public money, no one ever charged him with avarice, as he was exhibiting daily evidence of an unbounded generoſity. He never would accept legacies from ſuch as had children; and he ordered the eſtates of criminals condemned for extortion to be reſtored to their heirs, after having rendered ſatisfaction to thoſe whom they had pillaged. He alſo extirpated the whole tribe of informers; and upon any misfortune that happened to any city or province, he was ready to leſſen their tribute or taxes. Antoninus every where favoured men of learning, encouraged the education of youth, and ſpent conſiderable ſums in providing for the children of indigent parents. Although he was not addicted to building, he raiſed ſeveral ſtately edifices in Rome and its vicinity. He cauſed a port to be made at Caieta or Gæta; repaired that of Terracina; finiſhed Adrian's magnificent mauſoleum; built a ſtately palace at Lorium in Hetruria, about ten miles from Rome, where he had been educated; and he contributed large ſums towards repairing ſeveral ancient buildings in Greece, Ionia, Syria, and Africa. It is probable that Niſmes was indebted to him for thoſe magnificent decorations that ſtill diſtinguiſh it, the amphitheatre and aqueduct. Having declared at the commencement of his reign, that he would not ſpill the blood of any ſenator, he religiouſly obſerved his engagement; ſo that when one was convicted of parricide, he contented himſelf with baniſhing him, after he had confeſſed his crime. When Attilius Tatianus and Priſcianus were accuſed of conſpiring againſt his life, and after the latter had deſtroyed himſelf, and the former was baniſhed, he took the ſon of the ſurvivor under his care, and brought him up as if he had been his own child; nor would he ſuffer any inquiry to be made after their accomplices, obſerving to the ſenate, who urged him to it, "I do not care the world ſhould know by how many perſons I am hated." In the exerciſe of juriſprudence, he iſſued three decrees which manifeſt a laudable ſpirit of equity. The firſt was, that no one ſhould be again proſecuted on a charge of which he had been once acquitted:—the ſecond, that the children of a perſon become a Roman citizen, who were not ſo themſelves, ſhould not, as in former times, forfeit their inheritance to the treaſury:—and the third, that a woman proſecuted for adultery by her huſband, ſhould have a right to recriminate. He alſo iſſued reſcripts in favour of the Chriſtians, to protect them from popular rage and legal injuſtice. One of theſe, addreſſed to the people of Aſia Minor, is preſerved by Euſebius (E. H. l. iv.), and it bears teſtimony to their character. So pacific was his diſpoſition, that he never engaged in any war which he could avoid; and was often heard to ſay, "that he had rather ſave one citizen than deſtroy a thouſand enemies." Some commotions, however, aroſe in various parts of the empire; but they were ſuppreſſed, without much difficulty, by his lieutenants. In Britain, the incurſions of the Brigantes were ſuppreſſed; and the boundaries of the Roman province were extended, by building a new wall to the north of that of Adrian, from the mouth of the Eſk to that of the Tweed.

Antoninus, by his temper and conduct, gained the affections, not only of his own people, by whom he was revered as their father and protector, but of thoſe who were the avowed enemies of Rome. Such was the influence of his known character, that a letter addreſſed by him to the king of Parthia, induced him to decline a meditated invaſion of Armenia, and to diſband his troops. The kings of Hyrcania, Bactria, and India, ſent ambaſſadors to him, courting his friendſhip and alliance. Pharaſmanes, king of Iberia, paid him a viſit in perſon at Rome; and the Lazi, the Armenians, the Quadi, and ſeveral other nations, readily received ſuch perſons as he was pleaſed to appoint for their rulers, though they were not then ſubject to the empire. Antoninus is by ſome hiſtorians compared, and by others even preferred, to Numa, on account of the tranquillity which Rome enjoyed during the greateſt part of his reign; and his extraordinary care of all things belonging to the worſhip of the gods, and to religion.

Some perſons have thought that he extended his indulgence to the empreſs Fauſtina, whoſe life was diſſolute, to an improper and culpable extreme. After ſhe died, ſhe was honoured with divine worſhip, prieſts, temples, and ſtatues of gold and ſilver; games were alſo inſtituted to her honour; and her ſtatue was carried, by his expreſs order, amongſt thoſe of the other gods, at the Circenſian ſports.

Soon after his advancement to the throne, Marcus Aurelius was diſtinguiſhed by his favour; for he married him to his daughter Fauſtina, and declared him Cæſar; nor had any reaſon to regret the honours he conferred upon him, and the confidence he repoſed in him. In this ſtate of domeſtic and public tranquillity, Antoninus attained his 74th year; and being ſeized with a fever at one of his country ſeats at Lorium, he cloſed his life, in the month of March, A. D. 161. He foreſaw the event, and ſummoned the principal officers of ſtate to attend him; and in their preſence confirmed his choice of Marcus Aurelius as his ſucceſſor, and cauſed the imperial enſigns to be carried to him. In the ſtate of derangement, occaſioned by his fever, his thoughts were evidently directed to the republic; and he deprecated the anger of the kings whom he ſuppoſed hoſtile to it. In a lucid interval, he gave as a watchword to the prætorian tribunes, "Equanimitas;" and then placidly expired, after a reign of 22 years ſeven months and 26 days. His funeral was conducted with pomp and magnificence; his remains were depoſited in the tomb of Adrian; he was ranked by the ſenate among the gods; a temple was built to his honour; and prieſts, ſacrifices, and annual ſports were inſtituted. His death, though at an advanced age, was the ſubject of univerſal lamentation; and ſo highly honoured was his memory, that ſucceeding emperors choſe to bear the name of Antoninus, as the moſt popular appellation they could aſſume. Marcus Aurelius and the ſenate conſecrated to his memory a ſculptured pillar, which ſtill ſubſiſts, as one of the principal ornaments of Rome, under the name of the *Antonine* COLUMN. Anc. Un. Hiſt. vol. xiii. p. 294—309. Crevier's Hiſt. of the Emperors, vol. vii. p. 198—245. Lardner's Works, vol. vii. p. 388—395.

ANTONINUS, MARCUS ANNIUS AURELIUS, one of the moſt illuſtrious of the Roman emperors, was born in the year

of

of Rome, 874, A. D. 121, during the ſecond conſulſhip of his grandfather, L. Annius Verus; and deſcended from an honourable family of Succubis or Ucubis, of Betica, ſuppoſed to be related to that of Adrian. He was diſtinguiſhed by the patronage and favour of Adrian in his early years; and at the age of ſix years he advanced him to the rank of knighthood, at eight admitted him into the college of Salii, and at length adopted him into the imperial family, ſo that his ſucceſſion to the empire was ſecure. The Emperor uſed to call him M. Annius Veriſſimus, on account of his great ſincerity. When he was adopted, he took the names of M. Ælius Aurelius Verus, Aurelius being an appellation peculiar to the family of Antoninus, and Ælius belonging to that of Adrian, into which Antoninus had been adopted. Upon his acceſſion to the empire he aſſumed the name of Antoninus; and he is uſually diſtinguiſhed from his predeceſſor by the prenomen of Marcus, or ſurname of Philoſophus, which was given him by the unanimous conſent of hiſtorians, and not by any decree of the ſenate. The care of his education in his infancy was devolved on his paternal grandfather, Annius Verus; and in his maturer years, he was brought up in the palace, and inſtructed under the direction of Adrian, in all the arts that pertain both to the body and mind; eloquence and poetry, however, engaged little of his attention, for his thoughts and time were devoted to philoſophy; and more eſpecially to that kind of philoſophy that tended to regulate the temper and conduct. His principal maſters were Herodes Atticus, and Cornelius Fronto, Greek orators: and above all, Junius Ruſticus, who joined to an illuſtrious birth an hereditary taſte for the ſtoical philoſophy. Such was his proficiency under theſe inſtructors, that at the age of 12 years he aſſumed the philoſophical gown. To his intenſe ſtudy he added the auſterity of the profeſſion to which he was devoted; and by unwearied application and ſtrict regimen he prejudiced his health. With the gravity of a philoſopher, however, he blended no part of the ſeverity; his addreſs was agreeable and engaging to all with whom he had any intercourſe; he was virtuous without pride, modeſt without timidity, and grave without melancholy. To his maſters he was reſpectful and grateful; he honoured them living and dead; and kept their images of gold, with thoſe of his houſehold gods, in his domeſtic chapel; and offered up chaplets of flowers and victims at their tombs. At 15 years of age, he put on the manly gown, and ſoon afterwards was appointed præfect of the city. About this time he manifeſted his diſintereſted generoſity, by ſurrendering to his only ſiſter, Annia Corniſicia, all his father's effects. His adoption into the Aurelian family, by Antoninus Pius, took place in his 17th year; but ſuch was the ſuperiority of his mind to all diſtinctions of this nature, that the honour produced no change in his diſpoſition and mode of life, nor in the courſe of his ſtudies. After his adoption, he was appointed quæſtor; and immediately upon Adrian's death, Antoninus married him to his daughter Fauſtina, advanced him to the dignity of Cæſar, and conferred upon him, in quick ſucceſſion, a variety of civic honours. He was appointed chief of one of the centuries of Roman knights, had a houſehold aſſigned him, was twice conſul, and received the tribunitial and proconſular authorities. Such was the emperor's confidence in him, that he was called to all his public councils, and he gave away no office without his advice and approbation; and ſuch was Aurelius's attachment to the emperor, that, during almoſt 23 years, he never ſlept apart from him more than two nights either in town or country.

Of the diſintereſtedneſs of Aurelius, we have a ſingular inſtance on his firſt acceſſion to the throne. L. Aurelius Commodus, the ſon of that Verus whom Adrian had adopted, had been joined with Marcus Aurelius in the adoption of Antoninus, and equally intended for the ſucceſſion. But Antoninus, on account of the errors and vices of his youth, had excluded him from any ſhare in the ſovereignty, and appointed Aurelius heir to the empire; and, upon the death of Antoninus, the ſenate confirmed his purpoſe. Aurelius, however, procured Commodus to be declared his colleague, promiſed him his daughter Lucilla in marriage, and ordained that he ſhould take his own original name of Verus, by which name he was afterwards known. In the firſt year of Aurelius's reign, Fauſtina was delivered of male twins, one of whom died under age, and the other was Commodus, who ſucceeded his father in the empire, diſgraced his elevation, and became notorious for every kind of profligacy. About the ſame time, the public tranquillity was diſturbed in Germany, Great Britain, and Parthia; but the moſt important events were, the invaſion of Armenia by Vologeſes, king of the latter country, and his irruption into Syria. Verus proceeded to the eaſt, rather making a tour of pleaſure than conducting a military expedition, and took upon him the ſupreme command. After four years the war terminated in a treaty, which reſtored the king of Armenia to the throne; and though Verus was an object of contempt, on account of his luxurious diſpoſition, to foreign nations, and had little perſonal ſhare in the honour of bringing the war to a termination, he was dignified with the title of "Imperator" by the army, and other pompous appellations. During the courſe of this war, he married Lucilla; and, on his return to Rome, both emperors were united in the triumph, and a cordial harmony ſubſiſted between them. The character of theſe two emperors was, however, eſſentially different. Verus was debauched and extravagant; and if we except cruelty, in the exerciſe of which he was reſtrained, he exhibited all the follies and vices of the worſt of his predeceſſors. Aurelius, on the other hand, was a philoſopher on the throne; and exhibited a pattern of every private and public virtue. He diſtinguiſhed himſelf more than any former emperor had done, by his reſpect and deference to the ſenate, and by his attention to the happineſs of the people. He would not touch the money in the treaſury, without the expreſs permiſſion of the ſenate: "Every thing," ſaid he, "belongs to the ſenate and people; we have nothing which we do not hold of you; the very palace we inhabit is your property." When he was under a neceſſity of patiently enduring thoſe vicious habits which he could not reform by gentle means, he uſed to ſay, "We cannot make men as we wiſh them to be: we muſt take them as they are, and do the beſt with them that lies in our power." So determined was Aurelius in reſiſting exactions, that he checked the rapacity of his ſoldiers at a moment of victory, by telling them, "All that is given you beyond your due muſt come from the blood of your parents and relations." In a time of public diſtreſs, he preferred ſelling the furniture of his palace, and the rich wardrobe of his wife, to increaſing the burden of the provinces. Although he did not wholly aboliſh, he reſtrained the expence of public exhibitions: and he ſoftened the cruelty of the combats of the gladiators, by ſubſtituting leſs hurtful arms in the room of thoſe that were deſtructive. Lenity was the chief foible of his character; and yet he ever manifeſted a ſtrict regard to juſtice. He expedited the deciſion of legal proceſſes, increaſed the number of days on which the courts were to ſit for the diſpatch of buſineſs, and followed the example of his predeceſſor in his improvement of juriſprudence. The right of ſucceſſion of children to their mothers was made by him

a part

a part of the Roman law, and he appointed a particular prætor for the guardianſhip of minors.

The cloſe of the life and reign of this tranquil prince was diſturbed by the hoſtilities of the Marcomanni and other German tribes; and when a peace had been concluded with the Parthians, theſe hoſtilities, which had become formidable, demanded attention. In the year 169, the two emperors having levied an army, left Rome together, and wintered at Aquileia. Antoninus had prepared for the conflict that was expected, by a variety of religious ceremonies, which he thought might tend to render the deities propitious, while they manifeſted his own attachment to the forms of religion which ſuperſtition had deviſed and ſanctioned. Till the death of Verus, in the year 169, nothing deciſive ſeems to have occurred. Worthleſs as his character was, Antoninus proſtituted upon him divine honours; and in his memoirs, he ſpeaks of him with undue reſpect, and in a manner that is not very compatible with the reproach which he caſt upon him in his addreſs to the ſenate. In the following year, the emperor, who was now ſole poſſeſſor of power, returned to Pannonia, and vigorouſly oppoſed the Marcomanni, who had advanced as far as Aquileia. During a conteſt which detained Antoninus in theſe parts for five years, he had many opportunities for the exerciſe of fortitude and patience, and for the practice of thoſe leſſons which he had ſtudied in his youth. The moſt celebrated event which occurred in this period, was a victory obtained by the emperor in perſon over the Quadi, the conſequence of a ſudden ſtorm of rain, hail, and lightning, which diſconcerted the barbarians, and was regarded as miraculous. Antoninus and the Romans aſcribed it to an interpoſition of Jupiter and Mercury, but the Chriſtians attributed it to the effectual prayers of a legion of Chriſtians who ſerved in the army, hence called the *thundering legion*. See a more particular account under that article. Pannonia was at length delivered from the incurſions of the barbarians; to whom territories were aſſigned on the confines of the empire. The ſubjugation of the Marcomanni was delayed by the revolt of Avidius Caſſius, who aſſumed the purple in Syria; and who obtained ſupport in conſequence of a rumour of the emperor's death, which he contrived to circulate. This rebellion was ſoon quelled by the officers of Caſſius, who conſpired againſt him, and killed both himſelf and his ſon. Such was the magnanimity of the emperor on this occaſion, that, having obtained the papers of Caſſius, he committed them to the flames without reading them. After the ſuppreſſion of this inſurrection, Antoninus made a progreſs through the eaſt, and was accompained by Fauſtina, who died in this journey, after a ſhort illneſs. In her licentious conduct ſhe rivalled the infamous Meſſalina; and yet, ſuch was the ſtoical inſenſibility of her huſband, that he paid her divine honours after her death. This conduct on the part of the emperor, either betrays great want of penetration, or offers an inexcuſable inſult to decorum and good morals. Whilſt the emperor viſited Syria, Egypt, and Greece, in the year 176, he was initiated at Athens, in the Eleuſinian myſteries, and he conferred various privileges on this ſeat of philoſophy. On his return to Rome, after an abſence of eight years, he obtained a triumph on account of his conqueſt of the Marcomanni, and profuſely diſtributed largeſſes among the people. After two years, he marched again towards the Danube, where the war with the Marcomanni was renewed; and in this expedition he was accompained by his ſon. Before his departure, it is ſaid that, in compliance with the requeſt of the people, who wiſhed him to inſtruct them in the ſecrets of philoſophy, he gave public lectures for three days; and the report of adulation adds, that he delivered ſimilar lectures in ſome of the capitals of the provinces. In this new war Antoninus was ſucceſsful, and was for the 10th time honoured with the title of "Imperator." After an abſence of two years, he fell ill at Vindobona, now Vienna, in Auſtria, apparently of a peſtilential diſeaſe which prevailed in the army, and died on the 7th day, March 17th, A. D. 180, U. C. 933, at the age of 59 years, and after a reign of ſomewhat more than 19 years. His death was univerſally lamented; he was deified by the acclamation of the ſenate and people; his image was kept in the private houſes of the Romans among their deities, and he who had not one was deemed impious; this worſhip of him continued above 100 years; and Dioclefian gloried in honouring him as one of the principal deities.

Marcus Aurelius, notwithſtanding all the good qualities by which he was diſtinguiſhed, and the mildneſs and clemency which perhaps on ſome occaſions he carried to a blameable exceſs, perſecuted the Chriſtians. He was undoubtedly prejudiced againſt them, and in his own book, (xi. 3.), cenſures very unreaſonably what he ought to have approved (as the excellent Dr. Jortin remarks, Diſcourſes concerning the Truth of the Chriſtian Religion, p. 57)—their readineſs and reſolution to die for their religion. The ground of this cenſure is particularly examined by Dr. Lardner; and he aſcribes it partly to the Chriſtians refuſing to join in the common worſhip of the Heathen deities, and to the freedom of their reflections upon the philoſophers; partly to their ſurpaſſing even the ſtoics in patience under all kinds of ſufferings; and partly to the emperor's bigotry, both in religion and philoſophy, which often miſleads the judgment, and induces perſons of the beſt diſpoſition to act contrary to the laws of equity on ſome occaſions. Of the perſecutions in this reign, which were numerous and ſevere, and which have led the ancients to reckon Aurelius among the perſecuting emperors, we muſt ſeek the cauſe in the ſtoical and hard-hearted philoſophy which he had embraced; in his attachment, real or diſſembled, to the religion of his country, and to the eſtabliſhed worſhip of the gods againſt which Chriſtianity militated; and perhaps principally to the inſtructions and inſtigations of the philoſophers, who frequented his court, and who cherithed in his mind an enmity againſt the Chriſtians. Whatever motives influenced the conduct of Aurelius, the Chriſtians were under great diſcouragements during his reign. In that period were publiſhed many apologies, as the ſecond of Juſtin Martyr, thoſe of Tatian, Athenagoras, Apollinaris of Hierapolis, Melito of Sardis, and Theophilus of Antioch. In this period were alſo many martyrs; ſome of great diſtinction, as Juſtin, Polycarp, and the martyrs of Lyons, with their aged biſhop Pothinus.

Aurelius was a writer; and his "Meditations," written in Greek, have reached our time. The moſt valued editions are thoſe with Gataker's notes, particularly that of Cambridge, 4to., 1652; of London, 4to., 1697; and of Utrecht, folio, 1698. In order to form a true judgment of theſe meditations, with reſpect to their meaning and ſpirit, they ſhould be read, not as detached moral maxims or reflections, but as connected with, and founded upon, the principles of ſtoiciſm. The leading feature in the character of Aurelius was goodneſs of heart: but it was not accompanied with a comprehenſive underſtanding and ſound judgment. "His philoſophy was not free from pedantry and oſtentation. We want in him the manly ſenſe of Trajan, and the ſimple virtue of Antoninus Pius; yet he will ever ſtand high among the friends and benefactors of mankind; and will afford a memorable example of philoſophy ſtrictly maintained upon a throne." Anc. Un. Hiſt. vol. xiii. p. 310—341. Crevier's Hiſt. Emp. vol. viii. Gibbon's Hiſt. Brucker's Phil.

Phil. by Enfield, vol. ii. p. 134, &c. Lardner's Works, vol. vii. p. 395—459.

ANTONIO, Nicholas, was born at Seville in Spain, in 1617; and having ſtudied law in the univerſity of Salamanca, became agent-general for the king of Spain, at Rome. He is known as the author of a celebrated work in Spaniſh literature, intitled "A Catalogue of Spaniſh Authors," to the compilation of which he devoted ſeveral years in the royal monaſtery of Benedictines at Salamanca; and for the completion of which, as well as the gratification of his taſte for letters, he purchaſed 30,000 volumes. The work was completed in four volumes folio, and printed at Rome in 1696. It is copious, correct, and methodical; and is now ſcarce. He alſo wrote in Latin a treatiſe "On Exile," which was publiſhed at Antwerp in 1659. Antonio died in the year 1684. Gen. Biog.

Antonio, *Port*, in *Geography*, a bay or harbour on the north-eaſt coaſt of the iſland of Jamaica, two leagues weſt-north-weſt from north-eaſt point.

Antonio *Iſland*. See St. Anthony's *iſland*.

Antonio, St. *Cape*, lies in a ſmall deep bay, about two leagues north-weſt from Cape St. Martin's, on the coaſt of Valencia, in the Mediterranean, belonging to Spain.

Antonio, St. *Port*, lies in the iſland of Lemnos, in the Archipelago, between two hills, appearing at ſea like two iſlands; 12 leagues north-weſt from Mitylene, or Leſbos.

Antonio *Viana*, is a ſhoal due weſt of Cape Negro, on the coaſt of Africa, 80 or 90 leagues from the ſhore, which is very dangerous, and ſhould be carefully avoided.

Antonio, St. *Cape*, is the extreme weſtern point of the iſland of Cuba, in the Weſt Indies. N. lat. 21° 45′. W. long. 84° 10′.

Antonio, St. *Fort*, lies on the coaſt of Brazil, within the north point of the river Paraba. S. lat. 21° 25′: called Point Lucena, and the rendezvous of the Brazil ſhips for Europe.

Antonio De Suchitepec, St., a town in Mexico, or New Spain, on the coaſt of the Pacific Ocean. N. lat. 15°. W. long. 93° 5′.

Antonio, St, the capital of the province of Apachiera, in New Mexico.

Antonio, a town in the province of Navarre, in North America, on a river which runs ſouth-weſt into the gulf of California.

Antonio De Cabo, St. a town of Brazil, in South America, near Cape St. Auguſtine, ſubject to the Portugueſe, where they manufacture a conſiderable quantity of ſugar. S. lat. 8° 34′. W. long. 35° 22′.

Antonio, St. a town of New Mexico, on the weſt ſide of Rio Bravo river, below St. Gregoria. It is alſo the name of a town on the river Hondo, which falls into the gulf of Mexico, north-eaſt of Rio de Brava.

ANTONIOTTO, Giorgio, in *Muſical Biography*. See Giorgio.

ANTONIUS, Marcus, the *Orator*, in *Biography*, was the greateſt ornament of the Antonian family. Having obtained the quæſtorſhip of the province of Aſia, he had proceeded to Brunduſium, when he was informed that he was accuſed of inceſt; and that the cauſe lay before Caſſius the prætor, who was a very ſevere judge. Declining to avail himſelf of the privilege belonging to thoſe who were abſent in the ſervice of the commonwealth, againſt whom no accuſation could be preferred, he haſtened back to Rome, and ſubmitted to a trial, in which he was honourably acquitted. Whilſt he was prætor, Sicily fell to his lot, and he cleared the ſeas of the pirates which infeſted thoſe coaſts. He was conſul in the year of Rome 653, before Chriſt 101, and was very active in ſuppreſſing the tumults excited by the tribune Sextus Titus. His conduct, whilſt he was governor of Cilicia, obtained for him the honour of a triumph. In order to improve his talents for eloquence, he put himſelf under the inſtruction of the principal teachers of rhetoric, both at Athens and Rome. On his return to Rome, he performed the office of cenſor, and gained a cauſe againſt Duronius, who had from revenge preferred an accuſation of bribery againſt him. He was highly admired and eſteemed on account of both his talents and conduct; but unfortunately fell a ſacrifice in the tumults occaſioned at Rome by the factions of Marius and Cinna. The ſoldiers who were diſpatched to diſcover his retirement and to kill him, were ſo overpowered by his addreſs that they were unable to execute their commiſſion; and the commanding officer, obſerving that they heſitated, and enraged that his orders were not complied with, became himſelf the aſſaſſin. His head was afterwards expoſed before the roſtrum, which he had adorned with his triumphal ſpoils. This happened in the year of Rome 667, before Chriſt 87. Marcus Antonius was one of the greateſt orators of Rome; and in the judgment of Cicero, it was owing to him and to Craſſus, that Italy was the rival of Greece in the art of eloquence. He makes him one of the principal interlocutors in his "Dialogue on Oratory;" and in his "Treatiſe on famous Orators," deſcribes at length his character as a ſpeaker. His diſtinguiſhing qualities were force, earneſtneſs, acuteneſs, variety, readineſs, and copiouſneſs, and he excelled as much in action as in language. His memory was ſingularly retentive; and though he began to ſpeak without any ſeeming preparation, he was always ſo much maſter of his ſubject, that the judges ſeemed not ſufficiently prepared to anſwer him. In his defence of Marcus Aquilius and others, he moved the judges, by the tears he ſhed, and by exhibiting the ſcars on the breaſt of his client, to ſuch a degree, that he gained his cauſe. Although a tract of his on oratory had got abroad ſurreptitiouſly, he never ſuffered any of his pleadings to be publiſhed; alleging that whenever it would have been better that any thing had not been ſaid, it might not be proved againſt him. Cicero, de Oratore, lib. ii. c. 47. &c. Apud Oper. tom. i. p. 254, ed. Olivet.—De Claris Oratoribus, c. 30, 31, &c. Oper. tom. i. p. 416, &c. Pro Cluentio, c. 50. Oper. tom. v. p. 88. Valer. Max. lib. vii. c. 3. Gen. Dict.

Antonius, Musa, phyſician to the emperor Auguſtus. Having had the good fortune to reſtore the emperor to health, from a tedious and dangerous complaint, which his other phyſicians had attempted in vain, he was loaded with riches, and was allowed the liberty of wearing a gold ring, a privilege only granted to perſonages of the firſt rank. This privilege was afterwards granted to other phyſicians at Rome, in compliment to Antonius.—The medicines he uſed in the cure of Auguſtus are ſaid to have been principally cooling herbs, to which he added the uſe of the cold bath, at that time but little known. He was ſkilful, Haller ſays, in the knowledge of medicine, and many of his compoſitions continued to be uſed to a very late period. Bib. Med. Pract.

Antonne, in *Geography*, a town of France, in the department of the Dordogne, and chief place of a canton, in the diſtrict of Perigueux, on the Ille; five miles eaſt of Perigueux.

ANTONOMASIA, compounded of ἀντι, *for*, and ὀνομα, *name*, a figure in *Rhetoric*, whereby a noun appellative is uſed inſtead of a proper name, or *vice verſa*. Thus we ſay, the Philoſopher, inſtead of Ariſtotle; the Orator, for Cicero; the Apoſtle, for St. Paul; the Prophet,

for Moſes, &c.—Thus alſo we call a voluptuous perſon, a Sardanapalus, &c. And thus the French ſay, Henry the Great, meaning Henry IV. of France.

ANTONOW, in *Geography*, a town of Poland, in the palatinate of Minſk, 16 miles ſouth-ſouth-eaſt of Mozyr.

ANTONY, a town of France, two leagues S. of Paris.

ANTONY, MARK, MARCUS ANTONIUS, the *triumvir*, in *Biography* and *Hiſtory*, was grandſon of the celebrated orator of that name, and ſon of Antonius, ſurnamed *Creteſis*. His mother's name was Julia, of the Cæſarian family, a lady of diſtinguiſhed merit. He was born in the year before Chriſt 86, and educated under his mother's direction. But, following the example of his father, he launched out at an early age into the exceſs of riot and debauchery. His comely perſon, lively wit, and inſinuating addreſs, recommended him to Curio, who encouraged and ſupported his licentiouſneſs, and involved himſelf on his account in a debt of 50,000 pounds. On this occaſion Cicero was requeſted to appeaſe the anger of Curio's father; and having prevailed with him to pay his ſon's debts, he adviſed him to enjoin on his ſon the ſurrender of all intercourſe with Antony. This laid the foundation of an early averſion in Antony to Cicero, which was increaſed by his forming intimate connection with the enemies of Rome. He afterwards attached himſelf to the profligate Clodius; but conceiving a diſlike of him, and dreading the termination of the meaſures he was purſuing, he went to Greece with a view of improving himſelf in eloquence and the military art. Here he was invited to ſerve under the proconſul Gabinius, and obtained the command of the cavalry in his expedition into Syria, where he ſignalized himſelf by his valour in a complete victory over the Jews, and in his attempts to reſtore Ptolemy to the throne of Egypt. When Peluſium was taken, Ptolemy ordered the inhabitants to be put to death; but Antony interpoſed, and by his influence ſaved their lives. He afterwards performed ſeveral glorious actions, by which he gained the reputation of a great general. Upon the breaking out of the civil war, he joined Cæſar's party, and was created augur and tribune of the people; but becoming obnoxious to the ſenators, he was driven out of Rome, and ſought an aſylum in the camp of Cæſar, in Gaul. Having complained, that the tribunes of the people were not permitted to ſpeak freely, and that thoſe who appeared in favour of equitable meaſures were in danger of loſing their lives, Cæſar marched immediately into Italy; and on this account Antony as been conſidered as the promoter of the civil war among the Romans. When Cæſar had made himſelf maſter of Rome, he aſſigned to Antony the government of Italy and the ſupreme command of the army, whoſe attachment he engaged, whilſt he incurred the charge of oppreſſing the people. Such was the reputation he acquired by the effectual aſſiſtance which he gave to Cæſar, that he was appointed to the command of the left wing in the battle of Pharſalia, whilſt Cæſar himſelf led the right. When Cæſar, after the victory over Pompey, was made dictator, Antony was appointed general of the horſe, which office he retained for a whole year, though the uſual period of it was only ſix months. In the exerciſe of this office he was tyrannical and intolerant; and his general conduct was ſo diſſolute and licentious, that Cæſar treated him with coldneſs, and did not admit him to be his colleague in the conſulſhip at this time; as he died two years after, in the year before Chriſt 44, when he himſelf was conſul the fifth time. His reſtoration to favour was the recompence of the moſt profligate adulation and ſervility, and his conduct in office was ſo baſe as to accelerate the fall of his patron. At the feſtival of the Lupercalia, he thrice tempted Cæſar with the offer of a regal diadem, which was as often refuſed by Cæſar, to the great ſatisfaction of the multitude. This attempt at royalty was ſoon ſucceeded by the conſpiracy which deprived Cæſar of his life. Antony eſcaped by the interpoſition of Brutus; and afterwards contrived, by his art and eloquence, to procure a confirmation of Cæſar's acts, and to oblige the conſpirators to fly from Rome. The government of Antony, after Cæſar's death, was for ſome time abſolute; and he ſeemed to aſpire to the ſovereign power which Cæſar had poſſeſſed. His contemptuous treatment of Octavianus, the heir of Cæſar, however, threw him into the arms of the ſenate, and defeated his own ambitious projects. Having failed in his various attempts for regaining him, Antony levied forces and retired to Ciſalpine Gaul, of which he had been appointed governor, and laid ſiege to Mutina, now Modena, which was occupied by Decimus Brutus. For this conduct he was declared a public enemy; and the two conſuls, Hirtius and Panſa, accompanied by Octavianus, were ſent againſt him. In the battle which enſued, the two conſuls loſt their lives, but Antony was defeated, and the whole republican army was at the diſpoſal of Octavianus. Antony was compelled to leave Italy, and to march his troops over the Alps, which he conducted with a fortitude that did him honour. Having arrived in Gaul, he attached the ſoldiers of Lepidus to his intereſt; and they induced Lepidus to join him. Strengthened alſo by the troops of Plancus and Pollio, he returned to Italy with a large army. At Bologna, Antony and Lepidus had an interview with Octavianus, who abandoned the ſenate; and here they agreed on the partition of the Roman empire. They alſo concurred in that deteſtable proſcription, of which the firſt ſanguinary meaſure was the death of Cicero, againſt whom Antony had conceived an inveterate hatred on account of the condemnation of Lentulus the ſecond huſband of his mother, and the Philippics which he had pronounced againſt himſelf. The uſurpers proceeded to Rome, and filled the city with rapine and murder; and Antony enjoyed the baſe ſatisfaction of fixing the head and right hand of the illuſtrious Roman orator upon the roſtra, which had ſo often witneſſed the triumphs of his eloquence.

After having completed the deſtruction of their enemies in Rome, Antony and Octavianus marched into Macedonia, againſt Brutus and Caſſius; the latter of whom, after a defeat at Philippi, put an end to his own life; and, in a ſecond battle, Brutus fell in the ſame manner. It is recorded, as an inſtance of generoſity on the part of Antony, that when Lucilius, who was miſtaken by the Thracians for Brutus, ſurrendered himſelf in order to give his friend an opportunity of eſcaping, Antony commended his fidelity, and embraced him as a friend; and alſo, on viewing the dead body of Brutus, his ſenſibility was affected, he threw over it his own rich mantle, and ordered it an honourable funeral. At Athens in Greece, whither Antony next proceeded, he endeavoured to ingratiate himſelf with that city, by expreſſions of regard, and he frequented its public ſchools and gymnaſia. In Aſia, he indulged his taſte for ſplendour and voluptuouſneſs; and, though he ſhewed ſome lenity to the friends of Brutus who fell into his hands, he plundered ſeveral cities, and beſtowed the wealth he thus collected on his paraſites and buffoons. In Cilicia he ſummoned the famous Cleopatra, queen of Egypt, to give an account of her conduct, which had given offence to the triumvirs. The interview was ſingularly ſplendid; and the queen advanced with confidence, not doubting that, as in her youth ſhe had enſlaved Cæſar and Pompey, ſhe would be able, by her charms and the art which experience had taught her, to captivate the heart of Antony. The intercourſe terminated as ſhe expected. The triumvir was completely ſubdued, took the queen with him to Alexandria, and

and indulged in diſſipation and luxury, which made him regardleſs of every important concern. In the mean while, Fulvia, the widow of Clodius, whom Antony had married before the death of Cæſar, quarrelled with Octavianus, and aſſembling ſome legions at Prænesſte, commenced hoſtilities. Before Antony could reach Italy, the war had terminated in favour of Octavianus; and the death of Fulvia, who is thought to have concerted this war for the purpoſe of detaching Antony from Cleopatra, made way for completing a reconciliation with Octavianus, by the marriage of Antony with his ſiſter Octavia, to whom the brother was affectionately attached, and who was a lady of an excellent and amiable character. On this occaſion, Antony and Octavianus, the two principal of the triumvirate, agreed on a new partition of the Roman empire; and by virtue of this partition, Codropolis, a town of Illyricum, being fixed as the boundary of their dominions, the whole that lay weſt of this place was allotted to Octavianus, and the whole that was ſituated to the eaſt belonged to Antony; ſo that the former had Dalmatia, the two Gauls, Spain, and Sardinia, and the latter all the eaſtern provinces as far as the Euphrates. Africa was aſſigned to Lepidus. It was alſo agreed that Antony ſhould make war upon the Parthians; and Octavianus reduce Pompey, if he refuſed to ſubmit to reaſonable conditions. Antony, after this buſineſs was amicably ſettled, ſpent the winter at Athens with Octavia, and diſpatched his lieutenant Ventidius into Aſia, to check the incurſions of the Parthians. The ſucceſs of Ventidius rouſed the jealouſy of Antony, and he determined to leave Athens and to march into the eaſt. When he arrived, he diſmiſſed his lieutenant, who was beſieging Samoſata, and ſent him to Rome to demand of the ſenate and people the honours of a triumph. Antony, having offended his ſoldiers by diſmiſſing Ventidius, and raiſing the ſiege without much honour, returned to Octavia at Athens, and ſoon afterwards ſailed to Italy, at the requeſt and for the aſſiſtance of Octavianus, in order to overpower by their united counſels and forces their rival, Pompey. Antony came as far as Brunduſium; and not finding Octavianus there at the time appointed, he returned to Athens. However, when Octavianus was reduced by Pompey to great danger, Antony aſſembled a large fleet, and ſailed for Italy. But the two ambitious triumvirs, jealous of each other, diſagreed; and Octavia, by a conference with her brother, in the preſence of Mæcenas and Agrippa, and by earneſt entreaties, prevailed with him to meet Antony, and to compromiſe the differences that ſubſiſted between them. In this office of prudence and affection ſhe ſucceeded; and after an accommodation, Antony departed once more for Syria. Octavia accompanied him to Corcyra, but from thence returned to Italy. Upon Antony's arrival in Syria, he invited Cleopatra, and beſtowed upon her all Phœnicia, Cœloſyria, Cyprus, and a great part of Arabia and Judæa. His profuſion offended the Roman people, and they cenſured his conduct on account of his ſcandalous connection with Cleopatra. After theſe extravagant grants, he marched with a large army againſt the Parthians, which only ſerved to render his retreat the more ignominious. The Romans juſtly attributed the misfortunes of this fatal expedition to his paſſion for Cleopatra, and they were alſo particularly incenſed by his conduct towards Artabazes, king of Armenia, whom he ſeized in a treacherous manner, and led in triumph to Alexandria. Having been induced by the crafty queen to order Octavia not to purſue her journey into Syria, but to return to Rome; he accompanied Cleopatra to Alexandria, and paſſed the winter with her in every kind of pomp, luxury, and voluptuouſneſs. Octavianus availed himſelf of the general reſentment againſt Antony, and preferred to the ſenate and people ſeveral articles of accuſation againſt him. A war between theſe two triumvirs became inevitable: but Antony, inſtead of making neceſſary preparations, appointed the iſle of Samos for the place of general rendezvous; and ſummoned thither players and muſicians, and all the miniſters of riotous luxury. From Samos he afterwards ſailed for Athens, where he purſued the ſame courſe of luxury and diſſipation: and in order to teſtify his reſentment againſt Octavianus, he ſolemnly divorced Octavia, and ordered her to be expelled from his houſe at Rome. Many of his friends abandoned him. War was declared againſt the Egyptian queen; and Antony was deprived of his conſulate and government; and the reaſon aſſigned for it was, that he ſuffered himſelf to be ruled by a woman. Each party collected its forces; and the Ambrazian gulf, between the iſlands of Corcyra and Cephalonia, became the ſcene of conteſt. The famous battle of Actium enſued: and this was fought at ſea, againſt the advice of Antony's beſt officers, and chiefly through the perſuaſion of Cleopatra, who was proud of her naval force. In the midſt of the action, Cleopatra, with her 50 gallies, took to flight, and Antony followed her in a ſmall veſſel, and thus overwhelmed his character in perpetual ignominy. After an obſtinate reſiſtance on the part of the ſoldiers, though abandoned by Antony, and at length by their principal officers, they ſurrendered to Octavianus, and were incorporated in his legions. Antony, thus defeated and diſgraced, vented his reſentment againſt Cleopatra; but they were ſoon reconciled; and he purſued his courſe to Libya, where he had ſtationed a conſiderable body of troops: but on his arrival, he found that they had deſerted to Octavianus. Diſtracted with diſappointment and vexation, he returned to Egypt, and lived for ſome time in gloomy ſolitude: but Cleopatra by her arts drew him to her palace, and he reſumed his former voluptuous life. Hither he was purſued by Octavianus: and though on his approach to Alexandria, Antony made a ſucceſsful ſally againſt the invader; yet, deſerted by the Egyptian fleet, by his own army, and betrayed, as he ſuſpected, even by Cleopatra, he ſunk down in deſpair. His firſt frantic effort was directed againſt the queen, who had been the cauſe of all his misfortunes: but ſhe fled from her palace and eſcaped: he then deſired one of his own ſervants to diſpatch him; but the faithful Eros ſtabbed himſelf, and fell down at the feet of his maſter. Antony, emboldened by this act of heroiſm, fell on his own ſword: but as the wound did not immediately prove mortal, he ſought Cleopatra in her place of retirement and ſafety; and being drawn up to the tower in which ſhe lodged, by ropes, he expired in her arms, in the 56th year of his age, and in the year before Chriſt 30. He was magnificently interred by Cleopatra; but at Rome his ſtatues were demoliſhed, and his memory was declared infamous.

Antony left ſeven children by his three wives; two ſons by Fulvia; two daughters by Octavia, who by their alliances gave three emperors to Rome; and two ſons and a daughter by Cleopatra, whom he had lawfully married after his divorce from Octavia. Of theſe children Octavia took the moſt laudable care; and at length the daughter of Cleopatra was married to Juba king of Mauritania.

Antony was neither a great nor a good man: he wanted that vigour of underſtanding which entitled him to a place in the firſt claſs; and his love of pleaſure, his want of principle, as well as his meanneſs and cruelty, exclude him from the ſecond denomination. He has had, however, his partiſans and admirers; and, it muſt be allowed, poſſeſſed a generoſity of diſpoſition which raiſed him above his rival, the cold and crafty Octavianus. Plutarch in Anton. apud. oper. tom. i. p. 915—957. ed. Francf. Anc. Un. Hiſt. vol. xi. and vol. xii. Gen. Dict.

ANTONY, St. *the hermit*. See ANTHONY.

ANTONY *of Lebrixa*, or *Antonius Nebriſſenſis*, a Spaniſh writer, was born at Lebrixa in Andaluſia, in 1444, and contributed to the revival of literature in Spain. He firſt ſtudied at Salamanca; and acquired farther knowledge in the univerſity of Bologna. Beſides claſſics and polite literature, he was acquainted with the mathematics, law, medicine, and theology, and might have been juſtly claſſed among the moſt learned men of his age. After his return to Spain, he taught grammar at Salamanca for 28 years; and at Alçala, under the patronage of cardinal Ximenes, he taught till his death. Here he employed himſelf in publiſhing a polyglot edition of the bible. As hiſtoriographer to the king, he publiſhed, in 1509, two decades of the hiſtory of Ferdinand and Iſabella, which are to be found in the work intitled "Hiſpania Illuſtrata." His dictionary of the Latin, Greek, and Hebrew languages, was printed at Grenada in 1545. He alſo wrote notes upon ſeveral Latin claſſics, and upon Ariſtotle's Rhetoric; a Treatiſe on Weights and Meaſures; a coſmography; a law dictionary; a medical dictionary; Commentaries on the Scriptures, &c. He died in 1522. Cave, Hiſt. Lit. Appendix, vol. ii. p. 209. Nouv. Dict. Hiſtor.

ANTONY *of Meſſina*. See ANTONELLO.

ANTONY *of Padua*, a monk of the order of St. Francis, was born at Liſbon, in 1195. A deſire of obtaining the crown of martyrdom induced him to ſail for Africa; but being driven on the coaſt of Italy, he devoted himſelf in that country to the ſtudy of theology, and became an eminent preacher. The fraternity of Flagellants is ſaid to have owed its origin to his ſermons. Pope Gregory XI. uſed to call him "the Ark of the Covenant, and the Depoſitary of ſacred Learning." He was ſucceſſively a teacher at Montpelier, Toulouſe, and Padua; where he died, in 1231, at the age of 36 years. His works, conſiſting of ſermons, commentaries, and a moral concordance to the bible, were publiſhed at the Hague, in 1641. Nouv. Dict. Hiſtor.

ANTONY *of Pratovecchio*, in Tuſcany, was educated at Florence, and diſtinguiſhed himſelf in the 15th century, by his attempt to form a new code of feudal law. The emperor Sigiſmund created him count and counſellor of the empire, and charged him with the execution of this undertaking. The reſult was a treatiſe, entitled "A Courſe of Feudal Law," and publiſhed in the year 1428. Although the emperor, under the influence of the lawyers, who envied the reputation of Antony, refuſed his imperial approbation of this new code, it was afterwards granted by Frederic III. Antony alſo wrote "Commentaries on the Decree of Gratian," and a "General Repertory" or Lexicon of Juriſprudence. He died at Bologna about the year 1464. Gen. Biog.

ANTOSIANDRIANS, in *Eccleſiaſtical Hiſtory*, a ſect of rigid Lutherans, who oppoſe the doctrine of Oſiander, relating to juſtification. Theſe are otherwiſe denominated *Oſiandro-maſtiges*.

The Antoſiandrians deny that man is made juſt, with that juſtice wherewith God himſelf is juſt; that is, they aſſert, that he is not made eſſentially, but only imputatively, juſt; or, that he is not really made juſt, but only pronounced ſo.

ANTRAIGUE, in *Geography*, a town of France, in the department of the Ardeche, and chief place of a canton, in the diſtrict of Privas, ten miles weſt of Privas. The place contains 1521 and the canton 7401 inhabitants: the territory includes 187½ kiliometres and 8 communes.

ANTRAIN, a town of France, in the department of the Ille and Villaine, and chief place of a canton, in the diſtrict of Fougeres, ſeven leagues north-north-eaſt of Rennes, and four ſouth-eaſt of Dol. The place contains 1375 and the canton 14,252 inhabitants: the territory includes 220 kiliometres and 10 communes.

ANTRIM, a county of Ireland, in the province of Ulſter, lying at the north-eaſtern extremity of the iſland, and being one of the moſt reſpectable in point of culture and population. It is waſhed on its northern and eaſtern ſides by the north channel, which divides Ireland from Scotland. On the weſt, Lough Neagh and the river Bann form a natural boundary, except for about five or ſix miles near the ſea. On the ſouth-eaſt, it has a large eſtuary, called Carrickfergus Bay, or the Lough of Belfaſt; and on the ſouth lies the county of Down, from which it is partly ſeparated by the river Lagan. Its greateſt length from north to ſouth is 44 miles (56 Engliſh), and its greateſt breadth 24 (30½ Engliſh), containing 387,200 Iriſh plantation acres (622,059 Engliſh), and being about 605 (or 972 Engliſh) ſquare miles. The number of houſes, according to an official return made to the Houſe of Commons, in 1791, is 30,314, from which we may eſtimate the population at about 170,000. The number of pariſhes is 74, of which 42 only have churches, all of them, except one, in the dioceſe of Down and Connor. This county returns five members to the Imperial parliament; namely, two knights of the ſhire, and one each for the towns of Carrickfergus, Belfaſt, and Liſburn. The face of the country, eſpecially in the northern and eaſtern parts of it, is very mountainous, and there are ſeveral extenſive bogs, ſome of which have been improved, and others are very improveable. There is alſo a tract of very rough and high hills on the weſt of Belfaſt; of which Mr. Arthur Young obſerves, that to their ſummits they conſiſt of exceedingly good loam, and ſuch as might be improved into good meadow. Of the mountains, Devis near Belfaſt, Sleniſh in the middle, and Knocklayd in the northern part of the county, are the moſt conſiderable. The richer and more fertile parts of it are well cultivated, producing fine crops, eſpecially the ſouthern extremity, which is in a high ſtate of beauty and improvement. The linen buſineſs extends throughout the whole county, in a manner which ſeems peculiarly favourable to the morals and happineſs of the people. The farms are generally very ſmall, and chiefly in the hands of weavers, who make the web at their own houſes, and on their own account, and then carry it to the neareſt market-town, where it is purchaſed by the bleacher. They grow their own flax, and generally have a patch of oats, ſome potatoes, and a cow, which ſupply them with their uſual diet. The rivers of this county are generally ſmall, but very numerous: the principal ones are, the Lower Bann, a broad and rapid ſtream, by which all the waters of Lough Neagh are diſcharged into the ſea; and the Lagan, which paſſes by Liſburn, and a little below Belfaſt flows into Belfaſt Lough. The northern coaſt of this county is remarkable for its baſaltic pillars, an account of which will be found in the article relating to the Giants' Cauſeway, where they are moſt conſpicuous. The ſtupendous promontories of Bengore and Fairhead (the *Robogdium* of Ptolemy), in particular, are in a great meaſure compoſed of theſe pillars. The eaſtern coaſt has many little bays, on which are villages inhabited by fiſhermen. At the ſouth eaſt is a little peninſula, called Iſland Magee, which is improperly repreſented in moſt maps as an iſland, though connected with the main land by an iſthmus of more than a mile broad. The inhabitants of this county had from an early period a conſiderable intercourſe with the adjoining parts of Scotland; and ſome Scotch families ſettled in it, previouſly to the encouragement given by James I. The counteſs of Antrim, of the family of M'Donnell, deſcended from one of theſe, has in her poſſeſſion, according to Mr. Young, 173,000 acres in

this county, which are let on very long leaſes for 8000l. per annum, and relet for 64,000l.

At preſent the greater part of the inhabitants are of Scotch extraction, and moſt of them continue attached to the Preſbyterian form of worſhip. The aſſizes, elections, &c. for the county are held at Carrickfergus, but the quarter-ſeſſions at Antrim. Dr. Beaufort's Memoir; Mr. Young's Travels in Ireland; Dr. Hamilton's Letters reſpecting the Coaſt of Antrim.

ANTRIM, a town in the county of the ſame name in Ireland, pleaſantly ſituate on a ſmall ſtream, called the Sixmile-Water, which a little below the town empties itſelf into the north-eaſtern extremity of Lough Neagh. This was a populous, thriving place, but was injured ſome years ago by the deſire of the proprietor to increaſe his influence in the election of members of parliament. It ſtill partakes the benefits of the linen manufacture; and the fine yard-wides are chiefly bleached and finiſhed in the neighbourhood of this town, Liſburn, and Belfaſt. Amongſt the diſſenting miniſters of this town were Mr. Abernethy and Dr. Duchal, ſo well known by their writings, both of whom afterwards removed to Dublin; and from it that preſbytery took its name, which firſt advocated the cauſe of religious toleration in the north of Ireland. At a place called Steeple, near Antrim, is one of thoſe round towers peculiar to Ireland. See ROUND TOWERS. In the ſtreets of this town, a ſmart engagement took place on the 7th of June, 1798, between 6000 inſurgents, and ſome detachments of the regular troops and yeomanry, in which the former were defeated with conſiderable loſs. Lord O'Neil, a nobleman much reſpected, received a wound from a pike, of which he ſoon after died. Diſtance from Dublin 84 miles. W. long. 6° 6′ N. lat. 45° 42′.

ANTRIM, or ANTERIM, a townſhip of Hilliſborough county, New Hampſhire, in America, having 528 inhabitants, incorporated in 1777, 75 miles weſt from Portſmouth, and as many north-weſt from Boſton.

ANTRODOCO, a ſmall town of Italy, in the kingdom of Naples, ſituate in Abruzzo Ulterior, on the ſmall river Velino, between Aquila and Rieti.

ANTRON, in *Ancient Geography*, a town of Greece, in that part of Theſſaly, called Phthiotis, ſituate at the entrance of the Pelaſgic gulf. It was famous for furniſhing apes of a large ſize. This town exiſted in the time of the Romans; and in the war againſt Perſeus, the conſul Licinius, in the year before Chriſt 171, obtained it by treaty.

ANTROS, a ſmall iſland of France, at the mouth of the Garonne, where was erected the tower of Cordouan, which ſerved as a light-houſe to veſſels that entered this river, in paſſing to Bourdeaux.

ANTRUM *Genæ*, in *Anatomy*, a large cavity in the bone of the upper jaw, which communicates with the noſtrils. It was thus called by Caſſerius, but by Dr. Highmore *antrum maxillæ ſuperioris*. It is alſo frequently called *antrum Highmorianum*. For a further account of this cavity, ſee the deſcription of the ſuperior *maxillary-bone*.

ANTRUM *Pylori*, is a term which has been employed to expreſs the concavity in the great curvature of the ſtomach, as it approaches the pylorus.

ANTRUM *Maxillare, Diſeaſes of the*, in *Surgery*. The cavity of the cheek bone is liable to inflammation and abſceſs. The bone itſelf may become carious, and be followed with very diſtreſſing conſequences. Inſects will ſometimes be generated within this ſinus, and produce the moſt excruciating pain for years together.

We have already had occaſion to notice the treatment of abſceſſes in the maxillary ſinus, to which we therefore refer our readers. See ABSCESS, INFLAMMATION, CARIES, and DISEASES of the TEETH.

ANTRUM, in *Geography*, a mountain of Switzerland, in the Valais, which is a part of the Alps, that may be paſſed from the Valais into the Milaneſe.

ANTRUSTIO, in *Antiquity*, q. d. *qui in truſte dominica eſt*, a name given in the Salic law to the king's vaſſals, for whoſe death that law impoſed a compoſition of 600 ſous. Monteſq. Sp. of Laws, vol. ii. p. 406.

ANTULLY, in *Geography*, a town of France, in the department of the Saone and Loire, and chief place of a canton, in the diſtrict of Autun, five miles ſouth-eaſt of Autun.

ANTWERP, or ANTORFF, in French *Anvers*, and in Spaniſh *Amberes*, the capital of a marquiſate in Brabant, called the Marquiſate of Antwerp, and alſo the Marquiſate of the Holy Roman Empire; ſituate in a large plain on the eaſtern ſide of the Scheld, which is ſufficiently deep and wide for admitting veſſels of great burthen to the quay; and veſſels may be brought by means of canals cut through the town to unload at the doors of the warehouſes. It ranks the third city in Brabant; it is large and well built, and contains 22 ſquares, and more than 200 ſtreets, which are ſtraight and broad; and one of them, called the Mere, is ſo wide, that ſix carriages may paſs it abreaſt. At the head of this ſtreet is a crucifix of braſs 33 feet high. The cathedral church is a beautiful and elegant building; but in the courſe of the laſt war it was robbed of its richeſt ornaments, or the pictures of Rubens, which are now placed in the Louvre gallery at Paris. The Stadt-houſe and the Exchange are alſo magnificent ſtructures. The latter built in 1531, is the firſt building of that kind in Europe, and on the model of this were built the exchanges of London and Amſterdam. Its pillars are of blue marble, and carved, but every one of them in a different ſtyle. Antwerp, towards the end of the 15th century, when the commerce of Bruges declined, and the Engliſh fixed their ſtaple in it, became one of the moſt celebrated trading towns that ever exiſted. There were two circumſtances in particular, that contributed to the great increaſe of its commerce and riches; one was the grant of free fairs for commerce, two of which laſted ſix weeks, and hither merchants reſorted from all parts of Chriſtendom, with their merchandiſe, cuſtom free; and at theſe fairs great concerns were managed, not only in merchandiſe, but in bills of exchange with all parts of Europe: the other was, Portugal's bringing over in immenſe quantities, the rich produce of India, firſt to Liſbon, and thence to Antwerp, as to a kind of half-way port between the northern and ſouthern parts of Europe. This drew the German and other merchants to ſettle at Antwerp; and after the archduke Maximilian had, about the year 1499, brought Bruges into ſubjection, the merchants of that city removed to Antwerp. In 1543, it was enlarged for the third and laſt time, and encompaſſed with new walls, built of fine hewn ſtone, and beautifully adorned. At this time it contained, according to the computation of Guicciardin, 100,000 inhabitants. When the emperor Charles V. wiſhed to introduce the infernal tribunal of the inquiſition into this city, about the year 1550, he was awed by the information, that the Engliſh merchants would leave the city and country; and this remonſtrance proved effectual; for upon inquiry the emperor found, that the Engliſh merchant adventurers maintained or employed at leaſt about 20,000 perſons in Antwerp alone, beſides 30,000 more in other parts of the Netherlands. At this time this city, and Hamburgh, poſſeſſed the principal commerce of the northern and middle parts of Europe; but after the Union of the ſeven United Provinces, in 1579, the commerce of Antwerp began to decline; and this misfortune was accelerated by the perſecutions of the duke d'Alva, and the ſack of the town by the duke of Parma, in

1585,

1585, which forced its inhabitants to ſeek an aſylum in Holland, and particularly at Amſterdam, whither its trade, in conſequence of the entire command of the Scheld, was transferred. The loſs of their trade led them to direct their attention to painting, jewelling, or banking, which they have proſecuted with ſucceſs and reputation; and they have alſo had a conſiderable manufactory of tapeſtry and lace. The future trade and proſperity of this city muſt depend on the reſtrictions or enlargements to which the navigation of the Scheld ſhall be ſubject. This city is the ſee of a biſhop; and beſides the cathedral, it has ſeveral other fine churches. As to the fortifications of the city, it is encompaſſed by a wall, planted with rows of trees on each ſide, and of ſuch breadth as to admit two carriages abreaſt; and it is alſo defended by a pentagonal citadel, erected by the duke d'Alva, in 1568, which commands the town and the neighbouring country. The magiſtracy of this city is elected out of the ſeven patrician families, and conſiſts of two burgo-maſters and 18 echevins, beſides inferior magiſtrates. Among its privileges, there is one, by which every perſon born in it becomes a citizen, though both his father and mother were foreigners.

One of the moſt remarkable ſieges which hiſtory records, was that of Antwerp by the duke of Parma in 1585. In later times, after the battle of Ramillies, it ſurrendered to the duke of Marlborough. In 1746, it was taken by the French, but reſtored to the houſe of Auſtria at the treaty of Aix-la-Chapelle. It was taken by the French in 1792, and evacuated in the beginning of 1794; but in July of the ſame year it ſurrendered again to the republican troops. The navigation of the Scheld was declared free in Auguſt 1794. This city is 25 miles north of Bruſſels, and 75 ſouth of Amſterdam. By the new arrangement ſince the revolution, it is the principal place of a diſtrict in the department of the Deux Neuthes; the place contains 61,800, and the canton 66,480 inhabitants; the territory includes 10 kilometres, and five communes. N. lat. 51° 13′ 15″. E. long. 4° 22′ 45″.

ANTYX, from *ἀντυξ*, in *Antiquity*, the outermoſt round or circumference of a ſhield.

ANUA, in *Ancient Geography*, a town of Paleſtine, in the tribe of Zebulon, mentioned by Euſebius and Jerom. This was alſo the name of a town in the tribe of Ephraim, on the borders of that of Benjamin.

ANVARI, or Anveri, in *Biography*, one of the moſt famous of the Perſian poets, was born in a village of Khoraſan, in the 12th century. He ſtudied as a poor ſcholar, at the city of Thous, in the college called Manſuriah. As the equipages of ſultan Sanjiar chanced to paſs by, he inquired into the name and condition of a perſon who appeared ſo well dreſſed and mounted, and being told that he was one of the ſultan's poets, he became deſirous of excelling in an art that was ſo much honoured and encouraged, and the next day preſented to the ſultan a poem in praiſe of him. The prince approved it, and immediately attached the author to his perſon. To him belongs the reputation of having been the firſt who reſcued the Perſian poetry from impurity and licentiouſneſs; and he acquired ſuch renown, that the ſurname of the king of Khoraſan was conferred upon him. Between him and the poet Raſchidi there was carried on a ſingular kind of conteſt; as they were in oppoſite intereſts, and the latter was ſhut up in a fortreſs beſieged by Sanjiar, they made war upon each other by means of miſſile pieces of verſe, faſtened to the points of arrows. Anvari was much addicted to aſtrology; and he predicted a ſtorm which was to happen on the day of the conjunction of the ſeven planets in the year 1185, but the day proved ſingularly ſerene. His enemies took this occaſion to ridicule him, and the ſultan reprimanded him. Thus mortified and abuſed, he retired firſt to Meru, and then to Balk, where he wrote a poem in which he renounced aſtrology, and all its predictions. He died at Balk about 1200. D'Herbelot Bibl. Orient. p. 110.

ANVAT, in *Ancient Geography*, a town in the iſland of Taprobana, according to Ptolemy.

ANUBINGARA, a town alſo in the ſame iſland.

ANUBIS, in *Mythology*, a deity worſhipped among the Egyptians, the Greeks, and the Romans. Ovid mentions this deity, when he ſays to Iſis, (Amor. lib. ii. eleg. 13.)

"Per tua ſiſtra precor, per Anubidis ora verenda."

The head of this deity was that of a dog, and in Egypt eſpecially he was regarded as the faithful companion of Oſiris and Iſis, and received divine honours. Temples and prieſts were conſecrated to him; and his image was borne in all religious ceremonies. His temples were denominated *Anubidea*. This kind of worſhip ſeems to have commenced in Egypt, by conſecrating an animal to Anubis, as was the cuſtom with regard to other deities. Soon afterwards they ſubſtituted the figure of a dog for that of Anubis himſelf, and then annexed the head of this animal to a human body, as an emblem of the new deity. Thus he is repreſented in the ruins of the ancient temples of Egypt, as well as on bronzes and marbles in the collections of antiques. Diodorus Siculus (lib. i.) ſays alſo, that the god called Anubis is repreſented with the head of a dog. Virgil, Ovid, Lucian, and the ancient fathers of the church repreſent him under this form, and Virgil (*Æn.* lib. viii.) and Ovid (Metamorph. lib. ix. v. 692.) denominate him the "Barker Anubis." Cynopolis, the preſent Minieh, ſituated in the lower Thebais, was built in honour of Anubis. The prieſts celebrated his feſtivals there with great pomp, and conſecrated the dog to him, as a living repreſentation of him. This city of dogs, ſays Strabo, (lib. xvii. tom. ii. p. 1116) is the capital of the Cynopolitan prefecturate. Theſe animals are fed there with ſacred aliments, and religion has decreed them a worſhip. The medals of this city bear upon them the figure of a man with a dog's head. But though Cynopolis was the centre of the worſhip of Anubis, the whole of Egypt adopted it; and to this purpoſe Juvenal ſays, Sat. xv. v. 8.

"Oppida tota canem venerantur."

From the univerſality of the worſhip of this deity proceeded the reſpect which the Egyptians manifeſted for dogs. This ſtrange worſhip, however, was not confined to the banks of the Nile. The Greeks adopted it not only in the time when the Ptolemies blended the worſhip of Greece with that of their new ſubjects, but in the more remote periods of the Greek hiſtory. When Rome had adopted the ceremonies of Egypt, the emperor Commodus, in celebrating the Iſiac feaſts, ſhaved his head, and carried the god Anubis. His ſtatue was either of maſſive gold or gilt, as well as the attributes that accompanied it. Even the name of Anubis, derived according to Jablonſki (Panthæon Ægypt.) from *nub*, *gold*, and *annub*, *gilt*, ſignifies gilded.

But what was the ſignification of this emblematical deity? What is the natural meaning concealed under it? Plutarch, in his Treatiſe of Iſis and Oſiris (Oper. tom. ii. p. 368), explains this. "The circle which touches and ſeparates the two hemiſpheres, receiving the name of horizon, is called Anubis. He is repreſented under the form of a dog, becauſe that animal watches night and day." St. Clement of Alexandria, well informed concerning the myſtic theology of the Egyptians, favours this explication. The two dogs, ſays he, (Strom. v. tom. ii. p. 671), the two Anubis are the ſymbols of two hemiſpheres, which environ the terreſtrial globe. He adds in another place; others pretend, that

that theſe animals, the faithful guardians of men, indicate the tropics, which guard the ſun on the north and the ſouth, like porters. According to the former of theſe interpretations, the prieſts, regarding Anubis as the horizon, gilded his ſtatue, to denote that this circle, receiving the firſt rays of the ſun, appears ſparkling with brightneſs on his riſing; and that at his ſetting he reflects his laſt rays upon the earth. In their ſacred fables they ſaid, that Anubis was the illegitimate ſon of Oſiris. In fact, he only gives to the earth a borrowed light, and never can be eſteemed like Horus, as the father of the day, or as the legitimate offspring of Oſiris. We may add, that the viſible horizon turning with the ſun, is his inſeparable companion. According to the latter explication, which makes Anubis to repreſent the tropics, he is alſo the faithful guardian of Iſis and Oſiris. In reality, the courſe of the ſun and of the moon is contained between the circles in which the ſolſtices occur, without deviating from them. Theſe limits aſſigned by the author of nature, might therefore, in hieroglyphic language, be repreſented by a divinity with the head of a dog, who ſeemed to oppoſe their paſſage on the ſide of the two poles. The other opinion, however, ſeems to be more natural, and more analogous to the ideas of the prieſts. Upon the whole it is not unreaſonable to imagine, that Anubis was, at firſt, only a ſymbolical image, invented by aſtronomers, to convey a ſenſible expreſſion of their diſcoveries; that afterwards the people, accuſtomed to ſee it in their temples, which were the depoſitaries of ſcience, adored it as a deity; and that the prieſts favoured their ignorance by connecting it with their religion. The worſhip of Anubis introduced that of the dog, which became his emblem. Almoſt all the gods of the Gentiles have originated in this manner. Before the invention of writing, men made uſe of hieroglyphics or imitative figures to convey their ideas; thoſe hieroglyphics remained in their ſanctuaries, and the prieſts alone preſerved the knowledge of them. In the end, theſe allegorical ſigns no longer repreſented the real meaning of things to vulgar underſtandings, but the exterior forms and figures only, which became the objects of ſuperſtition. Savary's Letters, vol. ii. p. 488—495.

Siris or Oſiris (ſays Bruce, Travels into Abyſſinia, vol. i. p. 412.) was not the ſun, but Syrius or the dog-ſtar, repreſented under the figure of a dog, becauſe of the warning he gave to Atbara, where the firſt obſervations were made at his heliacal riſing, or his diſengaging himſelf from the rays of the ſun, ſo as to be viſible to the naked eye. He was the "Latrator Anubis," and his firſt appearance was figuratively compared to the barking of a dog by the warning it gave to prepare for the approaching inundation of the Nile. This, he thinks, was the firſt hieroglyphic; and Iſis, Oſiris, and Tot, were ſubſequent inventions relating to it. In this opinion he is confirmed by conſidering, that in the city of Axum, once a large city, there is not any other hieroglyphic beſides that of the dog-ſtar.

At Rome they had many ſtatues of Anubis, the principal of which are two in the Villa Albani, and one in the Barbarini palace. Anubis is frequently repreſented in pictures, &c. with a dog's head, holding in one hand a branch of palm, and in the other a caduceum, or Mercury's wand.

ANUBUS, in *Entomology*, a ſpecies of SPHINX that inhabits Surinam, and is figured by Cramer. The anterior wings are ſub-ferruginous, poſterior wings black with a row of whitiſh ſpots. Fabricius. A black ſpot in the middle, and a large brown ſpot with a few ſtreaks near the margin of the anterior wings.

ANUCHTA, in *Ancient Geography*, a town of Aſia, in Suſiana, according to Ptolemy.

ANVERS, D', HENRY, earl of Danby, in *Biography*, is here introduced, as being founder of the botanic garden at Oxford. In the year 1622, he purchaſed five acres of land in the vicinity of Oxford, which he took care to ſtock with numerous foreign as well as indigenous plants; and having erected hot-houſes and other neceſſary buildings, gave it to the univerſity in 1631. He alſo endowed it with an annual rental, for the ſupport of a gardener and proper aſſiſtants; and of a botanical profeſſor, to teach the ſcience to the ſtudents of the univerſity. Dr. Sherard augmented the eſtate of the garden, by a donation of 500l., to enable the curators to enlarge the conſervatory; and preſented them with a large number of exotic plants, and a handſome collection of books on the ſubject of botany.

ANVERSA, in *Geography*, a town of Italy in Naples, five miles weſt of Solmona.

ANUI BOLSCHE, a river of Siberia, which runs into the Kolima, eight leagues eaſt of Niznei Novimſkoi.

ANUI *Sachoi*, a river of Siberia, which runs into the Kolima, nine leagues eaſt of Niznei Novimſkoi.

ANVIL, a ſmith's utenſil, ſerving to place the work on, to be hammered or forged.

The face, or uppermoſt ſurface of the anvil muſt be very flat and ſmooth, without flaws; and ſo hard, that a file will not touch it. At one end there is ſometimes a pike, bickern, or beak-iron, for the rounding of hollow work. The whole is uſually mounted on a firm wooden block.

Forged anvils are better than thoſe of caſt work; and the beſt have the upper part made of ſteel. Lockſmiths have a ſmaller kind of anvil, called the *ſtake*, which is moveable, and placed ordinarily on their work bench. Its uſe is for ſetting ſmall cold work ſtraight, or to cut or punch on with the cold chiſel or cold punch.

ANVIL *Iſland*, in *Geography*, an iſland of the Pacific Ocean, on the north-weſt coaſt of America, ſo called from the ſhape of the mountain that compoſes it, and lying in N. lat. 49° 30'. W. long. 237° 3'.

ANVILLE, JEAN BAPTISTE BOURGUIGNON D', in *Biography*, geographer to the king of France, and adjunct-geographer to the Academy of Sciences, was born at Paris, July the 11th, 1697. D'Anville poſſeſſed a peculiar talent and diſpoſition for geographical reſearches; and the principal part of his time was devoted to this kind of employment. Accordingly he collected, from the peruſal of ancient and modern authors of various deſcriptions, ſuch as geographers, hiſtorians, travellers, and even poets, materials for his main purpoſe, which was, the conſtruction of charts, and the accurate adjuſtment of the ſituation of different places. At the age of 22, he began to publiſh ſome of thoſe charts which have given celebrity to his name. To every chart of importance he annexed an account of the authorities upon which he depended, and of the means by which he obtained neceſſary information; and this he did not with ſelfiſh views, or for the purpoſes of oſtentation, but from a conſciouſneſs of the aſſiduity and extent of his inquiries, and in order to enable others to form a competent judgment for themſelves. The ſucceſs of his inveſtigations, and the reputation he acquired, were owing partly to the natural vigour of his mind, and perhaps principally to his indefatigable ſtudy; for he is ſaid to have devoted, for 50 years of his life, 15 hours of every day to ſtudy. To this recluſe mode of life it was probably owing, that though he was cheerful, modeſt, and unaſſuming, his deciſions on the peculiar objects of his ſtudy were more poſitive and dogmatical than they would have been if he had accuſtomed himſelf more to the ſociety and converſation of literary men. In the year 1773, the Academy of Sciences appointed him adjunct-

junft-geographer; and though he was then near 80 years of age, he prefented ſeveral memoirs to that learned body. His known talents for geographical reſearch, and the eſteem in which he was held by the learned of all Europe, enabled him to collect an immenſe and valuable maſs of charts of various deſcriptions, which was purchaſed by the king of France a few years before his death. Having completed the favourite work of his life, he reſigned himſelf to that decay of his faculties, which might naturally be expected at the cloſe of ſuch a life as his; and after an interval of two years, during which his infirmities increaſed, he died on the 28th of January 1782, in the 85th year of his age. He married in 1738, and two daughters ſurvived him. His principal works are as follow: "Geographie ancienne abrégée," 1768, 3 vols. 12mo.; to which are annexed the author's maps of ancient geography, and a complete ſyſtem of this ſcience: "Traité des Meſures Itineraires Anciennes et Modernes," 1769, 8vo.; "Diſſertation ſur l'étendue de l'ancienne Jeruſalem," 1747, 8vo.; "Memoire ſur l'Egypte ancienne et moderne, avec une Deſcription du Golphe Arabique," 1766, 4to.; "Etats formés in Europe après la chute de l'Empire Romain en Occident," 1771, 4to. "Notice de l'ancienne Gaule, tirée des monumens Romains," 1761, 4to. To theſe may be added, a work intitled, "Meſure de la Terre ſous l'Equateur," occaſioned by the diſcuſſion of the oblate figure of the earth, and founded on erroneous principles. Hiſt. de l'Acad. Royal Paris, 1782. Nouv. Dict. Hiſt.

ANVILLE, or MILLER'S TOWN, in *Geography*, a town of America, in Dauphine county, Pennſylvania, at the head of Tulphehocken Creek; eighteen miles north-eaſt by eaſt from Harriſburgh, and 65 north-weſt from Philadelphia.

ANUISKAIA, a fortreſs of Siberia, 50 miles weſt-north-weſt of Biiſk. N. lat. 52°. E. long. 93°.

ANUROGRAMMUM, in *Ancient Geography*, a town in the iſland of Taprobana, according to Ptolemy.

ANUS, in *Anatomy*, is the termination of the inteſtinum rectum. It is kept contracted and cloſed by a ſphincter muſcle, and ſupported in its ſituation by two muſcles named *levatores ani*.

ANUS is a name which was abſurdly applied to a ſmall hole leading from the third to the fourth ventricle of the brain. It is now called *foramen commune poſterius*.

ANUS, *Diſeaſes of the*, in *Surgery*. The complaints which moſt commonly affect this part of the body, are, EXCRESCENCES, ABSCESSES, FISTULÆ, PILES or HEMORRHOIDS, PROLAPSES, and IMPERFORATION. Each of theſe diſorders is deſcribed in its proper place. It will be only neceſſary at preſent to treat of the *artificial anus*.

Artificial anus is a preternatural paſſage through the abdominal ring, occaſioned by an adheſion being formed, after gangrenous herniæ, between the upper end of the inteſtine and the abdominal ring, leaving an orifice, through which, inſtead of through the natural paſſage of the anus, the excrements are continually voided. This circumſtance occurs when, after a gangrenous hernia has been opened, the gangrenous part cut away, and the excrements evacuated, the inteſtine does not re-unite. Sometimes it occurs without the aſſiſtance, nay, even againſt the wiſh of the ſurgeon, when, for example, his attempt to produce the re-union of the inteſtine does not ſucceed; ſometimes he muſt endeavour to promote it, namely, when for a conſiderable time before he was called in, the fæces have been voided ſolely through the abdominal ring, whilſt nothing has paſſed through the anus; and conſequently there is reaſon to believe that the lower portion of the inteſtine is already contracted, or even cloſed, ſo that the natural paſſage for the fæces can no more be reſtored. Sometimes the ſurgeon muſt do all in his power to prevent its production, and endeavour to promote the re-union of the inteſtine. This is particularly neceſſary when the inteſtinal canal has been opened, in conſequence of gangrene, at no great diſtance from the ſtomach; for example, in the jejunum, as in that caſe the patient would die from inanition. Sometimes it is arbitrary, whether the ſurgeon ſhall promote the formation of an artificial anus, or endeavour to make the inteſtine re-unite; as when the caſe is a recent one, and a contraction of the lower portion of the inteſtine is not yet to be apprehended; and when the gangrenous part is ſituated at the middle or inferior part of the ileum, or even at the beginning of the colon, ſo that there is no reaſon to fear that the patient will fall into a maraſmus or waſting, in conſequence of the formation of an artificial anus.

When the ſurgeon wiſhes to promote the formation of an artificial anus, he muſt firſt carefully examine which is the ſuperior portion of the inteſtine; and this he may, in general, know, by obſerving through which the excrements are diſcharged. However, as this is not always a certain mark of diſtinction, he may let the patient ſwallow a few ſpoonfuls of oil, after which he may diſtinguiſh the ſuperior portion of the inteſtine with certainty, by obſerving from whence the oily diſcharge proceeds. Through this end of the inteſtine he then paſſes a thread, which he faſtens with adheſive plaſter to the external ſkin, in order that it may not be drawn back into the cavity of the abdomen. This operation, however, is not often neceſſary, as both ends of the inteſtine generally adhere within and behind the abdominal ring. The lower portion of the inteſtine muſt then be cleared by glyſters and purgative injections; and it may be ſuffered to lie in the wound, in order to avoid the inconveniences which might ariſe from returning it into the abdominal cavity. At the end of the cure, a plug of ſponge ſhould be introduced into the upper orifice, to prevent its contracting, and occaſioning an impediment to the diſcharge of the fæces.

With reſpect to the formation of an artificial anus, however, the moſt rational practice is to leave the whole to nature. The ſurgeon, in general, has done all that he can when he has opened the gangrenous hernia, ſeparated the gangrenous portion, and evacuated the excrements from the inteſtines; after which nature either re-unites the inteſtine, or does not re-unite it, in which caſe an artificial anus is formed, with regard to which the ſurgeon has nothing to do beſides what has already been mentioned. If the ſurgeon wiſhes from the very firſt to form an artificial anus, he ſhould immediately introduce pledgits into the ſuperior extremity of the inteſtine, whereby the re-union of the two ends will be prevented.

His next buſineſs muſt be to endeavour to obviate the inconveniences ariſing from the involuntary diſcharge of the excrements through an unuſual paſſage, and to keep the parts clean. For receiving the matters diſcharged, he may faſten a receptacle of horn or ſtrong leather to the body by means of a ſtrap, in ſuch a manner that its orifice reſts upon the artificial anus. Dr. Richter (Abhandlung von den Bruechen. neue Aufg. Goettingen, 1785, page 458.) propoſes, for the ſame purpoſe, an elaſtic rupture-bandage, having a piece of ſponge faſtened under its head, which covers and cloſes the artificial anus in ſuch a manner as to prevent both the acceſs of the air and the diſcharge of the fæces; and to ſupply the place of a ſphincter, without either irritating or rubbing the orifice. Whenever the patient wiſhes to diſcharge either fæces or wind, he muſt take it off. M. Loeffler (Archiv. der practiſchen Arzneykunſt, &c.

&c. Leipzig, 1785. b. i. p. 115.), however, has found the uſe of this bandage to be attended with ſome inconveniencies, which, he thinks, may be avoided by one of a different conſtruction. In the pelotte of the bandage he directed a hole to be made, an inch in diameter, and a varniſhed leathern receptacle to be adapted to its outer margin.

As the ſphincter is wanting, a prolapſus of the inteſtine may more eaſily be produced through an artificial anus than through the natural one. Such a prolapſed inteſtine may ſometimes be eaſily reduced with the hand; ſometimes it is reduced ſpontaneouſly, merely by the patient lying down upon his back. When this is not the caſe, the patient ſhould conſtantly lie on his back, every exertion of the body ſhould be carefully avoided, and gentle preſſure permanently applied, by which means the prolapſus will generally be effected in a longer or ſhorter ſpace of time: force ought never to be applied, as by too haſty and forcible reduction of the inteſtine the iliac paſſion might eaſily be excited. A prolapſus of the lower portion of the inteſtine is in general far more difficult to be reduced than that of the upper portion; and frequently it cannot be reduced at all, the inteſtine being contracted, or even entirely cloſed, behind the prolapſed part. Such herniæ ought never to be ſuffered to attain too large a ſize, as in that caſe it may become impoſſible to reduce them; they may particularly alſo prevent the diſcharge of the excrements, and occaſion the death of the patient. By uſing an elaſtic bandage, the head of which is provided on its inner ſide with a ſponge, which covers and gently compreſſes the artificial anus, both the production of ſuch a prolapſus, and its recurrence after having been reduced, may be prevented. Mr. Lange (Schmuckers vermiſchte chirurgiſche Schriften, &c. b. ii. p. 298.) has ſhewn that ſuch a hernia may actually become ſtrangulated. He mentions an inſtance in which the inteſtine hung down a foot in length, and was ſo turgid with blood, that it was impoſſible to reduce it. He was, therefore, obliged to enlarge the artificial anus and abdominal ring by an inciſion, after which the reduction was eaſily performed.

It is always a dubious undertaking to attempt to cloſe up an artificial anus of a pretty long ſtanding, and reſtore the diſcharge of the excrements by the natural paſſage. However, when ſtill ſome part of the excrements is diſcharged by the natural anus, when clyſters can be thrown in by that paſſage, eſpecially when the artificial anus is of no long ſtanding, and we can be aſſured that the lower portion of the inteſtine is ſtill open, we may make the attempt to cloſe the artificial anus. That even where the artificial anus is already of long ſtanding, the cure is ſtill poſſible, has been proved by a caſe related by Mr. Deſſault. The diſeaſe had already continued for the ſpace of four years, the inteſtine was protruded out of the body, in the form of a cylinder, nine inches in length; and its membranes were ſo much thickened and hardened, that it appeared more than temerity to attempt the reduction of ſo conſiderable a maſs. The patient had diſcharged nothing from the rectum ſince he had received his wound; every two or three months, however, he had a ſtool, by which he voided a whitiſh hard kind of ſubſtance. Mr. Deſſault applied a ſimple bandage over the whole tumor from the top to the bottom, in ſuch a manner that the turns of the bandage applied cloſe over each other, leaving only a ſmall opening at the point, for the purpoſe of diſcharging the feculent matter, which conſiſted of half-digeſted aliments. When by this means the inteſtine had been reſtored to its natural ſize, on the fourth day, he directed it to be raiſed up into a perpendicular direction: and having introduced his finger into the orifice of the inteſtine, whilſt he preſſed the inteſtine itſelf with his other hand, in order to prevent the protruſion of the parts, he extricated the inteſtine, ſo that it now contracted into itſelf, and conſequently the hernia was reduced. The orifice of the inteſtine, through which the excrements were voided, was cloſed by means of a plug three inches long, and made of a piece of linen rolled up, which was introduced into the orifice, and ſecured by means of the common inguinal bandage. His intention with this plug was, that it ſhould be withdrawn twice a day, in order to afford a paſſage to the fæces; but ſoon after the reduction of the inteſtine, flatus were ſeveral times diſcharged through the anus; and ſoon afterwards fluids; which, in the courſe of the following days, acquired more conſiſtence, ſo that on the eighth day the plug was no longer uſed, but the external orifice merely covered and ſecured with pledgits of lint, compreſſes, and the cuſhion of an elaſtic bandage: by this means the diſcharge of the excrements through the preternatural orifice was prevented, and its natural paſſage by the rectum permanently re-eſtabliſhed.

But, in general, the attempt to cloſe up an artificial anus is not unattended with difficulty and danger; and it ought never to be riſked, unleſs when the vicinity of the orifice to the ſtomach gives riſe to inanition, or a conſumption, or ſome other material inconvenience. But even in theſe circumſtances, Prof. Richter thinks we ought to uſe gentler means of alleviating the ſymptoms, and with a view to the cure. He recommends to keep the orifice of the artificial anus conſtantly cloſed, by means of the bandage above mentioned, whereby the chylous fluids will be detained longer in the alimentary canal, and a greater abſorption of the nutritive parts take place; to let the patient take only eaſily digeſtible, very nouriſhing, and fluid aliments; and to avoid whatever might tend to accelerate the paſſage of the aliments through the inteſtinal canal. By theſe means he thinks that the above mentioned inconveniencies may generally be remedied.

ANUS, in *Botany*, denotes the poſterior opening of a monopetalous flower.

ANUS, in *Conchology*, a ſpecies of MUREX in the order of *teſtacea vermes*, having a veiny ſhell with membranaceous dilated lips, gibbous reticulate-tuberculate aperture, ſinuous and erect at the end. It is the auris hirſuta of Rumpf. Muſ. t. 24; found in the Mediterranean, and the ocean contiguous to the ſouthern part of Aſia: the ſhell is about three inches long, for the moſt part brown, with white bands, and an almoſt triangular aperture. Gmelin.

ANWEILLER, in *Geography*, a town ſituate in the duchy of Deux Ponts, ceded to France by the treaty of Weſtphalia; eight miles weſt of Landau. It is the chief place of a canton in the diſtrict of Deux Ponts, and department of Mont-Tonerre: the place contains 1,841, and the canton 12,690, inhabitants; the territory includes 24 communes.

ANXA, in *Ancient Geography*, the name given by the Romans to CALLIPOLIS.

ANXANUM, LANCIANO, or ANCIANO, a conſiderable town of Italy, which was the capital of the people called Frentani. It was ſituate in Latium, near the mouth of the Sagrus.

ANXI, in *Geography*, a town of Italy, in the kingdom of Naples, and province of Baſilicata, eight miles ſouth-eaſt of Potenza.

ANXUR, in *Ancient Geography*, a town of the Volſci, called by the Greeks and Latins Tarracina, ſituate at the lower extremity of a ſmall gulf to the eaſt of the Circean promontory. In alluſion to its ſituation on a mountain,

Martial calls it "ſuperbus Anxur." Jupiter ἀξυρος, or the beardleſs Jupiter, was worſhipped in this town; and at the diſtance of three miles from it were a grove and waters conſecrated to the goddeſs Feronia, mentioned by Horace, lib. i. ſat. 5.

ANYM, a town of Paleſtine, placed by Joſhua in the tribe of Judah; and ſuppoſed by Calmet to be the ſame with Anam or Anem.

ANZABAS, a river of Aſia, which, according to Ammianus Marcellinus, was not far from the Tigris.

ANZA, in *Geography*, a river of Italy, which runs into the Toſa near Ugogna, in the principality of Piedmont.

ANZAR, a town of Turqueſtan, in the vicinity of the northern part of China, where Tamerlane died.

ANZERMA, a town and province of Popayan in South America, ſituate on the river Coca, and having mines of gold. N. lat. 4° 58'.

ANZIKO. See ANSIKO.

ANZITA, in *Ancient Geography*, a town of Aſia, ſituate on a ſmall river, near the eaſt of the Euphrates.

ANZUQUI, in *Geography*, a town of Japan, in the iſland of Niphon, upon the eaſtern ſide of the gulf of Macao.

ANZUQUIAMA, a town of the kingdom of Mino: the territory ſo called was the paradiſe of Nubunanga, who went from the ſovereignty of Mino to that of Japan.

AOAYS, a town of Spain, in Navarre, on the river Yrate, ſeven leagues from Pampeluna.

AOBRIGA, or AOBRICA, in *Ancient Geography*, a town of Spain, called alſo Abobrica and Abobriga.

AOCHARA, a town of Africa, in the kingdom of Algiers, between Tenez and Sercelles.

AONÆ, or AONIANS, in *Ancient Geography*, a people of Bœotia, who jointly with the Hyantes ſucceeded the Ectenes. At the arrival of Cadmus, according to Pauſanias (in Bœot. c. 5.), the Hyantes took up arms to oppoſe him; but the Aonians ſubmitted, and were afterwards incorporated with the Phœnicians. The Aonians derived their name from Aonia.

AONIA, an ancient name given to Bœotia.

AONIDES, in *Mythology*, the appellation of the Muſes, derived from the mountains of Bœotia, where they were particularly honoured, called the Aonian mountains.

AONIS, in *Entomology*, a ſpecies of PAPILIO (Nymp. Gem.) found in India. The wings are angulated, grey, anterior pair clouded with yellow: a large and ſmall eye-ſhaped ſpot above. Cramer, Gmelin, &c.

AORASIA, formed of α, *priv.* and ὁραω, *I ſee*, denotes inviſibility, and was applied by the ancients to the gods; for they apprehended that, in their intercourſe with man, they never ſhewed themſelves face to face, but were diſtinguiſhed, as they retired, by their backs. Thus Neptune, as Homer repreſents him (Iliad ii.), aſſumed the form of Calchas in converſing with the two Ajaxes, and was known merely as he withdrew by his majeſtic gait and ſtep. Venus alſo, according to Virgil, appeared to Æneas under the form of an huntreſs; but ſhe diſcovered herſelf in her retreat by her radiant head, flowing robe, and dignified movement.

AORISTIA, in the *Sceptic Philoſophy*, denotes that ſtate of the mind, where we neither aſſert nor deny any thing poſitively, but only ſpeak of things as ſeeming or appearing to us in ſuch a manner.

The aoriſtia is one of the great points or terms of ſcepticiſm, to which the philoſophers of that denomination had continual recourſe by way of explication or ſubterfuge. Their adverſaries, the dogmatiſts, charged them with dogmatiſing, and aſſerting the principles and poſitions of their ſect to be true and certain.

AORISTUS, compounded of α, *privative*, and ὁριζω, *to limit*, in the Greek *Grammar*, an indefinite and indeterminate kind of tenſe, which ſometimes expreſſes the preſent, ſometimes the future, but moſt frequently the paſt time.

The Greeks have two aoriſti; the Latins have none.

Dr. Beattie, in his "Theory of Language," (Part ii. ch. 2.), giving an account of the Greek tenſes, omits the ſecond aoriſt as well as the ſecond future; becauſe he conſiders them as unneceſſary. Some grammarians, he ſays, are of opinion, that the firſt aoriſt ſignifies time paſt in general; and the ſecond, indefinite time paſt; and that the firſt future denotes a nearer, and the ſecond a more remote futurity. But this he apprehends to be mere conjecture, unſupported by proof; and he inclines rather to the ſentiments of thoſe who teach, that the ſecond future and ſecond aoriſt have no meaning different from the firſt future and the firſt aoriſt; and that they are the preſent and imperfect of ſome obſolete theme of the verb; and, when the other theme came into uſe, were retained for the ſake of variety, or, by accident, with a preterite and future ſignification. In this opinion Lord Monboddo concurs; and he has endeavoured to ſtrengthen it by the teſtimony of ſome ancient grammarians. Dr. Browne, in his "Brief Strictures on certain Obſervations of Lord Monboddo reſpecting the Greek Tenſes" (See Tranſactions of the Royal Iriſh Academy for 1789, or vol. iii. part ii. p. 11, &c.), has controverted this opinion. Aoriſts, or indefinites, he obſerves, are ſometimes ſo called, becauſe they are uſed for many tenſes indifferently, paſts, preſents, and futures: ſometimes, becauſe they do not mark any preciſe point of time when an action happened, but only expreſs that it did happen: ſometimes, becauſe the verb, when uſed in theſe tenſes, doth not expreſs whether the action ſignified be perfected or imperfect. In this laſt ſenſe he uſes the term aoriſt; and by definite, he means the ſenſe in which the verb expreſſes the perfection of the action. Having thus defined the meaning which he annexes to the term aoriſt, he allows that both the aoriſts are often uſed, without diſcrimination, as mere paſt indefinites; but he maintains, that the firſt aoriſt has much more frequently a definite meaning than the ſecond; whereas the ſecond appears in nine inſtances out of ten to be uſed indefinitely. Grammarians have obſerved, that the firſt aoriſt is oftener introduced to denote the paſt perfect time, than their preterperfect tenſe itſelf; and hence he argues, that its proper meaning is of a definite nature, and that it is not *properly* an aoriſt. Sanctius, he alleges, ſeems to have been of this opinion, when he calls the ſecond only by the name of aoriſt. He then proceeds to ſhew, that ſuch a definite, as he conceives the firſt aoriſt to be, was wanting in the Greek language, and is not ſupplied by the preterperfect; which implies, that the action has been done, and ſtill continues to be done. In the Greek language there muſt be ſome other tenſe for expreſſing the time of the performance of an action which was perfected at a time paſt, and has ceaſed to continue. Dr. Clarke has aſſigned to this office the tenſe uſually called the preterpluperfect; but in Dr. Browne's opinion, without ſufficient authority, as that tenſe expreſſes ſomething more. He has recourſe, therefore, for this purpoſe, to the firſt aoriſt, the original intention of which was to expreſs the real preterperfect time of philoſophical grammar. In the Latin and Engliſh languages we have no diverſity of tenſes, or of ſingle words, to expreſs whether a paſt action has been done lately, or a long time ſince. It is only from the tone of the ſpeaker, from the circumſtances of the event, or from the context, that we can find out the difference. To ſupply the defect which theſe languages labour under, in their *active* voice, in not diſtinguiſhing, by

different ſounds or words, the difference between what was lately perfected, and that which was perfected ſome time ago; and in the *paſſive*, in not making this diſtinction except by the help of auxiliary verbs; the Greeks, according to Dr. Browne, invented their firſt aoriſt; and intended by it to indicate the latter, as the preterperfect indicated the former. When Archimedes ruſhes out of the bath, after having made his celebrated diſcovery, he exclaims εὕρηκα, becauſe he had juſt at that moment found out and ſolved the difficulty. But when Neſtor (Homer Il. i. v. 260, 261.) ſpeaks of ancient days and ancient heroes with whom he had been converſant, he ſpeaks in the aoriſt, ἀριστόν ἠπτερ ὑμῖν Ανδρασιν ὡμίλησα. When Demoſthenes ſuppoſes the queſtion τεθνηκε Φιλιππος; it follows, that if it had been ſo, and any perſon had ſuddenly announced it, he would have replied τεθνηκε. But when Chryſis (Il. i. v. 40.) alludes to actions formerly and frequently performed by him, he uſes the aoriſt, "if I have ever crowned your altars or burnt victims," ἐρεψα and ἑκηα.

Moreover, the probability that the Greek language had a diſtinct tenſe to denote what had lately, or what had long ſince happened, is augmented by the conſideration that they had a tenſe to expreſs what was ſoon to come. As they had a "paulo-poſt future," they might alſo have had a "paulo ante preterit."

If an action be ſpoken of which has been often done, the Greeks generally uſe the firſt aoriſt. Thus, in the beginning of the "Cyropedia," where Xenophon reflects how many democracies have been reduced, and how many oligarchies ſubverted, caſes frequent in human affairs, he uſes the firſt aoriſt: thus alſo he expreſſes, in the beginning of the "Memorabilia," his frequent ſurpriſe at the errors reſpecting Socrates; "I have often wondered," in the firſt aoriſt. This is alſo the caſe in the example of Neſtor above mentioned; and in ſimiles, where a compariſon is made with ſomething frequently occurring, the firſt aoriſt is generally uſed. In ſuch caſes, no particular time at which the action happened is ſpecified, but an action which has often paſſed is mentioned, without determining any preciſe time. The ſecond aoriſt, on the other hand, which generally refers to a particular time, is ſeldom if ever uſed to denote a frequentative; although lord Monboddo has aſſigned this office to this as well as to the firſt aoriſt.

To cloſe this article, we may obſerve, that definite tenſes are thoſe which limit both the times of the perſon and of the action: whereas thoſe tenſes which leave the nature of the action wholly undecided, and take no notice whether it be finiſhed or unfiniſhed, are indefinite, or aoriſts; *e. g.* "I write," is the aoriſt of the preſent tenſe, "I wrote," is the aoriſt of the paſt; and "I ſhall write," is the aoriſt of the future.

AORNUS, in *Ancient Geography*, a town of Bactriana, ſituate to the eaſt of Bactra.

Aornus was alſo a place of Epirus, according to Pliny; belonging to the Threſprotiæ, according to Pauſanias; whence iſſued an exhalation that was fatal to birds which flew over it; and where, it is ſaid, they invoked the dead to predict future events. In this place were a temple and grove conſecrated to the Manes.

Aornus, *Rock of*, a name given to a high mountain of India, ſituate in the modern diſtrict of Bijore, and deriving its name from α, *priv.* and ορνις, *bird*, expreſſing its great elevation, which was ſuppoſed to be above the flight of a bird. The circuit of it was, according to Arrian, 200 ſtadia or about 18 or 20 miles; its height about 11 furlongs; and the acceſs to it was only by one narrow path, cut out of the rock. On the ſummit was a great extent of arable and paſture land, with ſprings of water; ſo that a garriſon of 1000 men might ſubſiſt, without any extraneous ſupply. It may be ſuppoſed to be ſomewhat ſimilar to Gwalier, or Rotas Gur, in Bahar. Some have ſaid, that the Indus paſſed by Aornus; but this, ſays Mr. Rennell (Memoir, &c. p. 174.), could not be the caſe; becauſe the diſtrict of Sowhad Proper lies between the Indus and Bijore, according to the Ayeen Acbaree. The ſiege and capture of this fort were among the moſt celebrated exploits of Alexander in his Indian expedition. Hercules was ſaid to have attempted it in vain; but Arrian informs us, that this was a groundleſs report; and that it was a fable, probably invented by ſome of Alexander's flatterers to magnify his enterpriſe. Whilſt he was preparing for the ſiege, an old man and his two ſons, who had long lived in a cavern of the mountain, offered to ſhew him a private way of aſcending it; and a deputation of light-armed troops, under the command of Ptolemy, was ſent to accompany them. As ſoon as they were ſafely lodged, they cauſed a lighted torch to be erected on a pole in their camp, as a ſignal to Alexander. Alexander, attempting the ordinary paſſage with a body of troops, was repulſed with great ſlaughter. But Ptolemy attacking the Indians in the rear, whilſt Alexander renewed the aſſault, a ſecond repulſe took place. Upon this Alexander, perceiving that the ſtrength of the Indians depended on the narrowneſs and declivity of the paſſage, gave orders to fell a quantity of trees, and to fill the cavities between the plain on which the Indians were encamped, and the higheſt of his own advanced poſts. Theſe meaſures were at firſt derided by the Indians; but as ſoon as they began to feel the effects of the miſſile weapons of the Macedonians, they propoſed terms of ſurrender. Alexander, ſuſpecting that they merely wanted to gain time, and to make their eſcape, took the advantage of their deſcent; and having gained poſſeſſion of the deſerted rock, he then made a ſignal for the forces to fall upon the flying Indians. The fugitives, hearing their loud ſhout, were ſo terrified, that many of them fell from the rocks and precipices, and were daſhed to pieces, and the reſt were cut off in the roads. Anc. Un. Hiſt. vol. vii. p. 398.

AORSI, a people who, according to Strabo, inhabited the banks of the Tanais. They afterwards extended themſelves along the northern parts bordering on the Caſpian ſea, and carried on a commerce in gold and other articles of merchandiſe between India and Babylon.

AORTA, formed of αειρω, which ſignifies a *bag*, *cheſt*, &c. in *Anatomy*, the great artery proceeding from the left ventricle of the heart; from which all the other arteries either mediately or immediately proceed, and by which the whole maſs of blood is conveyed to all parts of the body.

The ſtructure, diviſions, courſe and branches of this veſſel, are explained under the article Artery.

Aorta, *diſeaſes of the*, in *Surgery*. The moſt common local diſorders of this veſſel are, aneurism, oſſification, or a thickening and opacity of the ſemilunar valves of the aorta, interrupting their proper action, and ſometimes producing fatal conſequences. This artery is likewiſe ſubject to inflammation and ulceration, like other parts of the body; but in all theſe complaints the art of healing affords only palliative means of relief. See Polypus of the heart and blood veſſels.

AOUS, in *Ancient Geography*, a river of the iſle of Cyprus.

Aous is alſo a name given to the river Æas, near Apol-

lonia, which rose in the south-east, and discharged itself towards the west into the Ionian sea.

AOUSTA, or Aost, in *Geography*, formerly *Augusta prætoria*, a city of Piedmont, situate at the foot of the Alps, on the river Doria, is so called probably from its ancient name, which was given it by Augustus, who sent thither a colony of 3000 of the Prætorian legion. It is the see of a bishop, has several Roman antiquities, such as a triumphal arch, an amphitheatre, &c., and was the birth-place of Anselm, archbishop of Canterbury. It is distant 25 miles north-west from Ivrea, and 50 north-north-west from Turin; N. lat. 45° 38′. E. long. 7° 33′.

Aousta, a district of Piedmont, with the title of a duchy, is a valley about 30 miles long, and fertile in pasturage and fruit; extending from the pass of St. Martin's, near the frontiers of Yvrée, to St. Bernard. Its capital is Aoustа, and most of the inhabitants are Goitres.

Aouste, a town of France, in the department of the Drome, and chief place of a canton in the district of Crest, situate on the Drome; 15 miles south-east from Valence, and two south-east from Crest.

AOUTA, the name of the paper mulberry-tree at Otaheite, in the South Sea, from which a cloth is manufactured that is worn by the principal inhabitants. The bark of the trees is stripped off, and deposited to soak in running water; when it is sufficiently softened, the fibres of the inner coat are carefully separated from the rest of the bark; they are then placed in lengths of about 11 or 12 yards, one by the side of another, till they are about a foot broad; and two or three layers are laid one upon the other. This is done in the evening; and by the next morning the water is drained off, and the several fibres adhere together in one piece. It is afterwards beaten on a smooth piece of wood, with instruments, marked lengthways with small grooves of different degrees of fineness; and by means of this operation becomes as thin as muslin; and after bleaching it in the air in order to whiten it, it is fit for use. If the cloth breaks in the beating, it is easily repaired by patting on a patch with a gluten that is prepared from the root of the *pea*, which is done so nicely that it cannot be discovered. This cloth is cool and soft, but as liable to be rent as paper. The colours with which it is dyed are principally red and yellow. The red is a beautiful scarlet, and produced by mixing the juices of two vegetables, *viz.* the fruit of the fig called *matle*, and the leaves of the *cordia sebastina* or *etou*. The yellow is made of the bark of the root of the *marinda citrifolia* called *nono*, by scraping and infusing it in water. The inhabitants of the island also dye yellow with the fruit of the *tamanu*. Hawkesworth's Voyages, &c. vol. ii. p. 210, &c.

AOUTOS, in *Geography*, a town of European Turkey, in the province of Romania, 44 miles west-north-west from Burgas.

AOYCA, a town of Spain, in Navarre, four leagues from St. Estevan, and five from Pampeluna.

APACHES, a people of North America, in New Mexico, who occupy an extensive country under the appellations of Apaches de Parillo, to the south; Apaches de Xilla and de Navaio, to the north; and Apaches Vaqueros, to the east. They are brave, and resolute, fond of liberty, and the inveterate enemies of tyranny and oppression. Ever since their revolt from the catholic king towards the close of the 17th century, they have been the allies, but not the subjects of the Spaniards.

APACHIERA, an audience and province of New Mexico, whose capital is St. Fe, in N. lat. 36° 30′. W. long. 104°.

APACTIS, (Απακτος; *abductus*, from απαγω), in *Botany*, Thunberg, Jap. 11. Schreb. gen. 808. Juss. 432. Class, *dodecandria monogynia*. Generic Character: *calyx*, none; *corolla* four-petalled; *petals* roundish crenate, concave, unequal, two opposite broader; *stam.* filaments from 16 to 20; *pist.* germen superior; *style* one. Essential character: *cor.* four-petalled; *cal.* none. *Apactis japonica*, the only species of this genus, is a tree growing erect, with numerous branches, which are alternate, round, scabrous, dotted, erect. Leaves alternate, petiolate, ovate, acute, serrate, entire at the base, nerved, smooth, paler underneath, an inch long. Petioles half round, furrowed a quarter of an inch in length. Flowers in racemes, at the ends of the branchlets. Racemes usually ovate, as they advance becoming more oblong. Peduncles villose-scabrous.

APÆDUSIA, from α and παιδευω, *instruction*, denotes ignorance or unskilfulness in what relates to learning and the sciences. Hence also persons uninstructed and illiterate are called *apædeutæ*. The term apædeutæ was particularly used among the French in the time of Huet; when the men of wit at Paris were divided into two factions, one called by way of reproach apædeutæ, and the other *eruditi*.

The apædeutæ are represented by Huet as persons who finding themselves either incapable or unwilling to undergo a severe course of study, in order to become truly learned, conspired to decry learning, and turn the knowledge of antiquity into ridicule, thus making a merit of their own incapacity.

The apædeutæ, in effect, were the men of pleasure; the eruditi, the men of study.

APAGMA, a term used, by some writers, in *Surgery*, for the thrusting of a bone or other part out of its proper place. But it is more properly used for a fracture of a bone at or near the part whereby it is articulated with another.

APAGOGE, from απο and αγω, *I draw*, or *bear*, in the *Athenian Law*, the carrying of a criminal, taken in the fact, to the magistrate. If the accuser was not able to bring him to the magistrate, it was usual to take the magistrate along with him to the house where the criminal lay concealed, or defended himself.

Apagoge, in *Logic*. See Abduction.

Apagoge, in *Mathematics*, is something used to denote a progress or passage from one proposition to another; when the first, having been once demonstrated, is afterwards employed in the proving of others.

APAGOGICAL *demonstration*, is such as does not prove the thing directly, but shews the impossibility and absurdity which arises from denying it.

Hence it is also called, *reductio ad impossibile*, or *ad absurdum*.

APALACHES, or St. Mark's River, in *Geography*, rises in the country of the Seminole Indians, in East Florida, in N. lat. 31° 30′, and runs south-west, through the Apalachy country, into the bay of Apalachy, situate N. lat. 30°. W. long. 83° 53′, in the gulf of Mexico, about 15 miles below St. Mark's. After a course of about 135 miles, it falls into the bay, near the mouth of Apalachicola river.

Apalachian *Mountains*, sometimes called the *Allegany Mountains*, pass through the territory of the United States, from the south west to the north-east. According to the best maps, they commence on the north of Georgia, where they give rise to many rivers that run south to the gulf of Mexico,

Mexico, and to the Tenaſſee, and others that have their courſe to the north. The Apalachian chain, from which proceed ſeveral collateral ridges, as the Iron, or Bald mountains, the White Oak mountains, and others, extends from thence through the weſtern territory of Virginia, together with its collateral ridges, the breadth of the whole being often 70 miles, and advancing through Pennſylvania, paſſes Hudſon's river, and afterwards riſes to a greater elevation, and ſeems to terminate in the country of New Brunſwick. Accordingly, this chain may extend about 900 geographical miles, which is a length unrivalled by any European mountains, except the Norwegian Alps. The collateral ridges are ſingularly diſtinct; and a naturaliſt would at once pronounce that the central or higheſt muſt be granitic, the next ſchiſtoſe, and the exterior belts calcareous. The granite ſeems commonly to conſiſt of white feltſpar, bluiſh or rather pellucid quartz, and black mica. The ſchiſtoſe band preſents copper ore; and in Canada, lead and ſilver are ſaid to have been diſcovered. The limeſtone contains, as uſual, many petrifactions, particularly the cornu ammonis, a ſmall ſcallop ſhell, and ſeveral ſorts of corals. The height of the chief ſummits, which appear to be in the province of New Hampſhire, has not been accurately aſcertained, but does not probably exceed 3000 feet above the ſea; and they are often clothed with foreſts. Mr. Weld conjectures, that the Peaks of Otter, the higheſt of the Blue Mountains, are little more than 2000 feet high, and at any rate their height is much inferior to that of Snowdon. Morſe's Amer. Geog. p. 292. Pinkerton's Mod. Geog. vol. ii. p. 552.

APALACHICOLA, a river of America, between Eaſt and Weſt Florida, riſes in the Apalachian Mountains, in the Cherokee country, within 10 miles of Tuguloo, the upper branch of Savannah river, and from its ſource to the mouth of Flint river, in a courſe of 300 miles, bears the name of Chata-Uche, or Chatuhooche river. Flint river falls into it from the north-eaſt below the lower Creek towns, in N. lat. 31°. From thence it runs near 80 miles, and falls into the bay of Apalachy, or Apalachicola, in the gulf of Mexico, at Cape Blaize. From its ſource to N. lat. 33° its courſe is ſouth-weſt, and thence to its mouth nearly ſouth.

Apalachicola is alſo the name of the mother town, or capital of the Creek or Muſcogulge confederacy, called Apalachicola by Bertram; who deſcribes it as ſacred to peace, no captives being put to death or blood ſhed there; and when a general peace is propoſed, deputies from all the towns in the confederacy meet here to deliberate. Whereas the great Coweta town, 12 miles higher up the Chata-Uche river, is called the "Bloody Town," where the Micos chiefs and warriors aſſemble, when a general war is propoſed; and here captives and ſtate malefactors are put to death. Apalachicola is ſituated one mile and a half above the ancient town of that name, which lay on a peninſula, formed by the doubling of the river, but deſerted on account of inundations. The town is about three days journey from Talaſſee, a town on the Tallapooſe river, a branch of the Mobile river.

APALACHY Country extends acroſs Flint and Apalaches rivers in Eaſt Florida, having the Seminole country on the north-eaſt. Apalachy, or Apalachya, is alſo a name applied by ſome writers to a town and harbour in Florida, 90 miles eaſt of Penſacola, and at the ſame diſtance weſt from Del Spiritu Santo river. The tribes of the Apalachian Indians lie around it.

APALATOA, in *Botany*. See Cyclas.

APALHAO, in *Geography*, a town of Portugal in Alentejo, containing about 1200 inhabitants.

APALIORIA, an iſland that lies on the eaſtern coaſt of the peninſula of India, in S. lat. 9° 8′. E. long. 79° 40′.

APALUS, in *Entomology*, a genus of the COLEOPTERA inſects, with filiform antennæ, equal and filiform palpi, maxilla horny and unidentated, and lip membranaceous, truncated and entire. There is one ſpecies, the *ap. bimaculatus*, pyrochroa bimaculata of Degeer; found early in the ſpring in the ſandy parts of Sweden.

APAM, in *Geography*, a village of Africa, in the kingdom of Acron, on the Gold Coaſt, inhabited by fiſhermen, and fortified by the Dutch in 1697. See Acron.

APAMA, in *Botany*, a genus of the *polyadelphia polyandria* claſs and order: the characters of which are, that the *calyx* is trifid, no *corolla*, and the filaments diſtributed in three ranks. Gmelin mentions one ſpecies, *viz.* A. *dubia*, the *alpany* of Rheed, Malab. vi. p. 51. This is a tree in the Eaſt Indies, with aſh-green bark and white wood. It is an ever-green, and bears fruit twice a year. With its juice and oil are formed an ointment which cures the itch, and deterges old ulcers. La Mark. Encycl. t. i. p. 91.

APAMATUCK, in *Geography*, a river of North America, in Virginia, runs into the Powhatan.

APAMÆA, or Apamia, in *Ancient Geography*, a town of Syria, ſituate in a marſhy country, at the confluence of the Orontes and Marſyas, which form a kind of lake, that has no communication with the land but by a ſmall iſthmus. It is about 60 miles almoſt ſouth of Antioch, and about 90 from Aleppo, in N. lat. 35° 6′. E. long. 37° 18′. Its former name was Pharnaſca, and the Macedonians called it Pella; and as it was almoſt wholly ſurrounded by water, it was denominated Cherſoneſus. According to Strabo, it was founded by Seleucus Nicator; and derived its name from his wife Apamea, the daughter of Artabazus the Perſian. It had its own kings till the arrival of Pompey in Syria; and afterwards the whole country became a Roman province. It was there, ſays Strabo, that the Seleucidæ had eſtabliſhed the ſchool and nurſery of their cavalry. The ſoil of the vicinity, abounding in paſturage, fed no leſs than 30,000 mares, 300 ſtallions, and 500 elephants. It is now called *Famia*; and its marſhes ſcarcely afford ſupply for a few buffaloes and ſheep. To the veteran ſoldiers of Alexander, who here repoſed after their victories, have ſucceeded wretched peaſants, who live in perpetual dread of the oppreſſions of the Turks, and the inroads of the Arabs. Some have ſuppoſed this city to have been the preſent *Hama*. Volney's Travels, vol. ii. p. 298.

APAMEA is alſo a town of Aſia Minor, in Bithynia. It was originally called Myrlea, but deſtroyed by Philip, king of Macedon, the ſon of Demetrius, and the father of Perſeus; and given to his ally Pruſias the Bithynian, who rebuilt it, and called it after his wife's name, Apamea. Such is the account of Strabo. But Steph. Byz. ſays, that it was founded by Myrlus, general of the Colophonians; and that Nicomedes Epiphanes, ſon of king Pruſias, called it Apamea in honour of his mother. Others ſay, that it derived its name from Myrlea, an Amazon. The Romans fixed a colony there called *Colonia Apamena*.

Apamea *Cibotos*, ſo called, according to Salmaſius, from κιβωτος, an *ark* or coffer, becauſe it was the mart or common treaſury of thoſe who traded from Italy and Greece to Aſia Minor, was the metropolis of Phrygia, till Conſtantine's diviſion of the empire. It was ſituated at the confluence of the Marſyas and Mæander. It was built, according to Strabo, by Antiochus Soter, and ſo called from his mother Apamea, the wife of Seleucus Nicator. He alſo removed

removed the inhabitants of the ancient Celenæ, the ſituation of which is confounded by ſome writers with that of Apamea, to this city. It is now called *Iſphion Kara Hiſar*, or the black caſtle of Opium, which drug is collected in its environs.

APAMEA was alſo a city on the confines of Media and Parthia, not far from Rage, and ſurnamed *Raphanæ*, or probably as it ſhould have been, *Ragianæ*.

APAMEA, *Meſene*, is a town of Aſia, in Meſopotamia, ſituate to the ſouth-eaſt upon the Tigris, in a diſtrict which lay between the canal and the river, whence the epithet Meſene, becauſe it was in the midſt of that ſmall territory now called *Dilgel*.

APAMEA, *Koma*, a town ſituate at the confluence of the Tigris and Euphrates, to the ſouth of the preceding.

APAMEA, *Cebene*, a town of Aſia, on the left bank of the Euphrates, oppoſite to Zeugma; both founded by Seleucus, and connected by a bridge.

APAMIS, a name anciently given, according to Steph. Byz. to Lampſacus.

APAMIS is now the name of the Ancient Apamea, on the Mæander, called Mindra, a town of Aſiatic Turkey, and the ſee of a Greek biſhop; 100 miles weſt of Eſki-hiſſar.

APAMMARIS, a town of Aſia in Syria, on the banks of the Euphrates, ſouth-eaſt of Hierapolis.

APAN, in *Conchology*, a name given by Adanſon to the ſame ſhell as Linnæus has ſince called PINNA RUDIS; which ſee.

APANAGE, APENAGE, APPANAGE, APANNAGE, or APENNAGE, in the *French Laws*, the fortune of a king's younger ſon; or a ſettled portion of land, &c. aſſigned for the ſubſiſtence of the cadets or younger ſons of a ſovereign prince. Nicod and Menage derive the word from *panis*, *bread*, which frequently includes all other ſorts of proviſion neceſſary for ſubſiſtence. Some will have the apanages, at the firſt inſtitution, to have been only penſions, or annual payments, of a certain ſum of money.

During the firſt and ſecond races of kings, the right of primogeniture and apanages were unknown; but the domains were divided pretty equally among all the children.

Great inconveniencies ariſing hence, it was at length found proper to put off the younger-born with counties, duchies, or other diſtricts; on condition of their paying homage and fealty for the ſame, and of their reverting, in defect of heirs male, to the crown.

This has happened, accordingly, to the firſt and ſecond branch of the dukes of Bergundy. The duchy of Orleans was the apanage of the ſecond ſon of France. The apanage was unalienable: collateral branches did not inherit it. The eldeſt ſon alone was heir to the whole apanage: but bound to allow the younger an honourable maintenance.

In France, apanages were of two kinds, *royal* and *cuſtomary*; the firſt only granted to males the king's brothers, excluſive of the females. Theſe are not ſo properly alienations of the king's demeſnes, as diſmembering of them. *Cuſtomary apanages* were thoſe granted to women, the king's ſiſters. Joach. Mierus has publiſhed a body of all the writers on *apanage* and *parage*, in one volume in folio.

APANORMIA, in *Geography*, a town in the iſland of Santorin, in the Archipelago; it has a ſpacious port, in the form of a half-moon; but the ſea is ſo deep as to afford no anchorage.

APANTA, or APANTE, a province of Terra Firma, in South America, between the lake Parima and the river of the Amazons; to the weſt of the province of Caropa.

APANTHROPY, in *Medicine*, a term ſometimes uſed to denote a love of ſolitude, or an averſion from the company of mankind; and is reckoned by ſome a ſymptom, and by others a ſpecies or degree of melancholy; and it is a bad indication in leucophlegmatic caſes.

APANTORA, in *Entomology*, a ſpecies of CANCER that inhabits Chili. The thorax is ovate, ſides denticulated, tail triangular. Molin, and Gmelin.—Obſ. legs hairy, tail rather long.

APARA, in *Zoology*, a ſpecies of armadillo or daſypus. See DASYPUS.

APARGIA, in *Botany*. See HEDYPNOIS.

APARIA, in *Geography*, a province of South America, in Peru, near the river of the Amazons, where it receives the Curavaya.

APARINE, in *Botany*. See ASPERUGO, GALIUM, SHERARDIA, VALANTIA, and UTRICULARIA.

APARINES. See AMMANNIA.

APARITHMESIS, from απαριθμεω, *I number*, or *enumeration*, in *Rhetoric*, is a figure, whereby that which might be expreſſed in few words is branched out into ſeveral particulars, to enlarge the idea and render it the more affecting; and ſometimes it denotes the anſwer to the protaſis or propoſition itſelf. Thus if the protaſis be "appellandi tempus non erat," the aparithmeſis is "ac tecum anno plus vixi."

APARTISMENUS, in the *Ancient Poetry*, an appellation given to a verſe, which comprehended an entire ſenſe or ſentence in itſelf.

This is ſometimes alſo written *apartemenus*, *i. e.* ſuſpended, as not needing any following verſe.

APARTMENT, a portion of a large houſe, wherein a perſon may lodge ſeparately; having all the conveniences requiſite to make a complete habitation.

The word comes from *apartimentum*, of the verb *partiri*, *to divide*; or, as ſome imagine, *a parte manſionis*, *making part of a dwelling*.

A complete apartment muſt conſiſt of a hall, a chamber, an antechamber, a cloſet, and a cabinet or wardrobe.

APATE, in *Botany*. See LACTUCA.

APATE, in *Entomology*, a genus of coleopterous inſects in the Fabrician ſyſtem (Ent. Syſt.); the character of which is, feelers filiform; jaws, one tooth in each; lip membranaceous and truncated; and the antennæ perfoliated. This genus includes ſome of the Linnæan dermeſtes, as capucinus and domeſticus; boſtrichus of Geoffroy and Olivier, as cornutus & bimaculatus; and ligniperda of Pallas, as terebans & cornuta.

Gmelin makes a ſubdiviſion of the Linnæan DERMESTES, in his edition of the Syſtema Naturæ, according to the number of teeth in the jaws, maxilla biſida, and maxilla unidentata; the latter he calls *apate*, and it includes ſeveral of the ſpecies deſcribed by Fabricius in his genus of the ſame name.

APATHY, formed of the privative, α, and παθος, *paſſion*, denotes an inſenſibility; or a privation of all paſſion, all emotion, or perturbation of mind.

The Stoics affected an entire apathy; their wiſdom was to enjoy a perfect calmneſs or tranquillity of mind, incapable of being ruffled, and above the reach of any ſenſe either of pleaſure or pain.

Whilſt Epicurus taught his followers to ſeek happineſs in a kind of indolent eaſe or freedom from labour and pain; Zeno imagined his wiſe man, not only free from all ſenſe of pleaſure,

pleaſure, but void of all paſſions and emotions, and capable of being happy in the midſt of torture. That he might avoid the torpid indolence of the Epicureans, he had recourſe to a moral inſtitution, which bore indeed the loſty front of wiſdom, but which was elevated far above the condition and powers of human nature.

In the firſt ages of the church, the chriſtians adopted the term apathy to expreſs a contempt of all earthly concerns; a ſtate of mortification, ſuch as the goſpel preſcribes. Clemens Alexandrinus, in particular, brought it exceedingly in vogue; thinking, hereby, to draw the philoſophers to Chriſtianity, who aſpired after ſuch a ſublime pitch of virtue.

Quietiſm is only apathy diſguiſed under the appearance of devotion.

APATI, in *Geography*, a ſmall town of Hungary in the county of Jarmat, ſituate on the river Caraſna or Tibiſer, eaſt of the leſſer Varadin, and north-weſt of Samos. Its territory is fertile in grain and paſturage.

APATIT. *Phoſpholite* of Kirwan. *Calcareus apatites* of Werner.

This mineral is divided by the German mineralogiſts into two varieties, the cryſtallized, and earthy.

I. Cryſtalized apatit. *Gemeiner apatit*, Germ. *L'Apatite commune*, Brochant. *Chaux phoſphatée*, Hauy. *Fosforite lamellare*, Napione.

The uſual colours of this ſubſtance are greeniſh-white, mountain green, olive green, violet blue, roſe-red, and clove brown; more rarely pearl grey, greeniſh grey, ſky blue, Pruſſian blue, or fleſh red. In ſome cryſtals ſeveral of the colours are combined, other ſpecimens are irideſcent.

It is generally found cryſtallized, but occaſionally diſſeminated; the forms of its cryſtals are the following:

1. A ſhort regular hexahedral priſm, (Chaux phoſphatée primitive of Hauy), Cryſtallography (*Pl.* xxx. *fig.* 90), but this is of rare occurrence.

2. The ſame priſm truncated on its prependicular edges (Ch. phoſph. péridodecaedre of Hauy), Cryſtallography (*fig.* 91). Incidence of *e* on M = 150°. The ſides *e* are often ſtriated longitudinally.

3. The ſame priſm bevelled on its lateral edges (Ch. phoſph. annulaire of Hauy, Cryſtallography (*fig.* 92). Incidence of *r* on M = 112° 12′ 28″, and on P = 157° 47′ 32″.

4. The ſame priſm exhibiting a combination of the truncatures and bevellings of the two preceding varieties (Ch. phoſph, emarginée of Hauy), Cryſtallography (*fig.* 93).

5. The ſame priſm bevelled on the edges as N° 3, and having a quadrangular facet on each of the ſolid angles of the original priſm. (Ch. phoſph. unibinaire of Hauy). Incidence of *s* on P = 125° 15′ 52″. Cryſtallography (*fig.* 94).

Theſe cryſtals, &c. are commonly ſmall, or very ſmall, being rarely of a middling ſize; they are almoſt always grouped one upon the other in an irregular manner, being ſeldom found ſingle. The ſurfaces are uſually ſmooth, except the lateral faces of the priſms which are ſometimes furrowed with ſtrong longitudinal ſtriæ. Their external luſtre is ſhining, and often brilliant. Internally they are ſhining, with a vitreous luſtre.

The croſs fracture (or parallel to the baſe of the priſm) is ſtraight lamellar: in the oppoſite direction it is uneven fine-granular, ſometimes imperfectly conchoidal.

Its fragments are indeterminate, with ſomewhat ſharp edges.

It is uſually ſemitranſparent, paſſing, however, on one hand to tranſparent, and on the other to tranſlucid.

Its hardneſs is a little inferior to that of fluor ſpar; it is brittle, eaſily broken; ſp. grav. = 3.218.

When thrown on hot coals, the apatit gives a greeniſh phoſphoric light. It is infuſible, without addition, by the flame of the blowpipe, only loſing its colour. It diſſolves almoſt totally in nitric acid. It has been erroneouſly ſuppoſed to become electric by mere heat, not acquiring this property without friction.

According to the analyſis of Klaproth, its conſtituent parts are 55 lime and 45 phoſphoric acid, with a little manganeſe.

It is met with in the tin-mines of Ehrenfriedersdorf and Schneeberg in Saxony, and at Kuttenberg and Schlackenwald in Bohemia, accompanied by fluor ſpar, quartz, brown ſpar, wolfram, molybdena, lithomarga, ſteatite, and cupreous and arſenical pyrites.

This mineral was formerly conſidered as a ſchorl by ſome authors, as a flour ſpar by others; it was alſo not unfrequently ranked among the beryls and aquamarines; hence its old German names of aquamarinfluſs, chryſolithfluſs, baſaltamethyſt, &c. The analyſis of Klaproth however, in 1788, eſtabliſhed its chemical nature; and Werner made a particular ſpecies of it, to which he appropriated the name apatit from the Greek *απαταω*, *to deceive*, on account of its reſemblance to ſubſtances from which it is eſſentially different. See SPARGELSTEIN.

II. Earthy apatit. *Erdiger apatit*. Germ. *L'Apatite terreuſe*, Brochant. *Chaux phoſphatée terreuſe*, Hauy. *Fosforite compatta*, Napione.

Its colour is yelloviſh or greyiſh white. It occurs maſſive or earthy, amorphous.

Its fracture is earthy, paſſing into the fine grained uneven. The fragments are indeterminate, blunt-edged, ſometimes wedge-ſhaped.

It is opaque; half hard, ſometimes friable; brittle; eaſily broken; meagre and harſh to the touch: ſp. grav.= 2.824.

On expoſure to the blowpipe it yields a phoſphoric light and fuſes into a white glaſs; it is alſo phoſphoreſcent when pulverized and thrown on hot coals; it diſſolves in nitric acid, and gives out white vapours when treated with the ſulphuric acid.

Its conſtituent parts, according to the analyſis of Bertrand, Pelletier, and Donadei, are,

Lime	59
Silex	2
Phoſphoric acid	34
Fluoric acid	2.5
Carbonic acid	1.
Muriatic acid	0.5
Oxyd of iron	1.
	100.0

This mineral is found in beds mixed with quartz, in great abundance in Spain, near Truxillo, in the province of Eſtremadura. It is uſed by the inhabitants of the country for building ſtone, who appear to have been long acquainted with its phoſphoreſcent property. It is to Prouſt however that the public is indebted for the firſt ſcientific account of it. (See his Letter to Darcet, Journal de Phyſique for April 1788.)

Widenmann's Handbuch der Mineralogie, p. 528. Emmerling,

merling, vol. i. p. 302. Lenz. Verſuch, &c. vol. i. p. 426. Brochant, vol. i. p. 579. Hauy, Traité de Mineralogie, vol. ii. p. 134. Kirwan's Min. vol. i. p. 128.

APATURIA, in *Antiquity*, a ſolemn feaſt celebrated by the Athenians in honour of Bacchus.

The word is uſually derived from απατη, *fraud*.

It is ſaid to have been inſtituted in memory of a fraudulent victory obtained by Melanthus, king of Athens, over Xanthus, king of Bœotia, in a ſingle combat, which they agreed upon, to put an end to a debate between them relating to the frontiers of their countries.—Hence Budæus calls it "feſtum deceptionis, the feaſt of deceit."

Other authors give a different etymology of this feaſt; they tell us, that the young Athenians were not admitted into the tribes on the third day of the Apaturia, till their fathers had firſt ſworn, that they were their own children; and that till that time, they were ſuppoſed in ſome meaſure to be without fathers, απατορες: whence the feaſt, they ſay, took its name.

Xenophon, on the other hand, informs us, that the relations and friends met on this occaſion, and joined with the fathers of the young people who were to be received into the tribes; and that from this aſſembly the feaſt took its name; that in απατορια, the α, far from being a privative, being here a conjunctive, ſignifies the ſame thing with αμα, *together*.

This feaſt laſted four days: the firſt day, thoſe of the ſame tribe made merry together; and this they called δορπια: the ſecond day, which they called αναρρυσεις, they ſacrificed to Jupiter and Minerva: the third day, which they called κουρεωτις, ſuch of their young men and maids as were of age were admitted into their tribes: the fourth day they called [illegible].

APATURIAN, a denomination given by Strabo to a temple conſecrated to Venus. It was built at Corocondoma, a peninſula between the Euxine ſea and the Palus Mæotis. The ſurname *deceitful*, from απατη, was given to Venus, becauſe this deity uſed artifice in the war of the gods againſt the giants.

APAULIA, in *Antiquity*, the third day of a marriage ſolemnity.

It was thus called, becauſe the bride, returning to her father's houſe, did απαυλιζεσθαι τω νυμφιω, lodge apart from the bridegroom. Some will have the apaulia to have been the ſecond day of the marriage, *viz.* that whereon the chief ceremony was performed; thus called by way of contradiſtinction from the firſt day, which was called προαυλια. On the day called απαυλια (whenever that was), the bride preſented her bridegroom with a garment called απαυλιζια.

APAUMEE', in *Heraldry*. The French heralds uſe this term to expreſs a hand open and extended, ſo that the full palm appears, as is ſeen by the hand of Ulſter, borne by the baronets of England.

APAVORTEN, in *Geography*, a pleaſant and fertile country of Aſia, in Mawaralnahra, to the eaſt of the Caſpian ſea. In this country, Arſaces, the reſtorer of the Parthian empire, built *Dara* or *Daraum*.

APE, in *Zoology*, one of the four ſections into which the numerous race comprehended under the genus, *Simia*, is divided; including ſuch as are deſtitute of a tail. The other three are *baboons*, *monkies*, and *ſapajous*; to which ſome have added a fifth, called *jagoins*. For the Linnæan generic characters and diſtribution of the genus *Simia*, ſee Simia.

It is the diſtinguiſhing character of the *apes*, that they have no tails. Beſides, their viſage is flat; the teeth, hands, fingers, feet, toes, and nails, reſemble thoſe of man; and they walk naturally erect. This diviſion includes the ſimiæ or apes, properly ſo called, of the ancients, which are not found in America. Dr. Gmelin, in his edition of the Syſtema Naturæ, refers to this diviſion the following ſpecies, *viz.* 1. S. *Troglodytes*, or Chimpanzee, which Dr. Shaw conſiders as a ſmaller variety of the Jocko, in its leſs ſhaggy or more naked ſtate. 2. S. *Satyrus*, or Oran-Otan, with the varieties, or two diſtinct ſpecies of this animal, as Dr. Shaw denominates them, the Pongo and the Jocko. 3. S *Lar*, long armed ape of Pennant, and grand Gibbon of Buffon, with the varieties of the leſſer gibbon and ſilvery gibbon. 4. S. *Sylvanus*, or Pygmy. 5. S. *Innuus*, Barbary ape, or Magot of Buffon. See the ſeveral articles.

Ape, *Sea*, in *Ichthyology*, the long tailed ſhark, a ſpecies of Squalus.

Ape, *Sea*, in *Zoology*, is alſo a name given to a very ſingular animal ſeen by Mr. Steller on the coaſt of America, and which is thus deſcribed. It was five feet long, with a head like a dog's, erect and ſharp ears, large eyes, a ſort of beard on both lips, round body, thickeſt near the head and tapering to the tail, which was bifurcated, the upper lobe the longeſt: its body was covered with thick hair, grey on the back, and red on the belly. Mr. Steller could diſcover neither feet nor paws. It was full of frolic, and played a thouſand tricks, ſometimes ſwimming on one ſide, ſometimes on the other ſide of the ſhip, and looking out with ſeeming aſtoniſhment. It would come ſo near the ſhip that it might be touched with a pole; but if any perſon ſtirred, it would immediately retire. It often raiſed one third of its body above the water, and ſtood erect for a conſiderable time; then ſuddenly darted under the ſhip, and appeared in the ſame attitude on the other ſide; and it would repeat this 30 times together. It would frequently bring up a ſea-plant, not unlike the bottle-gourd, which it would toſs about and catch again in its mouth, playing with it numberleſs fantaſtic tricks. Nat. Hiſt. of Quadrupeds, &c. vol. i. p. 573.

APECHEMA, Απεχημα, in *Surgery*, the ſame with Contrafiſſure.

APEDIA, in *Zoology*, *ſimia apedia*, little baboon, with ſhort tail, thumbs of the hands cloſe to the fingers, oblong nails on the fingers, and rounded nails on the thumbs, and hairy buttocks. This is ſaid by Linnæus to be of the ſize of a ſquirrel; but in a deſcription given in the Amoenitates Academicæ, it is ſaid to be as large as a cat. Its general colour is yelloviſh, the hairs being tipped with black; face brown, with a few ſcattered hairs; head roundiſh; ears roundiſh and naked; tail ſcarce an inch long. No bare ſpaces on each ſide. A native of India, and ſaid to be a lively ſpecies. Gmelin queries whether this animal be not a variety of the ſimia ſciurea.

APEE, in *Geography*, an iſland, one of the new Hebudes, about 20 leagues in circumference, ſituate in the South Pacific ocean. S. lat. 16° 45'. E. long. 168° 31'.

A-PEEK. See Anchor.

A-PEIBA, in *Botany*. See Aubletia.

APELCHE, or Apelscheduel, in *Geography*, a town of the United Netherlands, in the country of Frieſland, 12 leagues ſouth of Lewarden.

APELINA, in *Conchology*, a ſpecies of Tellina, figured by Chemnitz. It is oval, pellucid, colours changeable, with a white rib in each valve that extends from the hinge to the exterior margin. Gmelin. A variety (β) tellina papyracea alba ſpengleri is deſcribed by Schroet; this papyraceous white kind, is found with the other in Nicobar.

APELLA,

APELLA, among *Phyſicians*, a name given to thoſe whoſe prepuce is either wanting or ſhrunk, ſo that it can no longer cover the glans. Some have ſuppoſed that Horace uſes the word in this ſenſe, when he ſays, "Credat Judæus Apella, non ego," but Salmaſius and others maintain, that Apella was the proper name of a Jew, and not an adjective, ſignifying "circumciſed."

Apella, Simia, in *Zoology*, a ſpecies of ſimia or monkey in the claſs of ſapajous, ſai a gorge blanche of Buffon, and weeper monkey of Pennant; is the long-tailed beardleſs monkey, with prehenſile tail, brown body, black feet, and without calloſities. It is of the ſize of a very ſmall cat; face round, ſwarthy, and fleſh-coloured; general colour of the animal ferruginous brown, deepeſt on the back and outſides of the limbs; tail blackiſh, or in Schreber's figure, annulated with black and whitiſh, and well covered with hair; hands and feet duſky; nails flat and round. Shaw. It inhabits Surinam and Braſil, appears as if always weeping, and of a melancholy diſpoſition, but prone to imitation. Pennant ſuggeſts that this was one of the ſpecies of monkies which Dampier ſaw in the bay of All Saints, and which were ugly and ſmelled ſtrongly of muſk, kept in large companies, and made a great chattering, eſpecially in ſtormy weather, and reſiding in a ſpecies of tree, bearing a podded fruit, on which they feed.

APELLES, in *Biography*, the moſt famous painter of Antiquity, was born in the iſland of Cos, and flouriſhed in the time of Alexander the Great, in the fourth century. Having been inſtructed in his art by Pamphilus of Amphipolis, he diſtinguiſhed himſelf by his aſſiduity; and from this circumſtance aroſe the proverb; "No day without a line." It was his wiſh, in the exerciſe of his art, to approve himſelf even to the vulgar; accordingly when a ſhoemaker pointed out a defect in a ſhoe which he had painted, he corrected it; but when the ſame artiſan was proceeding to criticiſe the leg of his picture, he came forth from his hiding place, and reproved him in thoſe words, which are become proverbial, "ne ſutor ultra crepidam." Such was his idea of excellence, that he uſed to write under his pictures, in the imperfect tenſe, "Apelles εποιει, faciebat, and not πεποιηκε, fecit." Nevertheleſs he cenſured Protogenes for not knowing when "to take his hand from his work," an expreſſion which is become proverbial. The characteriſtic excellence of Apelles in all his performances was "grace," and in this he claimed the pre-eminence. His colouring was chaſte and ſimple; and, according to Pliny, he uſed only four colours. The varniſh with which he covered his pictures was of a peculiar kind, and ſerved to ſoften and harmonize his tints. It is recorded of him, that when he ſaw a Helen painted by one of his pupils with a profuſion of gold and jewels, he ſaid jocoſely to him; "not knowing how to make her handſome, you have made her rich." Apelles was a great favourite of Alexander, and was admitted into very intimate familiarity with him. Alexander would not allow any other painter to take his portrait; and it is related by Pliny, that when he had painted one of the moſt beautiful and beloved of his concubines, Campaſpe, naked, Alexander finding that Apelles had fallen in love with her, generouſly ſurrendered her to him. Apelles was permitted to uſe freedoms with Alexander, the reality of which has been diſputed on account of their ſingularity. When Alexander was one day in his ſhop talking very ignorantly of his art, it is ſaid that Apelles requeſted him to be ſilent, leſt the boys who ground his colours ſhould laugh at him. Apelles painted many pictures of Alexander, but the moſt famous was one, in the character of a thundering Jove, in the temple at Epheſus. The hand which held the thunderbolt ſeemed to come out of the canvas, and excite horror in thoſe who beheld it. But the moſt celebrated of all the pictures of Apelles was his "Venus Anadnomené," or riſing from the ſea, and preſſing her wet locks with her hands. The lower part of it was injured by time; but no one ventured to repair it. Another unfiniſhed Venus, of which the head and neck only were executed, was very much admired. Several of his other works were the ornaments of the temples and other edifices in which they were placed. Of the volumes which he wrote on the art, and inſcribed to one of his ſcholars, nothing is extant. Apelles was fond of ſociety, pleaſant in converſation, addicted to pleaſure, and devoted to the fair ſex. It is ſaid that the courteſan Lais was initiated by him into her profeſſion. The time and place of his death are not known. Gen. Dict.

Apelles was the name alſo of one of the ſect of Marcionites, who flouriſhed about the year 160. Tertullian and ſome others charge him with criminality in his connection with Philomene, a fanatical virgin who pretended to prophetic illuminations; but Rhodon, in Euſebius, bears teſtimony to his character, as a perſon venerable for his age and abſtemious courſe of life. Beauſobre and Lardner vindicate him from this aſperſion. Apelles, however, ſeparated from his maſter, and adopted different ſentiments. Whilſt he taught that there is one God, perfectly good, he maintained that this holy and good God, who is over all, created an inferior deity, who was a fiery being, and who made heaven and earth, and all things in this world. He alſo believed that ſouls have ſexes, or at leaſt that bodies derived their ſexes from the ſouls that animated them. Concerning Chriſt, he taught that he aſſumed fleſh, not from the Virgin Mary, but that he formed for himſelf a body out of the four elements; and believing the reality of his crucifixion and reſurrection, it was his opinion, that when Chriſt aſcended, he ſurrendered his body to the elements from which he took it, and returned to heaven. Theſe peculiarities of Apelles are aſcribed to his conferences with Philomene. As he rejected Moſes and the ancient prophets, he maintained that Jeſus was the only perſon who ever came from God. He alſo denied the reſurrection of the body. In other matters he generally agreed with Marcion, and concurred with him in condemning marriage. As to his opinion concerning the ſcriptures of the Old Teſtament, it appears by his writings, as they are cited by Euſebius, Origen and others, that if he did not abſolutely reject the Old Teſtament, he charged upon it contrarieties and contradictions, and he laboured to evince the difficulties that occur in it, if not totally to overthrow its authority. His ſentiments concerning the New Teſtament were probably not different from thoſe of Marcion; as he denied the miraculous conception of Chriſt, it is likely that he rejected at leaſt the beginning of the goſpels of St. Matthew and St. Luke. It appears, upon the whole, that he treated the ſcriptures as Marcion did, by receiving part, and rejecting what did not ſuit his purpoſe. And to this purpoſe Epiphanius accuſes him with acting, in this reſpect, like a judge, and not like an interpreter of ſcripture. None of Apelles's writings are preſerved, and therefore we muſt depend altogether upon the report of others with regard to his ſentiments. Lardner's Works, vol. ix. p. 437—448. Cave's Hiſt. Lit. tom. i. p. 85.

Apelles, in *Entomology*, a ſpecies of scarabæus, found at the Cape of Good Hope. The head is furniſhed with a very ſhort horn; and the wing-caſes are cinereous, with elevated black dots. Fabricius, and Gmelin. This is a ſmall inſect: the legs are yellow and ſpotted with black.

Apelles is alſo a ſpecies of Hesperia *rurales*, in the Fabrician ſyſtem. (Ent. Syſt.) The wings are dentated, fulvous, border brown. Underſide of the poſterior pair marked with rufous ſilvery-marginated bands. Inhabits New Holland. Obſ. In the Linnæan ſyſtem, this is one of the Papilio *Pilæ rurel.*

APELLICON, in *Biography*, a peripatetic, was a native of Teos, and lived about 90 years before Chriſt. He was extremely rich and avaricious; but his peculiar propenſity led him to expend his wealth in the purchaſe of books. This propenſity he indulged to ſuch a degree, that his collection conſiſted of all the moſt ſcarce and valuable books that could be purchaſed or procured by any means, however illicit and diſhonourable. Amongſt other literary treaſures, he at length obtained poſſeſſion of the libraries of Ariſtotle and Theophraſtus. Theſe libraries had paſſed, by bequeſt, into the hands of Neleus of Scepſis, and from him they deſcended to his heirs. When they were informed that the king of Pergamus, to whoſe juriſdiction Scepſis was ſubject, eagerly ſought after books, they buried their collection in a cavern, where they lay for more than 100 years, and ſuffered great damage. Apellicon diſcovered this treaſure, and purchaſed it at a great price. Upon removing his library to Athens, he cauſed the writings of Ariſtotle and Theophraſtus to be copied; but the chaſms occaſioned by the depredation of time were ſupplied by the tranſcribers, ſo that though the copies were made from the originals, they were of courſe in many reſpects erroneous and faulty. After Apellicon's death, Sylla ſeized on all his books, and took them with him to Rome to enrich his own library, and hence erroneous tranſcripts were communicated to the world. Apellicon himſelf was more pleaſed with having the poſſeſſion of valuable books than with the peruſal and ſtudy of them; ſo that Strabo juſtly calls him a lover of books rather than a lover of wiſdom; φιλοβιβλος μαλλον η φιλοσοφος. Strabo Geog. lib. xiii. tom. ii p. 906, &c.

APELLITÆ, in the *Primitive Church*, denote thoſe who taught in the ſecond century, that Chriſt left his body diſſolved in the air; and ſo aſcended into heaven without it. See Apelles.

APENE, απηνη, *chariot*, in *Antiquity*, a kind of chariot wherein the images of the gods were carried in proceſſion on certain days, attended with a ſolemn pomp, ſongs, hymns, dancing, &c.

The *apene*, or ſacred chariot of the Greeks, is called *tenſa*.

It was very rich, made ſometimes of ivory, or of ſilver itſelf, and variouſly decorated.

APENNAGE. See Apanage.

APENNINES, in *Geography*, a chain of mountains or hills of Italy, extending from the Alps to the ſouthern extremity of the kingdom of Naples. At firſt they are a branch of the Alps, which ſeparates the plains of Piedmont from the ſea; ſo that they commence near Ormea, in the high ridge which now forms the boundary of the French department of the Maritime Alps, and ſtretch without interruption along both ſides of the gulf of Genoa, at no great diſtance from the ſea, giving ſource to many rivers that flow to the eaſt. In the ſouth of the former teritory of Modena, after giving riſe to the Panaro, and Reno, they proceed almoſt due eaſt to the centre of Italy, where they afford ſources to the Arno and the Tiber, and thence paſs ſouth-eaſt to the extremities of Italy, generally approaching nearer to the Adriatic than to the Mediterranean. Theſe mountains conſiſt, to the ſouth of Bologna, of ſtratified grey hard limeſtone, with a few petrifactions. Yet in the Genoeſe territory and Tuſcany, appear not only the beautiful marble of Carrara, but rich ſerpentine, here called Gabbro, with ſteatite and aſbeſtos. Granitone, conſiſting of white felſpar and green mica, is alſo found here. Among the animals of the Apennines we may reckon the marmot and the ibex. Pinkerton's Geog. vol. i. p. 631. The Apennines derive their name from Alpen, a Celtic word, ſignifying a high mountain.

APENNIS, in *Ancient Law*, a deed or inſtrument made in favour of a perſon, who has loſt the title-deeds to his houſe or land by fire. Du-Cange.

In ſuch caſe, an aſſembly of the people of the neighbourhood being called, and an exact inquiry made before the judge, another inſtrument was framed to confirm and ſecure the unhappy perſon's right.

APENRADE, in *Geography*, a ſea port town of Denmark, in the duchy of Sleſwick, ſituate at the bottom of a bay in the Baltic ſea, ſurrounded with hills, which form a harbour, both deep and ſecure. The inhabitants are much employed in fiſhing, and it is beſides a place of conſiderable trade. N. lat. 54° 52′. E. long. 10° 7′.

APEPSY, in *Medicine*, denotes crudity, or a want of digeſtion.

The word is formed from the privative particle α, and πεπτω, *I concoct.*

Apepſia may be defined a defect in the ſtomach, which prevents the aliment taken in from affording a proper chyle for ſupplying the blood and nouriſhing the body. Abſtemiouſneſs and exceſs are alike cauſes of indigeſtion. The method of treatment in the *apepſy* is the ſame as in the *anorexy*. The columbo root is particularly uſeful, when the ſtomach is languid, and digeſtion difficult, &c. It may be given in ſubſtance with any grateful aromatic, or in Madeira wine, now and then interpoſing gentle doſes of rhubarb in tincture. A mixture of muſtard-ſeed with the *columbo* root is of great utility in caſes of this nature, where acidity and flatulence prevail much in the *primæ viæ*. See Percival's Eſſays, &c.

APER, Marcus, in *Biography*, a Roman orator in the firſt century, was a native of Gaul, who diſtinguiſhed himſelf by his genius and eloquence, and occupied ſeveral important poſts in the empire. He was probably the author of the dialogue "On the Corruption of Eloquence," ſometimes aſcribed to Tacitus or Quinctilian, and placed at the end of their works. He died at Rome about the year 85. Gen. Biog.

Aper, in *Zoology*, a name given to ſeveral ſpecies of the Sus; as the variety *ferus* of the *ſus ſcrofa*, the *ſus tajaſſu*, the *ſus æthiopicus*, and the *ſus babyruſſa*. See theſe articles, and Boar, and Hog.

Aper, in *Ichthyology*, a ſpecies of Zeus that inhabits the ſeas about Rome and Genoa. The tail is even, and the body reddiſh. Linn. and Gmel. Some deſcribe it as having the tail even, body entirely red or reddiſh, and the beak reflected.

APERÆ, in *Ancient Geography*, a town of Lycia, which became an epiſcopal ſee.

APERANTES, a people who inhabited *Aperantia*, which was a diſtrict of Theſſaly, ſituate towards the ſouth-weſt, and abounding with mountains, in which was the ſource of the river Achelous.

APEREA, in *Zoology*, a ſpecies of Cavia or Cavy, having no tail, and the upper parts of the body being of a reddiſh aſh-colour. This is the cuniculus braſilienſis, having

A P E

no tail, &c. of Briſſon and Ray; the aperea of the Braſilians, ſo called by Marcgrave, &c.; the cuniculus indicus femina of Aldrovand. This animal inhabits Brazil, in the holes of the rocks, from which it is driven out and taken by little dogs; the colour of the upper part of the body reſembles that of the hare; its belly is white; the upper lip divided; the ears ſhort and rounded like thoſe of a rat. It moves like the hare, the fore legs being ſhorter than the hind; it has four toes with ſhort ſmall claws on the fore feet, which are black and naked, and only three on the hind, of which the middle is the longeſt; its length is about 12 inches; its fleſh is like that of the rabbit, but reckoned of a ſuperior flavour; and its manner of living is alſo very ſimilar. There is a variety, which is the rock cavy of Pennant, of a black colour, mottled with tawny on the back, belly and throat white. It is exactly ſimilar in every reſpect, except in colour, to the former. The animal called *cori* by Oviedo, Charlevoix, &c. is thought by Buffon to be the ſame with the aperea. There are many varieties of the cori with reſpect to colour; and they are found in various parts of the Weſt Indies, and on the continent of America.

APERIENS *Os*, in *Anatomy*, a name given by ſome writers to a muſcle of the mouth, called by Albinus *biventer maxillæ inferioris*, and by others DIGASTRICUS.

APERIENS *palpebram rectus*, is a name that has been given to the muſcle more commonly called LEVATOR *Palpebræ*.

APERIENTS, or APERITIVE *medicines*, from *aperio, I open*, are ſuch as are ſuited to open obſtructed paſſages; and particularly to reſtore ſuppreſſed excretions or evacuations; and the term is moſt commonly applied to thoſe that are adapted to open the veſſels of the uterus, and thereby to excite the retained, or to reſtore the ſuppreſſed, menſtrual flux. The term, however, as variouſly employed, both with reſpect to different caſes and to different modes of operation, is, without ſpecifying the particular caſe and operations, extremely improper. Cullen's Mat. Med. vol. i. p. 171. The term aperients in its preſent uſe is ſynonymous with *laxatives* or *purgatives*, which ſee.

APERISTATON, from *α*, *without*, and *περιστασις*, *unfavourable circumſtance*, in the *Ancient Phyſic*, denotes an ulcer of a mild or benign kind, and not attended with any ſevere ſymptom.

APEROPIA, in *Ancient Geography*, a ſmall iſland of the Ægean ſea, oppoſite to the promontory of Buporthmos in the Argolide. It was ſo called by Pliny.

APERTIONS, in *Architecture*, are the openings in a building; as doors, windows, ſtair-caſes, chimneys, outlets and inlets for light, ſmoke, &c.

The apertions ſhould be as few as may be; it being a rule, that all openings are weakenings: and they ſhould not approach too near the angles of the walls.

APERTO, *Ital.* in *Muſic*, open, oppoſed to *Chiuſo*, cloſe.

APERTOR *oculi*, in *Anatomy*, a name given by Spigelius and others to the muſcle called the APERIENS *palpebram*, and LEVATOR *palpebræ ſuperioris* by others.

APERTURE, the opening of any thing; or hole, cleft, or vacant place, in ſome otherwiſe ſolid or continuous ſubject. It comes from *aperire, to open*.

In *Geometry*, *aperture* is uſed for the ſpace left between two lines, which mutually incline towards each other to form an angle.

In *Optics*, *aperture* is the hole next the object-glaſs of a teleſcope or microſcope, through which the light and image of the object come into the tube, and are thence carried to the eye.

APERTURE is alſo underſtood of that part of the object-glaſs itſelf which covers the former, and which is left pervious to the rays. See TELESCOPE.

A great deal depends on having a juſt aperture. To find it experimentally, apply ſeveral circles of black ſmutted paper, each bigger than the other, upon the face of the glaſs, from the breadth of a ſtraw to ſuch as leave only a ſmall hole in the glaſs; and with each of theſe ſeparately view ſeveral diſtinct objects, as the moon, ſtars, &c.; that through which they appear the moſt diſtinctly is to be choſen.

M. Auzout affirms, that he found that the apertures of teleſcopes ought to be nearly in the ſubduplicate ratio of their lengths: but Huygens, who firſt found that the uſe of apertures conduced very much to one perfection of teleſcopes, aſſures us he found by experience, that the aperture of an object-glaſs, e. gr. of 30 feet, is to be determined by this proportion; as 30 to 3, that is, as 10 to 1, ſo is the ſquare root of the diſtance of the focus of any glaſs multiplied by 30, to its proper aperture; and the focal diſtances of the eye-glaſſes are to be proportional to the apertures. A table of apertures for teleſcopes of various lengths, &c. ſee under the article TELESCOPE.

The greater or leſs aperture of an object-glaſs, it is to be noted, does not increaſe or diminiſh the viſible area of the object; all that is effected by this is, the admittance of more or fewer rays, and, conſequently, the more bright or obſcure appearance of the object; but the largeneſs of the aperture or focal diſtance cauſes the irregularity of its refractions. See ABERRATION.

Hence in viewing Venus through a teleſcope, a much leſs aperture is to be uſed than for the Moon, Jupiter, or Saturn, becauſe her light is ſo vivid and glaring. This circumſtance does a little invalidate and diſturb M. Auzout's proportion, as is ſhewn by Dr. Hook. Phil. Tranſ. N° 4.

APERTURA *tabularum*, in *Ancient Law Books*, ſignifies the breaking open a laſt WILL and TESTAMENT.

APERTURA *feudi* denotes the loſs of a feudal tenure, by default of iſſue to him to whom the feud or FEE was firſt granted.

APESAS, or APESANTUS, in *Ancient Geography*, a mountain of Peloponneſus, in the territory of Nemea.

APETALOUS, or APETALOSE *plants*, are ſuch as are without, or have an imperfect or ſtamineous flower. They are ſo called becauſe they are deſtitute of thoſe tender fugacious coloured leaves, called *petals*; but conſiſt only of a calyx or cup, and of ſtamina, or capillaments, or ſtyles. Phil. Tranſ. N° 186.

The word comes from the privative particle *α*, and *πεταλον*, *folium, a leaf*.

The apetalous kind is ſubdivided by Ray, 1. Into ſuch whoſe fruits are not contiguous to their flowers; as in hops, hemp, nettles, ſpinach, mercury, *palma Chriſti*, the American phyſic-nut, &c. 2. Such as have a triquetrous or triangular ſeed, as the docks, ſorrels, arſmarts, knot-graſs, ſnake-weeds. 3. Thoſe which have round, compreſſed, and otherwiſe figured ſeeds, as the pond-weeds, oraches, ſea purſlane, the blites, the amaranthi, the beets, ſome kalies, &c.

APETNA, in *Ancient Geography*, a town of Bœtica, near Corduba.

APETOUS, or APETUBES, in *Geography*, a people of South America, in Braſil, occupying the parts in the vicinity of the government of Puerto Saguro.

APEUCTIC, from *απευχομαι*, *I deprecate*, in the *Ancient Poetry*,

Poetry, denotes a kind of poem or prayer preferred to God for averting ſome evil.

In which ſenſe *apotheum* ſtands contradiſtinguiſhed from *profectitium carmen*, which begs for ſome good, e. gr. *di prohibete minas, dii talem avertite caſum, et placidi ſervate ſoos.*

APEX, the vertex or ſummit of any thing.

APEX is peculiarly uſed in *Antiquity*, for a kind of conical cap or covering of the head, wore by the flamens or prieſts of Jupiter; and alſo by the Salii, or prieſts of Mars. This was otherwiſe denominated *filum apicis ficus*, or *albanus*.

The apex is deſcribed as a ſtitched cap in form of a helmet, with the addition of a little ſtick fixed on the top, and wound about with white wool.

The ordinary flamens only wore the apex in the time of performing divine ſervice; the flamen dialis always wore it out of doors; for within it was allowed him to be bareheaded. See APICULUM.

APEX was alſo uſed among the Romans for the creſt of a helmet.

APEX, in *Botany*, denotes the point, end, or termination of a leaf, &c. Leaves, with reſpect to their apices, are called *truncate*, or lopped, when they end in a tranſverſe line; *præmorſe*, or bitten in the fore-part, when they are very obtuſe, and are terminated by unequal notches or inciſions; *retuſe*, or blunted, when they terminate in an obtuſe ſinus; *emarginate*, or nicked, when they terminate in a notch; *obtuſe*, or blunt, when they terminate as it were within a ſegment of a circle; *acute*, or ſharp, when they terminate in an acute angle; *acuminate*, or pointed, when they terminate in a ſubulate apex; and *cirrhoſe*, or claſpered, when they terminate in a claſper or tendril. See LEAF.

APEX is alſo uſed, by *Grammarians*, for a long accent or mark, to denote that a ſyllable is to be pronounced long. Quinctilian condemns the practice of putting the apex on all long ſyllables; yet in ſome caſes he allows the apex neceſſary, e. gr. where the different lengths of a ſyllable diſtinguiſh the different ſenſes of a word, as in *malus*, which, as long or ſhort, denotes an *ill man*, or an *apple tree*. See ACCENT.

APHACA, in *Botany*. See LATHYRUS.

APHACA, in *Ancient Geography*, a town of Syria, between Heliopolis and Biblos, near mount Lebanon. Zoſimus (lib. i. c. 58.) informs us, that in this town was a temple of Venus called *Aphacitis*; and near the temple there was a lake, in which the gifts that were preſented to the goddeſs, however light in themſelves, ſunk to the bottom, if acceptable; but if diſpleaſing, they floated, however heavy, on the ſurface of the water. Euſebius (in Vit. Conſt. lib. iii.. c. 55.) ſtyles his temple a ſchool of wickedneſs, in which men proſtituted themſelves like women, in order to render the goddeſs propitious by their infamy. The temple was raſed to the ground by Conſtantine the Great, and all its ſtatues deſtroyed. The name is of Syriac origin, and denotes *embrace*, or *ſalute*: and hence this Venus was denominated "The Goddeſs of embraces."

APHÆREMA, one of the three toparchies added to Judæa by the kings of Syria.

APHÆRESIS, from ἀφαιρέω, *I take away*, in *Grammar*, a figure whereby ſomething is taken away from the beginning of a word.

Thus *ciconia*, by aphæreſis, is written *conia*; *contemnere*, *temnere*; *omittere*, *mittere*, &c.

A like retrenchment at the end of a word is called *apocope*.

APHÆRESIS, in *Medicine*, denotes a neceſſary taking away or removing of ſomething that is noxious.

In *Surgery*, it ſignifies an operation whereby ſomething ſuperfluous is taken away.

APHANES (Aφανής, *not apparent* from its diminutive ſize), in *Botany*, parſley-piert. Linn. Gen. 166. Schreb. 223. Juſſ. 337. Claſs, *tetrandria digynia*, or *monandria monogynia*; natural order, *ſenticoſæ*; *roſaceæ* of Juſſieu.

Generic Character. *Calyx*, perianth one-leafed, tubular, permanent; mouth flat, eight-parted; *corolla* none; *ſtamina*, filaments four, or one, erect, ſubulate, very ſmall, placed at the mouth of the calyx; authers roundiſh, or one twin; *piſtillum*, germ ovate; *ſtyle* filiform, inſerted into the baſe of the germen; *ſtigma* headed; *perianthium* none; *ſeeds* ovate, acuminate, compreſſed, contained in the bottom of the calyx. This plant is by Dr. Smith removed to the genus *alchemilla*. Flor. Brit. vol. i. 190. 1. A. *arvenſis*, parſley-piert. Hudſ. Ang. 72. With. 143. Flor. Dan. 973. A ſmall annual plant, with ſpreading branched leafy ſtems; leaves alternate, petiolate, palmato-tripartite, crenate and indented, hairy; calyx eight-toothed, alternately very minute; ſeeds one or two; it is a common Britiſh plant, growing in fallow fields. In moſt of the old Herbals, it is called parſley break-ſtone, from its ſuppoſed lithontriptic qualities.

APHAR, in *Ancient Geography*, the metropolis of Arabia Felix, ſituate near a bay on the ſea-ſhore, and not far north from the Promontorium Aromatum. Aphar, according to ſome authors, was the capital of the Homerites, where the king kept his court. In the Notitia Imperii, Aphar is a river. This place, now called *Al-Fara*, is ſituated on a river between Mecca and Medina.

APHARA, or APHERA, a town of Paleſtine, in the tribe of Benjamin.

APHARANTES, a people of Libya, who had no fixed habitation.

APHARSATHKITES, a people who were transferred together with the *Apharſites* into Samaria, by Eſarhaddon, king of the Aſſyrians, and who oppoſed the Jews in rebuilding their temple. Ezra, iv. 9.

APHAS, called by D'Anville *Avas*, a river of Epirus, which ran from north to ſouth in the eaſtern part of the country, and diſcharged itſelf into the Ambracian gulf, at ſome diſtance to the eaſt of the Araćthus.

APHASIA, from α, and φημι, *I ſpeak*, in the *Sceptic Philoſophy*, denotes a ſtate of doubt, wherein a perſon not knowing what to determine on, it is beſt for him to be ſilent. In this ſenſe *aphaſia* ſtands oppoſed to *phaſis*, under which are included both aſſertion and negation.

APHEA, in *Mythology*, a goddeſs worſhipped by the Eginetæ and Cretans. Pindar wrote an ode in honour of her, and ſhe had a temple in the iſland of Crete. The Cretans confounded her with Diana.

APHEK, in *Scripture Geography*, a name given to ſeveral cities. 1. Aphek in the tribe of Judah, was the place where the Philiſtines encamped, when the ark was brought from Shiloh, which they had taken in battle. 1 Sam. iv. 1, 2, 3, &c. 2. Aphek in the valley of Jezreel, where the Philiſtines encamped, while Saul and his army were near Jezreel, on the mountains of Gilboa. 1 Sam. xxix. 1, &c. 3. Aphek, a city belonging to the tribe of Aſher, near the country of the Sidonians. Joſh. xix. 30. xiii. 4. This was probably the ſame with Aphek of Syria, in Benhadad's kingdom, near which the Syrians were defeated in a battle between Ahab and Benhadad. 1 Kings, xx. 26, &c. It was, perhaps, the APHACA near Lebanon.

APHELIA,

APHELIA, from ἀφελης, *ſimple*, in *Rhetoric*, is uſed to denote ſimplicity of DICTION.

APHELION, from ἀπο, *from*, and ἡλιος, *ſun*, in *Aſtronomy*, that point of the earth's or any planet's orbit, in which it is at the greateſt diſtance from the ſun.

Thus, a planet being in A (*Plate* I. *Aſtron. fig.* 9.) its utmoſt diſtance from the ſun S, at the extremity of the greater or tranſverſe axis of the elliptic orbit, is ſaid to be in its aphelion. In the ſyſtem or ſuppoſition of the ſun's moving round the earth, the point in which he appears when the planet is in its aphelion, is called *apogee*. The aphelion ſtands oppoſed to the perihelion.

The times of the aphelia of the primary planets may be known by their diameters appearing the ſmalleſt, and by their moving with the leaſt velocity in a given time. Methods for calculating them, with the reſults of the computations, have been given by many aſtronomers; ſuch as Riccioli, Almag. Nov. lib. vii. § 2 and 3.; Wolfius, Elem. Aſtron. § 659; Dr. Halley, Phil. Tranſ. N° 128; ſir Iſaac Newton, Princip. lib. iii. prop. 14; Dr. Gregory, Aſtron. lib. iii. prop. 14; Keill's Introd. to Aſtron. lect. xxii–xxiv. De la Lande, Mem. de l'Acad. 1755, 1757, and 1766; and Aſtron. lib. xxii.: and alſo in the writings of M. Euler, M. D' Alembert, M. Clairaut, &c. upon Attraction. See alſo Vince's Aſtron. vol. i. p. 130, &c.; and the article PLANET in this Dictionary. The places of the aphelia are ſtated by different authors as in the following tables.

For the Year 1700, *according to* KEPLER *and* DE LA HIRE.

PLANETS.	KEPLER.	DE LA HIRE.
Mercury	♑ 8°. 25′. 30″	13°. 3′. 40″
Venus	♒ 3. 24. 27	6. 56. 10
Earth	♋ 8. 25. 30	* * *
Mars	♏ 0. 51. 29	0. 35. 25
Jupiter	♎ 8. 10. 40	10. 17. 14
Saturn	♐ 28. 3. 48	29. 14. 41

Place of the Aphelia for the Beginning of 1750.

PLANETS.	M. CASSINI.	DR. HALLEY.	M. DE LA LANDE.
Mercury	8ˢ. 13°. 41′. 18″	8ˢ. 13°. 27′. 12″	8ˢ. 13°. 33′. 58″
Venus	10. 7. 38. 0	10. 7. 18. 31	10. 7. 46. 42
Earth	3. 8. 27. 23	3. 8. 28. 43	3. 8. 37. 16
Mars	5. 1. 36. 9	5. 1. 31. 38	5. 1. 28. 14
Jupiter	6. 10. 14. 33	6. 10. 33. 46	6. 10. 21. 4
Saturn	8. 29. 13. 31	8. 29. 39. 58	8. 28. 9. 7

N. B. The place of the aphelion of Herſchel, or Georgium Sidus, in 1788, was 11ˢ. 16°. 19′. 30″; and in 1790, 11ˢ. 3°. 29′. 42″.

Kepler makes the earth's apogee to have coincided with the equinoctial point ♈, on July 24, in the year 3993 before the Chriſtian æra, which, according to ſome authors, is about the time of the creation. At the ſame time, he makes the aphelion of Saturn to be ♐ 24°. 28′. 0″; of Jupiter ♋ 23°. 34′. 18″.; of Mars ♐ 15°; of Venus ♎ 0°. 0′. 0″; of Mercury ♋ 0°. 0′. 0″; and the apogee of the Moon ♎ 0°. 0′. 0″.

None of the aphelia of the planets are at reſt; for their mutual actions upon one another keep thoſe points of their orbits in a continual motion; and this is greater or leſs in the different planets. The courſe of this motion is in conſequentia, or according to the order of the ſigns; and ſir Iſaac Newton ſhews, that it is in the ſeſquiplicate ratio of the reſpective diſtances of the planets from the ſun, or as the ſquare root of the cube of the diſtances. This motion, ariſing from their mutual attraction, is aſcertained by comparing the places ſettled by the ancient and modern obſervations; or by comparing the length of an anomaliſtic with that of a tropical or ſidereal revolution.

To find the Motion of the Earth's Apogee. Hipparchus, 140 years before Chriſt, determined its place to be 2ˢ. 5½°; and by the obſervations of Waltherus, in 1496, it was found to be 3ˢ. 3°. 57′. 57″; whence the motion of the apogee is 1′. 2¾″ in a year, with reſpect to the equinoctial points. M. de la Caille determined the place of the apogee for the beginning of the year 1749, to be 3ˢ. 8°. 39′; which compared with the obſervation of Waltherus, gives 1′. 6″ for the yearly motion. In the year 1588, Tycho determined the place of the apogee to be 3ˢ. 5°. 30′; and Kepler, in the ſame year, determined its place to be 3ˢ. 5°. 32′. Theſe compared with the obſervation of Caſſini, in the year 1738, who determined its place to be then in 3ˢ. 8°. 19′. 8″, give about 1′. 7″ for the annual motion. M. de la Caille determined the length of the anomaliſtic year to be 26′. 35″ longer than the tropical year, which makes the motion of the apogee to be 1′. 5″,5 in a year. Kepler made it 1′. 2″; Ricciolus 1′. 2″. 4‴. 4⁗. in a year. Mayer in his Tables makes it 1′. 6″. Dr. Halley makes it 1′. 1″; and Caſſini about 1′. 1″,25. M. de la Lande, in his Tables, makes it 1′. 2″ as computed by M. de Lambre, from Dr. Maſkelyne's obſervations in 1788; and this determination is moſt to be depended upon, as made by ſo eminent an aſtronomer, from obſervations

which are acknowledged to be the beſt that have been ever made. Theſe motions are in reſpect to the equinox. If we aſſume it to be 1′. 2″, and the preceſſion of the equinoxes to be 50¼″, we ſhall have the real motion of the apogee 11¾″ in a year.

To determine the Motion of the Aphelion of Saturn. The place of the aphelion, in 1694, was 8ſ. 28°. 58′; but from three oppoſitions obſerved in the years 127, 133, and 136, its place for the year 132 was 7ſ. 24°. 14′. 20″, which makes the annual motion 1′. 20″. Tycho found the place of the aphelion on December 19, 1590, to be 8ſ. 25°. 40′. 51″, which compared with the obſervation in 132, gives 1′. 18″,5 for the annual motion. The ſame obſervation of Tycho compared with the place of the perihelion on December 12, 1708, in 8ſ. 28°. 25′. 10″, gives 1′. 23″,5 for the annual motion. If the ſame obſervation of Tycho be compared with the place of the aphelion in April 1694, in 8ſ. 28°. 58′, it gives 1′. 55″ for the annual motion. Caſſini conjectured from all this, that the motion of the aphelion was quicker now than formerly. He alſo found the perihelion, in 1708, not ſo forward by a degree as it ought, when compared with the place of the aphelion in 1691, at the annual movement of 1′. 20″; from whence he ſuſpected that the orbit had a librating motion, and that there ought to be an equation employed between the two points. The irregularities of Saturn, however, are ſo great, that we need not wonder at theſe differences. Kepler makes it 1′. 16″; Caſſini ſuppoſes it to be 1′. 18″; and Dr. Halley 1′. 20″. M. de la Grange, from calculating the diſturbing force of each planet upon the other, has determined the annual motion of the aphelion to be 1′. 6″,3. M. de la Place makes it 1′. 6″,07, which M. de la Lande has employed in his Tables.

To determine the Motion of Jupiter's Aphelion. According to the obſervations of Ptolemy, the aphelion was in ♍ 14°. 38′ in the year 136; but in 1720 it was in ♎ 9°. 47′; this gives 57″. 11‴ for the annual motion. In the year 1590, the place of the aphelion, calculated from the obſervations of Tycho, was found to be in ♎ 6°. 30′. 43″; this compared with the obſervation in 1720, gives 1′. 30″ for the annual motion. If we compare the places in 136, and 1590, they give 54″ for the annual motion. This induced Caſſini to think, that the motion of the aphelion is accelerated; or that it was ſubject to ſome irregularities; he ſtates the motion at 57″. 24‴; Kepler makes it 47″; Dr. Halley makes it 72″; M. Jeaurat computed the place of the aphelion in 1590 to be ♎ 7°. 49′. 19″, and in 1762 in ♎ 10°. 36′. 41″; from which he found the annual motion to be 58″,4. Euler, from the theory of attraction, found it to be 55″; M. de la Grange, 57″,2. M. Wargentin ſays, that an annual motion of 62″ beſt agrees with obſervation. M. de la Lande has employed 56″,73 in his laſt Tables, according to the theoretical determination of M. de la Place.

To determine the Motion of the Aphelion of Mars. From three oppoſitions determined by Ptolemy, the place of the aphelion in 135 was found to be 3ſ. 29°. 24′; and by the obſervations made at Greenwich in 1691, 1696, and in 1700, the place was found to be in 5ſ. 0°. 31′. 34″ in 1696; hence the annual motion of the aphelion is 1′. 11″. 47‴. 20⁗; Kepler makes it 1′. 7″; Dr. Halley makes it 1′. 12″. From comparing the place, in 1748, in 5ſ. 1°. 26′. 10″, with the place in 1592 in 4ſ. 28°. 49′. 50″, the motion is 1′. The mean of theſe determinations is 1′. 7″,5. M. de la Lande ſuppoſes it to be 1′. 7″.

To determine the Motion of the Aphelion of Venus. Caſſini has found, from computing the place of the aphelion from the ancient obſervations, a difference of 15°, from which uncertainty it is more difficult to determine its annual motion. However, the place, computed from the obſervations in 136, 138, and 140 (and which he thinks are the moſt to be depended upon), was found, in 138, to be in ♐ 21°. 29′; this compared with the obſervations in 1715, 1716, and 1718, when it was found to be in ♒ 6°. 50′ in 1716, the annual motion is found to be 1′. 42″. 50‴. From comparing the place in 1596 in ♒ 1°. 54′ with the place in 1716 in ♒ 6°. 50′, the motion is 2′. 28″. Horrox fixed the place of the aphelion in 1639 in ♒ 5°; this compared with the place in 1716, gives 1′. 26″ for the motion. By comparing the place of the aphelion in the firſt Tables of M. de la Lande with the place in Kepler's Tables, the annual motion comes out 2′. 41″,5; Caſſini makes it 1′. 26″; and Dr. Halley 56″,5. Kepler makes it 1′. 18″. Amidſt ſo much uncertainty, M. de la Lande thinks it better to depend upon the theory which, according to M. de la Grange, makes it 48″,5, and which M. de la Lande employs in his Tables. On account of the ſmall eccentricity, this uncertainty of the place of the aphelion is not of ſo much conſequence, as an error of 1° in the place of the aphelion will never produce an error of 1′ in the heliocentric longitude.

To determine the Motion of the Aphelion of Mercury. From the obſervations of the paſſages of Mercury over the ſun in 1661, 1690, and 1697, Caſſini determined the place of the aphelion on November 9, 1690, to be in 8ſ. 12°. 22′. 25″; and upon ſuppoſition that the motion of the aphelion was 1′. 20″ in a year, he found that it repreſented the paſſages very well in 1631, 1672, 1723, and 1736. But as theſe paſſages were nearly at the ſame point of the orbit, it does not ſufficiently eſtabliſh 1′. 20″ to be the true motion, as it might anſwer to the ſame points nearly, but not to other parts of the orbit. We ought not therefore to be ſurpriſed, ſays M. de la Lande, that a motion of 52″,5 by Dr. Halley anſwers equally well to the ſame obſervations. Kepler makes it 1′. 45″. M. de la Lande found, by the greateſt equation, that on May 6, 1753, the place of the aphelion was 8ſ. 13°. 55′. From comparing this place with the place computed from eight obſervations of Ptolemy (rejecting ſix others, two of which did not appear to be reconcileable with each other, and four were too near the aphelion), he found the motion to be 1′. 10″ in a year, which he conſtructed his firſt Tables upon; obſerving, however, at the ſame time, that this motion does not agree perfectly with the obſervations in this century. He has ſince found that a motion of 56″,25 will beſt agree with obſervation; and this he has aſſumed in his laſt Tables. M. de la Grange makes it 57″ by theory. The motions of the aphelia here determined are their motions in longitude; if therefore we ſubtract 50″,25 (the annual preceſſion of the equinoxes) from each, we ſhall get their real motions.

Motion of the Aphelia in One Hundred Years.

Planets.	M. Cassini.	Dr. Halley.	M. de la Lande.
Mercury	2°. 13′. 20″	1°. 27′. 37″	1°. 33′. 45″
Venus	2. 23. 20	1. 34. 13	1. 21. 0
Earth	1. 42. 55	1. 41. 7	1. 43. 35
Mars	1. 59. 38	1. 56. 40	1. 51. 40
Jupiter	1. 35. 42	2. 0. 0	1. 34. 33
Saturn	2. 9. 44	2. 13. 20	1. 50. 7

According to the calculations of M. de la Grange, the aphelion of the Georgian planet is progreſſive 3″,17 in a year, from the action of Jupiter and Saturn; conſequently its motion in longitude is 50″,25 + 3″,17 = 53″,42. He has alſo calculated the effect of each planet in diſturbing the aphelia of the reſt. The following table contains the annual effect.

Annual Motion of the Aphelia.

. . .	Mercury.	Venus.	Earth.	Mars.	Jupiter.	Saturn.
By Mercury	. . .	— 4″,30	— 0″,42	0″,02	0″,00	0″,00
— Venus	4″,14	. . .	+ 5,20	0,70	0,01	0,00
— Earth	0,84	— 5,06	. . .	1,92	0,01	0,00
— Mars	0,04	+ 1,18	+ 1,54	. . .	0,00	0,00
— Jupiter	1,56	+ 6,38	+ 6,79	12,31	. . .	15,99
— Saturn	0,08	+ 0,08	+ 0,19	0,70	6,56	. . .
Real motion	6,66	— 1,72	13,30	15,65	6,58	15,99
Preceſſion	50,25	50,25	50,25	50,25	50,25	50,25
Mot. in long.	56,91	48,53	63,55	65,90	56,83	66,24

M. de la Grange here ſuppoſes, as before, the denſity of Venus to be 1,31, but M. de la Lande makes it only 0,95; for this denſity, therefore, the ſecond horizontal line muſt be diminiſhed in the ratio of 1,31 to 0,95. See Vince's Aſtronomy, vol. 1. c. 14.

APHELLAN, the name of a bright ſtar in the conſtellation Gemini, marked *α*.

APHERNOUSLI, in *Botany*, a ſpecies of pine growing wild on the Alps. The timber is large, and the planks made of it are of a finer grain, and more beautifully variegated than deal; and may therefore be applied to many uſes. It grows in bleak and barren ground, and moſt reſembles that which is called in England the Weymouth pine.

APHES Domin, in *Scripture Geography*, a place of Paleſtine in the tribe of Juda, between Socho and Azecha, where the Philiſtines were encamped whilſt Goliath inſulted the Iſraelites.

APHESIS, from *αφιημι*, *I remit*, in the *Athenian Laws*, was applied to the caſe of a perſon deeply indebted, who deſired the people to remit part of the debt, on account of his diſability to make payment.

Voetius has a diſſertation expreſs on the words *apheſis* and *pareſis*, and their difference.

APHETERIA, in the *Ancient Military Art*, a kind of engines uſed in the beſieging of towns.

Suidas does not mention their particular form or ſtructure. Aquinus takes them to have been of the projectile kind.

APHIDIOIDES, in *Entomology*, a ſpecies of acarus, of a red colour; the firſt pair of legs very long, and formed for running; two horns on the poſterior part of the abdomen. Linn. Faun. Suec. Fab. This is la tique rouge des pierres à pattes antérieures fort longues of Geoffroy, and is found among ſtones and rotten wood.

APHIDUM, a ſpecies of ichneumon that is produced from ſeveral of the European kinds of aphides. It is black, with yellow feet, and antennæ about the length of the body. Geofr. Inſ. L'ichneumon des pucerons.

APHILANTHROPY, from *α*, *φιλος*, *friend*, and *ανθρωπος man*, among *Phyſicians*, denotes the ſtate or diſorder, wherein

wherein a perſon has an unnatural diſreliſh for mirth and ſociety, and indulges ſolitude and melancholy.

APHIOCEM, a compoſition made principally of the buds of hemp before they flower. It is much in uſe among the Arabs, and has the intoxicating quality of OPIUM.

APHIOM, KARA HISSAR, in *Geography*, a town of Aſiatic Turkey in Natolia, ſituate on the Mindra, and defended by an elevated caſtle; 56 miles ſouth from Kutaia. N. lat. 38° 35′. E. long. 32° 18′. See APAMEA.

APHIS, in *Entomology*, a very intereſting and extenſive genus of the HEMIPTERA order, in the Linnæan ſyſtem. It is a tribe of creatures that has, in a particular degree, engaged the attention of naturaliſts for various reaſons: their generation is equivocal, and their inſtinctive economy differs, in ſome reſpects, from that of moſt other animals, as will appear hereafter.

Linnæus defines the generic character of the aphis thus; beak inflected, ſheath of five articulations, with a ſingle briſtle; antennæ ſetaceous, and longer than the thorax; either four erect wings, or none; feet formed for walking; poſterior part of the abdomen uſually furniſhed with two little horns. Geoffroy ſays, the aphides have two beaks, one of which is ſeated in the breaſt, the other in the head; this laſt extends to, and is laid upon the baſe of the pectoral one; and ſerves, as that writer imagines, to convey to the head a part of that nouriſhment which the inſect takes, or ſucks in, by means of the pectoral beak.

The ſpecies enumerated by Linnæus and Gmelin are, longiroſtris ribis, arundinis, ulmi, papaveris, paſtinacæ, pruni, ſambuci, ſolidaginis, ceraſi, rumicis, acetoſæ, liguſtici, lychnidis, capreæ, padi, roſæ, hortenſis, picridis, ægopodii, dauci, urticata, nymphææ, corni, tiliæ, juniperi, braſſicæ, craccæ, lactucæ, ſonchi, cirſii, cardui, achilleæ, tanaceti, abſinthii, millefolii, evonymi, avenæ, fraxini, jaceæ, betulæ, alni, roboris, fagi, quercus, pini, pineti, ſalicis, vitis, populi, tremulæ, viburni, mali, burſaria, aparines, urticæ, aceris, atriplicis, piſtaciæ, perſicæ, polyanthis, ſaligna, plantaginis, archangelicæ, leucanthemi, ſcabioſæ, fabæ, geniſtæ, coryli, juglandis, balſamitæ, gallarum, farinoſa, xyloſtei, and mayeri. The whole of theſe, and, no doubt, many others, are found in different parts of Europe. They infeſt an endleſs variety of plants; and it is believed each ſpecies is particularly attached to one kind of vegetable only; hence each ſort has been hitherto uniformly named after the individual ſpecies, or genus of plants, on which it feeds; or if that could not be aſcertained, that on which it had been found; for ſome ſpecies are rather uncommon and little known, though others are infinitely too numerous. The aphides are ſufficiently known by the indiſcriminate term of PLANT LICE; they abound with a ſweet and grateful moiſture, and are therefore eagerly devoured by ants, the larva of coccinellæ, and many other creatures, or they would become, very probably, more deſtructive to the whole vegetable creation than any other race of inſects known.

If Bonnet was not the firſt naturaliſt (as is generally acknowledged) who diſcovered the myſterious courſe of generation in the aphides, or, as he calls them, pucerons, his experiments, together with thoſe of his countryman Trembley, tended at leaſt to confirm in a moſt ſatisfactory manner the almoſt incredible circumſtances reſpecting it: that an aphis or puceron, brought up in the moſt perfect ſolitude from the moment of its birth, in a few days will be found in the midſt of a numerous family; and that if the experiment be again repeated on one of the individuals of this family, a ſecond generation will multiply like its parent; and the like experiment may be many times repeated with the ſame effect.

"M. Bonnet," ſays an ingenious writer, "had repeated ſome experiments of this kind, as far as the ſixth generation, which all uniformly preſented the obſerver with fruitful virgins, when he was engaged in a ſeries of new and tedious experiments, from a ſuſpicion imparted by M. Trembley, in a letter to him, who thus expreſſes himſelf: 'I have formed the deſign of rearing ſeveral generations of ſolitary pucerons, in order to ſee if they would all equally bring forth young. In caſes ſo remote from uſual circumſtances, it is allowed to try all ſorts of means; and I argued with myſelf, who knows but that one copulation might ſerve for ſeveral generations?' This '*who knows*' perſuaded M. Bonnet that he had not ſufficiently purſued his inveſtigations. He therefore now reared to the tenth generation his ſolitary aphides, having the patience to keep an exact account of the days and hours of the birth of each generation. He then diſcovered both males and females among them, whoſe amours were not in the leaſt equivocal; the males are produced only in the tenth generation, and are but few in number; that theſe ſoon arriving at their full growth, copulate with the females, and that the virtue of this copulation ſerves for ten ſucceſſive generations; that all theſe generations, except the firſt, from fecundated eggs are produced viviparous, and all the individuals are females, except thoſe of the laſt generation, among whom ſome males appear to lay the foundation of a freſh ſeries." Adams Microſc.

The hiſtory of aphides has alſo been very copiouſly treated upon by Dr. Richardſon, in a paper printed in the 41ſt vol. of the Philoſophical Tranſactions; nor muſt we omit another upon the ſame ſubject by the late ingenious Mr. Curtis, that appeared in the ſixth volume of the Tranſactions of the Linnæan Society.

The tenor of Dr. Richardſon's remarks is briefly this: the great variety of ſpecies which occur in the inſects now under conſideration, may make an inquiry into their particular natures ſeem not a little perplexing; but by reducing them under their proper genus the difficulty is conſiderably diminiſhed. We may reaſonably ſuppoſe all the inſects, comprehended under any diſtinct genus, to partake of one general nature; and by diligently examining any particular ſpecies, may thence gain ſome inſight into the nature of all the reſt. With this view, Dr. Richardſon choſe out of the various ſorts of aphides the largeſt of thoſe found on the roſe tree; not only as its ſize makes it more conſpicuous, but there are few of ſo long duration. This ſort appears early in the ſpring, and continues late in autumn, while ſeveral are limited to a much ſhorter term, in conformity to the different trees and plants whence they draw their nouriſhment.

If, at the beginning of February, the weather happens to be ſo warm as to make the buds of the roſe tree ſwell and appear green, ſmall aphides are frequently to be found on them, though not larger than the young ones in ſummer when firſt produced. It will be found, that thoſe aphides which appear only in ſpring, proceed from ſmall black oval eggs which were depoſited on the laſt year's ſhoot; though when it happens that the inſects make too early an appearance, the greater part ſuffer from the ſharp weather that uſually ſucceeds, by which means the roſe trees are ſome years in a manner freed from them. The ſame kind of animal is then at one time of the year viviparous, and at another oviparous.

Theſe aphides which withſtand the ſeverity of the weather,

ther, ſeldom come to their full growth before the month of April, at which time they uſually begin to breed, after twice caſting off their exuvia, or outward covering. It appears that they are all females, which produce each of them a numerous progeny, and that without having intercourſe with any male inſect; they are viviparous, and, what is equally ſingular, they all come into the world backwards. When they firſt come from the parent, they are enveloped in a thin membrane, having in this ſituation the appearance of an oval egg; theſe egg-like appearances adhere by one extremity to the mother, while the young ones contained in them extend to the other, and by that means gradually draw the ruptured membrane over the head and body to the hind feet. During this operation, and for ſome time after, the fore part of the head adheres, by means of ſomething that is glutinous, to the vent of the parent. Being thus ſuſpended in the air, it ſoon frees itſelf from the membrane in which it was confined; and after its limbs are a little ſtrengthened, is ſet down on ſome tender ſhoots, and left to provide for itſelf.

In the ſpring months there appear on the roſe trees but two generations of aphides, including thoſe which proceed immediately from the laſt year's eggs; the warmth of the ſummer adds ſo much to their fertility, that no leſs than five generations ſucceed one another in the interval. One is produced in May, which caſts off its covering, while the months of June and July each ſupply two more, which caſt off their coverings three or four times, according to the different warmth of the ſeaſon. This frequent change of their outward coat is the more extraordinary, becauſe it is repeated more often when the inſects come the ſooneſt to their growth, which ſometimes happens in ten days, where they have had plenty of warmth and nouriſhment.

Early in the month of June, ſome of the third generation, which were produced about the middle of May, after caſting off their laſt covering, diſcover four erect wings, much longer than their bodies; and the ſame is obſervable in all the ſucceeding generations which are produced during the ſummer months, but ſtill without any diverſity of ſex: for ſome time before the aphides come to their full growth, it is eaſy to diſtinguiſh which will have wings, by a remarkable fullneſs of the breaſt, which in the others is hardly to be diſtinguiſhed from the body. When the laſt covering is rejected, the wings which were before folded up in a very narrow compaſs, are gradually extended in a ſurpriſing manner, till their dimenſions are at laſt very conſiderable.

The increaſe of theſe inſects in the ſummer time is ſo very great, that by wounding and exhauſting the tender ſhoots they would frequently ſuppreſs all vegetation, had they not many enemies to reſtrain them. Notwithſtanding theſe inſects have a numerous tribe of enemies, they are not without their friends, if thoſe may be conſidered as ſuch, who are officious in their attendance for the good things they expect to reap thereby. The ant and bee are of this kind, collecting the honey in which the aphides abound, but with this difference, that the ants are conſtant viſitors, the bee only when flowers are ſcarce; the ants will ſuck in the honey, while the aphides are in the act of diſcharging it; the bees only collect it from the leaves on which it has fallen.

In the autumn three more generations of aphides are produced, two of which generally make their appearance in the month of Auguſt, and the third before the middle of September. The two firſt differ in no reſpect from thoſe which are found in ſummer; but the third differs greatly from all the reſt. Though all the aphides which have hitherto appeared were female, in this tenth generation ſeveral male inſects are found, but not by any means ſo numerous as the females.

The females have, at firſt, the ſame appearance as thoſe of the former generations, but in a few days, their colour changes from a green to a yellow, which is gradually converted into an orange before they come to their full growth: they differ alſo, in another reſpect, from thoſe which occur in ſummer, for all theſe yellow females are without wings. The male inſects are, however, ſtill more remarkable, their outward appearance readily diſtinguiſhing them from this and all other generations. When firſt produced they are not of a green colour like the reſt, but of a reddiſh brown, and have afterwards a dark line along the back; they come to their full growth in about three weeks, and then caſt off their laſt covering, the whole inſect being after this of a bright yellow colour, the wings only excepted: but after this change they become of a deeper yellow and in a very few hours of a dark brown, if we except the body, which is ſomething lighter coloured, and has a reddiſh caſt. The males no ſooner come to maturity than they copulate with the females, who, in a day or two after their intercourſe with the males, lay their eggs, generally near the buds. Where there are a number crowded together they of courſe interfere with each other, in which caſe they will frequently depoſit their eggs on other parts of the branches.

It is highly probable that the aphides derive conſiderable advantages by living in ſociety; the reiterated punctures of a great number of them may attract a larger quantity of nutritious juices to that part of the tree or plant where they have taken up their abode. Vide Adams Microſ. Phil. Tranſ. &c.

The obſervations of Mr. Curtis on the aphides are chiefly intended to ſhew that they are the principal cauſe of blights in plants, and the ſole cauſe of the honey-dew. He therefore calls them the aphis, or blighter; and after obſerving, that in point of number, the individuals of the ſeveral ſpecies compoſing it ſurpaſs thoſe of any other genus in the country, ſpeaks thus, in general terms, of the whole tribe:

"Theſe inſects live entirely on vegetables. The loftieſt tree is no leſs liable to their attacks than the moſt humble plant. They prefer the young ſhoots on account of their tenderneſs; and on this principle often inſinuate themſelves into the very heart of the plant, and do irreparable miſchief before they are diſcovered. But for the moſt part, they beſet the foliage, and are always found on the underſide of the leaf, which they prefer, not only on account of its being the moſt tender, but as it affords them protection from the weather, and various injuries to which they would otherwiſe be expoſed. Sometimes the root is the object of their choice, which, from the nature of theſe inſects, one would not, *à priori*, expect; yet I have ſeen the roots of lettuces thickly beſet with them, and the whole crop rendered ſickly and of little value; but ſuch inſtances are rare. They rarely alſo attach themſelves to the bark of trees, like the aphis ſalicis, which being one of our largeſt ſpecies, and hence poſſeſſing ſuperior ſtrength, is enabled to penetrate a ſubſtance harder than the leaves themſelves."

Mr. Curtis next obſerves, that as among caterpillars we find ſome that are conſtantly and unalterably attached to one or more particular ſpecies of plants, and others that feed indiſcriminately on moſt ſorts of herbage, ſo it is preciſely with the aphides; ſome are particular, others more general feeders; and as they reſemble other inſects in this reſpect, ſo they do alſo in being more abundant ſome years than others. In 1793, they were the chief, and in 1798,

the ſole cauſe of the failure of the crops of hops. In 1794, a ſeaſon almoſt unparalleled for drought, the hop was perfectly free from them, while peas and beans, eſpecially the former, ſuffered very much from their depredations. Beans, in 1798, were almoſt wholly cut off by them; indeed they ſuffer more or leſs every year by a black ſpecies of aphis, particularly the latter crops. To potatoes, and even corn, they prove in ſome years highly detrimental, and not leſs ſo to melons. To plants in ſtoves, green houſes, and frames, where, from the warmth and ſhelter afforded them, a preternatural multiplication takes place, they prove extremely injurious; and many rare and valuable plants alſo in the open ground of our botanic gardens fall victims to theſe general depredators. "Seeing, therefore," ſays that writer, "that our neceſſaries, as well as luxuries of life, are ſo materially affected by the inſects of this genus, an attempt to aſcertain ſome curious and important facts relative to their hiſtory, and to make them more generally known, will not, we truſt, be unacceptable. Such inquiries may poſſibly lead to the means of obviating the injuries they occaſion; and if they fail in this, they may tend at leaſt to correct the erroneous notions entertained of blights, not by the vulgar and illiterate merely, but even by perſons of education, who may be frequently heard to maintain, that theſe inſects are brought by the eaſt winds; that they attack none but ſickly plants; with other notions, all as falſe in fact as unphiloſophical in principle."

In the courſe of this long but ingenious paper, Mr. Curtis proves, in a ſatisfactory manner, the truth of his preliminary remarks; and, by a ſeries of experiments, which are neceſſarily beyond our limits to detail, has diſcovered ſome peculiarities in their economy deſerving notice: we ſhall conclude with a brief ſurvey of thoſe moſt intereſting, and refer the more inquiſitive reader to the paper at length, in the Tranſactions of the Society for 1802.

Locuſts and caterpillars are furniſhed with ſtrong jaws, by means of which they crop and wholly devour the foliage of plants. The aphis deſtroys them in a different way. Inſtead of jaws and teeth, it is provided with a hollow-pointed proboſcis, which, when the animal is not feeding, folds under the breaſt. With this inſtrument it pierces the plant, and imbibes its juices to ſupport itſelf; but theſe juices being eſſential to the life of the plant, it follows, that when they are drawn off, the plant, exhauſted, flags and periſhes, being, in fact, literally bled to death by theſe leech-like animalcules. Yet ſo tenacious of life are plants in a healthy ſtate, that, in general, they only fall victims to the continued attacks of theſe inſects when in immenſe numbers. But it moſt commonly happens, that if they do not wholly deſtroy a plant, they deface it; and a ſmall number of aphides are ſufficient to produce this effect.

Aphides are deſcribed by the beſt authors as being generally oviparous and viviparous at different periods of the ſame year. Mr. Curtis found, from the 24th of September to the 6th of December following, during which time Fahrenheit's thermometer had been as low as 29, that the aphis ſalicis was conſtantly viviparous; though, from the inclemency of the weather, very few of theſe inſects, at the period laſt mentioned, remained on the trees; and thoſe few were ſoon after entirely cut off by the unuſual cold that took place, the thermometer falling to four degrees below 0. Other aphides are oviparous or viviparous, according to the temperature of the air to which they are expoſed. In very cold weather they are oviparous, for this obvious reaſon, that the eggs are capable of reſiſting cold more powerfully than the young. On the 22d of November, in the ſame year, he found a conſiderable number of eggs, which had been depoſited in ſome auricula plants by a green aphis, which infeſts plants very commonly, while the ſame ſpecies on a geranium within doors produced young. In mild winters, in the month of January, the ſame ſpecies of aphis has been obſerved in great numbers on various ſpecies of primula without doors, and all the females viviparous. Theſe, and ſome preceding facts, prove, that all aphides are not oviparous and viviparous at the ſame ſeaſon, but that ſome may be wholly viviparous; that all ſuch as are both oviparous and viviparous do not lay eggs toward the middle of autumn, nor at all during the winter, unleſs a certain degree of cold takes place.

In the quality of the excrement voided by theſe inſects there is ſomething wonderfully extraordinary. Were a perſon accidentally to take up a book, in which it is gravely aſſerted, that in ſome countries there were certain animals which voided liquid ſugar, he would lay it down, regarding it as a fabulous tale, calculated to impoſe on the credulity of the ignorant; and yet ſuch is literally the truth. Mr. Curtis collected ſome on a piece of writing paper from a brood of the aphis ſalicis, and found it to be as ſweet as ſugar; and obſerves, that were it not for the waſps, ants, flies, and other inſects that devour it as quickly as it is produced, it might, no doubt, be collected in conſiderable quantities; and by the proceſſes uſed with other ſaccharine juices, might be converted into the choiceſt ſugar or ſugar-candy. The ſweetneſs of this excrementitious ſubſtance, the gloſſy appearance it gave the leaves it fell upon, and the ſwarms of inſects this matter attracts, led him to imagine the honey-dew of plants was no other than this ſecretion, which further obſervation has ſince fully confirmed; and not, as its name implies, a ſweet ſubſtance falling from the atmoſphere. On this opinion it is further remarked, that it neither falls from the atmoſphere, nor iſſues from the plant itſelf, as is eaſily demonſtrated. If it fell from the atmoſphere, it would cover every thing it fell upon indiſcriminately, whereas we never find it but on certain living plants and trees. We find it alſo on plants in ſtoves and green-houſes covered with glaſs. If it exuded from the plant, it would appear on all the leaves generally and uniformly; whereas its appearance is extremely irregular, not alike on any two leaves of the ſame tree or plant, ſome having none of it, and others being covered with it but partially. As far as the writer's obſervation extended, there never exiſts any honey-dew but where there are aphides; though ſuch often paſs unnoticed, being hid on the underſide of the leaf; and wherever honey-dew is obſervable upon a leaf, aphides will be found on the underſide of the leaf or leaves immediately above it, and under no other circumſtance whatever. If by accident any thing ſhould intervene between the aphides and the leaf next beneath them, there will be no honey-dew on that leaf: and thus he conceives it is incontrovertibly proved that aphides are the true and only ſource of honey-dew.

Though no mode of deſtroying aphides will perhaps ever be deviſed on a large ſcale, in the open air, by artificial means, it can be accompliſhed moſt effectually when they infeſt plants in ſtoves, green houſes, and frames, or any ſituation in which they can be enveloped for a certain time in clouds of ſmoke. Powders or liquids, however fatal to aphides, muſt ever be ineffectual, from the trouble and difficulty of applying them, ſo that they may come in contact with the inſects. The ſmoke of common vegetables, however powerful, is found inadequate to their deſtruction, and the only one yet employed with ſucceſs is that of to-

bacco.

bacco. They may for hours, or even a whole day, be immerſed in water, and when taken out ſome will be living, and many of the reſt will revive afterwards; they remain affixed to the plant in water as before, and their bodies aſſume a luminous appearance from the minute bubbles of air which iſſue from them. One experiment is mentioned, in which a green-houſe plant, with the pot it grew in, was immerſed in the evening into a tub of water, and in the morning they appeared alive and well. When they are taken from the plant on which they feed, and are kept under water, they do not ſurvive ſo long; their ſtruggling in that caſe perhaps exhauſts them ſooner. It appears therefore, upon the whole, that they are extremely tenacious of life, and that wet is not ſo hurtful to them as might naturally be imagined.

Some curious remarks on the opinions that prevail reſpecting blights conclude the paper. Blights, he obſerves, originate from a variety of cauſes, the chief of which are unfavourable weather, and inſects. Some imagine that the inſects which are the cauſe of them are brought from a diſtance by eaſterly winds; and others, that they attach themſelves to none but ſickly plants; neither of which, ſo far as the writer has obſerved, are founded in fact; and he is induced to believe the aphides are by far the moſt general cauſe of the diſeaſes diſtinguiſhed by the name of blights.

APHLASTUM, from α and φλαστος, *frangible*, in the *Ancient Navigation*, a wooden inſtrument, ſhaped like a plume of feathers, faſtened on the gooſe's or ſwan's neck uſed by the ancient Greeks in the heads of their ſhips.

The aphlaſtum had much the ſame office and effect in a ſhip that the creſt had on a helmet. It ſeems alſo to have had this further uſe, *viz.* by the waving of a party-coloured ribband faſtened to it, to indicate from what quarter the wind blew. The aphlaſtum was the proper ornament of the head, as the acroſtolium was of the ſtern. The Greek aphlaſtum anſwered to, and was probably the origin of the Latin apluſtre.

APHLE, in *Ancient Geography*, a town of Aſia, in Chaldea, ſituate near the Tigris, where it borders on the Perſian gulf.

APHNEUM, a town of Phrygia, near Cyzicum. Steph. Byz.

Aphneum is alſo a town of Lydia.

APHONIA, in *Medicine*, the ſtate of a perſon who is deprived of voice.

The word is compounded of the privative α, and φωνη, *voice*, q. d. a loſs of ſpeech or voice.

This is rarely an idiopathic affection, and may ariſe from a variety of cauſes; ſuch as cutting the *recurrent nerves* which go to the larynx or glottis, where the voice is formed: or making an aperture into the trachea below the glottis, or any other mechanical injury to the parts.

Any fit may deprive the patient of the uſe of the organs of ſpeech, as *epilepſy*, *apoplexy*, *paralyſis*, or *hyſteria*, may become a cauſe of aphonia.

When a perſon is ſuddenly ſeized with a loſs of voice, and no cauſe appears, it generally indicates the approach of one or other of theſe attacks.

As all voluntary motion depends on the nerves and muſcles of the reſpective organs, ſo whatever injures thoſe of the tongue, or any of the other organs ſubſervient to the formation of the voice, may induce aphonia.

Some other cauſes have been mentioned by medical writers, which are only accidentally ſo; ſuch as the receding of cutaneous eruptions, inflammation of the tongue and fauces, ſpaſmodic affections, worms, fear or joy, a crumb of bread, or any other extraneous ſubſtance ſticking in the rima glottidis.

The *prognoſis* will vary with the cauſe; the moſt obſtinate caſes are thoſe which depend on a paralytic ſtate of the nerves. As hyſteria, worms, or extraneous matters, are commonly ſoon removed; ſo a diſeaſe depending on them may be deemed eaſily curable.

The *general* indications of *cure* are, to reſtore freedom to the nervous influence when impeded, and integrity to the organs themſelves when wounded or otherwiſe diſabled. The firſt indication is anſwered by the treatment of Paralysis; the ſecond by the practice of *ſurgery*. *Particular* indications are taken from the cure of thoſe particular diſeaſes on which the aphonia depends, viz. Hysteria, Epilepsy, Worms, Spasm, &c.; which ſee.

APHORISM, a maxim, general rule, or principle of a ſcience; or a brief ſentence, comprehending a great deal of matter in a few words.

The word is derived from αφοριζω, *I ſeparate*, q. d. a choice or ſelect ſentence.

The term is chiefly uſed in *Medicine* and *Law*. We ſay, the aphoriſms of Hippocrates, of Sanctorius, of Boerhaave, &c.; aphoriſms of the civil law, &c.

Aphorism is uſed, in *Eccleſiaſtical Writers*, for the leſſer excommunication, by which the delinquent is cut off from the benefit of the ſacrament and the prayers of the faithful; but allowed to bear a part in the reſt of the ſervice.

Aphorism is alſo uſed for a kind of figure in *Rhetoric*, whereby ſomething that has been ſaid is limited and corrected. This is otherwiſe called *diorifmus*.

APHORISTIC, ſomething relating to, or partaking of the nature of *aphoriſms*.

The *aphoriſtic* method ſtands contradiſtinguiſhed from the *ſyſtematic*, or methodical, as alſo from the *diexodic*, or diſcurſive way.

The aphoriſtic method had great advantages, as containing much matter in a ſmall compaſs; ſentiments are here almoſt as numerous as expreſſions; and doctrines may be counted by phraſes. Every thing is cloſe and pertinent, allowing no room for uſeleſs diſcuſſions, or for languiſhing connections and tranſitions; there is hardly a word to be loſt.

APHORMION, in *Ancient Geography*, a place of Bœotia, dependent upon Theſpia, which, according to Steph. Byz. was the birth-place of Typhus, who ſuperintended the conſtruction of the ſhip Argo.

APHOSIATIN, in *Geography*, a part of Romelia in European Turkey, near the Black Sea, and not far from Conſtantinople to the north.

APHPHADENA, a town of Aſia in Meſopotamia, near the Euphrates.

APHRACTI, from α, and φραχλος, *incloſed*, in the *Ancient Military Art*, denote open veſſels, without decks or hatches, furniſhed only at head and ſtern with croſs planks, whereon the men ſtood to fight.

The *aphracti*, or open veſſels, ſtood contradiſtinguiſhed from *cataphracti*, or covered ones.

APHRODISIA, in *Antiquity*, feſtivals in honour of the goddeſs Αφροδιτη, or Venus. There were ſeveral of theſe *Aphrodiſiæ* obſerved with laſcivious ceremonies in divers parts of Greece: the moſt remarkable was that at Cyprus, firſt inſtituted by Cinyras, out of whoſe family certain prieſts of Venus were elected, and for that reaſon named Κινυραδαι. At this ſolemnity ſeveral myſterious rites were practiſed: all who were initiated to them offered a piece of money to Venus as an harlot, and received as a token of the goddeſs's favour, a meaſure of ſalt, and a φαλλος; the former, becauſe ſalt is a concretion of ſea-water, to which Venus was thought to owe her birth; the latter, becauſe ſhe was the goddeſs of wantonneſs.

Athenæus (Deipnoſoph. l. xiii. c. 6.) informs us, that at Corinth theſe feaſts were celebrated by harlots; and that they who ſupplicated the goddeſs were accuſtomed to promiſe to devote ſome women to her, in order to the obtaining of their requeſts. Erafmus obſerves in his Adagia, that this city was filled with courteſans; and that the verb κορινθιάζειν, ſignified proverbially to ſurrender themſelves to debauchery. See CORINTH.

APHRODISIA is alſo uſed for the age of venery, more frequently denominated *puberty*.

APHRODISIA, in *Ancient Geography*, a town of Thrace, to the north of the peninſula which joined the Cherſoneſus of Thrace to the continent, between Candia to the weſt, and Heraclea to the eaſt.

APHRODISIA is alſo a town placed by Stephan. Byz. in Scythia, near the Euxine ſea.

APHRODISIACE, in the writings of the ancients, a name given to a gem, ſuppoſed, according to the idle traditions of thoſe times, to have a power of procuring love to the perſon who wore it about him; all the deſcription we have of it is, that it was of a pale fleſh-colour; but the ſtone, as well as its virtues, are wholly unknown to the world at preſent.

APHRODISIACS, in the *Materia Medica*, denote medicines ſuppoſed to be ſuited to excite the venereal appetite, or to increaſe the venereal powers. As there are no medicines of ſpecific power for theſe purpoſes, the term ſeems, for the moſt part, to have been very improperly employed.

In which ſenſe, *aphrodiſiacs* ſtand contradiſtinguiſhed from *antaphrodiſiacs*.

Some authors give the appellation *aphrodiſiaca* to the EPILEPSY.

APHRODISIAS, or APHRODISIUM *Promontorium*, in *Ancient Geography*, a promontory of Caria, near Cnidus.

APHRODISIAS, or *Aphrodiſium*, *Gheira*, is a town of Caria, towards the north-eaſt, at the confluence of the Corſinus and Timelas.

An iſland of Libya.

Alſo, an iſland in the coaſt of Bætica, near Gades, and afterwards called *Erythia*.

Alſo, a town of the iſland of Cyprus, towards the north-eaſt.

Alſo, an iſland in the gulf of Caramania, called by its inhabitants, according to Arrian, Cattea.

A town of Laconia.

A country of Aſia, in the Eolide.

An iſland, now *Bona*, on the coaſt of Africa.

Aphrodiſias and Aphrodiſium were appellations given to ſeveral other places, which it is needleſs to mention.

APHRODISIUS, in *Chronology*, denotes the eleventh month in the Bithynian year, commencing on the 25th of July in our's.

APHRODITA, in *Natural Hiſtory*, a genus of VERMES in the molluſca order; the character of which is, body creeping, oblong, covered with ſcales, and both ſides furniſhed with briſtly feet; mouth terminal, cylindrical; feelers two, ſetaceous and annulated; eyes four. Linn. Gmel. There are only nine ſpecies deſcribed by authors, and which are, aculeata, ſcabra, ſquamata, imbricata, plana, lepidota, cirrhoſa, violacea, and longa.

APHRODITA *quarta*, is alſo the name of one of the marine VERMES in Hiſt. Hiſt. An. t. 5, and which has been ſince named by Linnæus HOLOTHURIA PENTACTA.

APHRODITARIUM, in the *Ancient Pharmacy*, denotes a kind of dry medicine, compounded of frankincenſe, the ſcales of copper, ceruſs, ſtarch, and pomegranates, mixed in equal quantities.

The name is alſo given to a kind of *collyrium*, mentioned by Galen.

APHRODITE, in *Entomology*, a ſpecies of PAPILIO in the ſection Nymph. Phal. The wings are dentated, fulvous, with black ſpots: the underſide of the poſterior pair is brown, with 24 ſilver-coloured ſpots. Fabricius and Gmelin. This is a native of South America.

APHRODITE, in *Mythology*, a name of Venus, derived from αφρος, *froth*, becauſe, according to the poets, Venus is ſuppoſed to be produced from the froth or foam of the ſea.

APHRODITES, in *Natural Hiſtory*, a name given by ſome authors to the fineſt ſpecies of amethyſt. See GEMMA *Veneris*.

APHRODITES, in *Ancient Geography*, the name of an iſland in the Arabian gulf, near Egypt, according to Ptolemy. M. d'Anville ſuppoſes that it was the iſland called *Sufange-ul-Behri*.

APHRODITOIDES, in *Natural Hiſtory*, a ſpecies of NEREIS found in the Greenland ſeas. The body is depreſſed, without furrows; and the peduncles furniſhed with cirri and papillæ. Gmelin and Fabr. The head is white, eyes and jaws black, tentaculæ four, two cirri in front, body pellucid; anterior part ochraceous yellow, the reſt reddiſh, with two ferruginous lines along the abdomen. Sometimes, though rarely, it is green, with the ferruginous lines on the abdomen, and tranſverſe reddiſh lines upon the back.

APHRODITOIS, a ſpecies of TEREBELLA that inhabits the Indian ocean; it is about a foot and an half in length, and conſiſts of about 148 ſegments; the peduncles are fleſhy, furniſhed with a cirrus, and two cirri at the head. The ſpecific character is, body round, and gradually tapering towards the poſterior extremity; beneath rather depreſſed, with an obſolete furrow; the firſt eight ſegments deſtitute of branchiæ, thoſe on the three next ſimple, and the reſt becoming gradually larger, and pinnated on one ſide. Gmelin, &c. This is nereis aphroditois of Pall. nov. act. Petrop, &c.

APHRODITOPOLIS, in *Ancient Geography*, the name given by Pliny and Ptolemy, to two, and, after them, by M. d'Anville, to three towns in Egypt; and each of the two former the capital of a particular nome. *Aphroditopolis*, in the Heptanomia, upon the right of the Nile, at ſome diſtance ſouth from Memphis, is the capital of the 36th nome; and M. d'Anville ſuppoſes it to have been ſucceeded by *Atfieh*; but Father Siccard imagines that it is *Bercubel*, a ſmall place at a little diſtance to the ſouth-weſt.

Aphroditipolis is alſo a town of Upper Egypt, and the capital of the 42d nome. This town lay to the left of the Nile, a little north of Ptolemais; and it ſeems to have been that which Pliny calls *Oppidum Veneris*. M. d'Anville ſuppoſes that *Itfet* now occupies its ſituation.

Aphroditopolis belonged alſo to the nome of Hermonthitès; and was ſituated on the left of the Nile, at a ſmall diſtance north from Latopolis. M. d'Anville aſſigns it to the place where *Aſfan*, or *Aſfoun*, now ſtands.

APHRODITOPOLITES, a nome of Egypt, the metropolis of which is called by Ptolemy *Crocodilorum civitas*.

APHROGALA, from αφρος, *froth*, and γαλα, *milk*, in the *Ancient Phyſic*, denotes a kind of whipt cream, or milk, agitated till it be converted wholly into froth.

The

The aphrogala is directed by Galen, as proper againſt hot diſorders of the ſtomach.

APHROLITRUM, in the *Ancient Phyſic*, denotes the ſpume or froth of *litrum*; and ſeems to amount to the ſame with *aphronitrum*.

APHRONITRE. See NITRUM.

APHROSELENOS, among *Ancient Naturaliſts*, a denomination given to the SELENITES, or *lapis ſpecularis*.

APHTHÆ, in *Surgery*, from ἄπτομαι, *incendo*, the *thruſh*. By this term are denoted clear, white, pale, livid, painful ſpots, which appear in the mouth, fauces, and neighbouring parts, of various ſizes and ſhapes; and which generally raiſe themſelves into real veſications, filled with a clear or turbid yellow or bluiſh fluid. They attack every part of the cavity of the mouth, the trachea, œſophagus, ſtomach, and inteſtines: ſometimes alſo they are found in the noſtrils. Generally they appear at firſt in ſmall white points, which are always preceded by a very ſenſible degree of heat in the mouth and breath of the patient, which gradually increaſe in ſize; and ſometimes in the ſpace of a few minutes, or more ſlowly, ſpread themſelves farther, become elevated, and form veſications, which are either round or flattiſh, and ſtand either ſingle or in groups. In ſome caſes they ſoon burſt open, or ſeparate themſelves at their baſe; and the contained fluid is either quickly diſcharged, or is abſorbed; and they collapſe, or wither away, as it were, and the detached cuticle forms wrinkled white ſpots, which frequently occupy a larger extent of ſurface. Sometimes they remain longer elevated, the contained fluid grows thick, and they fall off in ſcales of a darker yellow colour. Sometimes aphthæ are not of a white colour; for when the morbid matter has long continued its ravages in the ſyſtem before aſſiſtance is procured, or if the aphthæ have not been diſcovered early enough, they are found ſometimes aſh-coloured, ſometimes lead-coloured, blue, and black, according as either the vitiated humours, or the bottom of the ſore, appears through the ſkin.

After a ſhorter or longer ſpace of time, they generally detach themſelves and fall off, upon which a moiſture is ſeen to cover the ulcerated parts. When this becomes greatly accumulated, a ſalivation is commonly produced. If the parts do not ſoon become covered with a new ſkin, they begin to bleed, and to occaſion acute pain. This ſeparation ſometimes takes place within a few hours, generally within twelve; ſometimes alſo the ſloughs remain for ſeveral days, and do not fall off at the ſame time, but one after the other, in different parts.

Frequently they diſappear, but as frequently return again, according as there is a larger or ſmaller quantity of morbid matter which depoſits itſelf in the mouth, and irritates it. Sometimes the internal ſurface of the mouth becomes covered with a perfectly white cruſt, produced by the coaleſcence of the ſeparate aphthæ, whence a variety of inconveniences are produced; for the ſymptoms of the diſeaſe are exacerbated, and at length putreſcence and gangrene ſupervene, which takes place the ſooner if there be fever at the ſame time preſent. In this ſtate the patient can take no nouriſhment, as he cannot ſwallow even liquids without intolerable pain and anxiety; and ſhould it be poſſible to get any thing down, it does not contribute to the nouriſhment of the body, ſo that the ſtrength of the body waſtes away, and death may at length terminate the ſufferings of the patient.

Frequently the aphthæ appear as a primary or idiopathic diſeaſe; but more commonly they are ſymptomatic, or concomitants of other diſeaſes. Some have alſo aſſerted, that they may be critical, which however is doubtful, or, if they ever are ſo, it is only with adults. In the idiopathic aphthæ, the following ſymptoms are obſerved: they appear in children from a week to a fortnight old, ſometimes alſo later. The infant becomes uneaſy, ſometimes ſleeps much, ſometimes little; he cries a great deal: his voice grows feeble, ſhrill, and hoarſe; his reſpiration is very quick and difficult; his pulſe uncommonly quick and ſmall, with ſymptoms of irritation; his mouth, tongue, and the other neighbouring parts, are dry and very hot; this heat extends itſelf over the whole body without perſpiration, and the patient becomes languid, feeble, and ſpiritleſs. The infant is very eager for the breaſt, where the mother feels an intolerable heat; but he is unable to ſuck, on account of the pain excited by the preſſure of the nipple, and the exertion of the muſcles requiſite in the action of ſucking; in conſequence of which many infants die for want of nouriſhment, even before the thruſh breaks out.

When aphthæ appear as ſymptoms or concomitants of other diſeaſes, the febrile ſymptoms become exacerbated; and they are very apt to appear when the patient has been affected with a diarrhœa at the very commencement of the febrile attack. The patient is moreover troubled with conſtant nauſea, a loathing of food and drink, and ſometimes alſo with vomiting. He feels a ſenſe of anxiety and weight at the pit of the ſtomach and in the thorax, eſpecially if copious and frequent evacuations have preceded. He feels a ſenſation as if ſome hard ſubſtance ſtuck in his throat, eſpecially when he ſwallows any liquid. If evacuants have been adminiſtered, and have produced a diſcharge of much mucus, bile, and other impurities, and the above-mentioned ſymptoms continue, aphthæ certainly make their appearance. Finally, they are frequently prognoſticated by a dulneſs and ſtupidity of the ſenſes and underſtanding, during which the patient is much inclined to ſleep, but his ſleep is attended with a great deal of dreaming.

It is neceſſary that the phyſician or ſurgeon ſhould be well acquainted with theſe ſymptoms, from which the appearance of aphthæ may be prognoſticated; for whether they be idiopathic or ſymptomatic, they are always an unfavourable occurrence, and ſeldom unattended with danger.

When aphthæ actually make their appearance, they are attended beſides with the following ſymptoms: ſhortly before they break out, or when they do break out, a ſenſation of heat and intolerable burning is felt in the mouth. The patient feels as if the whole cavity of his mouth were excoriated or ulcerated; and the ſlighteſt touch excites the moſt acute pain in it. If, at the ſame time the voice becomes hoarſe, with a hollow tone, the fever and uneaſineſs increaſe, hiccup ſupervenes, the tongue becomes very red, with a ſenſe of pain deep in the throat, or about the upper orifice of the ſtomach, we may conclude with certainty that aphthæ have already been formed in the ſtomach and œſophagus, which will gradually ſpread themſelves higher up, till they appear alſo in the fauces. Theſe excite ſingultus and vomiting, eſpecially with infants. The evacuations by ſtool are very copious; and infants void, together with the other excrements, lumps of undigeſted milk. With this copious and preternatural alvine evacuation, fever is often combined during ſeveral days. As ſoon as the aphthæ have ſpread themſelves over the whole internal ſurface of the mouth, they render maſtication, ſuction, and deglutition extremely difficult to the infant, who therefore continually cries; and when he yawns, he is always affected with violent griping in the belly, which is attended with a rumbling noiſe. When the aphthæ have completely broke out, they are accompanied alſo with a variety of ſymptoms of different kinds, of which we are to form our judgment, partly according to the colour of the

aphthæ,

aphthæ, partly according to the ſymptoms and courſe of the diſeaſe, of which they are ſymptoms or concomitants.

The morbid matter by which the aphthæ are produced, is to be ſought almoſt ſolely in the primæ viæ, where it is formed, particularly with new-born infants, when the firſt indiſpenſably neceſſary purgation has been neglected, and alſo when in any other manner, either by the improper diet of the infant, or alſo by that of the mother or nurſe, occaſion has been given to the production of impurities in the primæ viæ. It is prejudicial to ſuffer the infant to ſleep on the breaſt, as he then keeps ſome of the milk in his mouth, where it eaſily becomes ſpoiled.

This diſeaſe may alſo be produced by the infant receiving unwholeſome milk. With many infants, therefore, we may prevent the production of aphthæ, by frequently cleanſing their mouths, ſoon after birth, in order that none of the mucus may remain in them; by evacuating the contents of their inteſtines by proper purgatives; and by keeping them, in general, clean, and giving them wholeſome nouriſhment.

In the cure of the aphthæ, our firſt object muſt be to examine whether they be idiopathic or ſymptomatic, as each ſpecies requires a diſtinct mode of treatment. The moſt important general indication of cure, is to endeavour to correct and remove the viſcid, acrid, and offenſive humours. For this purpoſe we may adminiſter elder-flower tea, demulcent ptiſans, with a little lemon-juice, emulſion of almonds, ſweet milk, a dilute decoction of oats or barley, whey, &c. When the infant is affected with the aphthæ in his mouth, the mother or nurſe ſhould take theſe remedies; and, at the ſame time, it will be very beneficial to plunge the hands and feet of the infant frequently into warm water, or to apply either liquid or vapour-baths with elder-flowers, and other emollient herbs, wheat, bran, ſoap, &c. Emollient glyſters, compoſed with the above mentioned ſubſtances, are particularly to be recommended, as the requiſite remedies may thus be introduced into the body, without doing any violence to the mouth, fauces, and throat of the infant; beſides that, this manner of adminiſtering remedies is the beſt adapted for infants, who generally neither can nor will ſwallow them.

The uſe of much animal food, and whatever can increaſe the alkaline tendency of the fluids, muſt particularly be avoided in the diet of the patient, as the quality of the morbid matter would thereby be increaſed. On the other hand, freſh air, a clean and warm chamber, frequent cleaning of the body, bodily motion, both with children and adults, the application of acidulous vapours, and other ſubſtances that ſheath or neutralize the alkalies, alſo fixed air, are to be recommended. The diet of the patient ought in general to be liquid and light, but, at the ſame time, nouriſhing, conſiſting of bread-ſoups, barley-broth, ſago, &c. Panada, made with bread, honey, and wine, boiled in water, is alſo a good article of food; but with reſpect to the wine, we ought to be very cautious, in order that we may not increaſe the irritation in fevers of an inflammatory nature, and when there is already too much irritation in the ſyſtem. We may adminiſter it more plentifully in diſeaſes of debility and malignant fevers; and the ſame applies to all aromatic and other ſtimulant ſubſtances.

Our moſt important object here is to diminiſh the violence of the fever and the febrile heat. If the fever be an intermittent, cinchona, rad. bened., and other bitter and lightly aſtringent remedies are proper. In nervous, malignant, or putrid fevers, cinchona, contrayerva, arnica, camphor, and acidulous ſubſtances are indicated. But moſt frequently the fever is either of the inflammatory kind, or at leaſt it is attended with a conſiderable degree of febrile heat. In this caſe we may uſe warm drinks, a decoction of flor. ſamb. tiliæ with ſpir. vitriol. oxymel ſimpl. whey with tamarinds, cream of tartar, or other acidulous ſubſtances, ſucc. berb. and rub. idæor. diluted with water, emulſion of poppy ſeeds with nitre or ſal. acetoſell. eſſential; or alſo the following compoſition: ℞. Aq. flor. ſambuc. tiliæ āā ℥ij. nitr. depur. ℥j. ſyr. rub idæi, or acetoſell. citr. ℥j. M. D. S. A table-ſpoonful to be taken every two hours. Many of theſe remedies may be adminiſtered in the form of glyſters; injections with four whey are alſo particularly to be recommended.

Finally, we muſt moderate the heat by means of external applications, of which the moſt approved are the following. ℞. borac. venet. gr. xxx. ſolv. in aq. rub. idæi ℥iij. adde ſyr. rub. id. M. D. S. A ſponge, a piece of linen, or a bruſh of lint to be dipt into it, and the mouth cleaned with it. We may alſo give a tea-ſpoonful of it every two or three hours internally, with great advantage. We may likewiſe adminiſter from time to time aq. acetoſ. with ſyrup or honey. Alſo: ℞. ſpir. vitriol. ℈ij. ſyr. violar. ℥ij. aq. commun. ℥iv. M. D. S. A table-ſpoonful to be taken every hour by adults, and a tea-ſpoonful by infants, alſo to be uſed for waſhing the mouth. We may alſo adminiſter, particularly to young children, an ounce of houſe-leek juice *(ſempervivum)*, with an equal quantity of honey. Or, according to Mr. Starke, ℞. borac. venet. ℥j. ſyr. moror. ℥j. ſyr. papav. alb. ℥ſs. M. D. S. The mouth to be cleaned with a bruſh dipped in it.

Beſides what has been already ſaid, the following directions are particularly to be attended to: as ſoon as the idiopathic aphthæ appear, it will be very uſeful to adminiſter a purgative, either of rhubarb or manna, with ſome neutral ſalt, or magneſia and rhubarb, with infants; but with adults, tamarinds and ſome neutral ſalt, or the infuſion of ſenna. When there are bilious or other impurities in the inteſtines, an emetic with tart. emet. is adminiſtered in a doſe proportionate to the age of the patient; or with children, ſulph. aurat. antim. or laxative glyſters. If the patient already complains of great pain in the throat and œſophagus, or even in the belly, theſe remedies are altogether inadmiſſible. In the ſymtomatic aphthæ it depends upon the nature of the primary diſeaſe whether it ſhall be proper to adminiſter any evacuant. Emollient and gently laxative glyſters, however, will never do any harm. With theſe remedies the liquid ones firſt mentioned are to be combined.

When the aphthæ have actually made their appearance, the above mentioned draughts and remedies are to be adminiſtered; with children, frequent injections ſhould be uſed, and the mouth waſhed with emollient decoctions, or with figs and honey of roſes, or ſome other acidulous ſyrup, applied by means of a bruſh. But when it is obſerved that they extend lower down than the fauces, or even already form cruſts and excite pain, they muſt be moiſtened, ſoftened, and gently irritated. We may then apply to the aphthæ a decoction of carrots, or the expreſſed juice of boiled carrots, with honey of roſes, by means of a bruſh; or we may let the patient ſwallow a tea-ſpoonful of this remedy in caſes of internal aphthæ. Equally beneficial is alſo a decoction of the braſſica rapa ſweetened with ſugar, or its expreſſed juice ſlightly boiled and ſweetened with honey, and its efficacy will be increaſed if we rub down the peel together with the pulp; we may alſo uſe the juice expreſſed from it after having been roaſted, mixed with honey of roſes. With theſe remedies we ſhould frequently waſh out the mouth of the patient, or let him uſe them as gargles; and where there are internal aphthæ ſome of them muſt be ſwallowed down.

We

We may alſo boil the braſſica rapa in veal broth, and let the patient eat it; and he may either drink the broth, or it may be adminiſtered in injections. Sem. lin. boiled in water, and mixed with honey of roſes, or any other acidulous ſyrup, as alſo the compoſitions with borax, are very ſerviceable in theſe caſes.

As external remedies we may uſe thoſe that have juſt been mentioned with great advantage, as alſo the following: macerate ſage in warm wine, add ſome honey, and let the patient's mouth be waſhed with it; this mixture may be applied to the mouths of infants, even though they ſhould bleed; after which the mouth is to be waſhed again, by means of a bruſh, with ſyrup of mulberries, honey of roſes, ſyrup of quinces, or the juice of ſour cherries, diluted with an infuſion of ſage, and two or three drops of the ſpirit of vitriol; or we may uſe white vitriol diſſolved in barley-water, with the addition of honey of roſes; a decoction of roſe-leaves with honey has alſo produced very good effects. The following remedy has likewiſe been recommended: ℞. mell. commun. ℥j. borac. venet. ʒij. alum. uſt. ʒſs. aq. roſar. ℥ſs. M. D. S. To be applied to a bruſh, and the mouth cleaned with it. Finally, when the cruſts will not ſeparate, we may uſe the following compoſition: ℞. ſpir. cochlear. ʒv. ſucc. citr. preſſ. ʒj. M. For waſhing the mouth we may uſe alſo the decoction of Peruvian bark.

When the aphthæ at firſt appear diſcoloured and gangrenous, or become ſo in the courſe of time, we ſhould uſe the following compoſition: ℞. terr. catech. ʒiij. coq. in aq. calc. lbj. ad rem. ℥viij. colct. add. ſacch. ſaturn. ℈ſs. mell. roſar. ℥ij. M. D. S. A table-ſpoonful to be taken every hour, held for ſome time in the mouth, and ſwallowed down ſlowly. Cinchona adminiſtered internally, in injections, and mixed with honey of roſes, is likewiſe recommended. The ſame mode of treatment is to be purſued with the ſymptomatic aphthæ.

When the aphthæ ſlough off, and the parts become raw, ſore, bloody, and painful, the following mucilaginous and gently aſtringent remedies are uſeful: mucilag. cydon. with aq. ſalv. or ℞. aq. roſar. ℥ij. vitell. ovor. N° ij. ſyr. papav. alb. ℥j. crem. tart. ʒſs. M. Alſo borax with ſyrup of poppies, emulſion of poppy ſeeds, and even opium triturated with mucilage of quinces, and diluted with water, may be uſed with advantage. But if the parts appear diſcoloured, or the pain in general has abated, we may adminiſter the remedies mentioned juſt before, as they are of a more aſtringent nature, and tend to check inflammation and gangrene; alſo whey with vinegar, the juice of lemons and oranges, or oxymel; a decoction of hb. agrimon. & mel. roſat. is recommended, to which acetoſ. may be added; alſo Peruvian bark.

When the aphthæ have ſloughed off, both in the mouth and other parts, which we may know to be the caſe when any of them are voided by ſtool; when a ſufficient quantity of ſtrengthening remedies has been employed, which may be known by the abatement of the fever, and the abſence of morbid matter in the humours; purgatives, and particularly thoſe of a mucilaginous and tonic nature, are neceſſary; ſuch as tamarinds, manna, rhubarb, or glyſters made with theſe ſubſtances, in order that any impurities that may ſtill remain in the ſtomach and inteſtines may completely be evacuated.

Sometimes, however, the aphthæ, particularly the ſymptomatic, produce other peculiar ſymptoms; as in children, when they alleviate the other ſymptoms of the diſeaſe as ſoon as they make their appearance, in which caſe we muſt endeavour to promote the eruption by means of the above-mentioned decoction of braſſica rapa, and other ſimilar remedies. When the fever becomes of a malignant and putrid nature, cinchona, ſerpentaria, contrayerva, muſtard with ſome ſp. ſalis and mell. roſar., alſo butter-milk, are the proper medicines. When they are of a ſcorbutic or venereal nature, theſe morbid poiſons muſt be counteracted by the appropriate remedies.

When the bowels are obſtructed, we muſt looſen them by means of emollient glyſters with chamomile flowers, decoction of oats, ſoap, or oil of almonds. Frequently a violent and exhauſting diarrhœa comes on, which is to be checked by mucilaginous medicines, ſuch as corn. cerv. gum arabic diſſolved in barley water, with the addition of a quantity of ſaffron; the ſame end may alſo be obtained by means of opium, laud. liq. or tinct. opii and ſyr. paſſav. which the mother or nurſe may alſo take; and ſome time after having taken it give the infant breaſt. Mucilaginous glyſters with theriaca and ſoap are ſometimes very effectual. When a troubleſome and pernicious ſalivation comes on, it muſt firſt be treated with mucilaginous and gently aſtringent remedies, ſuch as mucilag. cydon. aq. ſalv. &c. and afterwards with ſtronger, ſuch as a decoction of rad. tormentill. herb. agrimon. or granate with honey of roſes.

The hiccup, with which patients are ſometimes attacked, frequently ceaſes ſpontaneouſly; however, nouriſhing mucilaginous remedies, combined with a little opium, will contribute much to remove it. With a view to reſtore the patient's ſtrength, mild, light, and mucilaginous ſubſtances muſt be given him, in order that the ſtomach and bowels may again become uſed to food; *e. g.* barley-water, ſago, ſalep, jelly, and even ſenegal. When the ſtomach has become ſomewhat accuſtomed to the reception of theſe ſubſtances, the patient may gradually return to his former diet.

With adults, aphthæ occur in various kinds of fever, but particularly in thoſe autumnal fevers which commence with diarrhœa or dyſentery, when the impurities of the bowels have not only not been evacuated, but have been detained by the medicines that have been uſed. Such aphthæ have ſometimes been obſerved to be epidemic; and they frequently appear in hectic fevers. The prognoſis depends upon the nature of the diſeaſe which accompanies the aphthæ, and the ſtrength of the patient. It is an unfavourable circumſtance when, after the aphthæ have made their appearance, the fever returns, the pulſe grows ſmall and weak, and the appetite is not reſtored.

This ſpecies of aphthæ is to be treated like the reſt; but when they are accompanied with a putrid fever, we muſt be very cautious with regard to the uſe of evacuating remedies: antiſeptic and other appropriate remedies ſhould rather be adminiſtered, and theſe combined with the former. When the aphthæ have ſeparated, acrid and too ſtimulant medicines and food, as alſo cold air and drink, ſhould be avoided; leſt the former ſhould excite inflammation or ſuppuration in the ſtomach and bowels, and the latter a new ſwelling of the mouth, and the moſt dangerous ſpecies of angina.

APHTHARTODOCETÆ, in *Eccleſiaſtical Hiſtory*, a ſect, ſworn enemies to the council of Chalcedon.

The name is derived from ἀφθαρτος, *incorruptible*, and δοκεω, *I imagine*; and was given them, becauſe they imagined the body of Jeſus Chriſt was incorruptible and impaſſible, and not capable of death.

They aroſe among the Eutychians, and made their firſt appearance in 535.

APHTHONIUS, in *Biography*, a rhetorician of the third century, wrote a work entitled "Progymnaſmata Rhetorica," or Rhetorical Exerciſes; firſt publiſhed in Greek by Aldus, at Venice, in 1508; afterwards with Hermogenes

mogenes and Longinus, in 8vo at Gen va, in 1560; and at Upfal, in 1670, by Scheffer, with a tranſlation and notes. To the ſame author are aſcribed Fables, printed with thoſe of Æſop, at Franckfort, in 1610. Suidas. Fabr. Bib. Græc. l. iv. c. 31. § 12. t. iv. p. 449.

APHYA, in *Ichthyology*, a ſpecies of CYPRINUS that inhabits in ſhoals the ſhores of the northern European ſeas. The body is pellucid; iris red; and the anal fin contains nine rays. Linn. Gmelin. Müll. According to Fauna Succica, the dorſal fin contains ten rays; pectoral twelve; ventral ſeven; anal nine; and caudal nineteen. It is from an inch and an half to four inches and an half in length; is long, thick, round, and covered with ſcales of a moderate ſize; above the colour is brown, beneath white or red. Fleſh white and ſavory. Upper jaw rather longeſt, iride of the eye yellow, encircled with red; lateral line along the middle ſtraight; fins cinereous, greeniſh at the baſe.

APHYA is likewiſe a ſpecies of GOBIUS found in the Nile and Mediterranean ſea. The firſt dorſal fin has ſix rays; ſecond ſixteen; pectoral eighteen; ventral twelve; anal fourteen; and caudal thirteen. Body and fins barred with brown. Linn. Gmel. Art. &c.

APHYLLANTHES, in *Botany*, (ἄφυλλος ἄνθος, a flower without leaves). Linn. gen. 408. Schreb. 556. Juſſ. 44. Claſs, *hexandria monogynia*; nat. order of *tripetaloidea, junci*, Juſſ.; Gen. character, *cal.* glumes univalve, lanceolate, ſeveral, imbricate; *cor.* petals ſix, ovate, ſpreading; *claves* ſlender, erect, converging into a tube; *ſtam.* filaments ſetaceous, ſhorter than the corolla, inſerted into the throat, anthers oblong; *piſt.* germ ſuperior, three-cornered, turbinate; *ſtyle* filiform, of the length of the ſtamens; *ſtigmas* three, oblong; *per.* capſule turbinate, triangular, trilocular; *ſeeds* ovate. Species 1, aphyllanthes montpelienſis; root creeping; culms naked, ſimple, ſurrounded at the baſe with ſheaths like theruſh: glume two-valved, two-flowered. It grows wild near Montpellier, in barren and rocky places. This plant differs ſolely from the ruſh in having a corolla.

APHYLLON. See OROBANCHE.

APHYLLUS, formed of α, *priv.* and φύλλον, *a leaf*, denotes leafleſs.

APHYTEIA, a plant having neither root, ſtem, nor leaves (from α, and φυτὸν). Linn. gen. Schreb. 1104. Amœn. Acad. 8. 312. Supp. pl. 48. Hydnora. Thunb. Act. Holm. 1775. 69. Claſs, *monadelphia triandria*. Generic character, *cal.* perianth monophyllous, ſemitrifid, funnel-ſhaped, large, fleſhy, erect, permanent; *corolla*, rudiments of three petals, growing to the diviſions of the calyx; *ſtam.* filaments connate at bottom, ſhort; *anthers*, convex, cordate, ſtriated; *piſt.* germ inferior; *ſtyle*, thickiſh, ſhort; *ſtigma*, triangular, channelled; *per.* a berry, one-celled; *ſeeds*, numerous, neſtling. There is one ſpecies, viz. *Aphyteia hydnora*, a vegetable without leaves, ſtem, or root,; paraſitical, terreſtrial, conſiſting of a ſingle fructification, which is four inches over, ſeſſile, coriaceous, ſucculent; calyx large, with an erect trifid border, white within, ſcutiform. The ripe fruit, which is not unpleaſant to the ſmell, is eaten, both raw and roaſted, by the Hottentots. Diſcovered by Thunberg at the Cape of Good Hope.

APHYTEIA, or APHYTIS, in *Ancient Geography*, a town of Thrace in the Pallena, a peninſula ſouth-weſt of the Thermaic gulf. Plutarch relates, that when Lyſander laid ſiege to this town, Jupiter Ammon appeared to him, and ordered him to abandon it.

APIAN, PETER, in *Biography* an eminent aſtronomer and mathematician, called in German *Bienewitz*, was born at Loiſnich in Miſnia, and became profeſſor of mathematics at Ingolſtadt, in 1524. He wrote ſeveral valuable mathematical and aſtronomical treatiſes, and enriched aſtronomy with many inſtruments and obſervations. His firſt work was a treatiſe on "Coſmography, or Geographical Inſtruction," which was publiſhed in 1530, and ſeveral times republiſhed, particularly by Gemma Friſius. In 1533, he conſtructed, at Nuremberg, a curious inſtrument, called from its figure, "Folium populi," which ſhewed the hour of the day by the ſun's rays, in all parts of the earth, and even the unequal hours of the Jews. In 1534, he publiſhed his "Inſcriptiones orbis;" and in 1540, his "Inſtrumentum ſinuum, ſive primi Mobilis," with 100 problems. In the ſame year his principal work, intitled "Aſtronomicon Cæſareum," was publiſhed at Ingolſtadt; and it contains many intereſting obſervations, with the deſcriptions and diviſions of inſtruments, calculations of eclipſes, and the conſtruction of them in plano. In the ſecond part of this work, or the "Meteorologicum Planum," he deſcribes the conſtruction and uſe of an accurate aſtronomical quadrant, and he has annexed to it obſervations of five different comets, *viz.* thoſe of 1531, 1532, 1533, 1538, and 1539, and here he has firſt ſhewn that the tails of comets are always projected in a direction oppoſite to the ſun. The elements of the comet of 1532 were nearly the ſame with thoſe of one obſerved 128½ years after, *viz.* in 1661, by Hevelius and others: hence Dr. Halley inferred that they were the ſame comet, and it was expected in the beginning of the year 1789. But aſtronomers, either through an error of Apian, or from ſome other cauſe, were diſappointed. Apian was alſo the author of many other works, among which may be enumerated the "Ephemerides" from 1534 to 1570; "On Shadows;" "Arithmetical Centilogues;" "The Rule of Coſs," or Algebra demonſtrated; "On Gauging;" "Almanacs;" "On Conjunctions;" "Books of Eclipſes;" "The Works of Ptolemy, in Greek;" the Works of Azoph," an ancient aſtrologer; "The Works of Gebre;" "The Perſpective of Vitellio;" "Of Critical Days, and of the Rainbow;" "A new Aſtronomical and Geometrical Radius, with various uſes of ſines and chords;" "Univerſal Aſtrolabe of Numbers;" "Maps of the World, and of particular Countries," &c. &c. Apian was treated with great reſpect by the Emperor Charles V., who publiſhed ſeveral of his works at his own expence, conferred on him the honour of nobility, and preſented him with 3000 crowns of gold. Apian, after a life devoted to ſtudy and the improvement of ſcience, died at Ingolſtadt in 1552. His ſon Philip, who ſurvived him, was alſo an eminent aſtronomer, and taught mathematics both at Ingolſtadt and Tubingen. He was born in 1531, and died in 1589. He has left a treatiſe on "Solar dials," and other writings. Tycho has preſerved his letter to the Landgrave of Heſſe, in which he gives an opinion on the new ſtar that appeared in Caſſiopeia, in 1572. Voſſ. de Scient. Montucla Hiſt. Mathem. tom. i. p. 623. Hutton's Math. Dict. Nouv. Dict. Hiſtor.

APIARIA, in *Entomology*, a ſpecies of MUSCA. (Linn.) The anterior part of the thorax is yellow; abdomen black at the apex; tips of the wings ferruginous. Gmelin. This kind inhabits Italy, and ſomewhat reſembles muſca myſtacea. The antennæ are feathered, front of the head, poſterior part of the thorax and abdomen, except the apex, black. Wings obſcure. Obſ. This is SYRPHUS APIARIUS of Fabricius. Spec. Inſ.

APIARIUS, a ſpecies of ATTELABUS; bluiſh, upper wings red, and three black bands; Gmelin. This is the clerus, with red wings, and three bluiſh bands of Fabricius; the clerus nigro-violaceus hirſutus, &c. of Geoff. Clerus ceruleo-violaceus of Degeer; and dermeſtes apiarius of Schranck. Found in Europe, America, and Siberia.

APIARY,

APIARY, from *apis*, a bee; a garden or place where bees are kept. The ancient as well as modern writers on bees agree in recommending a ſouthern aſpect as the moſt proper for this purpoſe; as a general rule bee-hives ſhould be placed in ſituations that are little expoſed to the wind, and enjoy as much of the influence of the ſun as poſſible: as wind always retards the bees in their work, while the ſun's beams invite them to it. Thus, though it be well known, that bees will thrive well in high and windy ſituations, a low one is obviouſly always to be preferred. In the vicinity of the apiary, there ſhould conſtantly be abundance of flowers, from which the bees may collect their wax and honey. Mr. Bonner, a late writer on the management of bees, obſerves, that were a choice allowed him where to place his bees, it ſhould be in an eaſterly ſituation, a hollow glen by the ſide of a rivulet, ſurrounded with abundance of turnips in bloſſom in the ſpring, muſtard and clover in ſummer, and heath in the latter end of autumn and harveſt; with a variety of other garden and wild flowers in their ſeaſons. It is not, however, to be underſtood from this, that bees will not thrive unleſs they are placed in ſuch an advantageous ſituation, as the contrary can, he ſays, be proved; for bees have thriven amazingly well in places where they were not within reach of any of the abovementioned flowers: but although they will do well in moſt ſituations, and fly far for their food, yet they will thrive far better when ſituated among or near good paſture, and ſurrounded with plenty of food, and Mr. Keys properly remarks that the hives ſhould be clear from the droppings of trees and the annoyance of dunghills, long graſs and weeds, as by theſe means inſects are bred which are not only deſtructive to the bees, but which greatly retard them in the preparation of honey. See BEE, and BEE-HOUSE.

APIASTELLUM, in *Botany*, the name of two different ſpecies of plants with different authors; Dodonæus expreſſing by it the common baum; and Apuleius the black bryony.

APIASTER, in *Ornithology*, a ſpecies of MEROPS found in Europe and Aſia. The back is ferruginous; abdomen and tail azure green, the two middle tail feathers long; chin yellow. Linn. Gmel.

This is MEROPS GALILAEUS of Haſſelquiſt, ISPIDA cauda molli of Kramer, guêpier of Buffon, ſchaeghaghi of Forſkal, and common BEE-EATER of Engliſh writers. Its length is about ten inches, of which the bill is an inch and three quarters. The pervading colours are green and blue, blending into each other; it has a few whitiſh feathers at the baſe of the upper mandible, and on the forehead a ſpace of blue green, behind this another of green, and then ſucceeds the cheſnut colour, tinged with green, and becoming paler on the back. From the bill to the back of the head is a black ſtripe that ſurrounds the eyes. Under parts of the body blue-green, paleſt on the belly. Leſſer wing-coverts dull green, middle one rufous, and the greater ones an intermediate colour between both green and rufous. The legs are of a reddiſh brown, and the claws blackiſh.

It takes the name of bee-eater becauſe thoſe inſects are its uſual food; but it purſues and devours other kinds, as gnats, flies, and cicadæ, on the wing, like the ſwallows; and at times will eat various kinds of ſeeds. Ray ſuppoſes, from its ſimilarity to the king's-fiſher, it may poſſibly feed on fiſh. Willoughby tells us on the teſtimony of Belon, "that its ſingular elegance invites the boys in the iſland of Candia, which it inhabits, to hunt for it with cicadæ, as they do for thoſe greater ſwallows called ſwifts, after this manner; bending a pin like a hook, and tying it by the head to the end of a thread, they thruſt it through a cicada, (as boys bait a hook with a fly), holding the other end of the thread in their hands; the cicada, ſo faſtened, flies nevertheleſs in the air, which the merops ſpying flies after it with all her force; and catching it ſwallows pin and all, wherewith ſhe is caught." Will. Orn.

APIASTRA, or American king-fiſher. See ALCEDO *leucorhyncha*.

APIASTRUM, in *Botany*, a name given by the ancients to two different plants of ſuch contrary form and qualities, that it is unlucky they ſhould have given occaſion of confounding them together, as miſtakes about them might be of fatal conſequence. The one of theſe plants was the poiſonous *water-crowfoot*; which they called apiaſtrum, becauſe of its having leaves that ſomewhat reſembled thoſe of ſallage. The other apiaſtrum is the common garden baum, ſo called by theſe writers, from their having obſerved that the bees were very fond of it.

APICALIS, in *Entomology*, a ſpecies of PHALÆNA, in form and ſize reſembling phalæna purpuralis. It is a native of South America, and its ſpecific character is, according to Fabricius, wings deep yellow, with a brown ſtreak, apex obſcure purple, with a yellow ſpot and two white dots on the margin. Obſ. In the Linnæan arrangement, this inſect belongs to the pyralis ſection of the Phalæna genus: Fabricius places it with the geometræ.

APICE, in *Geography*, a town of Italy, in the kingdom of Naples, and Principato Citra; ſeven miles eaſt-ſouth-eaſt of Benevento.

APICES, SUMMITS, in *Botany*, the ſame with ANTHERÆ.

APICILIA, in *Ancient Geography*, a town of Italy, at ſome diſtance eaſt of Concordia, in Carnia.

APICIUS, in *Biography*, a name rendered infamous by the gluttony and epicuriſm of three perſons at Rome, to whom it belonged. The moſt notorious of theſe lived under Tiberius; and he is recorded as the inventor of ſeveral new ſauces and delicacies, and as having kept, as it were, a ſchool of gluttony at Rome. Seneca and Martial inform us, that he ſquandered away in the gratifications of the table an hundred million of ſeſterces, which, computed by Mr. Raper's rule for Imperial money (ſee SESTERCES), amounts to about 853,601 l. ſterling; and when he found, that, after payment of his debts, he ſhould have but a tenth part of this ſum, he poiſoned himſelf for fear of ſtarving. Pliny deſcribes him, in reference to ſome of the diſhes of his invention, as "nepotum omnium altiſſimus gurges," *i. e.* the deepeſt whirlpool of all ſpendthrifts. Athenæus (Deipnos. lib. iv. p. 168.) mentions another Apicius of ſimilar celebrity, who lived about the year of Rome 660, and was the cauſe of the baniſhment of Rutilius. The third Apicius lived under Trajan; and having a ſecret for preſerving oyſters, he ſent ſome perfectly freſh to the emperor as far as Parthia. A work "De re culinaria," is extant under the name of Cælius or Cæcilius Apicius, which is ſuppoſed to have been written at a later period. Crevier's Rom. Emp. vol. ii. p. 227 Gen. Dict.

APICULUM, in *Antiquity*, a kind of thread or fillet which the flamens wore, in the heat of ſummer, in lieu of the APEX.

Feſtus ſpeaks of the *apiculum* as a cover for the *apex*; but the paſſage ſeems to be corrupt.

APIDANUS, in *Entomology*, a ſpecies of PAPILIO found in Surinam. The wings are tailed, blue; the lower ones, beneath brown, varied with blue; a double golden-coloured ſpot in the anal angle. Fabricius and Gmelin. Obſ. In the Fabrician ſyſtem it belongs to the HESPERIA genus; in that of Linnæus and Gmelin, it ſtands in the PAPILIO genus. (Section Pleb. rural.) The wings are edged with black and have a ferruginous ſpot at the baſe on the underſide.

APIDANUS, APIDANO, in *Geography*, a river of European Turkey, which runs into the Peneus, near Larissa.

APIFORMIS, in *Entomology*, a species of MUSCA, found in Germany. It is hairy and black; thorax at the base, and beneath, and the abdomen, yellow; tail whitish. Schrank. Gmelin. Pupa sooty, gibbous, found in decayed trees. Obs. This belongs to the section that has the hair of the antennæ naked. There is likewise another insect in the same genus called APIFORMIS by some: it inhabits Germany; is downy; thorax black with white dots and lines: abdomen yellow with black bars.

APIFORMIS, is also a species of SPHINX, in the Linnæan system, and SESIA in that of Fabricius. The wings are transparent, abdomen yellow with black belts; thorax black, with two yellow spots on each side. Linn. Fab. It lives in the larva state in the trunks of willow trees. This is sphinx scopigera of Scopoli; sphinx crabroniformis, Wien. Schmetterl.; and sphinx apiformis, hornet sphinx, Donov. Brit. Inf. tom. xxv.

APILAS, in *Ancient Geography*, a river of Macedonia, in Pieria.

APINA, a town of Italy, in Daunia.

APION, in *Biography*, a learned grammarian and historian, was born at Oasis in Egypt, about the beginning of the Christian æra; and probably derived his name from Apis, the Egyptian deity. The character of Apion, whatever might be his talents or learning, was that of a pedant, who took pains in investigating and ascertaining matters of trifling importance. Accordingly he took infinite pains, and had even recourse to magic, in order to discover the country and family of Homer. He valued himself on having discovered that the two first letters of the Iliad, considered numerically, amounted to 48, and he fancied that the poet had used these letters designedly to express the number of books. Hence he also concluded that the opening of the first poem was last written. His arrogance and ostentation are justly reprehended by Pliny, when he says (Præf. in Nat. Hist.); "a certain grammarian, named Apion, whom Tiberius called the cymbal of the world, but who might more properly be styled the drum of public fame, boasted that he conferred immortality on those to whom he dedicated any of his writings; an arrogant boast which time has refuted; for all the works of Apion are lost; and his name only lives in the writings of others."

Having been admitted to the citizenship of Alexandria, whence he obtained the appellation of Alexandrinus, he was sent to Caligula as chief of the embassy which carried complaints to the emperor against the Jews; and, on the other hand, Philo and several other deputies were commissioned to justify their conduct. Apion executed his charge with much partiality and rigour, and instead of confining himself to the subject in dispute, preferred charges against the Jews of a foreign nature, which merely tended to exasperate the emperor; accusing them of refusing to consecrate images to him, and to swear by his name. He also wrote a work with the express purpose of fixing reproach upon them, which Josephus refuted in a direct reply "against Apion," which he also designed as an apology for his Jewish antiquities. He wrote, moreover, a learned treatise "On the Antiquities of Egypt," in five books, one of which is cited by Tatian. In this work he also treated so largely on the pyramids of Egypt, that Pliny (Nat. Hist. lib. xxxvi. c. 12.) mentions him as a principal authority on this subject. He also wrote "On the luxury of Apicius;" "On the Roman Tongue;" "On the knowledge of metals;" and on "Universal History." Gen. Dict. Nouv. Dict. Histor.

APIOS, in *Botany*, see GLYCINE and EUPHORBIA.

APIRA, or APEIRA, in *Ancient Geography*, a town mentioned by Homer, and supposed to be that called Apera or Adapera. M. d'Anville places it in Galatia, to the west of Tavium, and south of Halys.

APIRÆ, a town of Asia Minor in Lycia, situate near the sea coast of Andriace, and south east of Myra.

APIS, MUSCA, the *bee*, or *fly*, in *Astronomy*, a southern constellation, containing four stars; the principal of which is marked by the abbe de la Caille, in his catalogue of stars, for 1750, with $185° 38' 44''$ of right ascension, and $67° 45' 15''$ of south declination.

APIS, in *Entomology*, a genus of the HYMENOPTERA order in the Linnæan system, and thus defined in his Systema Naturæ, by Gmelin; mouth horny, jaw and lip membranaceous at the apex; tongue inflected; palpi four, unequal, and filiform, antennæ filiform, and short; wings flat; sting of the females and neuters acute and concealed.

The species are numerous, and divided into several families: in the first are these, linguaria, glauca, longicornis, tumulorum, clavicornis, farfarisequa, curvicornis, centuncularis, punctata, cincta, bombyleus, muscaria, hæmorrhoidalis, cineraria, analis, hæmorrhousa, mexicana, carbonaria, retusa, rufa, lunata, bicolor, villosa, pubescens, mystacea, tunetana, bicornis, maxillosa, florea, truncorum, florisomnis, flavipes, dentata, cordata, versicolor, mellifica, disjuncta, rufipes, thoracica, flavifrons, cunicularia, argillosa, lagopus, mussitans, pilipes, plumipes, manicata, florentina, ireos, maculata, stictica, interrupta, varia, rotundata, erythropus, ferruginea, trispinosa, quadridentata, lanipes, cæcutiens, tridentata, fasciata, barbara, conica, sexcincta, quadricincta, annulata, smaragdula, albipes, ferruginata, bipunctata, cariosa, dimidiata, latipes, violacea, nigrita, caffra, africana, olivacea, carolina, terrestris, cryptarum, ruderata, nemorum, soroensis, hortorum, pratorum, lapidaria, sylvarum, bryorum, agrorum, muscorum, hypnorum, sibirica, fragrans, lucorum, brasilianorum, acervorum, subterranea, maiorum, surinamensis, virginica, hispanica, antiguensis, americanorum, aestuans, tropica, senilis, feminuda, alpina, leucorhousa, chalcoptera, cyanoptera, melanocephela, grisea, collina, floralis, musciformis, luctuosa, degener, vespiformis, agilissima, fuliginosa, arvensis, fulva, * bryorum, convexa, cetii, leucozonia, leucostoma, hirta, bicincta, hemisphærica, fulviventris, noveboracensis, albifrons, vesparia, sericea, præcox, vespoides, sphegoides, minuta, sanguinolenta, leucopus, leucomelas, lutea, acuminata, fusciventris, nigriventris, cinerascens, leskii, crocata, literata, nebulosa, fulvipes, annulus, sordida, lutescens, armata, denticulata, rufescens, lutulenta, chrysostoma, ochrocephala, ursina, nigricans, cana, triangulum, rostrata, canescens. The whole of this family is distinguished by a five-cleft tongue, and very short palpi; and are with few exceptions strictly apes of the Fabrician system. (Ent. Syst.) Also, for the character of his genus APIS is, *Os* lingua inflexa, quinquefida, *palpi* brevissimi, *antennæ* filiformes; and he includes nearly all the same species as Gmelin.

A trifid tongue is the chief criterion of the second section, which is again subdivided into two families, the first corresponding with the ANDRENA genus of Fabricius, and the second with the NOMADA of the same author. The species of the two subdivisions are these: in the first helvola, bicolor, tricolor, malabarica, æthiops, quadrifasciata, succincta, cingulata, virescens, bidentata, gulosa, dichroa, hirtuta, ciliata, zonata, marginella, ænea, labiata, cornuta, cœrulescens, maculosa, flavicornis, fascicornis, subvillosa, rubicornis, guttata. And in the second, suecica, hattorfiana, gibba, fabriciana, variegata, agrestis, ruficornis, lineata, scutellaris, histrio, riparia, squalida, montana, minor, ranunculi, nasuta, tranquebarorum, morio.

"The

"The induſtry of theſe little animals (ſays an ingenious writer), which is as profitable, as curious in itſelf, will always continue to excite the admiration of the wiſer part of mankind." Swammerdam, Reaumur, Hagſtrom, D'Aubenton, Geoffroy, and others, have written their hiſtory with great accuracy. Swammerdam, above all, deſerves to be read with the greateſt attention. To theſe may be added the names of ſeveral later naturaliſts, who have beſtowed uncommon attention upon their œconomy and manner of life, as will be more fully noticed in the article BEE, a term by which theſe creatures are better known to the Engliſh reader than that of apis.

In this general term it muſt notwithſtanding be obſerved many creatures are included, which, in the opinion of naturaliſts, do not belong to the ſame family, or even genus. This is obvious on the ſlighteſt inſpection of a few of the ſpecies ſo named; but whether, on the other hand, the characters laid down, by moſt of thoſe naturaliſts, for aſcertaining the different families and genera, are not rather more capricious than juſt, deſerves conſideration. It is certain that no two writers have yet agreed upon the ſame characters by which they are to be divided into ſections, and each ſeems to have had his own ſyſtem for their arrangement.

Linnæus, to whom a comparatively ſmall number of ſpecies was known, contented himſelf with dividing them into two families, one including thoſe with ſmooth bodies, or with only a few hairs upon them, *apes proprie dictæ*, and the other *bombinatrices hirſutiſſimæ*, with bodies very hairy. Theſe ſubdiviſions have been ſince found too vague and inapplicable for a number of later diſcovered ſpecies, and even for thoſe Linnæus had deſcribed; for, as Scopoli obſerves, the noiſe they make in their flight, and the hair on their bodies, increaſe ſo gradually, as to render it uncertain where the firſt family ſhould terminate, or the ſecond commence: and therefore he divides them in a different manner, into two ſections, according to the form of the antennæ, which in ſome were ſtraight, and in others bent, and forming an angle from the baſe, *antennis rectis*, and *antennis baſi infractis*; but he then perceived the inſufficiency of his own ſyſtem, as it would unavoidably exclude ſome ſpecies with which he was well acquainted, and for that reaſon he afterwards divided them into three diſtinct genera, *viz. eucera*, *apis*, and *nomada*.

Geoffroy, after Scopoli, gives this character of his *apes*; L'Abeille, antennes briſées, dont le premier anneau eſt très-long. Ailes inférieures plus courtes. Bouche armée de machiores, avec une trompe membraneuſe cochée en deſſous. Aiguillon ſimple et en pointe. Ventre attaché au corcelet par un pédicule court. Trois petits yeux liſſes. Corps velu. And theſe are divided into two families. Famille 1^e^. Abeilles proprement dites. Corpore villoſo. Famille 2^e^. Abeilles—bourdons. Corpore hirſutiſſimo. Theſe characters differ only in one exception from the VESPA genus of the ſame author, in which, inſtead of the body being hairy or downy, it is glabrous.

Degeer divides the apis into two genera, *apis* and *nomada*: the firſt he defines, antennæ fractæ articulo primo longiori; os dentibus et roſtro flexili fracto: ſurſumque plicato; alæ planæ; abdomen thoraci petiolo brevi adnexum; aculeus punctorius in abdomine reconditus: oculi reticulati ovales integri. And the ſecond, antennæ clavatæ vel filiformes articulus duodecim; os dentibus et roſtro porrecto vaginâ cartilagineâ cylindricâ; alæ planæ; abdomen petiolatum; aculeus punctorius in abdomine reconditus: oculi reticulati ovales uniti.

The Fabrician diviſions of the *apes* are theſe: HYLÆUS, ANDRENA, APIS, EUCERA, and NOMADA. The character of his genus APIS is, os lingua, inflexa, quinquefida; palpi brevioſſimi; antennæ filiformes. Ent. Syſt. (Tongue inflected, five-cleft; feelers very ſhort; antennæ filiform.)

Gmelin, we think, ſhould rather be commended than cenſured for the cautious manner in which he has adapted the improvements of the latter writer, to that of his great maſter, Linnæus; for had he ventured to divide the genera, and deſtroy the diſtinctions Linnæus had laid down, inſtead of endeavouring to reduce the newly-diſcovered ſpecies to his arrangement, he would have incurred more blame than he has for avoiding it. Some may perhaps think he has been cautious to a fault, and not made thoſe alterations that are abſolutely requiſite; the arrangement unqueſtionably demands ſome amendment.

Roemer, in his "Genera inſectorum Linnæi et Fabricii iconibus illuſtrata," gives another definition of APIS, to which it is objected, he introduces more characters than are needful; ſome of them belonging only to certain families, are conſequently not generical diſtinctions. APIS *os* maxillis dentatis, atque *proboſcide* inflexa, vaginis duabus bivalvibus *linguam* includentibus. *Capite* triangulare, fronte plana, flexum. *Antennæ* ſæpe pedatæ, primo articulo reliquis longiore. *Alæ* planæ, in omni ſexu. *Aculeus* punctorius reconditus, retractilis, ſerratus, feminis et neutris. *Tarſi* quinque articulis, primo longitudine tibiæ, compreſſo, ciliato, tranſverſim ſulcato. P. 28.

M. Latreille, about ſix years ſince, publiſhed a work at Paris, intitled, "Précis des caractères génériques des inſectes, diſpoſés dans un ordre naturel," in which the characters are taken from the antennæ, labium ſuperius, mandibulæ, lingua, maxillæ, tubus and palpi. The APIS, which, like Fabricius, this writer places between nomada and eucera, is thus briefly deſcribed; APIS, langue de trois pieces. (Organes de la nutrition plus petits dans les mâles.)

The lateſt treatiſe on *apes* is that of the Rev. Wm. Kirby, entitled "Monographia Apum Angliæ," a book we ſhall advert to more fully hereafter. It is an attempt to divide into their natural genera and families ſuch ſpecies of the Linnæan genus APIS as have been diſcovered in England; but the introductory and collateral remarks take a wider range. By way of illuſtration, theſe include many obſervations on the claſs *hymenoptera*, to which they belong; and a comparative view of the exotic ſpecies analogous to thoſe he deſcribes. Mr. Kirby firſt reviews the ſeveral characters of the genera into which different authors have divided *apes*, and after pointing out imperfections in each, proceeds to offer an arrangement altogether diſtinct from either.

His two genera are MELITTA, and APIS: the eſſential character of the firſt is, *aculeus* punctorius; *lingua* apice brevis, porrecta, planiuſcula, vaginâ ſubcylindricâ: and of the ſecond, *aculeus* punctorius; *lingua* elongata, inflexa. To each of theſe are added an artificial and a natural character. The artificial character of MELITTA is *os* proboſcide ſubcylindricâ, porrectâ linguam brevem, planiuſculam, exerente. *Antennæ* mediæ, aculeatis ſubclavatæ articulis 13; maribus ſiliformis, articulis 14. *Oculi* laterales, ſub ovales, integri. *Alæ* planæ. *Aculeus* punctorius, reconditus. That of APIS is *os* proboſcide fractâ, inflexâ, linguam cylindricam, elongatum, exerente. *Antennæ* mediæ, aculeatis articulis 13; maribus articulis 14. *Oculi* laterales, ſubovales, integri. *Alæ* planæ. *Aculeus* punctorius reconditus.

After ſtating theſe characters of the two genera MELITTA, and APIS, Mr. Kirby proceeds to mention the diſtinctions which divide them into families; in which his aim, as he obſerves, has not been ſo much to fix upon artificial cha-

racters, which often disunite those insects which nature has put together, but to discover whether the all-wise author of nature, who is a GOD of order, has not subdivided these genera, and impressed certain common characters upon such subdivisions, by which one who studies his works under no influence but a love of truth, and led by a single desire of finding out *his* system, might not be enabled to arrange them according to their natural affinities.

His first step was to place together all those individuals which appeared to agree in habit, adopting the sentiment of Linnæus, that habit would often lend a clue to discover nature. This led him at first to commit many mistakes; for relying solely on habit for the arrangement of species, he often placed the males in one subdivision, and the females in another; he however succeeded to arrange them very nearly according to their natural affinities, and by attending to the proboscis, and external anatomy, was enabled to detect the constant characteristics of the males in these genera, exclusive of their *genitalia;* and by further observations on those he had an opportunity of taking alive, and inspecting these parts, the mistake alluded to was in a manner rectified, and instead of confusion, lucid order now took place in the arrangement. "Thus (says the author) beginning with habit, and ending with anatomy and economy; descending from generals to particulars, and then tracing back my steps from particulars to generals; using both the synthetical and analytical modes of reasoning, as mathematicians speak, by a series of observations and experiments frequently repeated, I was enabled to trace the labyrinth of nature, and, by the assistance of this double *filum ariadneum,* to establish my system upon a sure basis."

The distinctions of these two families are as follow: MELITTA.—* *Linguâ* obtusâ,—a. *linguâ* obtusâ, apice bilobâ.—b. *lingua* obtusâ, apice truncatâ.—** *Linguâ* acutâ.—a. *labio* inflexo, emarginato—b. *labio* appendiculato, appendiculâ inflexâ.—c. *labio* obtusangulo, tuberculo munito.—APIS.—* *Proboscide* laciniis exterioribus nullis.—a. *Antennis* subclavatis in omni sexu.—b. *Antennis* filiformibus in omni sexu.—**Proboscide* laciniis exterioribus instructâ.—a. *Palpis* exterioribus 5-articulatis. *Labio* subquadrato.—b. *Palpis* exterioribus exarticulatis. *Labio* antice curvo.—c. *Labio* inflexo, elongato.—1. *Ventre* femineo glabro.—α. abdomine femineo conico, acutissimo.—β. femineo subcylindrico obtuso.—2. *Ventre* femineo hirsuto.—α. *Palpis* omnibus biarticulatis.—β. *Palpis* exterioribus exarticulatis.—γ. *Palpis* interioribus exarticulatis.—δ. *Palpis* exterioribus 4 articulatis.—d. *Proboscide* rectâ, apice subulato-conicâ; palpis exterioribus 6-articulatis.—1. *Laciniis* interioribus involutis, exteriorum longitudine.—2. *Laciniis* interioribus rectis, quàm exteriores brevioribus.—α. *Labio* quadrato inermi.—β. *Labio* emarginato, tuberculo munito.—e. *Proboscide* subinvolutâ, palpis exterioribus exarticulatis.—1. *Corpore* villoso.—2. *Corpore* hirsutissimo. Each of these families Mr. Kirby illustrates with figures, in his Tabularum Explicatio, and refers all the species he describes to their proper situation in his synopsis specierum, in conformity with this system.

From this comparative view of the different arrangements offered by naturalists for the distribution of BEES into distinct genera, subdivisions or families, it evidently appears a task of some difficulty to point out the true and invariable characters by which they may be arranged with the greatest propriety. Mr. Kirby has done much in behalf of a new mode of arranging them; he has pursued this subject with no common assiduity and skill, and furnished us with an admirably curious treatise, the result of his useful and well-directed labours. Of his accuracy in ascertaining, and integrity in delineating the characters he has chosen, there can be no distrust; and perhaps there can exist but one objection to his mode of arrangement, and that arises from the difficulty in some instances of perceiving them. All his descriptions were taken, as he himself says, from insects viewed under a lens; an advantage no doubt to him in defining those characters with fidelity, but which at once implies that they are minute, and the lamentable errors he points out by that means in the observations of his predecessors on those parts, prove sufficiently they are ambiguous also. Every naturalist will blame Fabricius for having taken his characters too frequently from the mouth, *Instrumenta cibaria,* and other minute and complicated parts; because, except in recent specimens, it is difficult, nay often impossible to ascertain his distinctions of genera and families, without injuring or destroying the very parts he describes, and frequently not then. Mr. Kirby has, we may believe, endeavoured to avoid this error as far as the subject would permit; and we must only regret that in such able hands, some characters less complicated and minute than those sometimes adopted by him, could not have been found for the arrangement of this curious tribe of creatures.

APIS, in *Geography,* a town of Egypt, on the banks of the lake Marcotis, not far south from Marea. It is mentioned by Herodotus; and Pliny says, it is 62 miles from Parætonium. South-east of this town, and at some distance from the sea, was a mountain of the same name.

APIS was also, according to the Scholiast of Apollonius, a small island near that of Crete.

APIS, in *Mythology,* a symbolical deity, worshipped by the Egyptians in the whole country, and particularly at Memphis. It was an ox, having certain exterior marks, in which animal the soul of the great Osiris was supposed to subsist. This animal was preferred to others, as being the symbol of agriculture, which Osiris had found out, and to the improvement of which he was zealously devoted. He was so famous, that all who visited Egypt had the curiosity to see him, and to render him respect and homage. Alexander conducted his army to Memphis, and according to Arrian, sacrificed to all the gods, and more especially to Apis. Pliny says, that when Germanicus was in the east, he consulted Apis; and the same curiosity which induced Augustus to visit Memphis, induced Titus, Adrian, and Septimius Severus, to follow his example. Apis was an object of worship, not merely on account of his divinity, but because he was consecrated in a peculiar manner to the sun and moon; that is, to Osiris and Isis. Suidas and Ammianus Marcellinus mention his consecration to the moon, and Porphyry expressly says, that this animal bore the characteristic signs of these celestial luminaries. The marks or characters, by which this sacred bull was distinguished from others of the same species, were, his black colour, a white square mark upon his forehead, the figure of an eagle on his back, a lump under his tongue resembling a beetle, and a white spot in the form of a crescent on his right side. These marks were obviously the contrivance of the priests, who secretly brought up the calf that was intended for the Apis. This sacred animal was not produced by the ordinary laws of generation. The Egyptians ascribed his birth to celestial fire; and, as Plutarch informs us, the priests pretended that the moon diffused a generative influence; and that as soon as the cow to whom it was imparted took the bull, she conceived an Apis. When a calf was produced in these circumstances, and with the appropiate marks, the priests announced to the people the birth of Apis. Accordingly, says Ælian (de Anim. lib. xi.), they built a temple to the new god, facing the east, in pursuance of the order of Mercury, and

nourished

nouriſhed the young calf with milk for four months. At the cloſe of this period, and at the time of the new moon, the prieſts repaired to his habitation, and ſaluted him with the name of Apis. He was then placed in a veſſel magnificently decorated, covered with rich tapeſtry and reſplendent with gold, and conducted to Nilopolis, a city of the Nile, with hymns and perfumes. Here they kept him for 40 days, and ſuffered only women to viſit and examine him. After the inauguration of the god in this city, he was conveyed to Memphis with the ſame retinue of prieſts, followed by a great number of boats ſumptuouſly adorned. From this time he became ſacred to all the world. He was ſuperbly lodged, and the place where he lay was myſtically called "the bed." The edifice in which he was kept, and which is particularly deſcribed by Strabo (lib. xvii.), was ſituated near the temple of Vulcan; in a court of which he was occaſionally preſented to gratify the curioſity of ſtrangers; and he might be ſeen at all times through a window; but it was the office of the prieſts to produce him to public view. Once a year, ſay Pliny, Solinus and Ammianus, they preſented a heifer to him, which they killed on the ſame day. This bull, to which ſupernatural knowledge was aſcribed, is ſaid by the prieſts to have predicted future events by certain ſigns and motions, which they interpreted according to their own fancy. Pliny ſays (lib. viii.), that he had two temples called "beds," which ſerved as an augury to the people. When they came to conſult him, if he entered into one of theſe, the omen was favourable; but if he paſſed into the other, unpropitious. He alſo gave anſwers to individuals, by taking food from their hands; and Ammianus ſays, that he refuſed that which was offered him by Germanicus; and that this unfortunate victim of the jealouſy of Tiberius was ſoon after poiſoned. The worſhip that was offered to this deity was very ſolemn. The people aſſembled to offer ſacrifices to him, and oxen were ſelected for the victims on this occaſion. In every part of Egypt feaſts were conſecrated in honour of him, and particularly in honour of his birth: they were called "Theophania," the apparition of God, and laſted ſeven days. "What feſtivals! (ſays Ælian) what ſacrifices take place in Egypt at the commencement of the inundation! At this time all the people celebrate the birth of Apis. It would be tedious to deſcribe the dances, the rejoicings, the ſhows, the banquets, to which the Egyptians abandon themſelves on this occaſion, and impoſſible to expreſs the intoxication of joy which breaks forth in all the towns of the kingdom."—"During the ſeven days in which the prieſts of Memphis celebrate the birth of Apis" (ſays Ammianus), "the crocodiles forget their natural ferocity, become gentle, and do no injury." This ſacred bull, however honoured, had a fixed term aſſigned to his life: at the termination of 25 years, the prieſts drowned him in the Nile; and as Pliny ſays, in the fountain of the prieſts. This number was the product of five by itſelf, and gave the number of the letters of the Egyptian alphabet, as well as the age of Apis: and this number marked a period of the ſun and moon, to which luminaries the bull was conſecrated. Hence it has been inferred, that Apis was the tutelary divinity of the eſtabliſhed form given to the ſolar year, which was to conſiſt invariably of 365 days, and of the cycle of 25 years, diſcovered at the ſame time. "Nor can it be doubted," ſays Savary (Letters, vol. ii. p. 472.), "that he had a marked relation to the ſwelling of the Nile, for it is teſtified by a great number of hiſtorians. The new moon which followed the ſummer ſolſtice was the æra of this phænomenon."—The creſcent on the right ſide of Apis indicated, according to Ælian, the commencement of the inundation. "If Apis," continues Savary, "poſſeſſed the characteriſtic ſigns which proved his divine origin, he promiſed fertility and abundance of the fruits of the earth. It ſeems demonſtrated, therefore, that this ſacred bull, the guardian of the ſolar year of 365 days, was alſo regarded as the genius who preſided over the overflowing of the river. The prieſts, by fixing the courſe of his life to 25 years, and by making the inſtallation of a new Apis concur with the renewal of the period now mentioned, had probably perceived, as the reſult of long meteorological obſervations, that this revolution always brought about abundant ſeaſons. Nothing was better calculated to procure a favourable reception of this emblematical divinity from the people, ſince his birth was a preſage to them of a happy inundation, and of all the treaſures of teeming nature." The name *Api* in the Cophtic language ſignifies number, and ſeems to have referred to the number of cubits which marked the increaſe of the Nile, that was moſt advantageous for the fertility of Egypt.

When Apis died, he was embalmed and privately depoſited in the ſubterraneous cavern deſtined for this purpoſe. If he died a natural death before the expiration of 25 years, the prieſts publicly proclaimed his death, and ſolemnly conveyed his body to the temple of Serapis, at Memphis. Strangers were forbidden to approach the temple, and the prieſts entered it only when Apis was interred. It was then, ſays Plutarch, that they opened the gates called Lethé and Cocyté (of oblivion and lamentation), which are ſaid to have made a harſh and piercing ſound. On occaſion of the death of Apis, Egypt reſounded with the cries and lamentations of thoſe who bewailed it, and the whole country put on mourning. To this purpoſe Tibullus ſays, (Eleg. i. 8.)

> "Te canit atque ſuum pubes miratur Oſirim,
> Barbara, Memphiten plangere docta bovem."

Lucian alſo repreſents this circumſtance in his uſual pleaſant manner. "When Apis dies, is there any one ſo enamoured of his long hair as not immediately to cut it off, or to diſplay on his bald head the ſymptoms of his ſorrow?" This diſtreſs and mourning continued till the people had obtained another Apis. Darius Hyſtaſpis, being at Memphis on an occaſion of this kind, and obſerving the conſternation of the town, offered 100 talents of gold to any one who diſcovered a new Apis. Polyænus, Strat. vii. Jablonſki, in his "Pantheon Egyptiorum," and M. Huet, biſhop of Avranche, and ſome others, have endeavoured to prove, though not with much ſucceſs, that Apis was a ſymbolical image of the patriarch Joſeph, and appointed for the commemoration of him. But the hypotheſis, that Apis and his worſhip were ſymbolical of the Nile, and the circumſtances attending it, ſeems to be more probable. The particulars that have been already recited afford a ſtrong preſumption to this purpoſe. The kind of animal that was ſelected favours this opinion; for rivers were anciently repreſented by bulls or oxen. Plutarch ſays expreſsly (De Iſide & Oſiride, Oper. tom. i. p. 66.) that the ox was in Egypt the ſymbol of the earth. All the myſtic phenomena that attended the birth, growth, character, death, and worſhip of Apis, bore an obvious reference to the agriculture of Egypt, and the fertility occaſioned by the inundation of the Nile.

Dr. Bryant apprehends that the name of Apis was an Egyptian term for a father, that it referred to the patriarch Noah, and that the creſcent, which was uſually marked on the ſide of the animal, was a repreſentation of the ark. Anc. Mythol. vol. ii. p. 420.

Jablonſki (*ubi ſupra*) fixes the æra of the conſecration of the

the said Apis at the year 1171 before the vulgar æra of Christ; and, according to the same writer, it ceased at Memphis, under the reign of Theodosius, together with that of Serapis at Alexandria; and he assigns a period of 1570 years for its whole duration.

Apis is represented on the Greek medals in the form of a bull, with a flower of the lotos, the water-lily of the Nile, supposed by Macrobius to be a symbol of the creation. On the medals of Adrian and Antoninus Pius, struck in Egypt, and on a marble preserved in the cabinet of Odescalchi, he is delineated with the crescent on his side.

Apis, in *Fabulous History*, the son of Phoroneus, second king of Argos, who settled in Egypt, according to the fables of the Greeks, and made himself so famous, that after his death he was ranked among the gods, under the name of Serapis.

APITANI, in *Ancient Geography*, a people of Arabia Felix, according to Pliny.

APITES. Apites Vinum, from ἄπιος, *the pear tree*; perry, or wine of pears. See Perry.

APIUM, (perhaps from *Apis*, bees, because these insects are fond of it,) in *Botany*, a genus of plants, including parsley, smallage, and celery. Lin. Gen. 367. Schreb. 489. Juss. 219. Class, *pentandria digynia*; natural order of *umbellatæ*; gen. character, *cal. general* umbel of fewer rays than those of the partial; *general* involucre small, of one or more leaflets; *partial* similar; *proper perianth* obsolete; *cor. general* uniform; *florets* almost all fertile; *petals* roundish; inflex, equal; *stam.* filaments simple; *anthers* roundish; *pist.* germ inferior; *styles* reflex; *stigmas* obtuse; *per.* none; fruit ovate, striate, splitting in two; *seeds* two, ovate, striated on one side, plane on the other. Ess. gen. char. *fruit* ovate, striated; *involucre* one-leafed; *petals* equal.—Species 1. A. *petroselinum*, *common parsley*, stem leaflets linear; involucels minute; the stems are round, smooth, striated. At the origin of the universal umbel there is usually one leaflet, and an involucre of six or eight short folioles, almost as fine as hairs, at the partial umbel. Flowers pale yellow, regular; petals small, long, narrow, acuminate, inflex. It is a biennial plant, and generally cultivated for culinary purposes. Linnæus found it growing wild in Sardinia. The varieties of parsley are α. A. *sativum*, common garden parsley. Wood. Med. Bot. lxxiii. β. A. *crispum*, curled parsley. γ. A. *latifolium*, large rooted parsley. 2. A. *graveolens*, smallage, or wild celery, stem leaves wedge-shaped. This is also a biennial plant, rising with a smooth, shining, deeply furrowed stem; leaves alternate, radical, pinnated, ternate; pinnas trifid, gash-serrate, shining, smooth; umbels axillary; with about fifteen unequal rays; flowers small, white; seeds minute. It grows wild in ditches and marshes, in which state it is acrid and fetid. Smith's Flor. Brit. 335. Miller states the varieties of this plant as follow; β. A. *dulce*, upright celery; γ. A. *rapaceum*, celeriac or turnip-rooted celery; δ. A. *lusitanicum*, Portugal celery.

In regard to the medicinal properties of parsley, Doctor Woodville, in his Medical Botany, remarks that both the roots and seeds are directed to be employed by the London College; the former of which have a sweetish taste, accompanied with a slight degree of warmth, and a flavour resembling that of a carrot; but that the latter are warmer in taste and more aromatic than any other part of the plant, and also manifest a considerable degree of bitterness. In distillation, three pounds were found to yield above an ounce of essential oil, a great part of which sunk in the fluid. They give out little of their qualities by infusion in watery menstrua, but readily impart all their virtue to rectified spirit. The roots by distillation in water were ascertained to afford but a very inconsiderable portion of essential oil, not more than two or three drachms from as many hundred pounds. These roots are said to be aperient and diuretic, and have been employed in apozems, to relieve nephritic pains and obstructions of urine. In this way they have been prescribed by Dr. Cullen, without producing any diuretic effect; and this, he thinks, may in some measure be attributed to the loss of their active matter, which they sustain in boiling.

The seeds, like those of many other umbelliferous plants, possess a share of aromatic and carminative power; but as this is inconsiderable, they are now seldom employed. They are stated, it is observed, to have been advantageously made use of externally for removing cutaneous diseases in children, by Con. Mich. Valentini, in Act. Nat. Cur. vol. 1. p. 255; and by Rosenstein in Burn's Junkd. ed. 3. p. 533.

The bruised leaves have been successfully made use of as a discutient poultice to various kinds of tumours. We are told, Dr. Woodville says, by Lange (Misc. Vert. Med. p. 26), that this application has succeeded in scirrhous tumours where cicuta and mercury have failed.

Although parsley is so commonly used at table, it is remarkable, says the above writer, that facts have been adduced to prove that in some constitutions it occasions epilepsy, or at least aggravates the epileptic fits in those who are subject to this disease. It has been supposed also to produce inflammation in the eyes.

Apium *Macedonicum*. See Bubon.

Apium *petræum* and *montanum*. See Athamanta.

Apium, *Pyrenaicum*. See Crithmum.

Apium, in *Gardening*, comprehends parsley, celery, and smallage, of which there are several species cultivated in the kitchen-garden; as the A. *petroselinum* or common parsley, which has two varieties, the common plane-leaved, and the curled-leaved; the A. *latifolium*, or broad-leaved, large-rooted parsley; the A. *dulce*, sweet, or common upright celery; of which the following varieties are cultivated: the common upright, with the stalks of the leaves hollow or fistular; the common upright, with the stalks of the leaves solid, generally known by the names of hollow and solid celery, the *giant upright*, that grows very tall, with a large body of thick fleshy leaf-stalks; the A. *rapaceum*, or turnip-rooted spreading celery or celeriac; and the A. *graveolens*, or smallage; all of which are herbaceous plants, of hardy growth, and of the biennial tribe, or of two years duration, producing only leaves the first year, but attaining perfection for kitchen and other domestic uses. The second spring they, however, shoot up stalks, flower, and perfect their seed; and in autumn perish both in root and branch, so that they continue useful only one year, and therefore a fresh supply must be raised annually from seed. Some of the species may, however, be deemed annual, as if sown very early, they run to seed the same year, especially in the celery kind.

Of the A. *petroselinum*, or common parsley, both the varieties are in use; but it is remarked by the authors of the Universal Gardener, that the plane-leaved sort is most commonly cultivated, though many prefer the curled kind, because its leaves are most easily distinguished from the *æthusa*, or fool's parsley, a sort of hemlock, and a poisonous garden-weed, which, while young, has great resemblance to the common plane-leaved parsley. Besides, the curled parsley, from its having larger and thicker leaves, and being curiously fimbriated and curled, so as to shew full and double, makes a better appearance in its growth, and is

more

more eſteemed by cooks for the purpoſe of garniſhing diſhes, &c. It may, however, be neceſſary to remark, that this ſort, as being only a variety, is liable to degenerate to the common plane ſort, unleſs particular care be taken to ſave the ſeed always from the perfect, full curled plants. Both the varieties are propagated by ſeed ſown annually in ſpring, where the plants are to remain; but the plants, as has been ſeen, are biennials, riſing from ſeed ſown in March, April, and May.

The proper ſeaſon for ſowing the different varieties, is any time from the beginning of February until the beginning of May; but they will grow at almoſt any time of the year; however, in order to have the plants come into uſe by the time the old parſley begins to run, it is neceſſary to ſow firſt about the time juſt mentioned. The beſt method for which is in drills, as it will be thus not only more conveniently kept clean and more eaſily gathered, but have a neater appearance. Where only a ſufficiency is required for the ſupply of a family, it may be ſown in ſingle drills along the edges of the borders, or the quarters of the kitchen-garden, the plants thus ſerving the double purpoſe of utility and edging; but for the ſupply of markets, gardeners generally ſow it in large plats, either in broad-caſt, raking it in, or in ſhallow drills, at eight or nine inches diſtance from each other, trimming the earth evenly over it, near half an inch deep, and then lightly raking the ſurface, to give it a degree of ſmoothneſs. Seed of this kind is extremely ſlow in vegetating, ſometimes not appearing in leſs than a month or five weeks from the period of its being ſown.

The chief culture the plants require while growing, is to be kept clean from weeds; and when they grow taller than wanted, which is often the caſe in private gardens, to be cut down cloſe. This ſhould be conſtantly practiſed in autumn, as about Michaelmas, or in ſufficient time for the plants to recover before the winter ſets in.

In order to ſave the ſeed, ſome rows of the one year old plants muſt be permitted to ſtand, and ſhoot up their ſtalks, which is done in May and June following, the ſeed being ripened in July and Auguſt.

A. *latifolium*, or broad-leaved parſley. The propagation of this ſpecies is alſo by ſeed ſown annually in February, March, or April, where the plants are to remain. For this purpoſe, a ſpot of light rich earth, in an open expoſure, is to be preferred; the ſeed being ſown broad-caſt, and raked in, the plants generally appearing in about a month after being ſown, and in May or June they require to be thinned and cleared from weeds, which may be performed either by hand or hoe; but the latter is moſt eligible, as it will ſtir and looſen the ſurface of the earth, which may be beneficial to the plants, cutting them out to about ſix inches diſtance from each other.

In the latter end of July, the roots will moſtly have attained a ſize proper for uſe; and may be drawn occaſionally; but they ſeldom acquire their full growth till about Michaelmas.

This is ſometimes called *Hamburgh parſley*, probably from its being much cultivated about that place.

It is chiefly cultivated and eſteemed for its large roots, which are white and carrot-ſhaped, being long, taper, and of downright growth, often attaining the ſize and appearance of ſmall middling parſneps; they boil exceedingly tender and palatable, are very wholeſome, and may be uſed in ſoup or broth, or to eat like carrots and parſneps, or as ſauce to freſh meat.

A. *dulce*, or the common celery. The method of propagation in all the varieties of this ſort is, by ſowing the ſeed in the ſpring, and when the plants have attained ſix or eight inches in height, tranſplanting them into trenches in the manner deſcribed below, in order to be earthed up on each ſide as they advance in growth, and have their ſtalks blanched or whitened, to render them criſp and tender.

As plants of this kind continue uſeful only one year, a freſh ſupply muſt be raiſed annually, as has been already obſerved.

The proper periods of ſowing, if a regular ſucceſſion of plants be required for eight or nine months in the year, are at two or three different times from the beginning of March till the middle of May. As, for example, if it is intended to have celery for uſe as early as poſſible in the ſummer, as in July, ſome ſeed muſt be ſown the firſt week in March on a warm border; or to bring the plants more forward, in a ſlender hot bed; or if it be neceſſary to have it ſtill more early, the middle of February; but as the plants of theſe very early ſowings are apt to pipe or run for ſeed the ſame year, before they attain their perfection, a few only need be raiſed. But for the principal crops, to come in for autumn and winter, as in Auguſt or September, and continue in perfection till Chriſtmas or ſpring, the ſeed may be ſown about the middle or towards the latter end of March, or in the firſt or ſecond week in April, in a bed of natural earth in an open expoſure; and a little more in the latter end of the laſt named month, or in the firſt or ſecond week in May, to furniſh a ſtill later crop to come in the beginning of November, and continue good until the March or April following; and to have a late crop principally for the ſpring, it will be neceſſary that a ſmall portion be ſown at the latter end of May; and by putting out ſome of the plants in ſhallow trenches about Michaelmas, and in October and November, they may be fit for uſe in March and April, and continue without running till the middle or latter end of the May following.

As it has been ſuggeſted, that the early crop may either be ſown upon a warm border of natural earth, or upon a ſlight hot-bed, it may be obſerved, that by the latter practice, the plants may be ſo forwarded, as to be fit to tranſplant into trenches ſooner by three weeks or a month, than thoſe raiſed in the natural ground; a ſmall bed of about eighteen or twenty inches deep of dung will be ſufficient, which may be ſheltered either with a ſmall frame, or occaſionally with mats ſupported on arches made with ſticks; upon this five or ſix inches of rich light earth ſhould be laid, the ſeed being then ſown on the ſurface, and covered near a quarter of an inch deep; when the plants appear, the full air muſt be freely admitted in mild days, but ſheltered with a glaſs or mats in the nights until they acquire ſome ſtrength, frequent light waterings being occaſionally given: when the plants of either of the ſowings are two inches high, ſome of the ſtouteſt ſhould be pricked out into a bed of rich earth, in a ſheltered ſituation, three inches apart; or to bring them ſtill more forward, upon a ſlender hot-bed, and occaſionally ſheltered with mats, giving them water, and occaſionally ſhade, till they have ſtruck root; and if rain do not fall, refreſhing them as frequently with water as may be neceſſary.

As thoſe that were thus firſt pricked out will, in May or the beginning of June, be generally five or ſix inches high, ſome of the ſtrongeſt of them ſhould be tranſplanted into trenches, in order to their being blanched. In regard to ſowing the main and later crops at ſuch times as have been recommended, make choice of a ſpot of rich light earth, in an open ſituation, and let it be neatly dug and divided into one or more beds; but one bed is generally ſufficient for private uſe, which ſhould be three feet and a half wide, the ſurface being made level and ſmooth. The ſeed may then either be ſown on the ſurface, and raked in lightly, or the ſurface firſt raked ſmooth, the ſeed then ſown, earth being ſifted over it near a quarter of an inch thick; or the bed being firſt raked ſmooth as above, the earth may be ſhoved with the back

back of a rake from off the ſurface a quarter of an inch deep into the alley; the ſeed then be ſown, and with the rake turned the right way, the earth drawn upon the bed again with a kind of jerk, ſo that it may ſpread and cover it equally.

When the plants of theſe ſowings are come up, they ſhould be frequently watered in dry weather, eſpecially while they are young. And when about three or four inches high, the ſeed-bed ſhould be thinned by pricking out a quantity of the ſtrongeſt into an open rich ſpot, properly dug and divided into beds three feet and a half wide, taking an opportunity, if poſſible, of moiſt weather, and in rows ſix inches aſunder, and three or four inches diſtant in each row, water being given, and if dry weather ſucceeds, occaſionally repeated till they ſtrike freſh root; in this bed, they are to remain a month, or five or ſix weeks, to acquire due ſtrength previous to their being tranſplanted into trenches, in order for blanching. The ſame ſeed-bed will frequently afford three, four, or more different drawings, to prick out in this way, by obſerving to thin out the largeſt plants regularly each time, before they draw each other weak by cloſe ſtanding; and by thus pricking them in beds till the ground intended for the trenches is at liberty, they will be advancing in their growth, and be conſiderably better prepared for ſetting out, than ſuch as have remained all the time in the ſeed-bed.

The next buſineſs is that of tranſplanting them into the trenches for the purpoſe of blanching; the ſeaſon for which is occaſionally from the middle of May till the latter end of October, or even middle of November, according to the forwardneſs of the plants, the time they are required for uſe, and the period it is intended they ſhall continue. When the plants are from about ſix to ten or twelve inches high, as has been obſerved, they are of a proper ſize for tranſplanting into the trenches.

It is neceſſary always to make at leaſt three different tranſplantations, allowing the diſtance of three or four weeks between each time of planting; but when the plants are required for uſe as early in ſummer as poſſible, and to be continued in ſpring as late as the middle or latter end of May, it is eligible to plant four, five, or even ſix different crops, allowing the diſtance of time abovementioned between the planting of each ſeparate crop; obſerving that the crops intended principally for ſpring uſe be of the lateſt ſown plants, and not planted in the trenches until September, October, and beginning of November.

In making the trenches, chuſe a dry rich ſpot of ground, in an open quarter, and with a line and ſpade mark and chop out the trenches croſſways of the piece of ground, each trench twelve inches, or about one ſpade breadth wide, and allow a ſpace of three feet between trench and trench, that there may be ſufficient ſcope to have a due portion of mould to earth up the plants to a proper height; the trenches being marked in this manner, proceed to dig them out in order to form the furrow for the reception of the plants, which ſhould be done lengthways to the depth of a moderate ſpade, or about ſix or eight inches for the early crops; but the later ones do not require ſo much, without taking out any ſhovelings, laying the ſpits of earth alternately to the right and left in the ſpaces between, levelling it neatly, and beating up the edges firm and ſtraight; then let the bottom be properly dug and levelled, or if the ground be poor, firſt ſpread therein two or three inches depth of rotten dung, and dig it in four or five inches deep.

The trenches being thus prepared, a quantity of the beſt plants muſt be drawn, the ends of their roots, and the tops of the ſtraggling leaves trimmed off; then a row planted exactly along the middle of each trench, placing the plants four or five inches diſtant, a good watering being immediately given out of a pot with the roſe on, and which, if ſhowers do not fall, ſhould be repeated every other evening at leaſt, till the plants have taken freſh root.

Only a few of the very early plants, as thoſe ſown in February, or early in March, ſhould be planted out at a time, as they are apt to pipe almoſt as ſoon as they are blanched, or ſometimes before it is fully effected.

When it happens that the plants intended to be planted in autumn, for the late crops, have, by the allotted compartment of ground for their reception not being vacant, ſtood ſo long in the ſeed or pricking-out beds as to have become rank, and drawn each other up weak, it may be proper to retard their running up tall, in order to obtain them of robuſt growth againſt October and November, for planting them in ſhallow trenches; to effect this, it will be adviſeable, in Auguſt or the beginning of September, either to cut them down low to ſhoot out again, or tranſplant them into rows nine inches diſtant.

Another method of planting and making the trenches, but which is leſs in uſe, is with a line and ſpade to cut or mark out a bed, or rather trench, ſix feet wide, croſſways the ground; then to begin at one end, and proceed to dig out a cavity the above width and length, one ſpade deep, laying the ſpits of earth to the right and left, in a ridge along each ſide of the cavity or trench, beating it up in front that it may not ſlip down; and when the trench is thus dug, to looſen and level the bottom; and where dung is neceſſary, to add it, digging it into the bottom four or five inches deep. When more than one of ſuch trenches are to be made, a clear ſpace of ſix feet muſt be allowed between trench and trench, to contain the earth dug out, and to have a ſufficiency to bring up to the plants afterwards.

The trenches being thus prepared, the plants are to be trimmed as before directed, and then planted, obſerving that they are here to be planted in rows croſſways the trench, about a foot aſunder, and in other reſpects as in the other method.

The plants of this ſort, in order to whiten or blanch the ſtalks, and render them criſp, tender, and of a grateful flavour, require to be earthed up as they riſe in height on each ſide, for which purpoſe the earth that was dug out of the trenches is to be employed; and when that is expended, that in the ſpaces between them muſt be dug out, broken, and applied repeatedly as the plants advance in growth, in this way blanching them from ten or twelve to fifteen or eighteen inches or more in height.

The proper time to begin this work, is when the plants are about ten or twelve inches high, which ſhould be repeated every fortnight or three weeks, as may be neceſſary, during their principal growth. In performing the work, regard muſt be had to break the earth, where lumpy, moderately ſmall with the ſpade: or the firſt and ſecond earthing may be performed with a large hoe, but afterwards in the principal earthings a ſpade is to be preferred, and care taken to trim the earth up lightly to the plants, ſo as not to break the ſtalks of the leaves, or force the mould into their hearts. The firſt time, they may be earthed three, four, or five inches, according to the ſize and height of the plants, obſerving the ſame rule at each time, till they are by degrees earthed to twelve inches, but fifteen or twenty are better. By this means, if the ſoil be rich, thoſe of the main crop that have been planted out in the end of June or in July, ſometimes make ſuch progreſs, that by September or October they may be blanched eighteen inches, or near two feet in length. Theſe earthings are to be continued to the later

crops occaſionally, until Chriſtmas, or as long as the plants continue to grow in height during the winter, at which ſeaſon, as about November and December, it is proper to earth them up pretty near their tops previouſly to hard froſt ſetting in, which often deſtroys ſuch plants as are out of the ground, and which, if of conſiderable duration, would occaſion the decay of moſt of the other parts that are within the earth.

But in the late crops, planted in October or November for ſpring uſe, ſuch plants as are of ſmall or low growth, will probably require but little or no earthing till February or March, at which time they ſhould be earthed up moderately, according to their growth, to have them for uſe in April and May, when the general crops are finiſhed.

In earthing up the plants that are planted in the latter of the above methods, it will be neceſſary to trim the earth in well between the rows, taking it equally from the different ſides; in doing which, it is of advantage, where the plants have attained a large growth, to be furniſhed with a couple of thin boards, ſix feet long; which are to be uſed at the time of earthing, to ſlip into the ſpaces between the rows of plants, to keep the ſtalks and leaves up cloſe juſt till the earth is put in, placing them cloſe to the plants, and then trimming in the earth between them; and when one ſpace is thus earthed, drawing out the boards, and placing them in the next.

The different earthings ſhould always, if poſſible, be performed when the plants are dry, as where this circumſtance is not attended to, they are apt to become ſpotted and cankery.

Some of the firſt earthed-up plants, where they have been planted in the trenches in May, or the beginning of June, will generally be fit to take up in July; for when ſuch early plants are blanched five or ſix inches in length, it is time to begin to take them up, as they rarely continue long before they begin to pipe and become uſeleſs.

But the plants of the main crop will ſeldom be blanched any conſiderable length, till the middle or latter end of Auguſt, and beginning of September, and will not have acquired their full perfection until October, as obſerved above. However, where there is much demand for the plants, you may begin to take ſome up, when they are blanched ſix or ſeven inches, as, if properly followed with earthing, they will be daily increaſing in length in the blanched part.

In winter, at the approach of very ſevere froſt, it may ſometimes be of advantage to cover ſome of the rows of the main crop with dry long litter to ſave the plants, and prevent the ground being frozen hard, that the plants may be readily dug up when wanted. And when a hard froſt is expected, a quantity of the plants may be taken up for uſe, and laid in ſome dry earth in a ſhed, or other ſheltered place.

A. rapaceum, or the turnip-rooted celery. This is likewiſe propagated by ſeeds, ſown in an open rich ſpot in March or April, as directed for the common ſort; and when the plants are an inch or two high, they are to be thinned to three inches; and at four, five, or ſix inches in height, tranſplanted into ſhallow trenches; previouſly to which the ground muſt be dug all over one ſpade deep, and drills three inches deep and eighteen aſunder, made with a hoe, in which the plants are to be ſet ſix inches diſtant.

When they are advanced nine or ten inches in growth, obſerve the progreſs of the roots, and if they have acquired a tolerable ſize, draw earth up to each ſide of the row of plants, three or four inches high, which, being well watered, will be ſufficient to improve the roots. They are generally fit to take up for uſe in a fortnight or three weeks afterwards.

A. graveolens, or ſmallage. This is a plant of the weed kind, and but ſeldom cultivated in the garden. If wanted, it may, however, be eaſily raiſed in the ſpring.

APIVORUS, in *Ornithology*, a ſpecies of the FALCO genus. The cere is black; feet half naked and yellow; head grey; tail banded with cinereous colour, and white at the tip. Linn.

This is a very variable bird in reſpect of its colour, and ſcarcely any two authors agree in deſcribing it. The length of one ſpecimen is twenty-three inches; weight thirty-eight ounces. The bill and cere black; irides golden yellow; head aſh-coloured; neck, back, ſcapulars, and wing coverts deep brown; the chin nearly white ſtreaked with narrow brown lines; fore part of the neck rufous, breaſt and belly barred with tranſverſe regular bars of rufous brown and white, each feather being white with two bars acroſs it. Tail brown, with two duſky bars, one in the middle and the other near the end. Legs ſhort, yellow, claws black. Lath. Gen. Syn.

One deſcribed in the Britiſh Zoology about the ſame ſize had the chin white, breaſt and belly of the ſame colour, marked with duſky ſpots, pointing downwards; and the tail long, of a dull brown colour, marked with three broad duſky bars, between each of which were two or three of the ſame colour, but narrower. Another, ſuppoſed to be the female, being ſhot on the neſt, is noticed in the ſupplement of the folio Zoology of Pennant; it was entirely of a deep brown, but had much the ſame marks on the wings and tail as the male; and the head was tinged with aſh colour. Linnæus ſays, the tail has only one cinereous band acroſs; the ſide tail feathers are banded with white, and ſpotted with brown, according to Briſſon; and Albin's bird had no bars on the tail.

The honey-buzzard inhabits various parts of the continent of Europe, but is no where common except in the open parts of Ruſſia and Siberia; is ſeen as far north as Sondonor in Norway; in England is ſcarcely ever met with.

It feeds on larvæ of bees and waſps, and on frogs and lizards; the eggs are of a deep red brown, with ferruginous blotches. This is the BUTEO APIVORUS of Ray, la bondrée of Briſſon and Buffon, le goiran ou boudrée of Belon, and honey-buzzard of Albin. Pennant, Brit. Zool. and Donov. Brit. Birds, t. 30.

APLANATIC, formed of *α, priv.* and *πλαναω, errø*, in *Optics*, a term applied by Dr. Blair, profeſſor of practical aſtronomy in the univerſity of Edinburgh, to that kind of refraction diſcovered by himſelf, which entirely corrects the aberration of the rays of light, and the colour depending upon it, in contradiſtinction to the word *achromatic*, which has been appropriated to that refraction, in which there is only a partial correction of colour. After a variety of reſearches and experiments, detailed at large in a paper read before the Royal Society at Edinburgh, in 1791, and publiſhed in the third volume of their Tranſactions, he diſcovered a mixture of ſolutions of ammoniacal and mercurial ſalts, and alſo ſome other ſubſtances, which produced diſperſions proportional to that of glaſs, with reſpect to the different colours; and he proceeded to conſtruct a compound lens, conſiſting of a ſemi-convex one of crown glaſs, with its flat ſide towards the object, and a meniſcus of the ſame materials, with its convex ſide in the ſame direction, and its flatter concave next to the eye; and the interval between theſe lenſes he filled with a ſolution of antimony in a certain proportion of muriatic acid. The lens, thus artificially adapted, did not manifeſt the ſlighteſt veſtige of an extraneous colour. His diſcovery is undoubtedly valuable and important, and may lead to a very uſeful improvement in the conſtruction of teleſcopes. Dr. Blair obtained a patent for his invention of a method of

improving the refracting telescopes, and other dioptrical instruments, in 1701. See ABERRATION and TELESCOPE.

APLEBECK, in *Geography*, a town of Germany, in the circle of Weſtphalia and county of Mark, three miles ſouth from Dortmund.

APLOGA, a diſtrict of the kingdom of Whidah, on the Slave coaſt in Africa, where is held a regular market for ſlaves, cows, ſheep, goats, birds, apes, cloth, cotton, callicoes, ſilk, ſtuffs, china, mercury, gold in duſt and ingots, &c.

A-PLOMB is a very expreſſive French term in *muſic* and dancing, for exactneſs and preciſion in time, or meaſure. To ſay that a vocal or inſtrumental performer has an exact *à-plomb* is pronouncing him or her to be a good timiſt. So a dancer who *falls on his feet* preciſely at the beginning of a bar, or the end of a period or movement, is ſaid to have a good *à plomb*—the higheſt praiſe that can be given him. A leader on the violin, who in *tempo rubato* (borrows time which he never pays), drags a note beyond its due length, and arrives not at the beginning of a bar at the ſame inſtant as the reſt of the band, has no *à plomb*. It ſeems as if the old refinement of *tempo rubato*, and the new one of *relentando*, could only be ſafely practiſed in ſolos, or ſolo paſſages, as great confuſion muſt ariſe in an orcheſtra by the relentandos and accelerations of an individual performer, if the reſt are not appriſed of the leader's intention.

APLUDA (the name of the chaff, &c. that lies off from grain), in *Botany*, a plant of the graſs kind, Lin. gen. 1147. Schreb. 1571. Gærtn. t. 175. Juſſ. 33. Claſs, *polygamia monœcia*; natural order of *gramina*.

Generic Character. *Calyx*, involucre-common univalve; valve ovate, concave, terminated by a very ſhort point or leaflet, two-flowered; the inferior flower ſeſſile, ſhort at the baſe, ovate, truncate, hollow down into the two oppoſite foot-ſtalks, which are glumaceous, flat, vertical; on one of theſe is placed the ſuperior flower, on the other a very ſhort rudiment of a flower; inferior flower hermaphrodite, almoſt wholly concealed between the foot ſtalks; *calyx* involucre-proper univalve; valvelet lanceolate, compreſſed, rigid, double-toothed at the tip, ſmooth, embracing the flower with its margins beneath, oppoſite to the common involucre; glume one-flowered, two valved; valvelets membranaceous, tranſparent, ſhorter than the involucre; the exterior navicular, gibbous on the back, keeled, contracted towards the tip, acuminate; the interior ventricoſe ſomewhat ſharp, ſmaller; *corolla*, glume bivalve, membranaceous, very thin, tranſparent; valve exterior navicular, compreſſed, ſmooth, greeniſh, gibbous on the back, bifid, acute, awned below the tip, concealed within the exterior valve of the calyx; the interior lanceolate, flat, acute, doubled together at each margin, the exterior rather longer; nectary very ſmall, two-leaved, truncate-rounded, greeniſh; *ſtamina*, filaments three, capillary; anthers linear, bifid on each ſide; *piſtillum*, germ oblong, ſmall; ſtyles two, ſimple, erect; ſtigmas oblong, villoſe, protruding on each ſide of the flower; *pericarpium* none; corolla cheriſhes the *ſeed*, which is ovate-oblong, compreſſed and ſmooth: flower-ſuperior ſmaller; *calyx*, glume two-flowered, two-valved; valves lanceolate, broadiſh, flat, ſharp, nervoſe, nearly equal; one floſcule female, the other male or neuter; *corolla* of the female a bivalve glume; valves membranaceous, greeniſh; the exterior veſſel boat-ſhaped, cornered, pointed; the interior lanceolate, narrower, ſhorter, obtuſe; of the male, glume bivalve; valves lanceolate, membranaceous, greeniſh; the exterior rather veſſel-ſhaped, ſharp; the interior narrower, ſhorter; nectary in both as in the ſuperior flower, and alſo the ſtamens of the male and piſtil of the female flowers. It has been obſerved, that ſometimes each floſcule of the ſuperior flower is male.

Eſſential generic character. *Calyx* glume common, bivalve; female floret ſeſſile, males pedunculed; male, *calyx* none; *corolla* bivalve; *ſtamina* three; female *calyx* none; *corolla* bivalve; ſtyle one; ſeed one, covered.

Species. 1. A. *mutica*, leaves lanceolate, all the flowers awnleſs; culms very long, weak, ſmooth, ſwelled at the joints; leaves long, flat, narrowed at the ſheath into a petiole; panicles ſmall, lateral: a native of India. 2. A. *ariſtata*, leaves lanceolate; male flowers awnleſs, except one at the end, which is awned and ſeſſile; culms a foot long, inflected; leaves rough, petiolate; racemes axillary; flowers in threes: a native of India. 3. A. *angiles*, mountain-reed-graſs, leaves ovate, flowers ſimilar to thoſe of the ariſtata; culms from one to two feet in height, filiform, jointed; leaves ſubpetioled, acute, nerved, reticulate, ſmooth; panicle ſpreading, few-flowered: a native of Jamaica, where it was found by Brown. See his Jam. 341. t. 4. f. 3. 4. A. *digitata*, ſpikes digitate; flowers all pointing in the ſame direction: a lofty Eaſt-Indian graſs, diſcovered by Thunberg.

APLUSTRE, or AMPLUSTRE, in the *Ancient Naval Architecture*, a carved tablet, ſomewhat after the manner of a ſhield, fixed by way of decoration to the extremity of a ſhip's head. This ornament was in the ſtern, and ſometimes on the prow, and from it was erected a ſtaff or pole, with a ribbon or ſtreamer on the top. It anſwered to the Greek *aplaſtum*.

The *roſtra*, or beaks of ſhips, were ſometimes alſo called *aplaſtria*.

But ſome think that the aplaſtre anſwered to what we call the flag, or enſign.

APNŒA, from α and πνεω, *I breathe*, in *Medicine*, denotes a want of breath, or loſs of reſpiration.

In this ſenſe is the word uſed among the ancients, not as importing a total privation of breath, which would only be another name for death; but to denote the reſpiration very ſmall and ſlow, ſo as to ſeem quite gone, as is the caſe in ſuffocation of the uterus, apoplexies, ſyncopes, lethargies, &c.

APOBATE, in *Antiquity*, the name given to thoſe athletæ, who were alſo denominated PARABATÆ.

APOBATANA, in *Ancient Geography*, the metropolis of Media, more properly and more generally called *Ecbatana*.

APOBATERION, from αποβαινω, *I depart*, among the *Ancients*, a farewel ſpeech or poem, made by a perſon on his departure out of his own country, or ſome other place where he had been kindly received and entertained.

Such is that of Helenus and Andromache, Æn. lib. iii. The apobaterion ſtands oppoſed to the EPIBATERIUS.

APOBATHMOS, in *Ancient Geography*, a place of Peloponneſus, on the coaſt of the Argolide, weſt of the gulf, near *Genethlium* and *Lerna*: where, according to tradition, Danaus and his ſons landed on the ſhore of Argos; whence the name.

APOBATHRA, a place in the Thracian Cherſoneſus, where the troops of Xerxes landed in their paſſage from Aſia to Europe.

APOBATHRÆ, in *Antiquity*, a kind of little bridges, or ſtairs, joining the land to ſhips, or one ſhip to another.

APOBEE, in *Botany*, a name given by the natives of Guinea to a ſpecies of corn-marygold, called by Petiver *chryſanthemum acaulon Guineenſe foliis longis anguſtis*, from its having long and narrow leaves, and no ſtalk to ſupport the flower. The people of the place uſe this in the ſmall-pox, and other eruptive fevers, boiled in water, and the liquor drank warm. Phil. Tranſ. N° 232.

APOBOMIOI, from απο, *below*, and βωμος, *altar*, in *Antiquity*, ſacrifices offered on the bare earth, without altars.

APOCALYPSE, formed of αποκαλυπτω, *I reveal; Revelation*: the name of the laſt book in the canon of Scripture.

The

The firſt queſtion that occurs in our examination of this book relates to its *authenticity*. This is a ſubject on which many ancient and modern writers have diſagreed; and it will be ſufficient to give a brief view of the evidence which teſtimony affords concerning it. It has been alleged, that there are evident alluſions to this book in the Shepherd or Paſtor of Hermas, a piece that was written towards the cloſe of the firſt century; and that it was received by Papias, who flouriſhed about the year 116. Juſtin Martyr, about the year 140, was well acquainted with this book, and received it as the genuine writing of the apoſtle John. Among the works of Melito, biſhop of Sardis, one of the ſeven churches of Aſia, about the year 177, Euſebius mentions one, intitled, "of the Revelation of St. John;" and it is probable, that he aſcribed this book to the apoſtle of that name, and eſteemed it of canonical anthority. It appears to have been referred to by the Martyrs at Lyons, A. D. 177. Irenæus, biſhop of Lyons, about 178, who in his youth was acquainted with Polycarp, often quotes this book as "The Revelation of John the Diſciple of the Lord;" and he ſays concerning it, that it was ſeen not long ago, but almoſt in our age, at the end of the reign of Domitian. From the writings of Athenagoras, the Teſtament of the Twelve Patriarchs, and the Clementine recognitions, Dr. Lardner has produced ſingle alluſions to the Apocalypſe, which prove, that the authors of theſe books were acquainted with it, though they do not warrant the concluſion, that they conſidered it as the genuine work of St. John the apoſtle. But it was undoubtedly received, and often cited by Theophilus, biſhop of Antioch, about A.D. 181, Clement of Alexandria, who flouriſhed about 194, and Tertullian about the year 200. Euſebius informs us, that Apollonius, who wrote againſt the Montaniſts about the year 211, quoted the Revelation. It was received by Hippolytus about the year 220, who wrote a commentary upon it; and about 230, by Origen, who has often cited it, and who ſeems to have had no doubts about its genuineneſs. Dionyſius, a diſciple of Origen, and biſhop of Alexandria, about the year 247, or ſomewhat later, wrote a book againſt the Millenarians, in which he allows the Revelation to have been written by John, a holy and divinely inſpired man, who was, as he ſuppoſes, not John the apoſtle, but an elder who alſo lived at Epheſus. About the year 240, and before, it was received by Nepos, an Egyptian biſhop, and by many others in that country, and held in great reputation.

After the age of Dionyſius, the number of eccleſiaſtical writers who quote the Apocalypſe, as a divine work, begins to increaſe.

According to Lardner, it was received and frequently quoted by Cyprian, biſhop of Carthage, about 248, and by the church of Rome in his time, by Novatus, A. D. 251, and his followers; by Commodian, A. D. 270; by Victorinus, who wrote a commentary upon it, and by Methodius, A. D. 290; probably by the Manichæans, though this is diſputed by Beauſobre; by Arnobius, and Lactantius, A. D. 306; by the Donatiſts, and by the Arians, in the fourth century. In the time of Euſebius, about the year 315, it was not received by all, and therefore he reckons it among contradicted books, obſerving that it was rejected by ſome, but by others referred to the claſs of books univerſally received. He ſeems to have heſitated about it; for he neither pronounced it to a forgery, nor aſcribed it to St. John the apoſtle. He ſays, however, that the Revelation was ſeen by John the elder, if not by John the apoſtle. Dr. Lardner obſerves, that the critical argument of Dionyſius of Alexandria had great weight with him, and with others of that time. The Revelation was received by Athanaſius, biſhop of Alexandria, A. D. 326; by Epiphanius, biſhop of Cyprus, A. D. 368; by Gregory Nazianzen, A. D. 370, as ſome have inferred from his citing it, but others have diſputed his acknowledgment of it; by Jerom, A. D. 392, who admitted it after a more cautious examination than was inſtituted by moſt of his predeceſſors, and who appealed in ſupport of its authenticity to ancient teſtimonies; by Ruſinus, A. D. 397; and by Auguſtine, A. D. 395. The authority of this father was ſo great, not only in the African church, but in the Latin church in general, that his reception of the Apocalypſe contributed very much to its almoſt univerſal admiſſion both in Africa and in the weſt of Europe. During his time, in the year 397, was held the third council of Carthage; and this was the firſt council in which this book was pronounced cononical. Innocent I. elected pope in 402, declared likewiſe, that this book, from which his ſucceſſors were to be proved the Antichriſt, was canonical. It is in the catalogue of Dionyſius the Areopagite, and in Greek manuſcripts, ſuch as the Codex Reuchlini, Alexandrinus, and Seidelianus. It was received by Sulpicius Severus about 401, and declared to be a genuine and divine work, in the fourth council of Toledo, A. D. 633, for this curious reaſon, becauſe it had been pronounced ſuch by ſeveral councils and ſeveral popes, and the decree of this council annuls all doubts of its authenticity in the Latin church. Andrew biſhop of Cæſarea in Cappadocia, at the end of the fifth century, and Arethas biſhop of the ſame place in the ſixth century, wrote commentaries upon it. In the Syrian church, which comprehended not only all the Chriſtians who reſided in Syria, Aſſyria, and Meſopotamia, but likewiſe all thoſe who were diſperſed in Arabia, Perſia, Tartary, and China, as well as in the Greek and Latin churches, the book of Revelation was acknowledged as a divine work. To this purpoſe Ephrem the Syrian, about A. D. 370, not only quoted it, but received it as a divine book; for he ſays concerning it, "John ſaw in revelation a great and wonderful book which God had written, and which was ſealed with ſeven ſeals." In the ſeventh century, a new and very literal tranſlation was made of the Apocalypſe, and taken into the Philoxenian verſion, which was chiefly uſed by the Monophyſites, ſo that they did not reject it. In the latter end of the ſame century, and the beginning of the next, lived Jacob the Monophyſite, biſhop of Edeſſa, who has quoted the Apocalypſe in his commentary on Gen. xlix. 17. That the Syrians of the Neſtorian party likewiſe received this book in the eighth century, appears from an ancient monument which was dug up at Sanxuen, in the Chineſe province of Xenſi, in the year 1625. On this monument, which appears to have been erected A. D. 781, at which period, as well as during ſome centuries later, there was a very numerous colony of Neſtorian Syrians, in China, mention is made of the New Teſtament as containing 27 books, ſo that the Apocalypſe muſt have been included; but it is needleſs to purſue the evidence to a wider extent, or to a later period.

Having cited a great number of very reſpectable authorities in favour of the genuineneſs of the Apocalypſe, it may not be improper, for aſſiſting the judgment of the reader, to preſent ſome of the teſtimonies that have been urged againſt it.

The moſt ancient evidence on this ſide of the queſtion, is that of Ignatius, A. D. 107, who wrote epiſtles to the churches of Epheſus, Smyrna, and Philadelphia; three of thoſe that are mentioned in the book of Revelation; and who reminds the Epheſians of the praiſes beſtowed upon them by St. Paul, and yet takes no notice of the praiſes which, according to Rev. ii. 1—7. 8—11. iii. 7—12. their biſhops had received from Chriſt himſelf. Hence it has been in-

ferred, either that the Apocalypse was unknown to Ignatius, or if known, not believed by him to be genuine: and if it was a genuine work of St. John the apostle, it could not have remained unknown to him. The old Syriac translator, who lived in the first century, did not translate the Apocalypse; and hence it is presumed, that he either knew nothing of it, or did not believe it to be genuine. The testimony of Papias in its favour is doubtful; for it is urged, that as he was the founder of the system of the Millennium, he would naturally have recurred to the 20th chapter of this book, if he had been acquainted with it, in support of his opinion. In the second century it was acknowledged and received by many eminent persons; nevertheless in this century there existed a sect, called the Alogians, who were acquainted with the Apocalypse, and yet denied it to be genuine. One of their principal and most plausible objections against the authority of this book is founded on the circumstance recorded in ch. ii. 18-29, in which the fourth epistle is directed to be addressed to the angel of the church at Thyatira; whereas, they affirm, that there existed no church at Thyatira. This objection of the Alogi Epiphanius has delivered in the following words, "[illegible] χριστιανῶν;" but these words are ambiguous, for they may denote either that there was no Christian community at Thyatira in the time of St. John, or there was no such community there when the Alogi made their objections. In the latter sense the argument is of no importance; for though there might be no Christian society at Thyatira in the middle of the second century, there might have been one in the reign of Claudius, to which period Epiphanius refers the Apocalypse. But the fact was not true, as there existed a community of Alogi, who certainly considered themselves as Christians, and another sect who were opposed to the Alogi, and who were called Phrygians. It is, therefore, not necessary to recur with Epiphanius to the prophetic spirit of St. John, who foresaw there would be a church at Thyatira in course of time. Besides the Alogi, there were other adversaries of the Apocalypse, who lived partly at the same time with them, and partly in the beginning of the third century; and who rejected the Apocalypse, not so much as the Alogi did, from their antipathy to the term λογος, but principally from their dislike of the doctrine of the Millennium. Among these we may reckon the Roman presbyter Caius, who lived about the year 210. Some, however, have supposed that Caius refers to a different Apocalypse from ours. Dionysius of Alexandria, though he did not reject it as a forgery, did not ascribe it to St. John the apostle, and probably did not believe it to be a divine work: but his reasons for not ascribing it to St. John are not historical but critical; and, therefore, their importance depends not on the antiquity of the writer who assigned them, but merely on their own internal strength. It is well observed by Michaelis, who himself hesitates in allowing the genuineness of this book, but who has fairly stated the evidence on both sides, that if it were not written by St. John, we have reason to wonder, that neither Dionysius nor his predecessors, neither the Alogi nor Caius, should have alleged against a work, supposed to have been first ushered into the world about the year 120, any arguments like the following: "It is not preserved in the archives of the seven churches; the oldest persons in these cities have no knowledge of its having been sent thither; no one ever saw it during the life of John; it was introduced in such and such a year, but was contradicted as soon as it appeared." Arguments like these would have at once determined the question in dispute; but since we meet with no such arguments in the writings of the ancient adversaries of the Apocalypse, its very adversaries have given it an advantage, which, if not decisive, merits peculiar consideration. Eusebius, who was in possession of almost all the information that was to be collected before his time, had not been able to discover any thing decisive in respect to the Apocalypse, and consequently remained in doubt. He, therefore, neither pronounced it a forgery, nor ascribed it to St. John the apostle. Michaelis closes his examination of the evidence prior to the time of Eusebius, with the following remarks: "How is it possible that this book, if really written by St. John the apostle, should have either been wholly unknown, or considered as a work of doubtful authority in the very earliest ages of Christianity? The other apostolical epistles are addressed only to single communities or churches; but the Apocalypse, according to its own contents, was expressly ordered by Christ himself, in a command to St. John the apostle, to be sent to seven churches; and not only were these seven churches in that part of Asia Minor where Christianity was in the most flourishing situation, but one of them was at Ephesus, where St. John spent the latter part of his life, and consequently where every work of St. John must have been perfectly well known. If St. John then had actually sent the Apocalypse to these seven churches, and that too not as a private epistle, but as a revelation made to him by Jesus Christ, one should suppose that its authenticity could not have been doubted, especially at a time when there were the best means of obtaining information. We cannot say that the book was kept secret, or was concealed in the archives, lest the prophecies against Rome should draw a persecution on the Christians; for secrecy is contrary to the tenor of the book; and the author of it enjoins (ch. i. 3.) that it should be both read and heard. "Under these circumstances," adds the author, "the authenticity of the Apocalypse appears to me very doubtful; and I cannot avoid entertaining a suspicion, that it is a spurious production, introduced probably into the world after the death of St. John."

Since the time of Eusebius, and some centuries later, the doubts that had prevailed concerning the authenticity of the Apocalypse considerably abated, especially among the members of the Latin church, who at last received it almost unanimously. Among the Greek writers, however, there were several who rejected it. It was not received by all in the time of Epiphanius; it was omitted in the catalogue of the council of Laodicea, held A.D. 363; but professor Spittler, says Michaelis, has clearly shewn, that the whole of the sixteenth canon, which contains this catalogue, is a forgery; and if this be true, no evidence can be deduced from it in future against the Apocalypse. It was not acknowledged by Cyril, who was bishop of Jerusalem from the year 350 to the year 386; nor was it admitted into the catalogue of canonical books by Gregory Nazianzen; and by Gregory of Nyssa it was placed among the Apocryphal writings. In fact, says Michaelis, it was almost universally considered as spurious by the members of the Greek church at the end of the fourth century: and Dr. Lardner acknowledges, not only that the two celebrated Greek commentators, Chrysostom in the fourth, and Theophylact in the eleventh century, have not quoted it in a single instance; but that Nicephorus, patriarch of Constantinople, about the year 806, expressly rejected it; and on his testimony, it was placed among the Apocryphal books.

Although the Apocalypse made no part of the old Syriac version, which is the vulgate of the Syrian church in general, it was translated in an early age into that language. Nevertheless, it was not received by Severian, bishop of Gabala in Syria, A. D. 401; nor by Theodoret, bishop of Cyrus, in Syria, A. D. 423; nor by Abulpharagius, who was primate of all the Monophysites of the east in the thirteenth century,

century, and was by far the moſt learned of all the Syrian writers; and it was entirely omitted in the catalogue of ſacred books formed by Ebedjeſu, metropolitan of Armenia, who died in the year 1318. It does not appear to have been received, or at leaſt to have been publicly read at Alexandria in the fifth century, but it was received in general by the Egyptian Chriſtians.

In more modern times, although the opinion of learned men has been very generally and decidedly in favour of the authenticity of the Apocalypſe, yet there have been ſome who have entertained doubts about it, and others who have denied it. Among the latter we may mention Luther, who, in the preface to his edition of 1522, poſitively rejected it; but in the later editions, he has expreſſed himſelf in terms leſs deciſive, and left it to others, who, he ſays, were better qualified than himſelf to determine whether it merited a place in the ſacred canon or not. Michaelis alſo, after an elaborate examination of the authenticity of this book, concludes with leaving the deciſion of this important queſtion to every man's private judgment.

The arguments for or againſt its divinity, deduced from the completion or non-completion of the prophecies contained in it, have been particularly conſidered by Michaelis (ubi infra), and to this learned writer the reader is referred. Sir Iſaac Newton cloſes his brief account of the ancient teſtimonies in favour of the genuineneſs of the Apocalypſe with this obſervation: "I do not, indeed, find any other book of the New Teſtament ſo ſtrongly atteſted, or commented upon ſo early as this."

As to the *author* of this book, there has been a conſiderable difference of opinion among both ancient and modern writers. Some have aſcribed it to John, a preſbyter of Epheſus. Of this number ſeems to have been Euſebius, who, after having ſhewn from the writings of Papias, that beſide St. John the apoſtle, there lived at Epheſus a preſbyter of the ſame name: he adds, "This latter John was probably the perſon who ſaw the Revelation, unleſs it be inſiſted on, that it was the former." Others attributed the Apocalypſe to Cerinthus, who is ſuppoſed to have lived in the time of St. John: and to this claſs we may refer the Alogi, and, probably, the Roman preſbyter Caius, and other perſons in Egypt, of whom Euſebius has given an account. Eccl. Hiſt. b. vii. c. 25. Againſt this opinion it has been juſtly alleged, that if the inſcription be not falſe, Cerinthus could not have been the author, unleſs he alſo was called John; beſides, the Revelation contradicts many of Cerinthus's ſentiments, and therefore could not be his work. According to Irenæus, Cerinthus denied that God made the world; whereas, the writer of the Revelation often teaches the contrary. See Rev. c. iv. 11. He alſo maintained, that Chriſt did not ſuffer, but Jeſus only. But the author of the Revelation calls Jeſus, Chriſt, not Jeſus alone, the firſt begotten of the dead; and adds, that the ſame Jeſus Chriſt waſhed us from our ſins in his own blood (Rev. i. 5.); and, v. 7. he ſays of Jeſus Chriſt, that he was pierced. It is, therefore, improbable to the higheſt degree, that Cerinthus ſhould have written the Revelation under the name of John; for if he had meditated ſuch a fraud in favour of his Millennium, he would have ſo contrived it, as not to hurt his other equally favourite opinions. It has been alſo ſaid, that the Revelation does not eſtabliſh Cerinthus's notions of the Millennium, but directly contradicts and overthrows them; for the author of the Apocalypſe deſcribes his Jeruſalem as inhabited by numbers of pure and holy perſons (Rev. xxi. 27. xxii. 14, 15.); whilſt Cerinthus's Jeruſalem was to be the reſidence of the earthly and ſenſual. His citizens were to ſerve their paſſions and their pleaſures; whilſt the men of John's Jeruſalem were to ſerve God and the Lamb (Rev. xxii. 3.). His millenary ſtate was not the life of ſaints, as the Apocalypſe repreſents it, but the life of libertines.

The more generally received opinion concerning the author of the Apocalypſe is, that it was written by St. John the apoſtle and evangeliſt, who was the writer of the Goſpel and the Epiſtles. To this purpoſe it has been argued, that in ch. i. v. 1. John ſtyles himſelf the "Servant of Chriſt," in a ſenſe not common to all believers, but peculiar to thoſe who are eſpecially employed by him; and, in v. 2. the writer is ſuppoſed to refer to the written goſpel of St. John, and to ſay, that he had already borne teſtimony concerning the word of God and of Jeſus Chriſt. On this particular, Dr. Lardner lays no great ſtreſs; and he thinks, that if St. John had intended to manifeſt himſelf in this introduction, he would have more plainly characteriſed himſelf in ſeveral parts of this book than he has done. But the evidence of antiquity, in favour of its having been written by St. John the apoſtle, is of much greater moment; beſides, it has been alleged in proof of its genuineneſs, and of St. John's being the author of it, that there are many inſtances of conformity, both of ſentiment and expreſſion, between this and the unconteſted writings of St. John. For ſuch coincidences, learned men have referred to Rev. xix. 13. John, i. 1.; Rev. v. 6. 12. John, i. 29. 36.; Rev. iii. 7. xix. 11. John, i. 14. xiv. 6.; 1 John, v. 20. Rev. ii. 17. John, vi. 32.; Rev. i. 7. John, xix. 37.; Rev. iii. 20. John, xiv. 23.; Rev. i. 5. 1 John, i. 7; Rev. iii. 21. John, xvi. 33. 1 John, ii. 13. 14. iv. 4. 5. Theſe coincidences tend to invalidate the objection of Dionyſius of Alexandria, who ſays that there is no affinity or reſemblance between them. This learned writer has alſo obſerved, that the Goſpel and firſt epiſtle of John are written correctly, and not only according to the propriety of the Greek tongue, but with elegance of phraſe, argument, and compoſition; quite free from barbariſm and ſoleciſm, and even idiotiſm of language; but the writer of the Revelation diſcovers no accurate ſkill in the Greek tongue; on the contrary, he has barbariſms and ſome ſoleciſms. The Apocalypſe, it is obſerved, abounds with harſh conſtructions, in which a nominative is placed where another caſe ought to have been uſed. Bengelius, in his "Apparatus Criticus," has alleged inſtances from ch. i. 5.; ii. 20.; iii. 12.; viii. 9.; ix. 14.; xiv. 12.; xviii. 11. 12.; xxi. 10. 12.; xiv. 5.; xvii. 4.: others might be added. Although conſtructions of this kind were probably not unuſual among the Greek Jews, yet we find no ſuch examples in the goſpel and epiſtles of St. John. Some of theſe unuſual conſtructions, it has been pleaded, are not found in all manuſcripts, and only in a very few printed editions; but they occur too frequently in the Apocalypſe to be imputed wholly to tranſcribers: and they exiſted in this book long before our moſt ancient manuſcripts were written, as in the third century, when they were noticed by Dionyſius. Beſides, the Apocalypſe abounds with Hebraiſms much more than the other writings of St. John; and this circumſtance has induced ſome commentators to ſuppoſe, that it was originally written in Hebrew, and that our Greek text is only a tranſlation; but this is wholly unſupported by hiſtorical evidence. Moreover, though the figurative language of the Apocalypſe, when compared with the ſimple ſtyle of St. John's Goſpel, cannot be fairly alleged as an argument that the two books were written by different authors; ſince the ſame author, when animated by a ſpirit of prophecy, will write in a different manner from that in which he had written as an hiſtorian; yet there is a certain character, it has been ſaid, in the language of the Apocalypſe, which is hardly to be reconciled with the manner that is viſible in St. John's Goſpel. In the latter, there is a ſoft and gentle cha-

racter,

racter, so peculiar to itself, as to exhibit no trace of imitation; whereas, in the former, we find the author an imitator of the ancient prophets, from whom he borrows his images, and renders them more beautiful than they were in the originals. And the imagery, which is taken from the theology of the rabbins, acquires in the Apocalypse a taste and eloquence, of which the rabbinical writings themselves are wholly destitute. The beauties of St. John's gospel are of a different kind; for while the author of the Apocalypse hurries us away to enchanted ground, and resembles a torrent which carries every thing before it, St. John the evangelist is plainness and gentleness, and is like a clear rivulet, which flows without rapidity and violence. Is it possible, therefore, subjoins Michaelis, that St. John the apostle, and the author of the Apocalypse, called St. John the divine, were one and the same person? It is, indeed, an undeniable fact, that the style of the Apocalypse is very different from that of St. John's gospel. Mr. Blackwall denies this; but it is allowed by Joachim Camerarius, Beza, Mill, &c. "This, I suppose," says the impartial and candid Lardner, "to be the more general opinion of learned men, that there is a considerable difference of sentiments and words, and manner, in the Revelation, and the acknowledged pieces of the apostle John: whatever this difference is owing to, whether it be that these writings are not all the compositions of one and the same author, or that it is entirely owing to the diversity of subject and design, or to some other cause. I shall, however, mention another thing to be considered: if there were any reason to think, that there was some considerable distance of time between the composing of any of these books, that might be one good way of accounting for differences of style; for it is not unlikely, that one and the same person, writing upon different arguments, and at a great distance of time, especially if he be one who does not frequently exercise his style, or write in the intermediate space, should have a very different manner in his several performances."

Dionysius has further remarked, that St. John the apostle has not mentioned his own name in his gospel, or in any of his epistles; but, when he has occasion to speak of himself, he makes use of a circumlocution. On the other hand, St. John the divine mentions his own name, not only in places where it was requisite, as in the address to the seven churches (ch. i. 4.), but likewise in places where the single pronoun "I," or the expression, "he who saw this," would have been full as proper as the term "I John." The one appears to have an excessive modesty, and to avoid even the shadow of egotism; the other avoids it so little, that he is lavish in the use of his name. And what renders this difference the more remarkable is, that the circumlocution by which St. John the apostle denotes himself, *viz.* "the disciple whom Jesus loved," is not once used by St. John the divine. This objection admits of various replies. Although St. John has not expressly named himself in his gospel, he has so described himself (John xxi. 24. and other places), that it is impossible not to know him; the other apostles have forborne to mentions their names as well as John; nor is there any name prefixed to the epistle to the Hebrews; and the character of the prophet being different from that of an evangelist, required the introduction of his name in conformity to the ancient prophets, who had inserted their names at the beginning, and in other parts of their prophecies. Dr. Lardner does not allow this last observation to be fully satisfactory, as the apostle has not specified the time of his prophecies and visions, and other particulars, which was done by the ancient prophets, and by Daniel in particular. As for the want of any description annexed to the name of John, we may infer from this circumstance, that he was the principal person of that name then living, that is, John the evangelist; and as this was the case, his name needed no additions. Besides, he is actually described (ch. i. 2.) under characters which were appropriate to John the apostle. Upon the whole we may observe, that he calls himself John; that he is described as one who bore record of the word of God; that he had been in the isle of Patmos for the testimony of Jesus; and we have no account of any John who had been an exile in this island about that time, except John the apostle; and, moreover, he writes to the seven churches of Asia, where the apostle and evangelist is supposed to have presided; and it is not likely that the spirit of God should admonish and reprove these churches by John the elder, allowing there was such a person, whilst John the apostle was living, and presided in those parts. Upon the whole, there seems to be sufficient reason for concluding, that St. John the apostle was the author of the Apocalypse.

Another subject of inquiry, concerning which the learned have differed, is the *time* in which this book was written. On this point six different opinions have been advanced. 1. It has been asserted, that the Apocalypse was written in the reign of the emperor Claudius. Epiphanius is the only evidence in favour of this opinion, and he lived 300 years later than St John. Although Grotius recommends this opinion by having adopted it, and supposes that the visions of the book were seen at several times, and afterwards joined together in one book, two very material objections have been urged against it: the first is, that there was no persecution of the Christians in the reign of Claudius, and therefore the banishment of St. John to the isle of Patmos cannot be referred to this period. This emperor did indeed issue an edict for banishing the Jews from Rome, but it did not affect the Jews in the provinces, much less the Christians; and the governors had no authority to banish Jews or Christians out of their governments, without an order from the emperor; and moreover, St. John was not in Ephesus during the reign of Claudius. The second objection to this date is founded on the circumstance, that the seven churches in Asia, to which the Apocalypse is addressed, did not exist at so early a period as the reign of Claudius; for this fact cannot be reconciled with the history given in the Acts of the Apostles, of the first planting of Christianity in Asia Minor. 2. It has been maintained that St. John was banished to Patmos, and wrote the Apocalypse there, in the reign of the emperor Nero, before the destruction of Jerusalem. This opinion has one evidence in its favour, but it is anonymous, and without date; and that is, the subscription to the Syriac version of the Apocalypse; but thus feebly supported, it has been sanctioned by the adoption and arguments of sir Isaac Newton. Dr. Lardner has examined the arguments of Newton, and does not allow them much weight. 3. According to another opinion, the Apocalypse was written before the time of Domitian, and before the Jewish war, but it does not determine whether it was in the reign of Claudius or in that of Nero. 4. The most probable, and the generally received opinion is, that St. John was banished into Patmos in the reign of Domitian, and by virtue of his edicts for persecuting the Christians, in the latter part of his reign, and that he had the Revelations contained in the Apocalypse on that occasion; but the book itself could not have been published till after St. John's release and return to Ephesus. All antiquity, says Mr. Lampe, is agreed that St. John's banishment was by order of Domitian. Irenæus, Origen, Eusebius, and various other ancients, refer the banishment of St. John to the latter part of the reign of Domitian; and they concur in saying, that he there saw the Revelation. As Domitian died A.D. 96, and his persecution did not commence till near the end of his reign, the

Revelation

Revelation ſeems to be ſtily dated in the year 95 or 96, in the laſt of which years Mill, Baſnage, and Le Clerc place it. Mr. Lowman ſuppoſes, that he had his viſions in the iſle of Patmos, in the year 95; Dr. Lardner refers the viſions recorded in this book, and the publication of them, to the years of Chriſt 95 and 96, or 97. There are two other opinions, which ſhall be merely mentioned, becauſe they are not ſupported by any ſufficient authority, that refer the baniſhment of St. John to Patmos, the one to the reign of Trajan, and the other to that of Adrian. Mr. Wettſtein (N. T. t. ii. p. 746.) favours the opinion of thoſe who have agreed that the Revelation was written before the Jewiſh war; and in this caſe, he ſays, it is likely that the events of that time ſhould be foretold in it. But upon this ſuppoſition, Dr. Lardner is of opinion, that it was not neceſſary the deſtruction of Jeruſalem, and the calamities attending it, ſhould be foretold in this book; becauſe our bleſſed Lord's plain predictions, and ſymbolical prefigurations of theſe events, had been recorded by no leſs than three hiſtorians and evangeliſts before the war in Judæa broke out. "If we conſider the Apocalypſe as a divine work," ſays Michaelis, "I think we muſt confine our choice to thoſe dates which precede the commencement of the Jewiſh war; for thus only ſhall we be enabled to ſhew, that its firſt prophecies were fulfilled in a ſhort time. And I grant, that if it is referred to the reign of Claudius, the explanation of it is ſtill eaſier than when it is referred to the reign of Nero; for the ſcarcity predicted (ch vi. 6.) is deſcriptive of that which took place in the time of Claudius. If it be conſidered as a mere human invention, it may be either aſcribed to Cerinthus, or attributed to ſome unknown writer, who lived between the time of Papias and that of Juſtin Martyr; in the latter caſe, it might have been written in the reign of Hadrian. But if it be really a forgery, if it contain prophecies of the Jewiſh war, made after the events themſelves had taken place, we have reaſon to wonder, that the author did not propheſy more circumſtantially, and that he appears ſo little acquainted with the events of that war."

The book of the Revelation, notwithſtanding the pains which have been taken by men of ability and learning to explain it, ſeems yet to the generality of Chriſtians very obſcure; and many look upon it as a ſealed book ſtill, never to be explained to any certainty or ſatisfaction. A great critic, Scaliger, ſaid, that Calvin was wiſe becauſe he did not write upon the Revelation. And another (Dr. Whitby), who has written with great reputation on the other books of the New Teſtament, confeſſes he did not do it for want of wiſdom; becauſe, ſays he, "I have neither ſufficient reading nor judgment to diſcern the intendment of the prophecies contained in that book." Michaelis has arranged the expoſitions of the Apocalypſe, conſidered as a divine work, under the following claſſes. To the firſt claſs may be referred all thoſe commentaries which are faſhionable among Proteſtants, and according to which, the Apocalypſe contains prophecies againſt the pope and the church of Rome; and in the commentaries belonging to this claſs, the prophecies in the Apocalypſe are conſidered as ſtill fulfilling. To this claſs of commentators we may refer Mede, ſir Iſaac Newton, Lowman, biſhop Newton, Hurd, &c. &c. and many other Proteſtant writers. To the ſecond claſs belong thoſe commentaries, which confine the prophecies of the Apocalypſe to the three firſt centuries, at leaſt ſuch as relate to perſecution and puniſhment: for the happy Millennium may, according to theſe commentaries, be made to commence with the converſion of Conſtantine the Great. Commentators of the third claſs find in the Apocalypſe nothing but the deſtruction of Jeruſalem, and the flight of the Chriſtians from that city to Pella before the commencement of the ſiege. The book of Revelation, according to the interpretation of the beſt commentators, comprehends a much longer period than has been aſſigned to it by thoſe who ſuppoſe that the expreſſions "which muſt ſhortly come to paſs," and "the time is at hand," and the like, point out a very ſhort period; ſo that the whole prophecy ſhould be accompliſhed in a few years after the viſion. Theſe expreſſions will, indeed, ſhew that the accompliſhment of the things foretold in this prophecy was ſoon to begin, but determines nothing concerning the time of their termination, the duration of which is much longer, and reaches from the time of the viſion to the day of judgment. The book itſelf ſeems alſo to ſhew farther very plainly the order of the ſeveral prophecies, according to their ſeveral periods, as well as the whole duration, from the time of the origin to the finiſhing of the whole myſtery of God's providence towards the church. The Revelation begins, according to Mr. Lowman, by opening the ſealed book, which deſcribes the future ſtate of the church in ſeven ſucceſſive periods.

The *firſt* period ſhews the ſtate of the church under the Heathen Roman emperors, from about the year 95 to about the year 323, and comprehends the opening of ſeven ſeals. The firſt ſeal repreſents a white horſe and the rider with a crown, ſignifying the Chriſtian religion prevailing againſt the oppoſition of Jews and Heathens. The ſecond ſeal repreſents a red horſe with its rider, having power to take peace from the earth, denoting the firſt memorable judgment on the perſecutors of Chriſtianity, in the deſtruction of of the Jews under Trajan and Hadrian, from 100 to 138. The third ſeal repreſents a black horſe, the rider of which has a balance to meaſure corn, denoting great ſcarcity, approaching to famine, in the time of the Antonines, from 138 to 193. The fourth ſeal repreſents a pale horſe with its rider, called Death, ſignifying a great mortality and peſtilence, in the reigns of Maximin and Valerian, from 193 to 270. The fifth ſeal repreſents the ſouls of the martyrs under the altar, denoting the ſevere perſecution in the reign of Dioclefian, with an encouragement to conſtancy. The ſixth repreſents earthquakes, &c. ſignifying great commotions in the empire, from Maximian to Conſtantine the Great, who put a period to the perſecution of Heathen Rome. The interval between the firſt and ſecond periods repreſents an angel ſealing 144,000 with the ſeal of the living God; ſignifying great numbers forſaking the idolatrous worſhip of the Heathen Roman empire, and embracing the profeſſion of Chriſtianity.

The *ſecond* period reveals the ſtate of the church and providence in the times following the reign of Conſtantine, during the invaſion of the empire by the northern nations and the riſe and firſt progreſs of the Mahometan impoſture, till the ſtop put to it in the weſtern empire; extending from the year 337 to 750, and denoted by ſeven trumpets. The firſt trumpet repreſents hail and fire mingled with blood, ſignifying great ſtorms of war falling upon the empire, and the blood that was ſhed in the reigns of the Conſtantine family and their ſucceſſors, till things were ſettled under Theodoſius, from 337 to 379. The ſecond trumpet repreſents a mountain burning with fire, caſt into the ſea, whereby it became blood; denoting the invaſion of Italy by the northern nations, and taking the city of Rome by Alaric, from 379 to 412. The third trumpet repreſents a burning ſtar falling upon the rivers, which became bitter; ſignifying the ravages in Italy, putting an end to the Roman empire, and founding a kingdom of Goths in Italy itſelf, from 412 to 493. The fourth repreſents a third part of the ſun

and

and moon darkened, fignifying the wars in Italy between Juſtinian's generals and the Goths, whereby the exarchate of Ravenna was erected, and the remaining power and authority of Rome quite ſuppreſſed, from 503 to 568. The fifth repreſents the bottomleſs pit opened, and locuſts coming out of it, ſignifying the riſe of the Mahometan religion and empire, and the great progreſs of both till a ſtop was put to them by a contest for the ſucceſſion, from 568 to 655. The ſixth trumpet repreſents four angels looſed, which were bound in the Euphrates, ſignifying the reunion of the divided Saracen powers in the invaſion of Europe by them, and threatening the conqueſt of it, but defeated by Charles Martel, from 633 to 755.

The *third* period reveals the ſtate of the church and providence, in the times of the laſt head of Roman government, repreſented by the beaſt, for 1260 years to its final overthrow, from about the year 750 to about the year 2016. The ſealed book opened by the lamb, and given to St. John to eat, denotes a further revelation of what was to follow, in order of time, to the end of the world. There are three general deſcriptions of this period in the xiith, xiiith, and xivth chapters. The firſt ſignifies the corruption of the church, and the conſtancy of ſome faithful witneſſes to the truth, though under ſevere perſecutions, during the whole of this period. The ſecond repreſents a woman forced to fly into the wilderneſs for ſafety, and protected there 1260 days, ſignifying the perſecution and preſervation of the church during the ſame period. The third deſcription repreſents a monſtrous wild beaſt riſing out of the ſea, with ſeven heads, ten horns, as many crowns and titles of blaſphemy, who was to continue 42 months, ſignifying that new Roman power, which ſhould uſe its authority to promote idolatrous worſhip, and to perſecute all who would not ſubmit to it, and ſhould be ſupported by another power like to its own form and conſtitution during the ſame period. In the xivth chapter, the chorus of the heavenly church celebrates in an hymn the happineſs of thoſe who remain faithful and conſtant; and a nuntius or angel is repreſented as coming down from heaven to declare the certain and ſevere puniſhment of the enemies of truth and pure religion in this period. In the xvth chapter, ſeven angels are repreſented as receiving ſeven cups full of the wrath of God; ſignifying that the enemies of truth and pure religion in this period ſhall be ſeverely puniſhed in the courſe of it, and be utterly deſtroyed in the end. The ſeven angels pour out their vials or cups: the firſt vial poured on the earth, and on the worſhippers of the beaſt, denotes great commotions through the whole empire, under the family of Charles the Great, by which that family becomes extinct, and the empire and crown of France are transferred to other families, from 830 to 988. The ſecond vial poured on the ſea, ſignifies the great bloodſhed of the holy war, to recover Jeruſalem from the Saracens, from 1040 to 1150. The third vial poured on the rivers and fountains, ſignifies the bloody civil wars between the Guelphs and Gibellines, the papal and imperial factions, when the popes were driven out of Italy into France, from 1200 to 1371. The fourth vial poured on the ſun, denotes the long wars in Italy, Germany, France and Spain, occaſioned by a long ſchiſm in the papacy; the Turks taking Conſtantinople, and putting an end to the eaſtern empire; and peſtilential diſeaſes occaſioned by intemperate heat, from 1378 to 1530. The fifth vial poured on the ſeat or throne of the beaſt, ſignifies the reformation, and the eſtabliſhment of it by the principal ſtates of Europe, in oppoſition to the papal authority, from 1560 to 1650. The ſixth vial poured on the river Euphrates, makes way for the kings of the eaſt; this, in the order of the prophecies, ſeems to be yet future; but may probably mean ſome invaſion of the pope's dominion from its eaſtern boundary on the Adriatic, from 1670 to 1850. The ſeventh vial poured on the air, the ſeat of Satan's empire, deſcribes the utter ruin of this perſecuting, idolatrous government, or myſtical Babylon, at the end of this period, from 1850 to 2016.

The *fourth* period is deſcribed in the xxth chapter; an angel being ſent from heaven to ſhut up Satan in the bottomleſs pit, as in a ſecure priſon, for 1000 years, during which time there will be a very happy ſtate of the church in purity, peace, and proſperity.

The *fifth* period terminates the 1000 years of the church's proſperity, when Satan will be looſed again for a little ſeaſon, and a new attempt will be made to revive the corruptions of the church, and a ſpirit of perſecution, which ſhall end in the final deſtruction of Satan's power, and of all the enemies of peace and true religion.

The *ſixth* period comprehends the general reſurrection and final judgment, and the everlaſting deſtruction of the wicked.

The *ſeventh* period concludes the whole prophecy, with the viſion of new heavens and a new earth, repreſenting in ſtrong images, the extent, ſecurity, riches, and grandeur of the heavenly Jeruſalem; ſignifying the conſummate happineſs of the heavenly ſtate; and the ſure reward of all who ſhall be found faithful and conſtant in the true religion of Jeſus Chriſt. Such is a ſpecimen of the interpretation of the prophecies of the Apocalypſe, given by Mr. Lowman, a judicious and approved writer on this ſubject; but the meaning aſcribed to particular parts and prophecies of this book by different commentators, is very various. On this article the reader may conſult Newton's Obſervations on the Apocalypſe of St. John, apud oper. by Horſley, tom. v. p. 439—491. Mede's Works. Lowman's Paraphraſe and Notes on the Revelation of St. John, preface paſſim. Lardner's Works. Michaelis's Introduction to the New Teſtament, by Marſh, vol. iv. p. 457—544.

There have been ſeveral other works publiſhed under the title of Apocalypſes. Sozomen mentions a book uſed in the churches of Paleſtine, called the Apocalypſe, or Revelation of St. Peter. He alſo mentions an Apocalypſe of St. Paul, which the Cophtæ retain to this day. Euſebius alſo ſpeaks of both theſe Apocalypſes. St. Epiphanius mentions an Apocalypſe of Adam; Nicephorus, an Apocalypſe of Eſdras; Gratian and Cedrenus, an Apocalypſe of Moſes, another of St. Thomas, and another of St. Stephen; St. Jerom, an Apocalypſe of Elias.

Porphyry, in his life of Plotin, makes mention of the Apocalypſes or Revelations of Zoroaſter, Zoſtrian, Nicothæus, Allogenes, &c.

APOCARITES, from αποχαιρω, *I cut off*, in *Eccleſiaſtical Hiſtory*, denote thoſe who aſſerted that the human ſoul is part of, or derived from the ſubſtance of God.

The Apocaritæ are ranked as a branch of the Manichæans.

APOCARPASUM, in *Natural Hiſtory*, a name given by the ancient Greeks to a poiſonous drug, called alſo ſometimes ſimply *carpaſum*; it was the exudation of a tree growing in the country of the Abyſſines, and was ſo like the fineſt myrrh, that it was often mixed with it, and many lives were loſt by adminiſtering it as myrrh. The wood of the tree which produced it was alſo poiſonous, though in a leſs degree, and was called by the ſame writers *opocarpaſum*, as the wood of the balm of Gilead tree is *opobalſamum*.

APOCATASTASIS, from αποκαθιστημι, *I reſtore*, denotes the entire reſtitution, or redintegration of thing.

In

In this ſenſe, we read of the *apocataſtaſis* of the world, or of all things.

APOCATASTASIS, among *Aſtronomers*, denotes the period of a planet, or the time wherein it returns to the ſame point of the zodiac from which it ſet out.

APOCATASTASIS is alſo uſed in *Medicine*, to denote the ſubſiding or ſinking of a thing.

In this ſenſe, we read of the *apocataſtaſis* of urine, the *apocataſtaſis* of tumours, and other diſeaſes.

APOCATHARSIS, in a general ſenſe, denotes the ſame with *catharſis*, or expurgation.

In this ſenſe, we read of *apocarthaſes* of bile, a ſymptom mentioned by Thucydides in the plague of Athens.

Quincy defines *apocarthaſes*, a purging upwards and downwards, but without ſufficient authority. Hence alſo *apocathartica*, a denomination ſometimes given to what we otherwiſe call ſimply CATHARTICS.

APOCENOSES, in *Medicine*, the fourth order of the fourth claſs, or *locales*, in the arrangement of diſeaſes, by Dr. Cullen; comprehending thoſe which have a flux of blood or ſome other humour, more abundant than uſual, without pyrexia, or an increaſed impulſe of fluids. This order includes the following genera, viz. profuſio, or a flux of blood; ephidroſis, or a preternatural evacuation of ſweat; epiphora, or a flux of the lacrymal humour; ptyaliſmus, or a flux of ſaliva; aneureſis, or an involuntary flux of urine without pain; and gonorrhœa. See the ſeveral articles.

APOCHA, from απο and εχω, *I have*, in *Civil Law*, denotes an acquittance or receipt given by the creditor to his debtor for money paid: in which ſenſe the word ſtands contradiſtinguiſhed from *antapocha*, which is given by the debtor to the creditor. Reuſner and Zieglerus have diſſertations *de apochis*.

APOCHULISMA, from απο and χυλιζω, *I extract the juice*, in *Pharmacy*, denotes an inſpiſſated vegetable juice; anſwering to what is called in the ſhops a ROB.

APOCOPE, compounded of the prepoſition απο, and the verb κοπτω, *I cut*, a figure in *Grammar*, wherein part of the end of a word is cut off; as in *dic* for *dice*, *fac* for *face*, *nil* for *nihil*, *hyp* or *hypo* for *hypochondriacal*.

A like retrenchment at the beginning of a word is called *apharеſis*.

When the *apocopation* is marked with a ſuperior comma (called an *apoſtrophus*), the word is ſaid to be *apoſtrophated*; as *thro'* for *through*.

APOCOPE, from αποκοπτω, *alſcindo*, in *Surgery*, is ſynonymous with *Extirpatio*.

APOCRISIARIUS, formed from αποκρισις, *reſponſum*, *anſwer*, in *Antiquity*, an officer appointed to carry or deliver the meſſages, orders, and anſwers, of a prince or emperor. Hence he is uſually called *reſponſalis*, q. d. *anſwerer*.

The apocriſiarius afterwards became the emperor's chancellor, and kept the ſeal. In the barbarous Latin we ſometimes meet with *aſcreta*, *ſecretary*, for apocriſiary. Zoſimus defines apocriſiarius, ſecretary for foreign affairs; being the ſame with what Vopiſcus, in the life of Aurelian, calls *notarius ſecretorum*.

The title of apocriſiary became at length appropriated as it were to the pope's deputy, or agent, who reſided at Conſtantinople to receive the pope's orders, and the emperor's anſwer.

St. Gregory was apocriſiary of pope Pelagius, at the time when he compoſed his morals on Job. The apocriſiary did the office of the modern NUNCIO. Sometimes, however, he held the rank and quality of the pope's LEGATE.

The inſtitution of apocriſiarii ſeems to have been in the time of Conſtantine, or not long after, when, the emperors being become Chriſtians, foreign churches had more occaſion to promote their ſuits at court than formerly; at leaſt we find the office eſtabliſhed by law in the time of Juſtinian. In one of the novels, it is ordered, that as no biſhop was to be long abſent from his church without ſpecial command from the emperor, if any one had occaſion to negotiate any eccleſiaſtical cauſe at court, he ſhould prefer his petition, either by the apocriſiarius of his church appointed for ſuch purpoſe, or by the œconomus, or ſome of his clergy ſent expreſs. In imitation of the apocriſiarii of churches, almoſt every monaſtery had their apocriſiarius likewiſe, whoſe buſineſs was not to reſide in the royal city, as the former did, but to act as proctors for their monaſtery or any member of it, when they had occaſion to enter any appearance at law before the biſhop under whoſe juriſdiction they were. This appears from another of Juſtinian's novels, which requires the aſcetics in ſuch caſes to anſwer by their apocriſiarii or reſponſales. Du-Cange. Bingham. Orig. Eccleſ. lib. iii. cap. 13. ſect. 6.

The hereſy of the Monothelites, and afterwards that of the Iconoclaſts, broke off the cuſtom of having a papal apocriſiary at Conſtantinople.

APOCRISIS, αποκρισις, literally denotes an *anſwer*. Under this denomination were anciently included, not only the reſcripts of the emperors to the petitions of parties, but all kinds of decrees and mandates.

We have ſeveral books extant under the title of Apocriſes, and ſome in oppoſition to theſe under the title of Antapocriſes.

APOCRUSTICS, derived from αποκρουω, *pulſo*, *pello*, *I drive*, in *Medicine*, remedies endued with a repelling and aſtringent power, whereby they prevent the too great afflux of humours to a part diſeaſed. See REPELLENTS.

APOCRYPHAL, ſomething dubious; or that comes from an uncertain author, on which much credit cannot be repoſed. We ſay, an *apocryphal* book, paſſage, hiſtory, &c. meaning ſuch as are of ſuſpected authority.

Voſſius obſerves, that, with regard to the ſacred books, none are to be accounted apocryphal, except ſuch as have been admitted neither into the ſynagogue, nor the church, ſo as to be added to the canon, and read in public.

For this reaſon alſo the books of Sibyls were anciently called apocryphal, as being committed to the truſt of the *decemviri* alone; and for the like reaſon the annals of the Egyptians and Tyrians were called by the ſame name.

In the original meaning of the word, all the writings depoſited in the temple were called apocryphal: becauſe they were kept ſecret from the people.

When the Jews publiſhed their ſacred books, they only gave the appellation of *canonical* and *divine* to ſuch as they thus made public; and ſuch as were ſtill retained in their archives they called apocryphal, for no other reaſon but becauſe they were not public; ſo that they might be really ſacred and divine, though not promulged as ſuch.

Thus in reſpect of the Bible, all works were called apocryphal, which were not inſerted in the Jewiſh canon of Scripture; and it is in this ſenſe that St. Epiphanius is to be underſtood, when he ſays, that the apocryphal books are not put in the ark among the other inſpired writings. By the ark he is ſuppoſed to have meant not the ark of the covenant, but the common archives; for, according to Joſephus, there was no ark in the ſecond temple. Nevertheleſs, the ſacred writings were locked up in the temple; and the apocryphal books were without doubt depoſited in a diſtinct archive from that in which the canonical books were kept. To this purpoſe Tertullian, ſpeaking of the book of Enoch, ſays, that ſome did not own it, "quia nec in Judaicum ar-

morium admittitur;" and St. Auſtin (de Civ. Dei, l. 15.) ſays, that the canonical books of the Old Teſtament were preſerved in the Jewiſh temple by the carefulneſs of the prieſts, who ſucceeded one another. Hence it is probable that the holy books were lodged in the temple in one archive, and the apocryphal in another place.

The word is derived from ἀποκρύπτω, *to hide*; becauſe the origin of ſuch books was unknown, or becauſe they contain ſome myſteries not fit to be known.

The notion expreſſed by the word Apocrypha is taken, as we have juſt ſhewn, from the Jews, and though the word itſelf is of Greek original, it cannot be explained by a Greek etymology, according to which it would convey a much higher idea, and ſignify writings preſerved in the ſacred receſſes of the temple. It is merely a tranſlation of the Rabbinical word גנוז, which ſignifies "laid aſide," ſo as not to be read in the ſynagogue: e. g. if a copy of the bible had two miſtakes in one and the ſame page, it was allowable to correct them; but if there were three miſtakes, the book muſt be laid aſide (ישליש יגנז), and they uſed the ſame expreſſion for books, which were not ſuppoſed to be of divine authority. However the terms גנוז, and ἀποκρυφος, though ſimilar in their original meaning, are very different in their uſe and application. The word גנוז was applied to books divinely inſpired, but we apply the term ἀποκρυφος, apocryphal, to thoſe, whoſe divine inſpiration is denied. It is true that the ancient Jews made a diſtinction, which varied at various periods, between books that were to be read, and books that were not to be read in the ſynagogue, which latter the Rabbins called גנוזים, but theſe were included in the ſacred canon, whereas we apply the term *apocryphal* to thoſe that are excluded from it; and this term, as applied by modern writers to ſuch books as have relation to the New Teſtament, ſignifies in general "ſpurious or ſuppoſititious," and in this ſenſe differs in a ſtill higher degree from גנוז as applied to the books of the Old Teſtament. Fabricius in his "Codex apocryphus N. T." includes ſuch writings as are ſuppoſed to be "a forgery;" whereas thoſe of a ſimilar deſcription, which have relation to the Old Teſtament, are contained in his "Codex Pſeudepigraphus." This term is applied by Jerom to books which by their title or otherwiſe make ſome claim to be a part of ſacred ſcripture, but are deſtitute of a right to be ſo eſteemed; and generally, or oftentimes, they are ſpurious. It is neceſſary, however, to diſtinguiſh between the terms apocryphal and ſpurious: a ſpurious work is that which is aſcribed to an author who did not compoſe it; and apocryphal, whether written by the author to whom it is aſcribed or not, is uſed in much the ſame ſenſe with uncanonical. Michaelis uſes the term apocryphal for authentic, as diſtinguiſhed from inſpired; and merely in oppoſition to canonical; and he cautions againſt conſidering it as a term of contempt, or as depreciating a book to which it is applied. The excluſion, he ſays, of books called on this account apocryphal, from the canon, by no means derogates from their real worth; and although there are many under this title, which are manifeſtly ſpurious, there are others again which are highly deſerving our eſteem. Apocryphal books, according to the definition of St. Auguſtine (Contr. Fauſt. l. xi. c. 2. and De Civ. Dei, l. 15. c. 23. n. 4.), are not ſuch as are of authority (or received by the church,) and are kept ſecret; but they are books whoſe original is obſcure, and which are deſtitute of proper teſtimonials; their authors being unknown, or their character either heretical or ſuſpected. The term apocryphal, which is variouſly uſed, is ſometimes applied to thoſe books that are not in the canon, (ſee CANON:) and of theſe there are two claſſes, viz. that of uſeful books, which may be read for the edification of the faithful, though doubtful and oppoſed, and that of the ſpurious pieces which are heretical and full of errors. Origen calls all the books which are out of the canon, apocryphal. Euſebius ſeems to uſe it for thoſe wicked books that were compoſed by heretics, and which he diſtinguiſhes from thoſe which are cited by eccleſiaſtical writers. Gregory Nazianzen, Athanaſius, Epiphanius in the 8th Hereſy, Ruffinus, and moſt of the modern Greeks, give the name apocryphal to ſuch books only, as are apparently ſpurious and wicked; and uſually denominate thoſe which are good and uſeful, eccleſiaſtical, though they were not received by all the churches as canonical. On the other hand, Cyril, Epiphanius in his Treatiſe of weights and meaſures, Jerom, the African Fathers, moſt of the Latins, and Antiochus among the Greeks, attribute the term apocryphal in general to all the books which are not in the canon. St. Auſtin diſtinguiſhes two ſorts of canonical books; thoſe which are received by all the churches, and thoſe which are only received by ſome. Sixtus of Sienna likewiſe diſtinguiſhes them into two claſſes; the proto-canonical, which have been always received and were never queſtioned; and the deutero-canonical, which were formerly doubted, but have been ſince admitted into the canon. All the reſt, according to this author, are apocryphal, though this term had been ſometimes applied only to heretical books. Mr. Jones lays down the following criteria or teſts, by which we may determine whether any books are apocryphal or ſpurious, or not. That book is apocryphal, in which are found any contradictions,—which either contains any hiſtories, or propoſes any doctrines contrary to thoſe which are certainly known to be true:—which contains things ludicrous or trifling, fabulous or ſilly relations:—which mentions facts that were later than the time in which the author, whoſe name it bears, lived:—the ſtyle of which is different from, or contrary to, the ſtyle of the author whoſe name it bears, in his known and undoubted writings:—the idiom and dialect of which are different from the known idiom or dialect of the author whoſe name it bears, or the country where he lived:—which manifeſts a diſpoſition in its author, different from the known temper of the author whoſe name it bears:—and which for the moſt part is tranſcribed or ſtolen out of another.

As the number of books in the Jewiſh canon was equal to the number of Hebrew letters, it amounted to 22; and that this number might not be exceeded, the book of Ruth was joined to that of Judges, and the Lamentations to the prophecy of Jeremiah. The books, therefore, that were not contained in this number, were excluded from the canon, and deemed apocryphal. The ancient catalogues of the canonical books of the Old Teſtament, which are to be met with in Chriſtian writers, whether Greeks or Latins, are conformable to the canon of the Jews, and contain no other books: ſuch are thoſe of Melito biſhop of Sardis, of Origen, of the council of Laodicea, of Jerom, &c. &c. The firſt catalogue in which the books of Wiſdom, Eccleſiaſticus, Tobit, Judith, and the two Maccabees were admitted as canonical, and as having the ſame authority, is that of the 3d council of Carthage, A. D. 397, which confirms the decree of the council of Hippo, A. D. 393, in which theſe books were received into the canon. St. Auguſtine, according to the authority of the African church, reckons all theſe books as canonical. Pope Innocent I. on behalf of the church of Rome, places the ſame books in the canon of the Old Teſtament, as did alſo pope Gelaſius in the council held A. D. 494; and moreover, the decree of pope Eugenius, and the canon of the council of Trent, agree with the canon of the council of Carthage, and with the decree

of

of pope Innocent, and rank the above mentioned books among thoſe of the Old Teſtament. See ECCLESIASTICUS, JUDITH, &c.

Among the books which have been wholly thrown out of the canon of holy ſcripture, we may mention a part of the book of Daniel, which the Jews rejected, containing the prayer of Azarias, and the ſong of the three children in the fiery furnace, which begin at the 24th verſe of the 3d chapter, and end at the 91ſt: the hiſtory of Suſanna, related in the 13th chapter; and of Bel and the Dragon, in the 14th and laſt. Theſe ſubjects are not in the Hebrew or Chaldee text, nor in the Greek verſion of the Septuagint, but are taken out of the Greek verſion of Theodotion, which was then uſed by the church, in Daniel's prophecy, as St. Jerom has obſerved. Africanus, Euſebius, and Apollinarius, have rejected theſe narrations, not only as being uncanonical, but alſo as fabulous; and St. Jerom ſeems to be of the ſame opinion. Theodoret, in his expoſition of Daniel, mentions neither the hiſtory of Suſanna, nor that of Bel and the Dragon. However that which is related in theſe two chapters is cited under Daniel's name, and as part of his prophecy, by Irenæus, Clement of Alexandria, Tertullian, Origen, Cyprian, Didymus, Hilary, Baſil, Gregory Nazianzen, Ambroſe, Auguſtine, the author of a homily erroneouſly attributed to Chryſoſtom, Fulgentius, Avitus, and Bede. Sulpitius Severus, and the author of the Synopſis of Athanaſius, mention theſe hiſtories as part of the ſacred text; though the latter owns, that the hiſtory of Suſanna is one of the dubious books. Ambroſe quotes the words of Daniel, related in the third chapter, as being certainly of divine inſpiration; and Ruffinus upbraids Jerom for having cut off from Daniel the ſong of the three children, the hiſtory of Suſanna, and that of Bel and the Dragon. The council of Trent, ſeſſ. 4. declared the following ſix books to be canonical, viz. Tobit, Judith, Wiſdom, Eccleſiaſticus, and the firſt and ſecond of Maccabees; but joined Baruch with Jeremiah, ſo that the whole number amounts to ſeven. The apocryphal books enumerated in the 6th article of the church of England, are the 3d and 4th of Eſdras, the book of Tobias, that of Judith, the reſt of the book of Eſther, that of Wiſdom, that of Jeſus the ſon of Sirach, Baruch the prophet, the Song of the three children, the ſtory of Suſanna, of Bel and the Dragon, the prayer of Manaſſes, and the firſt and ſecond books of Maccabees. Theſe books, by the ſame article, the church doth read for example of life and inſtruction of manners, but doth not apply them to eſtabliſh any doctrine. Accordingly in the table prefixed to the Common Prayer, and appointing the leſſons, they are directed to be read in the months of September, October and November. It appears, however, that in the Common Prayer of Edward VI. there was for Nov. 22d and 23d, no Bel and Dragon, nor hiſtory of Suſanna; but the order proceeded from Baruch to Jeremiah. The apocryphal books are prohibited in the other reformed churches. The Puritans, in the reign of queen Elizabeth, diſliked and objected to the reading of theſe books in the church.

The ſpurious and apocryphal books, compoſed in the early days of Chriſtianity, publiſhed under the names of our Saviour, his apoſtles, their companions, &c. and mentioned by the writers of the firſt four centuries, under the titles of goſpels, epiſtles, acts, revelations, &c. are numerous. Moſt of them have been long loſt, and ſome few are ſtill extant, to which claſs belong our Saviour's letter to Abgarus; his letter, which fell down from heaven at Jeruſalem, directed to a prieſt named Leopas, in the city Eris; the conſtitutions of the apoſtles; the creed of the apoſtles; the apoſtolical epiſtles of Barnabas, Clemens, Ignatius, and Polycarp; the ſhepherd of Hermas; the goſpel of the infancy of our Saviour; the goſpel of the birth of Mary; the prot-evangelion of St. James; the goſpel of Nicodemus; the martyrdom of Thecla or acts of Paul; Abdias's hiſtory of the twelve apoſtles, or the acts of Pilate; St. Paul's epiſtle to the Laodiceans, and St. Paul's ſix letters to Seneca, &c.; the others, that are not extant, are enumerated by Mr. Jones, *ubi infra*. Theſe books were not much uſed by the primitive Chriſtians. There are no quotations of them in the apoſtolical fathers, i. e. Barnabas, Clement of Rome, Hermas, Ignatius, and Polycarp, whoſe writings reach from about the year of our Lord 70, to the year 108. Some of them are mentioned, but not cited, by Irenæus and Tertullian. Several of them are mentioned and quoted by Clement of Alexandria and Origen, but never as having authority, and ſometimes with expreſſions of diſapprobation. Euſebius mentions ſome of them, and ſays, that they were of little or no value, and that they were never received by the founder part of Chriſtians. Athanaſius, without naming any of them, paſſes a ſevere cenſure upon them in general; and Jerom ſpeaks of them with diſlike and cenſure. We may obſerve further, that theſe books, ſo far from militating againſt the evangelical hiſtory, confirm it; for they are written in the names of ſuch, as our authentic ſcriptures ſay, were apoſtles, and companions of apoſtles; and they all ſuppoſe the dignity of our Lord's perſon, and a power of working miracles, together with a high degree of authority, to be conveyed by him to his apoſtles. It ought alſo to be conſidered, that few, if any, of theſe books were compoſed before the beginning of the ſecond century. As they were not compoſed before that time, they might well refer to the commonly received books of the New Teſtament, as moſt of them certainly do; and therefore, inſtead of invalidating the credit of our books, they really bear teſtimony to them. All theſe books are not properly ſpurious, that is, aſcribed to authors who did not compoſe them; but as they were not compoſed by apoſtles, nor at firſt aſcribed to them, they may be fitly called apocryphal; for they have in their titles the names of apoſtles, and they make a ſpecious pretence of delivering a true hiſtory of their doctrine, diſcourſes, miracles, and travels, though that hiſtory is not true and authentic, and was not written by any apoſtle or apoſtolical man. Moreover, we may account for the publication of theſe apocryphal or pſeudepigraphal books, as they were unqueſtionably owing to the fame of Chriſt and his apoſtles, and the great ſucceſs of their miniſtry. And in this reſpect the caſe of the apoſtles of Chriſt is not ſingular: many men of diſtinguiſhed characters have had diſcourſes made for them which they themſelves knew nothing of, and actions imputed to them which they never performed; and eminent writers have often had works aſcribed to them, of which they were not the authors. Chriſtians of former ages exerciſed a laudable caution and circumſpection with regard to books of doubtful authority. For a good while, the epiſtle to the Hebrews, ſome of the Catholic epiſtles, and the revelation, were doubted of by many, when other books of the New Teſtament were univerſally acknowledged. Upon the whole, the books, now and for a long time called apocryphal, afford no valid argument againſt either the genuineneſs or the authority of the books of the New Teſtament, generally received as written by apoſtles and evangeliſts; but they ſanction the truth of their genuine writings, and the reputation of their character; they confirm the general account given us in the canonical ſcriptures, and thus they indirectly eſtabliſh the truth and divine original of the goſpel.

The writing of books under ſpurious names, and obtruding them for the works of inſpired authors, though once reputed laudable, and conſecrated under the name of pious

fraud, was condemned very early by an apoſtolical canon, in the inſtance of a prieſt who was depoſed for forging the acts of Paul and Theela. Bing. Orig. Eccleſ. lib. xvii. cap. 5.

Fabricius has publiſhed the fragments and remains of the apocryphal books both of the Old and New Teſtament. Fabric. Codex Pſeudepigraphus Veteris Teſtamenti, Hamb. 1722 & 1723. 8vo. 2 vol. Codex Apocryphus Novi Teſtamenti, 2 vol. Hamb. 1719, &c. 8vo.

Wolfius has given the literary hiſtory of the apocryphal books, their various editions, tranſlations, commentaries, &c. See alſo Jones's Canon, vol. i. and vol. ii. Dupin's complete hiſtory of the Canon, &c. ch. i. Lardner's works, in various places. Michaelis's Introd. vol. i. p. 170. p. 376.

APOCYMA, from ἀπο, and κυμα, *wave*, in the *Materia Medica* of the *Ancients*, a name given by the Greek authors to a ſort of cement, uſed to daub over the bottoms of their ſhips, to preſerve them from injuries by the water; they called this alſo by the name of ζοπισσα; and Avicenna and Serapian call it *ketran*, *kitran*, or *alkitran*. It was a mixture of bees-wax and pitch melted together, and after it had been ſoaked ſome time in the ſea-water, it was ſuppoſed to have peculiar virtues, and was uſed in many compoſitions.

APOCYNUM, (ἀπὸ κυνὸς, becauſe it is ſuppoſed to kill dogs), in *Botany*, Dog's bane. Lin. gen. 305. Schreb. 426. Juſſ. 146. Claſs, *pentandria digynia*; nat. order, *contortæ; apocineæ*. Juſſ. Gen. Char.; *cal.* perianth, one-leafed, five-parted, acute, ſhort, permanent; *cor.* monopetalous, bell-ſhaped, ſemiquinquefid; diviſions revolute; nectary, five glandular oval corpuſcles ſurrounding the germ; *ſtam.* filaments very ſhort: anthers oblong, erect, acute, converging, bifid at the baſe; *piſt.* germs two, ovate; ſtyles, ſhort; ſtigma, roundiſh, bifid at the tip, muricate, glued to the anthers; *per.* follicles two, long, acuminate, one-valved, one-celled; *ſeeds* very ſmall, numerous, crowned with a long down: receptacle ſubulate, very long, rough, free.

Eſſen. gen. char. *cor.* bell ſhaped; nectaries five, alternate with the ſtamens.

Species. 1. A. *androſæmifolium, tutſan-leaved dog's-bane;* ſtem ſtraightiſh, herbaceous, leaves ovate, ſmooth on both ſides; cymes terminating; its ſtems are erect about three feet high; leaves oppoſite; flowers white, with purpliſh nectaries. If flies alight on this plant they are frequently entangled by the glutinous matter and deſtroyed. Hence this plant has been called *Herbe à la puce*. It is a native of Virginia and Canada, flowering from July till September: a perennial, cultivated by Miller, in 1731. 2. A. *cannabinum, hemp dog's-bane;* ſtem ſtraightiſh, herbaceous; leaves oblong; cymes lateral, longer than the leaf; ſtems about two feet high; leaves in pairs, ſmooth, and like the former abounding with a milky juice; flowers ſmall, of an herbaceous white colour, and not having an handſome appearance. The plant is only cultivated for the ſake of variety. It flowers about the ſame time, and is a native of the ſame countries as the former ſpecies. The Indians of North America uſe this ſpecies for the ſame purpoſe as we do hemp. It was cultivated by the ducheſs of Beaufort, in 1699. 3. A. *hypericifolium, St. John's-wort-leaved dog's-bane;* ſtem ſtraightiſh, herbaceous; leaves oblong-cordate, ſmooth; cymes ſhorter than the leaf. Martyn's Miller's Dict. A. *ſibericum*, Lin. ſyſt. Jacq. hort. 3. 37. t. 66. an annual, a foot and a half high, with oppoſite, ſharpiſh, ſubſeſſile leaves, and ſmall inodorous flowers. A native of North America, cultivated in 1756, by Miller. 4. A. *venetum, ſpear-leaved dog's-bane;* ſtem ſtraightiſh, herbaceous; leaves ovate-lanceolate: a perennial, about two feet high: leaves oppoſite, ſmooth; flowers in ſmall umbels, purple or white, appearing in July and Auguſt. It grows in the iſlands of the Adriatic. Cultivated here in 1690. 5. A. *minutum, petty dog's-bane;* ſtems proſtrate; leaves haſtate; ſtems filiform, about ſeven inches long; leaves oppoſite; peduncles alternate, umbelled with about ſix flowers. Found at the Cape by Montin. 6. A. *filiforme, thread-leaved dog's-bane;* ſtem proſtrate, herbaceous; leaves filiform, flowers umbelled. Found at the Cape by Thunberg. 7. A. *fruteſcens, ſhrubby dog's-bane;* ſtem erect, ſhrubby; leaves lanceolate-oval; corolla acute, villoſe at the throat; flowers ſalver-ſhaped, on axillary peduncles, in looſe bunches, and of a purple colour. A native of the Eaſt Indies, Ceylon, and the coaſt of Guinea. 8. A. *reticulatum, net-leaved dog's-bane;* ſtem twining, perennial; leaves ovate veined. This ſpecies climbs to a conſiderable height; its dark green leaves are beautifully reticulated with milky veins. A native of the Eaſt Indies and Cochin-China, cultivated by Miller. 9. A. *lineare, linear-leaved dog's-bane;* ſtem twining, herbaceous; leaves linear, flat; umbels axillary, compound. Diſcovered at the Cape of Good Hope by Thunberg. 10. A. *triflorum, three flowered dog's-bane;* ſtem twining, herbaceous; leaves lanceolate; umbels axillary, two or three-flowered. Found at the Cape by Thunberg. 11. A. *juventas, renovating dog's-bane;* ſtem twining, ſhrubby, leaves ovate, hairy; racemes dichotomous; the ſtem is hairy, red, uſually procumbent; flowers greeniſh yellow, ſmall, cut into lanceolate ſegments, which are three times the length of thoſe of the calyx. A native of Cochin-China. This plant is eſteemed by the Chineſe for poſſeſſing ſimilar properties to thoſe of the ginſeng. Lour. Coch. 12. A. *alterniflorum, alternate flowered dog's-bane;* ſtem climbing, ſhrubby, leaves ovate, acuminate, ſmooth; axils alternate, umbelliferous; flowers pale, inodorous; nectary compoſed of ten lobes. It grows in the iſlands near Canton. 13. A. *africanum, african dog's-bane;* ſtem ſuberect, ſhrubby; leaves ovate-oblong; peduncles two or three flowered. Loureiro Coch. A native of the coaſt of Zanguebar in Africa. Mr. Miller enumerates ſix other ſpecies. 14. A. *ſcandens, climbing dog's-bane;* leaves oblong-cordate, ſtiff; flowers lateral; ſtem ſhrubby, twining. It was diſcovered by Plumier in ſome of the French iſlands in America, and by him deſcribed to be citron-leaved with maculated pods. Since that time it has been found near Carthagena in New Spain, from whence ſeeds have been tranſmitted here, which have ſucceeded in ſeveral gardens. Miller. 15. A. *nervoſum, nerved-leaved dog's-bane;* leaves ovate, nerved; cymes lateral; flowers yellow, large, with a long tube; ſtem ſhrubby, climbing. A native of New Spain, near Carthagena. Miller. 16. A. *cordatum, heart-leaved dog's-bane;* leaves oblong-cordate, pointed, ſeſſile; flowers lateral; ſtem climbing. 17. A. *villoſum, villoſe-flowered dog's-bane;* leaves cordate, ſmooth; flowers villoſe, lateral, on long peduncles; ſtem climbing. Both the two laſt ſpecies were diſcovered at La Vera Cruz, in 1729, by Dr. Houſtoun, who ſent their ſeeds to England, where they have riſen in ſtoves to the height of twenty feet, but the laſt, though more luxuriant than the other, never had any appearance of flowers. The pods of theſe plants afford a cottony down which is in great eſteem in France for ſtuffing chairs, making quilts, &c. The French call it Delawad; and in the ſouthern parts of France there are ſeveral plantations of ſome of theſe ſpecies for the ſake of the down.

Propagation and culture. The firſt, ſecond, and third ſorts are propagated by parting their roots in March, before they put out new ſtems. They are hardy enough to thrive in the open ground; but the ſoil ſhould be light and dry, otherwiſe

wiſe the roots are apt to rot in winter. The fourth ſort will alſo live in the open air, provided it be planted in a warm ſituation and dry ſoil. The ſpring, before the ſtems ſhoot out, is the beſt time to remove it. The other ſpecies are tender, and muſt be conſtantly kept in a hot-houſe, plunged in the tan-bed. They may be propagated by cuttings, during the ſummer months; but ſhould be laid to dry in the ſtove three or four days before they are planted. When the ſeeds are obtained from their native places, they ſhould be ſown in pots filled with light ſandy earth, and plunged into a tan-pit: in a month or five weeks they will appear, and ſhould then be watered ſparingly. As they advance, they will require larger pots; and the ſecond year the plants will generally flower, and ſome of them make a fine appearance. Martyn Miller's Dict.

Apocynum. See Asclepias, Ceropegia, Cynanchum, and Echites.

APODA, in *Ornithology*, a ſpecies of Paradisea, called the greater bird of paradiſe. The ſide feathers are longer than the body; the two middle tail feathers long and ſetaceous. Gmelin. This is called Manucodiata, by Briſſon and Marcgrave; Paradiſea Avis, by Seba, &c.; Oiſeau de Paradis, by Buffon; bird of Paradiſe, by Willughby; and Greater Bird of Paradiſe, by Albin and Edwards.

This bird appears from the plumage to be as large as a pigeon, but the body ſcarcely exceeds in ſize that of the thruſh. The length is twelve inches, the bill greeniſh yellow, and an inch and an half in length; its eyes are ſmall; head and neck covered with ſhort thick feathers, of which thoſe on the head and hind part of the neck are of a pale gold colour. The baſe of the bill is ſurrounded with black; front of the neck green; lower part of the neck, back, wings, and tail are cheſnut, deepeſt on the breaſt, where it aſſumes a tint of purple. From under the wings ſpring a great quantity of feathers, which are looſely webbed, and appear like the herring-bone; ſome of theſe are eighteen inches in length, and of different colours; but the prevailing tint is yellowiſh white. The legs are ſtout and of a brown colour.

The female is ſaid to be like the male, except that the webs of the two wire-like feathers in the tail are ſhorteſt. They inhabit the Molucca iſlands, and thoſe ſurrounding New Guinea, and particularly that of Aroo. It is ſuppoſed they breed in New Guinea, from whence they emigrate in the weſterly or dry monſoon, and return when the eaſterly or wet monſoon commences. They are ſeen at theſe times in flights of thirty or forty, with a leader at their head, which is conſtantly ſeen flying higher than the reſt. During their flights, it is obſerved they take the advantage of going againſt the wind, and have a cry like the ſtarlings; but ſhould the wind ſhift, they are in great diſtreſs, and croak like ravens, for their long ſcapular feathers then become rumpled, their flight is impeded, and they fall to the ground, from which they cannot riſe until they gain an eminence, or into the water, from which they cannot extricate themſelves. The natives, who make a trade of their ſkins with the Dutch, watch this opportunity, and take them in large numbers: the value of each to the people of Aroo is a *ſpike-nail*; but at Banda they fetch half a rix-dollar apiece, and perhaps of late more, ſince it is the plume of this ſpecies which has become a faſhionable ornament to the head-dreſs of the ladies in England. The food of theſe birds is not certain; ſome ſay they feed on berries; others, on butterflies; and others again, on ſmall birds; the latter of which is probable, as they are very courageous, and are furniſhed with claws and beak of ſtrength ſufficient for that purpoſe. The were formerly brought to Europe without legs, and many were perſuaded they never had any; but the truth is, the legs being uſeleſs for the purpoſe of ornament, the only motive for which they are taken, are torn off on the ſpot, and thrown aſide. They were worn in the Eaſt Indies by people of diſtinction; the grandees of Perſia and Surat uſe them as aigrettes, and even adorn their horſes with them.

In Forreſt's Voyage to New Guinea, &c. a ſmaller bird of this kind is deſcribed as a native of Papua; Gmelin makes it a variety only (β) of this ſpecies.

APODACRYTICA, from $\alpha\pi o$ and $\delta\alpha\kappa\rho\upsilon$, a *tear*, in *Pharmacy*, medicines proper to excite tears. Some alſo uſe the term apodacrytica, for remedies proper to ſuppreſs tears.

APODECTÆ, from $\alpha\pi o\delta\epsilon\chi o\mu\alpha\iota$, *I receive*, in *Antiquity*, a denomination given to ten general receivers, appointed by the Athenians, to receive the public revenues, taxes, debts, and the like.

The apodectæ had alſo a power to decide controverſies ariſing in relation to money and taxes, all but thoſe of the moſt difficult nature and higheſt concern, which were reſerved to the courts of judicature.

APODECTÆI, in the Athenian government, officers appointed to ſee that the meaſures of corn were juſt.

The *apodectæi* were nearly related to the *agoranomi*.

APODEMICA, from $\alpha\pi o\delta\eta\mu\epsilon\omega$, *I travel*, the doctrine or ſcience of travelling, whether for knowledge or devotion's ſake.

Jo. Meraker has publiſhed an apodemica. Ranzovius, a methodus apodemica.

APODES, in a general ſenſe, from α and $\pi o\upsilon\varsigma$, denotes things without feet. Zoologiſts apply the name to a fabulous ſort of birds ſaid to be found in ſome of the iſlands of the New World, which being entirely without feet, ſupport themſelves on the branches of trees by their crooked bills.

The Germans and Dutch have alſo their apodes, a ſort of birds ſomewhat like ſwallows, whoſe legs and feet are ſo very ſmall, that they ſeem rather formed for creeping than running.

Apodes, is one of the four orders of fiſhes in the Linnæan diſtribution of animals. Their character is that they have no belly fins.

APODICTICAL *argument*, or syllogism, ſignifies a clear convincing proof, or demonſtration of a thing. The word is formed of $\alpha\pi o\delta\epsilon\iota\kappa\nu\upsilon\mu\iota$, *I demonſtrate*.

Apodictical *method*, is uſed by ſome writers, to denote the ſyſtematical or ſcientifical method of teaching or writing.

APODIOXIS, from $\alpha\pi o\delta\iota\omega\kappa\omega$, *I exclude*, in *Rhetoric*, a figure whereby we either paſs over a thing ſlightly, or refer treating of it to ſome other time or place.

This is alſo called by Latin writers, *rejectio*, e. g. "Quid ego ſenatum defendam, judices? Equidem debeo," &c. Again, "Quid ego ſenatum hoc loco defendam, judices? Fiat id rectius, tum quum," &c.

Apodioxis, in *Logic*, the rejection of ſuch things as do not neceſſarily belong to the queſtion to be conſidered.

APODIPNE, or Apodeipne, ſongs which the Greeks ſung after ſupper; either to thank the Gods, or congratulate themſelves for their good fare.

APODIXIS, from $\alpha\pi o\delta\epsilon\iota\kappa\nu\upsilon\mu\iota$, in *Rhetoric*, denotes an evident proof, or demonſtration of a point.

We have ſeveral books extant under the names of apodixes; and ſome by way of anſwer to theſe, under that of antapodixes.

Apodixis, in *Middle-Age Writers*, denotes a receipt for money paid. In which ſenſe it amounts to the ſame with *apocha*.

Apodixis is alſo ſometimes uſed for a ſpecimen or proof of a thing.

APODOSIS, from $\alpha\pi o\delta\iota\delta\omega\mu\iota$, *I apply*, in *Rhetoric*, makes the

the third part of a complete exordium, being properly the application, or restriction of the protasis.

The apodosis is the same with what is otherwise called *[illegible]*, and stands opposed to protasis, e. g. *protasis*, "all branches of history are necessary for a student;" *[illegible]*, "so that without them he can [illegible] figure;" *apodosis*, "but literary history is of a more special use, which recommends it," &c.

Apodosis is also used in speaking of similes, for that part which makes the application of them.

Apodosis is also used, in a rhetorical period, for the consequent to a protasis, or antecedent [illegible].

Apodosis is also [illegible] for a return to the foregoing antecedent, or that went before.

This is otherwise called *[illegible]*.

APODYTERIUM, formed of [illegible], *to undress*, in *Antiquity*, a stripping room, or apartment at the entrance of baths, or in the palæstra, wherein persons dressed and undressed, either for bathing, or for the gymnastic exercises.

This was otherwise denominated *[illegible]*, *gymnasterium*, and *spoliarium*.

Some will have the apodyterium to have been the same with the *conisterium*; but Vossius shews they were two different places.

APOGEE, formed of ἀπὸ, *from*, and γῆ, *earth*, in *Astronomy*, that point in the orbit of the sun, or a planet, which is farthest distant from the earth.

The apogee is a point in the heavens at the extreme of the line of the apsides; in which the sun, or a planet, is at the greatest distance that it can be at, from the earth, in its whole revolution, and the opposite point to this is called the PERIGEE.

The ancient astronomers, regarding the earth as the centre of the system, chiefly considered the apogee and perigee: the moderns, making the sun the centre, change the apogee and perigee for APHELION and PERIHELION.

The apogee of the sun is, therefore, the same with the aphelion of the earth, and the perihelion of the sun the same with the perigee of the earth. The manner of determining the place of the apogee of a planet is exactly the same with that for determining the place of the aphelion for the sun and superior planets. See APHELION and PLANETS. The place of the apogee of the sun, at the beginning of the year 1750, was, according to the tables of La Caille, $3^s\ 8^\circ\ 38'\ 4''$.

The quantity of the motion of the apogee may be found by comparing two observations thereof made at a great distance of time; converting the difference into minutes, and dividing it by the number of years elapsed between the two observations: the quotient gives the annual motion of the apogee. Thus, from an observation made by Hipparchus in the year before Christ 140, whereby the sun's apogee was found $5^\circ\ 30'$ of ♊; and another made by Ricciolus, in the year of Christ 1646, wherein it was found $7^\circ\ 26'$ of ♋; the annual motion of the apogee is found to be $1'\ 2''$. See APHELION.

Its secular motion, with respect to the equinoxes, is, according to the tables of La Caille, $1^\circ\ 49'\ 10''$. The cause of this motion is the attraction of the planets, particularly of Venus and Jupiter, as M. Euler has shewn in his tract "On the inequalities of the earth," which obtained the prize of the Academy of Sciences, in 1756.

The apogee of the moon, in 1750, was in $5^s\ 21^\circ\ 2'\ 32''$, and its annual motion is about $1^s\ 10^\circ\ 39'\ 50''$; and the revolution of the apogee, according to the tables of Mayer, in relation to the fixed stars, is performed in 8 years, 311 days, or 3231 days, $8^h\ 34'\ 57\frac{1}{2}''$.

Besides the progressive motion of the apogee of the moon, astronomers have also considered the orbit of the moon as subject to an equilibration of its apogee, joined to a variation in its eccentricity. Horrox was the first author of this ingenious hypothesis, which Newton adopted in his "Principia," and upon which are founded Halley's tables of the moon, and those of Flamstead, which were published by M. le Monnier, in his "Astronomical Institutions." M. Euler was the first who substituted to this hypothesis an equation more convenient, and called *evection*, the quantity of which is $1^\circ\ 20'\ 34''$. In order to explain the hypothesis of Horrox agreeably to the principles of attraction, it ought to be considered that the motion of the apogee of the moon depends upon the diminution of the central force of the moon towards the earth; so that the motion ought to be the greatest when the line of the syzigies concurs with the line of the apsides, or when the place of the sun corresponds to the apogee or perigee of the moon. When it is in the quadratures, the motion of the apogee is the slowest, because the total diminution of the central force is then the least; when the sun is at 45° from the apsides, the true motion of the apogee is equal to the mean motion; but his true place differs then the most from the mean place, and the equation is the greatest, because it results from all the degrees of velocity which the apogee has acquired to this point. This equation, in the tables of Halley, amounts to $12^\circ\ 18'$. There is also an inequality in the place of the apogee, which proceeds from the distances of the sun with respect to the earth, and which is $23'\ 12''$ additive, when the sun is at 3 signs of anomaly: this is an annual equation. See MOON.

APOGRAPH, a copy or transcript of some book or writing. The word is formed of ἀπὸ, *ab*, *from*, and γράφω, *I write*. In this sense apograph stands opposed to *autograph*, as a *copy* to an *original*.

APOGRAPHE, in the *Ancient Law*, was, when a person being sued for money supposed due to the public, pleaded that the charge was unjust, and withal produced all the money he was possessed of, and declared by what means it came to his hands.

Suidas adds, that it is sometimes taken for an action against such as neither paid the fines laid upon them before the ninth *prytanea* following their sentence, nor were able to give sufficient security to the city. Potter, Arch. Græc. lib. i. cap. 23.

APOGRAPHE, in the Roman *Law*, denotes a catalogue or inventory of goods.

APOKERA, in *Geography*. See *Cape* BECUR.

APOKOPA, in *Ancient Geography*, a name given to the *Cape* BAXOS of the Portuguese, situate upon the coast of Zanguebar.

APOLDA, in *Geography*, a town of Germany, in the circle of Upper Saxony, and principality of Weimar, eight miles N. W. from Weimar, and 40 S. W. from Leipsick. N. lat. 50° 56′. E. long. 11° 22′.

APOLEPSIS, from ἀπολείπω, *I leave*, in the Athenian *Law*, an action of divorce; brought when a woman had fled from her husband.

APOLEPSIS, from ἀπολαμβάνω, *I retain*, in the *Ancient Physic*, denotes a retention of the urine, or any other matter which ought to be evacuated.

APOLEPSIS is also understood of an interception of the blood or spirits, or an extinction of the native heat of the veins.

APOLEPSIS is also a denomination of a species of apoplexy, wherein the speech, sense, motion, &c. suddenly fail.

This

This ſeems to coincide with what is otherwiſe called a CATALEPSIS.

APOLIDES, from ἀ and πολις, *city*, in *Antiquity*, thoſe condemned for life to the public works, or exiled into ſome iſland, and thus diveſted of the privileges of Roman citizens.

APOLLINARIANS, APOLLINARISTS, call'ed alſo by Epiphanius, *Dimeritæ*, in *Eccleſiaſtical Hiſtory*, ancient heretics, who denied the proper humanity of Chriſt, and maintained that the body which he aſſumed was endowed with a ſenſitive, and not a rational ſoul, but that the Divine Nature ſupplied the place of the intellectual principle in man.

This ſect derived its name from Apollinaris, biſhop of Laodicea in the fourth century.

The *Apollinarians* have been charged with other opinions, ſuch as the *Millenarian* and *Sabellian*, the pre-exiſtence of the body of Chriſt, and the paſſion of his Deity; but eccleſiaſtical writers are not agreed with reſpect to theſe and other particulars. Their doctrine was firſt condemned by a council of Alexandria, in the year 362, and afterwards in a more formal manner by a council at Rome in 375; and by another council in 378, which depoſed Apollinaris from his biſhopric. Notwithſtanding theſe cenſures, his doctrine ſpread through moſt of the churches of the Eaſt; and his followers were ſubdivided into various ſects. The ſentence againſt Apollinaris and his followers was confirmed by a council held at Alexandria in 378, by an oecumenical council, aſſembled at Conſtantinople in 381, as well as by the council of Antioch in 379. In 388, the emperor Theodoſius enacted a law, forbidding them to hold aſſemblies, to have any eccleſiaſtics or biſhops, or to dwell in cities. The rigorous execution of this law, in concurrence with the decrees of different councils, reduced them to a very ſmall number, and their doctrine had no long duration. Dupin. Moſheim. Lardner. Bower's Lives of the Popes. Gen. Dict.

The doctrine of Apollinaris, viz. that the Logos, a divine perſon, which deſcended from heaven, ſupplied the place of a ſoul in Chriſt, ſays a learned and acute writer, (Mordecai's Letters, p. 53.) is plain and intelligible; and anſwers much better than any other to the texts, which aſſert that "Chriſt took on him the ſeed of Abraham—was made in the likeneſs of man—God was manifeſt in the fleſh—came in the fleſh, in the likeneſs of ſinful fleſh—in him dwelleth the fulneſs of the Godhead; the Word was made fleſh—was incarnate." "All theſe texts of ſcripture," ſays Dr. Sykes (External Peace of the Church, p. 29, 30.), "are, upon the Apollinarian ſcheme, natural, plain, and eaſy; it teaches a moſt proper unity of perſon; as making the God-man, Jeſus Chriſt, to be ſtrictly one intelligent agent." It makes the very ſame perſon ſuffer and die, that came down from heaven; which is the fundamental article of the Chriſtian religion. Mr. Whiſton alſo ſays (ſee Account of the Convocation's proceeding againſt him, p. 87.), "the ſcripture and earlieſt antiquity never affirm that Chriſt took a human rational ſoul; they never ſay he took a whole human nature; never ſay, he was in that ſenſe a true and perfect man; but that he was made fleſh, had a body prepared for him; was the Word, or a God incarnate; was made in the likeneſs of man; was found in faſhion as a man, while he was God the Word. Nay, Ignatius directly affirms, that it was the Word, and not a human ſoul, which inhabited in that body; and almoſt all the ancients agree in the ſame doctrine; even Athanaſius himſelf, before the council of Nice." Notwithſtanding the pains that were taken to diſcourage this opinion, it appeared again in different forms, in the Chriſtian church, in the doctrine of the Monothelites, who held, that Chriſt had only one will, which, without doubt, is ſufficient for one perſon.

APOLLINARIAN *games*, *Apollinares ludi*, in *Antiquity*, games at Rome, inſtituted A. U. C. 541, celebrated yearly in honour of Apollo, on the fifth day of July, under the direction of the prætor, in the Circus maximus.

The occaſion was a kind of oracle delivered by the prophet Marcus, after the fatal battle at Cannæ, declaring that, to expel the enemy, and cure the people of an infectious diſeaſe which then prevailed, ſacred games were to be annually performed in honour of Apollo. And that the prætor was to have the direction of them; and the *decemviri* were to offer ſacrifices after the Grecian rite.

The ſenate ordered that this oracle ſhould be obſerved, becauſe another of the ſame Marcus, wherein he had foretold the overthrow at Cannæ, had been verified; for this reaſon they gave the prætor twelve thouſand *aſſes* out of the public caſh to defray the ſolemnity. There were ſacrificed an ox to Apollo, as alſo two white goats and a cow to Latona; all with their horns gilt. Apollo had alſo a collection made for him, beſides what the people, who were ſpectators, gave voluntarily. The firſt prætor by whom they were held was P. Cornelius Sylla. For ſome time they were moveable and indictive, but at length were fixed, under the prætorſhip of P. Licinius Varus, to the fifth of July, and made perpetual. Livy, xxvii. c. 23. tom. iv. p. 75. Ed. Drakenb.

The men who were ſpectators at theſe games, wore garlands on their heads; the women performed their devotions in the temples at the ſame time; and at laſt they carouſed together in the veſtibules of their houſes, the doors ſtanding open.

The tradition reports, that at the firſt celebration hereof, the people were ſuddenly invaded by the enemy, and obliged to take to their arms: upon which occaſion a cloud of darts and arrows falling upon their enemies, the Romans ſoon returned victors to their ſports.

The Apollinarian games were only ſcenical; and at firſt only obſerved with ſinging, piping, and other ſorts of muſic; but afterwards there were alſo introduced all kinds of mountebank tricks, dances, and the like, yet ſo as that they ſtill remained ſcenical, no chariot races, wreſtlings, or the like laborious exerciſes of the body, being ever practiſed at them. Danet, and others, confound the *ludi Apollinares* with the *Actiaci* or ACTIAN *games*.

APOLLINARES *ludi* was alſo a general name given to all SCENICAL games.

Theſe were alſo called *ludi liberales*, and *ſcenici*.

They differed from the *ludi theatrales*, in that the former were celebrated with all ſorts of plays, farces, poems, recitations, &c. the latter only by dancing and muſic.

This kind of *Apollinarians* had their ſhare in almoſt all the ſolemn games.

APOLLINARIS, CLAUDIUS SULPITIUS, in *Biography*, a celebrated grammarian, was born at Carthage, and flouriſhed in the ſecond century under the Antonines. He was ſucceeded in his profeſſion by his ſcholar Helvius Pertinax, who afterwards became emperor: to him are aſcribed the verſes prefixed to the comedies of Terence, and the following epigram written upon the orders which Virgil gave to burn his Æneid:

"Infelix alio cecidit prope Pergamon igne,
Et pene eſt alio Troja cremata rogo."

Aulus

Aulus Gellius (l. xxiv. c. 10.) ſpeaks of him in terms of very high commendation; repreſenting him as "the moſt learned man of the age," and as altogether deſtitute of pedantic arrogance. Gen. Dict.

Apollinaris, Sidonius C. Sollius, an eminent biſhop of France, was born at Lyons, of a noble family, in the year 431, and educated under maſters by whoſe inſtruction he profited ſo as to make a great proficiency in the arts and ſciences, and particularly in poetry and polite literature. His firſt profeſſion was military, in the exerciſe of which he was captured by Maiorianus, by whom his father-in-law, Avitus, was deprived of the empire; but having been kindly treated by the new emperor, he compoſed in honour of him a panegyric, for which he had a ſtatue erected to him at Rome, and was honoured with the title of Count. In 467, the emperor Anthemius raiſed him to ſeveral poſts of dignity, and erected a ſtatue to him for a ſimilar ſervice. But quitting military and civil employments, he was preferred to the biſhopric of Clermont, the duties of which he is ſaid to have diſcharged with great integrity. Having occupied this ſee 15 years, he died, according to Dupin, in 487; but according to Cave and Olearius, in 482. He has been eſteemed the moſt elegant writer of the age in which he lived, both in proſe and verſe. Beſides his panegyrics on the emperors, there are extant poems addreſſed to his friends upon particular ſubjects, and letters collected in nine books, containing a variety of particulars relating to polite literature and profane hiſtory. His works were printed at Baſil in 1542, 8vo.; at Lyons, in 8vo. in 1552; and at Paris, in 4to. in 1599; and in 8vo. in 1614. They are publiſhed in the ſixth volume of the "Bibliotheca Patrum." Cave, Hiſt. Lit. vol. i. p. 453. Gen. Dict.

Apollinaris, or Apollinarius, Claudius, was biſhop of Hierapolis in Phrygia, A. D. 176, and flouriſhed in the time of M. Antoninus, to whom he preſented an apology for the Chriſtian faith. Euſebius and Photius mention other works, none of which are now extant. Euſebius informs us, that Apollinaris had mentioned the extraordinary deliverance and victory obtained by Antoninus in the year 174, when the thundering legion became ſo famous. Theodoret, in mentioning his writings againſt the Montaniſts, ſays, that he was worthy of praiſe, and that he had added to the knowledge of religion, the ſtudy of polite literature; and Photius commends his ſtyle. Lardner's works, vol. ii. p. 294.

Apollinarius, or Apollinaris, the *elder*, was a native of Alexandria, and flouriſhed about the middle of the fourth century, or according to Cave, A. D. 362. He was diſtinguiſhed, both as a grammarian and a divine. After having been a teacher of grammar at Berytus in Phœnicia, he became preſbyter at Laodicea in Syria. Under the reign of Julian, when the Chriſtians were forbidden the uſe of the Greek and Roman claſſics in their ſchools, he compoſed a grammar in a Chriſtian form, and wrote many books in imitation of the ancients. He tranſlated the books of Moſes into Greek heroic verſe, and wrote in the ſame manner the whole hiſtory of the Hebrews to the time of Saul, which he divided, like Homer's Iliad, into twenty-four parts, to which he prefixed, in regular ſeries, the letters of the alphabet. The remaining hiſtorical books of the Old Teſtament he exhibited partly in hexameters, and partly in a dramatic or lyric form, imitating the tragedies of Euripides, the comedies of Menander, and the odes of Pindar. Sozomen (Eccl Hiſt. l. vi. c. 15.) ſpeaks highly of his talents and performances, and leads us to lament, in proportion to our confidence in his judgment, "works equal in number and merit to the ancient Greek models." Suidas. Cave, Hiſt. Lit. vol. i. p. 225.

Apollinarius, or Apollinaris, the *younger*, the ſon of the former, was the diſciple of Epiphanius the ſophiſt, and taught grammar at Laodicea, of which city he was at length ordained biſhop. At the time, viz. A. D. 362, when Julian iſſued the decree mentioned in the preceding article; he concurred with his father in rendering ſervice to the Chriſtians; and he is ſaid to have put the goſpels and the apoſtolical doctrine into dialogues after the manner of Plato. He alſo wrote commentaries on the book of Pſalms, the Eccleſiaſtes, the prophecy of Iſaiah, that of Daniel, (rejecting the ſtories of Suſanna, and Bel and the Dragon, as not extant in Hebrew,) and that of Hoſea, and likewiſe on ſeveral books of the New Teſtament. His apology for the Chriſtian religion againſt Porphyry, in thirty books, is mentioned with commendation by Jerom and others. Some learned men have been of opinion, that he publiſhed a new Greek tranſlation of the books of the Old Teſtament, compiled from the Greek verſions that had been made before; but this does not ſeem to have been a fact, though Fabricius enumerates this as one of his works. Sozomen (Eccl. Hiſt. l. v. c. 18. p. 624.) mentions a valuable work of this author, addreſſed to the emperor himſelf and the Greek philoſophers, intitled, "Of the truth;" in which he ſhewed, by reaſon alone, without alleging the divine ſcriptures, that they did not think rightly of the deity. It is ſaid, that Julian writing to ſome Chriſtian biſhops concerning this book, made this remark; "I have read, underſtood and condemned;" to which he received this anſwer, "You have read, but you did not underſtand; if you had underſtood, you would not have condemned." Beſides all theſe, Apollinarius wrote divers books againſt thoſe called heretics; and he employed his poetical talents in compoſing ſhort pſalms and hymns fitted for feſtivals and for all ſeaſons, on a variety of ſubjects; ſome of which were uſed in their religious aſſemblies, and others were ſung by the men at their works and entertainments, and by the women at their ſpindle. For an account of the doctrine of Apollinaris, and of the ſect of which he is ſaid to have been the founder, ſee Apollinarians.

The character of Apollinarius has been very differently appreciated by modern writers. Lord Chancellor King, the reputed author of "The Apoſtle's Creed," &c. calls him the great Apollinaris, the ornament and ſplendor of the church of that age, the moſt ſignalized champion for the faith, and an illuſtrious example of piety and virtue; by all eſteemed the greateſt man of his age both for learning and piety; a moſt accurate and nervous defender of the faith againſt all its enemies, whether heathens or heretics. Dupin ſays, he was beloved and eſteemed by St. Athanaſius, St. Baſil, St. Epiphanius, and all the great men of his age, for learning and knowledge. St. Jerom ſays, that he had often ſeen him at Antioch, that he honoured him, and that he learned many things of him. Philoſtorgius, the Arian hiſtoriographer, ſays, that he and Baſil, and Gregory Nazianzen, defended the divinity of Chriſt better than any either before or after them; in compariſon of whom, the great Athanaſius was eſteemed to be but a child; and the moſt conſidered and eſteemed of theſe three was this Apollinaris; and that theſe three were wanting in nothing neceſſary for underſtanding and reading the ſcriptures; and eſpecially this Apollinaris, who underſtood the Hebrew language. He wrote againſt the Arians and other heretics, &c. in many volumes, overthrew hereſies, and confuted errors oppoſite to the faith; and in thirty large and noble books, moſt convincingly baffled

fied the calumnies of Porphyry: and his moral character was as conſpicuous as either Gregory's or Baſil's. His writings ſurpaſſed in beauty and ſtrength every thing that had been written by Euſebius, or any of the ancients. Nevertheleſs he was excommunicated by George biſhop of Laodicea, for taking the part of Athanaſius againſt him. To theſe teſtimonies in favour of Apollinarius, we ſhall ſubjoin a very different kind of judgment formed concerning him by M. Tillemont. "He mantained to the end his impiety, and died in his hereſy: ſo that we cannot admit the hope of any other lot for him, but the condemnation of hell." Dupin having mentioned Apollinarius's paraphraſe of the pſalms, adds, "All the other works of this author are loſt, except ſome fragments. His error in all probability occaſioned this loſs: the catholics had ſuch a dread of the books of heretics, that they have not preſerved ſo much as thoſe which had no relation to their hereſy, and which might have been uſeful to the church."—"If that be ſo (ſays the candid and impartial Dr. Lardner), we muſt acknowledge that the catholics were to blame; it is like rooting up tares and good corn altogether. And we may hence receive this inſtruction, to be upon our guard that we admit not too great an averſion for men on account of difference of ſentiment in things of a ſpeculative nature; leſt by violence in oppoſing error, we ſhould obſtruct the progreſs of knowledge, and the cauſe of truth which we are deſirous to ſerve." Apollinarius died, according to Jerom, in the reign of Theodoſius, and probably not long after the beginning of it, in 382, or ſoon after; for Epiphanius, in 376 or 377, calls him a venerable old man. Lardner's works, vol. iv. p. 380—397. Moſheim's Eccl. Hiſt. vol. i. p. 223, &c. Cave, Hiſt. Lit. vol. i. p. 250, &c.

APOLLINIS URBS, or APOLLINOPOLIS MAGNA according to Ptolemy, or APOLLONOS according to the Itinerary of Antonine, or APOLLONIAS according to Hierocles, in *Ancient Geography*, the capital of the fifty-ſecond nome of the ſame name in the ſouthern part of Upper Egypt, about twenty-five leagues nearly north of the great cataracts. M d'Anville, Savary, and Denon, agree in aſſigning to it the ſituation of the preſent village of *Edfou* or *Etfu*, governed by an Arabian ſcheik.

The ſite of this ancient city is ſingularly advantageous, as it commands the river and the whole valley of Egypt: and its magnificent temple, ſeated on a riſing ground, towers over the reſt like a large citadel which keeps the adjacent country in awe; and, indeed, it is known to the natives merely by the name of "the fortreſs." The extent, majeſty, magnificence, and high preſervation of this edifice, ſays M. Denon, ſurpaſſed every thing he had before ſeen in Egypt, or elſewhere. The building itſelf is a long ſuite of pyramidal gates, of courts decorated with galleries, of porticoes, and of covered naves, conſtructed, not with common ſtones, but entire rocks. The excellent preſervation of this ancient edifice forms a wonderful contraſt with the grey ruins of modern habitations built within its vaſt incloſure; a part of the population of this village being contained in huts built in the courts, and around the fragments of the temple. This temple is the moſt beautiful in Egypt, and, next to thoſe of Thebes, the largeſt. As it was built at a period when the arts and ſciences had acquired all their ſplendour, the workmanſhip of every part is equally beautiful, the hieroglyphics are admirably executed, the figures more varied, and the architecture of a higher order than in the Theban edifices, the building of which muſt be referred to an earlier age. At the foot of this greater temple, and on a much lower level, is a ſmaller one, at preſent almoſt buried; but in a hollow ſurrounded with rubbiſh may be ſeen a little portico of two columns, and as many pilaſters, a periſtyle, and the ſanctuary of the temple incloſed within a pilaſtered gallery. A ſingle column with its capital riſing from the ruins to the height of forty feet above the portico, and the angle of a wall forty feet beyond, ſhew that there formerly exiſted a court in front of the temple. The gates, it is obſerved, are not exactly in the middle of the ſides. It ſeems to have been dedicated to the evil genius; for the figure of Typhon is ſeen in relief on the four ſides of the plinth which ſurrounds each of the capitals: the whole friezes and all the paintings within appear deſcriptive of Iſis defending herſelf againſt the attacks of this monſter. M. Denon has illuſtrated his deſcription of theſe temples by appropriate drawings. See Denon's Travels into Upper and Lower Egypt, &c. vol. ii. p. 107. 277.

APOLLINIS *urbs*, or *Apollinopolis Parva* or *Minor*, another city of Egypt, called alſo *Vicus Apollinis* in the Itinerary. According to Ptolemy, it belonged to the forty-eighth nome of Coptos; and was ſituated between Coptos to the north, and Thebes to the ſouth-weſt, on the right of the Nile. M. d'Anville refers this to the preſent ſituation of *Kous*. Denon found in the middle of the ſquare the ſummit of a large and well-proportioned gate, ſunk into the ground to the cornice. This ſingle fragment, which muſt have belonged to a great edifice, and which appears larger than all the reſt of the city, proves, ſays this traveller, that Kous was built on the ſite of Apollinopolis Parva. The other parts of the edifice are, without doubt, buried under the mountain of rubbiſh that is occupied by the preſent town. The inſcription, engraved on the liſtel of the gate, was poſterior to the monument, and affords a curious example of ingenious flattery in a præfect of Upper Egypt, at the time of the Ptolemies; who, on account of ſome repairs twenty or thirty centuries after the building of the temple, ventured to dedicate it to his maſters, to inſcribe the gate with their names, and thus to tranſmit them to poſterity. Denon's Travels, vol. ii. p. 236. 297.

APOLLINIS *Fanum*, or *Temple of Apollo*, a town of Lydia, according to the periplus of Scylax, which became a biſhop's ſee. This is alſo the name of a place of Africa propria, according to Ptolemy, ſituate probably north-eaſt of Tabraca.

APOLLINIS *inſula*, an iſland of Africa, according to Steph. Byz.

APOLLINIS *lucus*, a grove conſecrated to Apollo in that part of Ciſalpine Gaul called Tranſpadana, among the Libici, to the north-weſt of Vercellæ.

APOLLINIS *oppidum*, a ſmall town of Ethiopia, in the country of the Megabores, according to Pliny.

APOLLINIS *Phæſii portus*, a port of Greece, attributed by Pliny to the Ozole Locrians.

APOLLINIS *promontorium*, *Ras-Zebib*, was ſituated to the eaſt of Utica, and to the north of Carthage. Another promontory of the ſame name is placed by M. d'Anville after Ptolemy, in Mauritania Cæſarienſis, north-weſt of Cæſarea.

APOLLINIS *regio*, a name given to the country of Ethiopia.

APOLLINIS *templum*, or *Temple of Apollo*, was ſituated in Thrace, and called Zerinthium. Another of this name was ſituated in Lycia, upon the gulf of Myra. Another was in Theſſaly, upon the Pelaſgic gulf, near Pagaſæ.

APOLLINIS *urbs*, or *city of Apollo*, was a name given to Delos, called alſo Aſtena, in the iſle of Delos.

APOLLO, in *Entomology*, a ſpecies of PAPILIO, in the

ſection Parnaſſius. The wings are white ſpotted with black: on the upper ſide of the poſterior wings are four eye-ſhaped ſpots, and on the underſide ſix. It inhabits Europe and Styeria: and is the PAPILIO RUMIA of Poda. Gmelin.

APOLLO, in *Mythology*, a pagan deity worſhipped by the Greeks and Romans. Cicero (De Nat. Deor. l. iii. c. 23. Oper. t. ii. p. 635. ed. Olivet.) diſtinguiſhes four deities of this name: the firſt and the moſt ancient was the ſon of Vulcan, and the guardian of Athens; the ſecond was the ſon of a Corybant, and born in Crete; the third was the ſon of Jupiter and Latona, who was born in the iſland of Delos at the ſame time with his ſiſter Diana, and who was, according to Euſebius, the moſt ancient of the three, and, in many reſpects, the moſt celebrated; the fourth was born in Arcadia, and called by the Arcades, Nomius, or the legiſlator, becauſe he enacted laws for them. Of theſe four, the three laſt were Greeks, and the firſt an Egyptian, who, according to Herodotus, was the ſon of Oſiris and Iſis, and called *Orus* or *Horus*. Pauſanias agrees with Herodotus, and ranks Apollo among the Egyptian divinities. Diodorus Siculus alſo, after ſaying that Iſis had invented the practice of medicine, adds, that ſhe taught this art to her ſon *Orus*, named Apollo, who was the laſt of the gods that reigned in Egypt. Indeed, all the Grecian fables and mythologies may be eaſily traced to Egypt. To this purpoſe, it is obſerved, that if the Apollo of the Greeks was ſaid to be the ſon of Jupiter, it was becauſe Horus, the Apollo of the Egyptians, had for his father Oſiris, whom the Greeks confounded with Jupiter. If the Greek Apollo was reckoned the god of eloquence, muſic, medicine, and poetry, the reaſon was, that Oſiris, the ſymbol of the ſun among the Egyptians, as well as his ſon Horus, had there taught thoſe liberal arts. If the Greek Apollo was the god and conductor of the muſes, it was becauſe Oſiris carried with him, in his expedition to India, ſinging women and muſicians. The parallel might be purſued, and ſufficient evidence is thus obtained, that the true Apollo was that of Egypt. Cicero ſays (De Nat. Deor. l. ii. c. 27. Oper. t. ii. p. 578.), that Apollo is a Greek name, and that he repreſents the ſun; and that the ſun is ſo called, becauſe this luminary is alone ſo great compared with the other ſtars, or becauſe this alone appears when it is riſen, all the others being obſcured. Accordingly the etymology may be deduced from α priv. and πολλος, *many*; as the Latins derive *ſol* from *ſolus*, alone. Voſſius thinks (De Idol. vol. i. l. ii. c. 17. p. 391.), that the Apollo of Greece and Rome was the ſame as the Abelion of the eaſt; and Abelion was, in the etymological ſyſtem of Bryant (Mythol. vol i. p. 17), a combination of the terms Ab-El-Eon, denoting "Pater ſummus Sol", or "Pater Deus Sol." The ſun was alſo worſhipped, adds this writer, under the title of Abaddon; which, as we are informed by the Evangeliſt, was the ſame as Apollo, or as he terms him (Rev. c. ix. v. 11), Απολλυων.

Apollo has been peculiarly diſtinguiſhed by the poets, in preference to the other deities; and many extraordinary diſcoveries and performances have been aſcribed to him. He has been eſteemed the inventor of all the fine arts, ſuch as poetry, muſic, and eloquence, and regarded as the protector of the poets, muſicians, and orators. No one has performed like him on the lyre; and he has been thought to poſſeſs an intimate acquaintance with all the ſecret powers of medicine. The muſes were under his protection, and he preſided on Mount Parnaſſus at all their concerts. None of the gods was endowed to the ſame degree with himſelf, with the knowledge of futurity; and therefore he was the god of divination, and had a greater number of oracles than any other deity. Of theſe the Delphian claimed the firſt rank on account of its antiquity, truth, and the perſpicuity of its anſwers, as well as the magnificence of its ſtructures, the variety and value of its *Anathemata* or preſents, and the multitudes that reſorted thither. There were others at Cirrha, Delos, among the Mileſians, at Abæ, at Claros, at Lariſſa, in Bœotia at Eutreſis, Teggyræ, and Ptous, at Orope in Eubœa, at Corypæ in Theſſaly, at Hybla, at Iehnæ in Macedonia, &c. He had alſo temples through all Greece and Italy; and he was honoured and worſhipped, as the repreſentative of the ſun, among the Gauls and Britons. It has indeed been doubted whether Apollo was a real perſonage, or merely a ſymbolical deity repreſenting the ſun. Voſſius (*ubi ſupra*) adopts the latter opinion, and maintains that there was never any other Apollo beſides the ſun: thus he was ſtyled the ſon of Jupiter, becauſe that god was reckoned by the ancients, the maker of the world. His mother was called Latona, ſignifying "hidden," becauſe all things were enveloped in the obſcurity of Chaos, before the creation of the ſun. He is repreſented as a beardleſs youth, becauſe the ſun never grows old and decays; and his bow and arrows denote his piercing beams. Beſides, according to this writer, all the ceremonies that were performed to his honour bore an obvious relation to the great ſource of light which he repreſented. It is in vain then, he concludes, to ſeek for any other divinity than the ſun, which was adored under the name of Apollo. There is reaſon, however, to imagine, that there might have exiſted ſome illuſtrious perſonage named Apollo, who after his apotheoſis was made the emblem or ſymbol of the ſun; as we know to have been the caſe with reſpect to the Egyptian deities, Horus and Oſiris.

To the diſtinguiſhing qualities above enumerated and aſcribed to Apollo, the poets have joined beauty, gracefulneſs, eternal youth, and the art of charming the ear by the ſweetneſs of his eloquence, and the melodious ſounds of his lyre, and of thus captivating both gods and men. Accordingly he is principally diſtinguiſhed in ancient ſtatues by the beauty of his face, and the gracefulneſs of his figure: and hence Virgil (Æn. iii. v. 119.) calls him "the beautiful;" and Tibullus (l. ii. el. 3. v. 11.), "the well-ſhaped god." We need not wonder then at the amours and love-conqueſts that have been attributed to him. His muſical conteſts, and ſome of his other feats, will be related in their proper places, in the courſe of this work. See MARSYAS, MIDAS, PAN, PYTHON, and THAMYRIS.

Apollo is uſually repreſented as a beautiful, beardleſs youth, with long hair (hence called "intonſus and crinitus;" Ovid. Triſt. iii. 1. 60.), holding a bow and arrows in his right hand, and in his left hand a lyre or harp. He is crowned with laurel, which was ſacred to him, and from this circumſtance his favourite poets wore the ſame crown. In the character of the ſun, his head is ſurrounded with rays. He is often repreſented on the coins of the Syrian princes. The animals conſecrated to him were the wolf and hawk, as ſymbols of his piercing eyes; the crow and raven, from their ſuppoſed faculty of predicting the future; the cock, from his announcing the dawn of morning and riſing of the ſun; the graſshopper, on account of his tuneful powers, recorded and celebrated by Anacreon (od. 43); and the ſwan, partly from his prediction of futurity, and partly from his extraordinary vocal powers. The various appellations which were appropriated to Apollo, were derived either from ſome of his chief attributes, or from the places where he was worſhipped. It would be endleſs to enumerate them all: we ſhall therefore content ourſelves with ſome of the principal, and refer for their more particular explanation to the articles under which they occur. He was called *Actian*, in reference

to

to ACTIUM; Ακτιοκομης, in his hymn, attributed to Homer; and "Intonſus," by Propertius, Ovid, &c. on account of his long hair; *Alexicacus*, from his power of healing; *Arciteneus* and *Argyrotoxus*, from his bow and arrows made of ſilver; *Comæus*, from κομη, on account of his fine hair, under which appellation he was worſhipped at Seleucia; *Conſervator*, on a golden medal of Aurelian; *Coryphæus*, from *Coryphe*, where he had an oracle; *Cynthius*, from a mountain of this name in Delos; *Delian*, from *Delos*; *Delphian*, from *Delphi*; *Didymæus*; Εκαεργος, or *longe ejaculator*, in alluſion to his arrows and the rays of the ſun; *Latous* and *Latonian*, from his mother Latona; *Medicus*, from his being the inventor of medicine; *Navalis*, from Auguſtus's having aſcribed his victory at Actium to him; Νομιος, or *Nomius*, either from his ſuperintending herds and paſturage, or from the fertility which the earth derives from the influence of the ſun; *Pæan*, formed of παιειν to ſtrike, becauſe he wounded with his arrows; *Patareus*, from Patara in Lycia, where he had a temple and oracles; *Phœbus*, from Phœbe the mother of Latona, or from his ſplendour; *Pythian*, from his victory over the ſerpent Python; *Smintheus*, from σμινθα, *rats*, a name given by the Cretes, who, having neglected his worſhip, were puniſhed by the deva-ſtations of theſe, and reſcued by his interpoſition; *Sortilegus*, from his preſiding over lots; *Thuræus*, from θυρα, a *gate*, becauſe he preſided at the gates, among the Greeks, who adorned them with his ſtatues; *Thymbræus* (Virgil Æn. iii. 85.), from Thymbra, where he had a grove and temple, &c.

APOLLO BELVIDERE, in *Sculpture*, a very celebrated antique ſtatue, eſteemed by the majority of artiſts the moſt excellent and ſublime of all the ancient productions. It was found towards the end of the fifteenth century, at Capo d'Anzo, upon the ſea coaſt, about twelve leagues from Rome, in the ruins of ancient Antium. It was purchaſed by pope Julius II. when only cardinal, and placed in his palace near the church of Santi Apoſtoli; but ſoon after, being made pope, he removed it to the Belvidere of the Vatican; from whence it takes its name, and where it was for three hundred years the admiration of the world; until Rome was taken and plundered by the French, who have tranſported this divine ſtatue to the muſeum at Paris.

The marble out of which this ſtatue was worked, is of ſo peculiar a kind, as to occaſion much doubt about the quarry it was taken from. The ſculptors of Rome are all of opinion that the marble is Grecian; with the exception of one or two, who call it marble of Luni or Carrara. However poſitive theſe opinions may be, it came moſt probably from a quarry totally unknown at this day.

Some accounts have ſtated, that this ſtatue was the work of Agathias the Epheſian; but the French artiſts, who were ſent to Rome at the time of the incurſion of the French into Italy, to explore the different works of art and their hiſtory, ſtate that the author is certainly unknown.

This ſtatue is a ſtanding figure, almoſt naked, and more than ſeven feet in height: it has a freedom, grace, and majeſty in the whole attitude, and eſpecially in the turn of the head, that ſurpaſſes any other antique known. The god is here repreſented with his quiver hanging behind his right ſhoulder, and his pallium over his left arm, which is extended, and has in the hand the remains of a bow, out of which he is ſuppoſed to have juſt diſcharged an arrow at the ſerpent Python. On this account the ſtatue is called Apollo Pythius. The mind of the god is here ſo nobly exhibited, that without ſaying too much, he evidently appears watching the event of his aim; but with ſuch confidence and majeſty, as proceed from a certainty of ſucceſs in the attempt; forming a ſublime contraſt to the tremulous anxiety of Diſcobulon, who, in another ſtatue, is repreſented as having juſt thrown the diſcus. On the ſtump of a tree, introduced in order to ſtrengthen the figure, is executed a ſerpent, the ſymbol of phyſic, of which Apollo was god. To deſcribe this figure in few words; it is a complete compoſition of ſublimity, elegance, activity, and youthful beauty. The right fore-arm and the left hand, which were wanting, have been reſtored by Giovanni Angelo da Montorſoli, pupil of Michael Angelo.

In the eighth year of the French Republic, Bonaparte, accompanied by the third conſul Lebrun, was preſent at the inauguration of this ſtatue; and on the occaſion, a bronze tablet was preſented, in the name of the artiſts, by Citizen Vien, and placed on the pedeſtal of the ſtatue, on which was engraved the following inſcription:

La ſtatue d'Apollon, qui s'éléve ſur ce piédeſtal
trouvée à Antium ſur la fin du XV^e ſiécle,
placée au Vatican par Jules II. au commencement du XVI^e,
conquiſe l'an V. de la République par l'armée d'Italie,
ſous les ordres du géneral Bonaparte,
a été fixée ici le 21 Germinal, an VIII.
premiere annee de ſon conſulat.

On the oppoſite ſide of the pedeſtal is engraved:

Bonaparte, I^er Conſul.
Cambacerés, II^e Conſul.
Lebrun, III^e Conſul.
Lucien Bonaparte, Miniſtre de l'intérieur.

Beſides the above, there are many other ſtatues of Apollo; ſome of which poſſeſs great merit. In the Villa Medicis were the following.

One ſmaller than life, grouped with a figure of the God Pan, who is teaching him to play on the ſyrinx. (One, the ſame as this, was in poſſeſſion of the Earl of Beſborough at Roehampton.)

Another Apollo, leaning his left elbow on the ſtump of a tree; his right arm reſts upon his head. A very elegant and beautiful ſtatue. The left arm and the feet are modern. This is called the Apollo de Medicis.

Another, leaning on the ſtump of a tree; with his legs croſſed. This was originally playing on a lyre; though the lyre is now wanting. Over the tree hangs the pallium of Apollo, and at the bottom is a ſwan. The air of the head, and the ſweep of the body of this figure, are very elegant.

Two others, of the ſame deſign; except that their heads are more elevated. Theſe are not quite equal in merit to the firſt.

Another, is alſo leaning on the ſtump of a tree, with his lyre: very fine.

In the palace Farneſe, was an Apollo of black marble, leaning on his lyre, with his right hand over his head.

Another in the palace Giuſtiniani, where he holds the ſkin of Marſyas: very fine.

A group of Apollo and Marſyas was in the palace Chigi, in which Apollo has one hand on the ſhoulder of Marſyas, with a knife in the other. They regard each other, in this group, with an expreſſion that is ſurprizingly well told. The air of Apollo's head is divine.

There are ſome ſmall beautiful ſtatues of Apollo at Wilton houſe: ſeveral at Paris, and very many in different parts of Europe, beſides a great many celebrated buſtos and baſſo-relievos.

APOLLO was alſo the name of a kind of pantomime dance, which exhibited ſome actions of this god.

APOLLODORUS, in *Biography*, a grammarian of Athens, was the ſon of Aſclepiades, and a diſciple of Ariſtarchus the grammarian, and of the two ſtoic philoſophers Panætius and Diogenes the Babylonian. He flouriſhed about

the 158th olympiad, or 148 years before Chriſt, under Ptolemy Philometor. None of his works are extant but the three books of his "Bibliotheca," which contain a compendious hiſtory of the Grecian divinities and heroes, from Inachus, who is believed to have founded the kingdom of the Argives in the time of Abraham, to the time of Theſeus, prince of Athens. This hiſtory was written in the reign of Attalus king of Pergamus, who died in the 3d year of the 160th olympiad, or 138 years before Chriſt. Heyne's preface proves this to be a very ingenious and elegant performance, from which we may derive ſome acquaintance with ancient hiſtory, as the fables are founded on hiſtorical truth, and as the perſons whom it records actually exiſted, though their actions are exaggerated or diſguiſed. He adds, that we may extract from Apollodorus a more certain and better founded chronology, than from the rhapſodies of Diodorus; and Voſſius is of opinion, that by ſeparating the fabulous ſtories from real events, we may form from his writings a true hiſtory. The firſt edition of this work was publiſhed by Sylburgius at Rome, in 1555, 8vo.; but the beſt edition is that of Gale, among "the five ancient Greek writers of fabulous hiſtory;" to which he has annexed notes, and a genealogical table, in 1655. Fabr. Bibl. Græc. l. iii. c. 27. t. ii. p. 670, &c.

Apollodorus, a famous Athenian painter, flouriſhed about the year before Chriſt 408. He is ſaid to have poſſeſſed the reſources, in which his predeceſſor Polygnotus failed, and to have diverſified the tone of his colours, and to have produced a happy mixture of light and ſhade. Heſychius ſays, that he was ſo ſenſible of his ſuperiority in the exerciſe of his art, that he wore a ſort of regal tiara, as the prince of his profeſſion. Zeuxis improved upon his diſcovery, and Apollodorus, in a poem written on the occaſion, records and exalts that of his rival. "I had diſcovered," ſays he, "for the diſtribution of ſhades, ſecrets unknown till our days; they have been wreſted from me; the art is in the hands of Zeuxis." Pliny, Hiſt. Nat. l. xxxv. c. 9. Anacharſis's Travels, vol. i. p. 448.

Apollodorus, a famous architect, was born at Damaſcus, and flouriſhed under Trajan and Adrian. In the year of Chriſt 104, he built the ſtone bridge over the Danube, which was one of the moſt conſiderable works of Trajan; and he alſo conſtructed the edifices round the Forum Trajanum in Rome, among which were a triumphal arch, and the ſculptured column of Trajan, now exiſting. His offenſive reply to Adrian, who ſeems to have envied his talents and fame, was reſented with a ſeverity which muſt be univerſally condemned. Whilſt Apollodorus was converſing with Trajan on ſome plans of architecture, Adrian interfered, and gave an opinion, which the artiſt treated with contempt: "Go," ſays he, "and paint gourds," (an amuſement which Adrian was fond of,) "for you are very ignorant of the ſubject on which we are converſing." When Adrian became emperor, the affront was remembered, and it prevented Apollodorus from being employed: nor was the opinion, which Apollodorus gave with reſpect to the plans of a ſumptuous temple of Venus, which the emperor was building, at all conciliatory. Adrian, meanly jealous, and inexcuſably revengeful, baniſhed the architect; and having cauſed him to be accuſed of various crimes, put him to death. Crevier's Rom. Empr. vol. vii. p. 171. Gen. Dict.

Apollodorus, born at Lemnos, was phyſician to Ptolemy Soter, to whom he is ſaid by Pliny to have dedicated a book on the qualities and uſe of wine. There were two other phyſicians of that name, both mentioned by Pliny; one of them is ſuppoſed to have invented an antidote againſt the bite of a viper, deſcribed by Galen. Haller, Bibl. Med. Pract.

Apollonia, in *Antiquity*, feaſts ſacred to Apollo at Ægialus. It is ſaid, that Apollo, after the deſeat of Pythius, having retired to Egialea with his ſiſter Diana, was driven thence by the inhabitants, and obliged to ſeek a retreat in the iſland of Crete. In a little while, a plague made great ravages in this place, and upon conſulting the oracle, information was received, that ſeven young women, and as many young men, ſhould be ſent to Apollo and Diana to requeſt their return to Egialea. As ſoon as theſe deities arrived, the plague ceaſed; and in commemoration of this event, they annually depated the ſame number of young women to go, as it were, in ſearch of Apollo and Diana.

Apollonia, in *Biography*, a female Chriſtian Martyr of Alexandria, was of an advanced age at the beginning of the Decian perſecution, in 248, and yet felt a ſacrifice to her profeſſion. Her perſecutors ſtruck her upon the cheeks, and beat out all her teeth; then lighting a fire without the city, they threatened to burn her alive, unleſs ſhe would join with them in pronouncing certain profane words; but ſhe begging a ſhort reſpite, and being releaſed, threw herſelf into the fire, and was conſumed to aſhes. Euſeb. Eccl. Hiſt. lib. vi. c. 41. p. 237. Lardner's Works, vol. viii. p. 147.

Apollonia, in *Ancient Geography*, the name of ſeveral ancient cities; viz. a town of Aſſyria, ſituate, according to Steph. Byz. between Babylon and Suza. M. d'Anville places it upon the river Delas, to the north-eaſt of Artemita.—A town of Paleſtine, between Cæſarea and Joppa, called Apollonias by M. d'Anville, and placed to the north-weſt of Antipatris. It was re-eſtabliſhed by Gabinius, preſident of Syria, after having ſuffered much in wars of this province.—A town which ſome authors place in Piſidia, but which M. d'Anville places in Caria, near the Mæander, at ſome diſtance to the weſt of Antiochia Mæandri.—A town of Myſia, according to Steph. Byz.—A town of Aſia Minor, in Bithynia, on the north bank of a lake of the ſame name, and near the Rhyndachus, now Abouillona: this was once a city of great note, and maintained its luſtre till the reign of the emperor Alexis Comnenus, when it was taken and pillaged by the Turks. Apollo is repreſented on the reverſe of ſeveral medals of this city. There are many Imperial Greek medals that have been ſtruck in this city, in honour of M. Aurelius Verus, Septimius Severus, Caracalla, Gordian, Plautilla, and Geta.—A town of Pontus, according to Pliny.—A town of the ſmall iſland of Syphnos, one of the Cyclades. A town of Thrace, now Sizeboli, ſituate on the ſouth ſide of a ſmall gulf of the Euxine ſea: this town was ruined by Lucullus, when he was governor of Macedonia.—A town of Macedonia in Chalcidica, ſituate upon the Chabrius to the north of Chalcis. Another town in Macedonia, in Mygdonia, ſouth-eaſt of Theſſalonica, and ſouth-weſt of Amphipolis. A town dependent on Macedonia, when it extended to the weſt as far as the Adriatic ſea. It was ſituate at a ſmall diſtance north of the Aous, and was an epiſcopal ſee.—A town of the Phocide, on mount Parnaſſus, and formerly called *Eranus*, and alſo *Cyparifſus*.—A town in an iſland near Acarnania.—A town of Sicily, near the promontory of *Pachinum*, where was a temple of Apollo. The medals of bronze ſtruck in this city, had the legend "Tauromenitan."—A town of Crete, near Gneſſus, according to Steph. Byz.—Another town of Crete, formerly called *Eleuthera*. It was, ſays Steph. Byz. the country of Linus, and of Diogenes the phyſician.—An iſland in the vicinity of Lycia, Steph. Byz.—A town of Lybia.—A town of the Cyrenaica, towards the north weſt, and near the ſea. Under the lower empire it took the name of Sozuſa, and its modern name is *Marza-Suſa*.—A town of Illyria, on the Ionian ſea, near Epidamnus,

Epidamnus, and not far from the port of Oricum, according to Herodotus.

Apollonia, *Cape*, in *Geography*, a promontory on the Ivory coaſt of Africa, in N. lat. 4° 50′, and in the midway between Rio Suero da Coſta, and Cape Threepoints, from which it is diſtant W. by N. 15 leagues. It is remarkable for its height, and the lofty trees with which it is covered. The ſurf at the Cape is ſo violent that no boats can land there; and though it has a fort, it is of little or no importance.

APOLLONIAN *Hyperbola* and *Parabola*, in *Mathematics*. See Hyperbola, Parabola, and Conic Sections.

APOLLONIATIS, in *Ancient Geography*, a country of Aſſyria, ſo called from its metropolis Apollonia, lay eaſt of Adiabene, and is placed by Ptolemy between the rivers Gorgus and Silla.

APOLLONIUS Pergæus, in *Biography*, an eminent mathematician of Perga in Phamphylia, flouriſhed under the reign of Ptolemy Euergetes, about 240 years before Chriſt. He ſtudied under the diſciples of Euclid at Alexandria, and there laid the foundation of that celebrity which entitled him to the diſtinguiſhing appellation of the "Great Geometrician." Of the various mathematical works which he is ſaid to have compoſed, the only one now extant is his Treatiſe on the Conic Sections; and even this has been tranſmitted to us in an imperfect ſtate. It appears by the author's dedicatory epiſtle to Eudemus, to have originally conſiſted of eight books, but of theſe ſeven only remain. Heraclius, in a life of Archimedes, charges Apollonius with having appropriated to himſelf the diſcoveries and writings of that eminent mathematician; but Eutocius repels the charge, and vindicates him from any diſhoneſt plagiariſm. Whilſt it might naturally be imagined that he would avail himſelf of the works of his predeceſſors, it nevertheleſs ſufficiently appears, that he has made ſeveral valuable improvements on Euclid and Archimedes. Eutocius informs us, that before the time of Apollonius, it was uſual for mathematicians to deduce the properties of the conic ſections from three different ſorts of cones; thoſe of the parabola from a right-angled cone; thoſe of the ellipſe from an acute cone; and thoſe of the hyperbola from an obtuſe cone; becauſe they admitted only one mode of cutting the cone, which was by a plane perpendicular to the ſide: but Apollonius, by varying the poſition or inclination of the cutting plane, derived all theſe ſections from any ſingle cone. This valuable improvement, now univerſally adopted, had been for a conſiderable time aſcribed by Eutocius, Pappus, and others, to Apollonius. Guido Ubaldus, however, in his Commentary on the 2d book of Archimedes's "Equiponderantes," publiſhed at Piſa, in 1588, has ſhewn, that he was acquainted with this method of obtaining the ſeveral ſections of the cone. Archimedes is ſaid to have appropriated the name of parabola to one of theſe ſections; and the appellations of ellipſe and hyperbola are ſaid to have been introduced by Apollonius, in imitation, probably, of the former. However this be, it is univerſally allowed, that the conic ſections of Apollonius rank among the moſt valuable remains of antiquity. The firſt four books have been preſerved in the original Greek; and the 5th, 6th, and 7th, have been tranſmitted to us in an Arabic tranſlation. The tranſlation of Apollonius's conics was begun under the caliph Almamon, in the year 830; and Thebit Ben Corah took pains to reviſe and augment it with that of the three laſt books, in the courſe of the ſame century. Abalphat made a new tranſlation, under the caliph Abu-Calighiar, in 994; and this verſion fortunately fell into the hands of Borelli, in the manner recited in the ſequel of this article. This celebrated work of Apollonius, in its imperfect ſtate of four books, was firſt known among the weſtern Chriſtians towards the middle of the 15th century, when Regiomontanus projected an edition of it, which he was prevented from completing by his death. In 1537, a Latin tranſlation was made by Memmius, a noble Venetian, and publiſhed after his death by his ſon. This ſeems to have been the firſt edition, and its being the firſt was the only merit that belonged to it. A better tranſlation of the firſt four books by Commandinus, with the Commentary of Eutocius, and the Lemmas of Pappus, was publiſhed at Bologna, in 1566; they were alſo printed in 12mo. by H. Stephens, at Paris, in 1626; in folio, at Antwerp, in 1655; and in 4to. at London, by Dr. Barrow, in 1675. The loſs of the other three books of Apollonius was much regretted by the Europeans; and attempts were made to recover them. Maurolycus, a Sicilian geometrician of the 16th century, ſketched out the theory of the 5th and 6th books, and it was publiſhed by Borelli, as a Supplement to Apollonius, in 1654. Father Richard, the Jeſuit, promiſed a work of the ſame nature, but it never appeared: however, his prolix Commentary on the firſt four books was printed at Antwerp, in 1655, in folio. Whilſt Viviani was collecting materials for the reſtoration of the loſt books, Golius returned from the eaſt with a great number of Arabian MSS. among which were the ſeven firſt books of Apollonius's Conics. This diſcovery was ſpeedily announced; and in 1644, it was noticed by Merſennus. Golius delayed the tranſlation that was expected; and in 1658, Borelli, viſiting Florence, found in the library of the Medicis, an Arabian MS. the Italian title of which announced the eight books of Apollonius. Ferdinand II. duke of Tuſcany, generouſly entruſted him with this MS. which he carried to Rome; and with the aſſiſtance of Abraham Ecchellenſis, an oriental linguiſt, it was tranſlated into Latin, and publiſhed with notes, and a preface, maintaining that theſe books are not ſuppoſititious, in 1661. The 8th book was ſtill wanting; and Golius affirmed, that it was not contained in the Greek copies from which the other books were tranſlated by the Arabians. However, the learned Merſennus, who publiſhed Apollonius's Conics, in his "Synopſis of the Mathematics," found an Arabian work of Aben Neden, written about the year 1020, in which the 8th book is mentioned; and it is aſſerted that all the books were extant in Arabic. A ſplendid edition of all the eight books has been publiſhed at Oxford, in folio, by Dr. Halley, in 1710; together with the Lemmas of Pappus, and the Commentaries of Eutocius; the firſt four books in Greek and Latin; the reſt in Latin only; and the laſt reſtored by the editor. An 8vo. edition was alſo publiſhed at Oxford by Dr. Halley.

This excellent work was begun by Dr. Gregory, whoſe death prevented his proceeding farther than the 44th page; and completed by Dr. Halley, with the aſſiſtance derived from an Arabic verſion in the Bodleian library, made by Thebit Ben Corah; and another Arabic MS. in the ſame library, made by Abdolmelech Schirazita, a Perſian, about 600 years ago, and brought out of the Eaſt by Chriſtianus Ravius, and principally the MS. of Golius, purchaſed of his heirs by Dr. Marſh, archbiſhop of Armagh, and communicated to him for the public benefit. This MS. contains the firſt ſeven books of Apollonius's Conics; was tranſlated by Thebit Ben Corah; and after ſeveral amendments, completed, in 1303, at Maraga, a city on the confines of Media and Aſſyria.

With reſpect to the conic ſections, we ſhall merely obſerve, that their properties are derived in the moſt ſcientific and

and ſatisfactory manner from the cone; and this has been done by ſeveral moderns, and among others, with peculiar advantage, by Dr. Hamilton. Others have, in a manner more operoſe, deduced their properties from deſcriptions of the ſeveral curves on a plane; and a late very ingenious attempt, which, in the conſtruction and demonſtration, is almoſt wholly original, has been made to deduce all the properties of the three conic ſections, from the 24th propoſition of ſir Iſaac Newton's Univerſal Arithmetic, in Mr. Walker's Treatiſe "on the Conic Sections," the firſt book of which was publiſhed in London, in 1794.

The other writings of Apollonius, mentioned by Pappus, are the following: "The Section of a Ratio, or proportional Sections;" "The Section of a Space;" "Determinate Section;" "The Tangencies;" "The Inclinations;" "The Plane Loci;" each of theſe comprehended in two books. Pappus delivers many Lemmas relating to them; and attempts have been made for reſtoring them by modern mathematicians. Montucla. Hiſt. des Math. tom. i. p. 243—253. Voſſ. de Scient. Math. Fabric. Bib. Græc. lib. iii. c. 22. § 17. tom. ii. p. 556. Gen. Dict. Halley's Preface.

Apollonius, ſurnamed *Diſcolus*, or the *Ivan*, on account of the poverty of his condition, a celebrated grammarian of Alexandria, lived in the reigns of Adrian, and Antoninus Pius. Such was his indigence, that having no money to buy paper, he was obliged to write on oyſter ſhells. Priſcian prefers Apollonius and his ſon Herodian to all preceeding grammarians, and profeſſes to follow Apollonius as his guide. His treatiſe "on Syntax," written in Greek, is highly commended by Priſcian. A correct edition of this work, with a Latin tranſlation and notes, was publiſhed in 4to. at Frankfort, by Sylburgius, in 1590. Another treatiſe aſcribed to this writer, intitled, "Ιστορικαὶ θαυμασίαι, or Wonderful Hiſtories," was publiſhed, with other pieces, by Antonius Liberalis, Phlegon and Antigonus, and the works of M. Antoninus, in 8vo. at Baſil, in 1568; and a better edition in 4to. at Leyden, in 1620, by Meurſius. Suidas. Fabr. Bibl. Græc. lib. v. c. 7.

Apollonius *Rhodius*, ſo called from his long reſidence at Rhodes, was a native of Alexandria, and flouriſhed in the 3d century before Chriſt, under Ptolemy Euergetes. Callimachus was his preceptor, by whom he was ſeverely ſatirized for his ingratitude; and he ſucceeded Eratoſthenes in the care of the Alexandrian library. Of his works, the moſt diſtinguiſhed is a poem, in four books, on the Argonautic expedition. The author, mortified by the cenſures paſſed upon it at its firſt publication, removed to Rhodes, and opened a ſchool of rhetoric; but having afterwards corrected and improved it, the Rhodians applauded it, and conferred on him the freedom of the city. This poem has been differently appreciated both by ancient and modern critics. Quinctilian and Longinus give it only the praiſe of mediocrity, and repreſent it as having no claim to real genius, and as diſplaying the rhetorician rather than the poet. By others it has been commended as exhibiting beauties of a ſentimental and deſcriptive kind; and Virgil has borne teſtimony to its value, by copying ſeveral incidents from the relation of the loves of Medea and Jaſon, into his beautiful ſtory of Dido and Æneas. Rapin, in his "Reflections upon Poetry," (Part ii. Refl. 15.) declares, that his ſtyle has no manner of elevation or ſublimity, and that the ſtructure of the fable is very injudicious; that the catalogue of the Argonauts is deſtitute of variety; and that the poem becomes extremely languid from the firſt book: beſides, Apollonius has egregiouſly erred in making this expedition to continue but four months.

The beſt editions of the "Argonautics," are Apoll. Rhod. impref. in literis majuſculis, ed. princeps; 4to. Florent. 1496. Apoll. Rhod. Gr. ed. 2d. 8vo. apud Ald. 1513. Apoll. Rhod. Gr. with the Scholia. 4to. H. Stephan. 1574. Apoll. Rhod. Gr. & Lat. by Hoelzlin, Leyden. 8vo. 1641. Gen. Dict.

Apollonius, a famous Rhodian ſculptor. The fame who, with his contemporary Tauriſcus, executed the celebrated groups of Niobe in the Villa Medicis; and of Zethus and Amphion, in the Farneſe palace.

Apollonius, a Roman ſenator and Chriſtian martyr, lived in the time of Commodus, and ſuffered death at Rome, probably in the year 186 or 187. Being accuſed before Perennis, præfect of the prætorium, he pronounced an eloquent apology for the faith before the ſenate; and was then ſentenced by their decree, to have his legs broke, and then to be beheaded: according to an ancient law, which enacted, that if any Chriſtian were in a court of juſtice, he ſhould be puniſhed, unleſs he denied himſelf to be a Chriſtian. Euſebius ſays, that he was celebrated for learning and philoſophy; and Jerom mentions him among ſome of the moſt eminent Chriſtian writers. Euſeb. Eccl. Hiſt. l. v. c. 21. p. 189. Lardner's works, vol. ii. p. 303. v. viii. p. 339.

Apollonius, a ſophiſt and grammarian, was the preceptor of Apion, and lived in the time of Julius and Auguſtus Cæſar. He was the author of a Greek lexicon to the Iliad and Odyſſey of Homer, which was publiſhed for the firſt time with a Latin tranſlation, after remaining long unknown, in 2 volumes 4to. by J. Baptiſt de Villoiſin, at Paris, in 1773, under the title of "Apollonii Sophiſtæ Lexicon Græcum Iliadis & Odyſſeæ." Nouv. Dict. Hiſt.

Apollonius, a ſtoic philoſopher, was a native of Chalcis in Syria, and a preceptor of Marcus Aurelius. When this ſtoic came to Rome, at the requeſt of Titus Antoninus, inſtead of haſtening to take the charge of his princely ſcholar, he replied to a meſſage ſent to him by the emperor deſiring his attendance; "It is not fit for the maſter to go to his ſcholar, but for the ſcholar to come to his maſter." Antoninus, upon receiving this arrogant and rude reply, mildly and jocoſely ſaid, "Apollonius could come from Syria to Rome, but cannot come from his houſe to the palace." Crevier's Rom. Emp. vol. iii. p. 241.

Apollonius *Tyanæus*, a Pythagorean philoſopher and notorious impoſtor, was born about the commencement of the Chriſtian æra, at Tyana, a city of Cappadocia. At 14 years of age he was ſent by his father to Tarſus, to be inſtructed by Euthydemus a rhetorician; but diſſatisfied with the luxury and indolence of the inhabitants, he removed with his preceptor to Ægæ, in which there was a temple of Æſculapius. Here he acquainted himſelf with the doctrines of the Platoniſts, Stoics, Peripatetics, and Epicureans: but the Pythagorean tenets and diſcipline being more conſonant to his own views and temper, attached his chief regard; and he made choice of Euxenus for his preceptor in philoſophy, and determined to conform in the ſtricteſt manner to the Pythagorean diſcipline. Accordingly he abſtained from animal food, and lived wholly upon fruits and herbs; he made no uſe of the ſkins of animals for his clothing; he went bare-footed, and ſuffered his hair to grow to its full length; and he ſpent the greateſt part of his time in the temple of Æſculapius with the prieſts, by whom he was much admired, and who, without doubt, initiated him by their adulation and inſtruction into the myſteries of impoſture. During his abode at Ægæ, he does not ſeem to have attempted any thing miraculous, but availed himſelf of the authority of the god, in whoſe temple he reſided, to enforce moral leſſons. To an Aſſyrian youth, who repaired to Æſculapius for the cure of a dropſy occaſioned by intemperance, he recommended abſtinence, and thus cured his diſeaſe. A wealthy citizen, who was profuſe

in his ſacrifices and oblations in the temple, that he might obtain the reſtoration of an eye that had been loſt in puniſhment of conjugal infidelity, Apollonius diſmiſſed as unworthy of admiſſion into the temple: and he alſo inſtructed the people who reſorted thither, that when they entered into the temples of the wiſe, juſt, and all-knowing gods, they ſhould pray for obtaining what it is fit for them to receive; and that the wicked, however laviſh they might be in the diſpoſal of their wealth, would be rejected; becauſe they made their offerings not to honour the deity, but to purchaſe exemption from deſerved puniſhment. Upon the death of his father, he attended his funeral at Tyana, and having given the greateſt part of his wealth to his brother, and admoniſhed him to reform his vicious conduct, he returned to Ægæ, where he erected a temple, and eſtabliſhed a ſchool of philoſophy. In order to qualify himſelf for the office of preceptor in the Pythagorean philoſophy, he determined to paſs through the noviciate of five years' ſilence, which the Pythagorean ſyſtem required; and during this period he chiefly reſided in Pamphylia and Cilicia, conveying inſtruction and admonition by his looks and geſtures. At Aſpenda he is ſaid to have quelled a tumult occaſioned by famine, and to have relieved the diſtreſſed people, by writing on a tablet the following reproof to the covetous engroſſers of the grain; "The earth, the common mother of all, is juſt; but ye, being unjuſt, would make her a bountiful mother to you alone: deſiſt from your iniquitous proceedings, or ye ſhall no longer be ſuffered to live." The terrified corn-merchants opened the granaries, the people were ſupplied, and the tumult was ſuppreſſed. When his term of ſilence was expired, he viſited Antioch, Epheſus, and other cities, and aſſociated chiefly with the prieſts. At ſun-riſing he performed certain religious rites, which he diſcloſed only to thoſe who had paſſed through the diſcipline of ſilence, the reſt of the day was ſpent in the inſtruction of his diſciples, and in communicating counſel and reproof to the people. His ſtyle was neither too florid nor too refined, but truly Attic. Avoiding verboſe declamation, and ironical raillery, he delivered his doctrine with conciſeneſs, and with the authority of a legiſlator. Being aſked why he did not purſue his inquiries, inſtead of dogmatically aſſerting his tenets, he replied; "I ſought for truth when I was young, it is now my duty to teach what I have found; a wiſe man ought to ſpeak as a law-giver, and make the doctrines which he embraces, injunctions to the people." Apollonius now reſolved to travel through diſtant nations; and having propoſed his deſign to ſome of his diſciples, they declined accompanying him. He therefore entered upon his expedition attended only by two ſervants. At Ninus, however, he engaged Damis as his aſſociate; and to him he boaſted, that he was acquainted with all languages, though he had never learned them; and that he even underſtood the language of beaſts and birds: the Aſſyrian youth believed him, honoured him as a god, and accompanied him in his journey. At Babylon, Apollonius converſed with the magi; and in an interview with the king, whom he viſited in his illneſs, he diſcourſed ſo excellently concerning the ſoul, that the ſick monarch acknowledged to his attendants, that this Greek had taught him not only to deſpiſe a kingdom, but even death itſelf. At the expiration of the term which he had fixed in his prediction, he took his leave of Babylon; and furniſhed with camels and proviſions for his journey over Caucaſus, he purſued his route to Taxella, the reſidence of Phraotis the Indian king. With Phraotis he had many philoſophical conferences; and being diſmiſſed with preſents, he was recommended to Jarchas, the chief of the Indian philoſophers or gymnoſophiſts reſiding between the Hyphaſis and the Ganges. After a reſidence of four months with theſe Indian ſages, Apollonius returned to Babylon; and from thence paſſed into Ionia, where he viſited Epheſus and ſeveral other places, every where reproving the people for their miſconduct, and enforcing the Pythagorean doctrine and diſcipline. In his viſit to Pergamus and the ancient ſeat of Troy, he paſſed a night by himſelf near the tomb of Achilles; and he afterwards informed his companions, that by the power of an incantation which he had learned in India, he raiſed that hero from his tomb, and held a converſation with him. In the iſland of Leſbos he converſed with the prieſts of Leſbos, and from thence proceeded to Athens. He arrived there at the time when they were performing their ſacred myſteries, and preſented himſelf for initiation, but was refuſed becauſe he was an enchanter; at a future period, however, he was admitted. After paſſing through ſome other Grecian cities, where he pretended to perform miracles and to predict future events, he purſued his courſe through the iſland of Crete to Rome. Juſt before his arrival, Nero had iſſued an edict, that all thoſe who practiſed magic ſhould be baniſhed from the city. His friends were alarmed on his account, and though twenty-ſix out of the thirty-four perſons who were his ſtated aſſociates, deſerted him, he perſevered in his purpoſe, and under the protection of the ſacred habit obtained admiſſion into the city, and alſo leave from the conſul Teleſinus to viſit the temples and converſe with the prieſts. From Rome, Apollonius travelled to Spain; and after the death of Nero, he returned to Italy in his way to Greece, whence he proceeded to Egypt, where Veſpaſian was trying every expedient to eſtabliſh his power. This prince engaged the philoſopher in his favour; and he in return adapted his meaſures to the views of the new emperor, and uſed all his influence among the people in ſupport of Veſpaſian's authority. Whilſt he was in Egypt, he viſited Æthiopia; and on his return he was favourably received by Titus the ſucceſſor of Veſpaſian, to whom he wrote the following laconic epiſtle, on his refuſing a crown of victory upon his taking Jeruſalem: "Apollonius to Titus emperor of the Romans ſendeth greeting: ſince you refuſe to be applauded for bloodſhed and victory in war, I ſend you the crown of moderation; you know for what kind of merit crowns are due." Upon the acceſſion of Domitian, he was concerned in exciting a ſedition in Egypt againſt that tyrant, and in favour of Nerva. An order was iſſued for ſeizing him and bringing him to Rome; but as ſoon as he heard of the order, he repaired thither of his own accord; and was brought to trial before the prætor Elian, who acquitted him. Apollonius now paſſed over into Greece, and viſited the temple of Jupiter at Olympia, the cave of Trophonius in Arcadia, and other celebrated ſeats of religion; and wherever he went the number of his followers increaſed. At length he ſettled at Epheſus, and there eſtabliſhed a Pythagorean ſchool, and had many diſciples. Of his fate, after he ſettled at Epheſus, nothing certain is related. The time, the place, and the manner of his death, are unknown. It is probable that he lived to an extreme old age, and died in the reign of Nerva. After his death, Damis became his firſt memorialiſt. His memoirs were communicated by a friend, to the empreſs Julia, the wife of Severus, and by her to Philoſtratus, with a requeſt that he would tranſcribe and embelliſh the narrative. Philoſtratus undertook the taſk, and ſo loaded his account of the life of this extraordinary man with marvellous tales, that it is very difficult to aſcertain the credit due to his narrative. He relates, for example, that while the mother of Apollonius was pregnant, the Egyptian divinity, Proteus, appeared

peared to her, and told her that the child ſhe ſhould bring forth was a god; that his birth was attended with a celeſtial light; that in the Æſculapean temple at Ægæ he predicted future events; that at the tomb of Achilles, he had a conference with the ghoſt of that hero; and that whilſt he was publicly diſcourſing at Epheſus, he ſuddenly pauſed, as if ſtruck with a panic, and then cried out, "Slay the tyrant;" at the very inſtant when Domitian was cut off at Rome. If to theſe tales we add the accounts which Philoſtratus gives of the efficacy of the mere preſence of Apollonius, without the utterance of a ſingle word, in quelling popular tumults; of the chains of Prometheus which he ſaw upon mount Caucaſus; of ſpeaking trees, of pigmies, phœnixes, ſatyrs, and dragons, which he met with in his eaſtern tour; and of other things equally wonderful; it will be impoſſible to heſitate in aſcribing the marvellous parts at leaſt of Philoſtratus's narrative to his ingenuity, or his credulity. Nevertheleſs, the narrative of Philoſtratus, with all its inconſiſtencies, was, about a century after its appearance, referred to in preference to other accounts of Apollonius then extant, by Hierocles, who firſt endeavoured to form a compariſon between Chriſt and this philoſopher; and Euſebius, in refuting this attack upon Chriſtianity, admits, in general, the accounts of Philoſtratus, and ſhews that, according to his account, Apollonius does not deſerve to be compared with Chriſt.

Dr. Lardner indeed has fully ſhewn that Philoſtratus did not write the life of Apollonius with any reference to the life of Chriſt: and that his deſign was to exhibit this philoſopher as a counterpart to Pythagoras. The narrative of Philoſtratus may be admitted, in concurrence with other collateral evidence, as a ſufficient teſtimony to the exiſtence of ſuch a man as Apollonius, and to his having been an eminent philoſopher of the Pythagorean ſect, who travelled through almoſt every part of the civilized world, exhibiting an example of ſtrict and rigid morality, teaching leſſons of moral wiſdom, and doctrines of ſpeculative philoſophy, and attracting popular attention and reverence by pretending to ſupernatural powers. After all, very different opinions have been entertained concerning his character. Some have even ſuppoſed that the whole ſeries of extraordinary events related concerning him has been the mere invention of Philoſtratus and others, for the purpoſe of obſtructing the progreſs of Chriſtianity, and providing a temporary ſupport for the falling edifice of paganiſm; and it muſt be acknowledged that ſeveral writers on the ſide of infidelity have availed themſelves of his hiſtory to caſt a ſhade over the character of Chriſt, and to perplex and weaken the evidence afforded by his miracles, of his divine origin and miſſion. Some, allowing that ſuch a perſon as Apollonius exiſted, of which there is no ſufficient reaſon to doubt, have apprehended that he was intimately acquainted with nature, and deeply ſkilled in magical arts; and that he applied his knowledge and ſkill to the purpoſes of impoſture, that he might thus delude a credulous multitude, and induce them to believe that he was ſomething more than human; whilſt others imagine, that he accompliſhed his fraudulent deſigns by means of a real intercourſe with evil ſpirits. Perhaps the truth of the caſe is, that Apollonius was one of thoſe impoſtors who profeſſed to practiſe magical arts and perform other wonders for the ſake of acquiring fame, influence, and profit among the vulgar. In this light he was regarded by his contemporaries: Lucian, who lived in the time of Trajan, and Apuleius, who flouriſhed under Antoninus Pius, rank him among the moſt celebrated magicians.

How ſucceſsfully Apollonius practiſed the arts of impoſture, ſufficiently appears from the events which followed. The dominion over the minds of men which he found means to eſtabliſh during his life, remained and increaſed after his death, ſo that he long continued to be ranked among the divinities. The inhabitants of Tyana dedicated a temple to his name. The Epheſians conſecrated a ſtatue to him, in commemoration of his having delivered them from the plague. The emperor Adrian collected his writings, and preſerved them in his library. Caracalla dedicated a temple to him, as to a divinity among men. Alexander Severus kept, in his domeſtic temple, the image of Apollonius with thoſe of Abraham, Orpheus, and Chriſt. Aurelian ſhewed the Tyaneans particular favour, from reſpect to his memory. Euſebius cites Hierocles, as aſcribing to Apollonius a divine and hidden wiſdom, by which, and not by magical art, he had performed great wonders: and it is added, that in his time there were perſons who pretended to perform magical incantations by invoking the name of Apollonius. Ammianus Marcellinus (l. xxi. c. 14.), ranks this philoſopher among thoſe eminent men who have been aſſiſted by the ſupernatural aid of a dæmon or genius, as Socrates and Numa: and Eunapius, who was indeed a credulous and fantaſtical Platoniſt, ſpeaks of him as ſomething between a god and man, and adds, that Philoſtratus ought to have intitled his hiſtory, "The Deſcent of a God upon Earth." The common people ranked him in the number of deified men, and made uſe of his name in incantations; and even among the philoſophers of the Eclectic ſect, he was regarded as a being of a ſuperior order, who partook of a middle nature between gods and men.

Of the writings aſcribed to Apollonius, none remain except his "Apology to Domitian," and his "Epiſtles." The firſt, in its ſubſtance, is genuine, but ſtrongly marked with the ſophiſtic manner of Philoſtratus: the latter abound with philoſophical ideas and ſentiments, and are written in a laconic ſtyle, which affords a preſumption in favour of their authenticity. From theſe epiſtles it appears, that Apollonius blended with the Pythagorean ſyſtem concerning the nature and origin of things, according to which God and nature are primary, independent principles, the notion of the Heraclitean ſchool, viz. that the primary eſſence of all things is one, endowed with certain properties by which it aſſumes various forms; and that all the varieties of nature are modifications of the univerſal eſſence which is the firſt cauſe of all things, or God. Hence Apollonius taught, that all things ariſe in nature according to one neceſſary or immutable law; and that a wiſe man, being acquainted with the order of nature, can predict future events. Thus Apollonius connected ſuperſtition with impiety, and made both ſubſervient to impoſture. The epiſtles of Apollonius were edited by Commelin, in 8vo. in 1603; and by Stephens, in 1577. Philoſtrat. Vit. Apoll. Brucker's Hiſt. Philoſ. by Enfield, vol. ii. p. 42—49. Gen. Dict. Lardner's works, vol. viii. p. 256—292.

APOLLOS, a native Jew of Alexandria, and a Chriſtian convert, was celebrated in the time of the apoſtles for his eloquence and his knowledge of the ſcriptures; Acts, xvii. 24. In the year 54, he went to Epheſus; and, during the abſence of the apoſtle Paul, preached the goſpel in the ſynagogue, and demonſtrated from the ſcriptures that Jeſus was the Chriſt. Having been more fully inſtructed by Aquila and Priſcilla, he went to Corinth, and preached with ſuch acceptance and ſucceſs, that he made many converts; and ſuch was his popularity, that they conſidered him as their leader, in oppoſition to Peter and Paul; 1 Cor. iii. 7. But this diviſion did not alienate the affections of Paul and Apollos from each other. St. Jerom ſays, Apollos was ſo diſſatisfied with the diviſion which had happened on his account

at

at Corinth, that he retired into Crete with Zeno, a doctor of the law; but when the diſturbance was appeaſed by the letter of St. Paul to the Corinthians, Apollos returned to this city, and became biſhop there.

APOLLYON, in *Scripture Hiſtory*, a Greek appellation correſponding to the Hebrew ABADDON, which ſee; ſee alſo APOLLO.

APOLOGETIC, APOLOGETICAL, ſomething ſaid or written by way of excuſe or apology for any action or perſon.

The Apologetic, or Apology of Tertullian, is a work full of ſtrength and ſpirit. He there vindicates the Chriſtians from all that had been objected to them; particularly from the abominable crimes ſaid to be perpetrated at their meetings, and their want of love and fidelity to their country. The ground of this laſt accuſation was, their refuſing to take the accuſtomed oaths, and ſwear by the tutelary gods of the empire. Tertullian addreſſes his Apologetic, written at Carthage about the year 200, to the magiſtrates of Rome, the emperor Severus being then abſent, or rather to the governors of provinces, or perhaps to the proconſul of Africa, and the chief magiſtrates reſiding at Carthage. His Apologetic addreſſed to Scapula, proconſul of Africa, on account of his ſevere treatment of the Chriſtians, is ſuppoſed by Cave (Hiſt. Lit. t. i. p. 93.), to have been written in the year 217.

APOLOGOS, in *Ancient Geography*, *Obolch*, a town of Aſia, upon the bank of the Paſitigris.

APOLOGUE, APOLOGUS, a moral fable, or a feigned relation intended to inform and amend the manners. Jul. Scaliger derives the name απο λοξου, inaſmuch as the apologue means ſomething more than what at firſt ſight it expreſſes. Such are the fables of Æſop: whence, moral fables are uſually denominated *Æſopic Fables*.

F. de Colonia makes it eſſential to the apologue, that it contain what paſſes among brutes; and diſtinguiſhes it from the parable by this, that the latter, though feigned, conſiſts of poſſible circumſtances, which the former does not, ſince beaſts cannot ſpeak. There is this farther difference between them, that the latter is a ſimilitude drawn from natural, moral, or any other branches of knowledge; the former only from moral topics. See PARABLE.

Apologue, according to ſome, differs from fable, as the former is uſed in ſpeeches and harangues, to perſuade; the latter in tragedies, comedies, and other pieces of poetry, to inſtruct, and correct the manners. See FABLE. Apologue alſo differs from *anus*, as the latter is only calculated for the uſe of men, and carries a graver and weightier admonition; whereas apologues are propoſed to children. We find many things in authors concerning the origin of apologues, the diſtinguiſhing characters of apologues, the uſe and advantage of the way of teaching by apologues. See Bayle, Dict. Crit. in voc. & Shafteſb. Charact. tom. iii.

APOLOGY, formed of απολογια, *to refute, defence*; a diſcourſe or writing in vindication of a perſon or performance.

The principal ancient apologies in favour of the Chriſtians are thoſe of Quadratus, written about the year 126, and addreſſed to the emperor Adrian, which is ſaid by Jerom and Euſebius to have had a good effect on the emperor; of Ariſtides, written at the ſame time with the former, and preſented to the ſame emperor; two of Juſtin Martyr, one of which was written in the year 150, and addreſſed to Antoninus Pius, Marcus Antoninus, Lucius Verus, and the ſenate and people of Rome, which is extant entire, and the other in 162, preſented to Marcus Antoninus, the beginning of which is wanting; one of Melito, in 177, preſented to the ſame emperor; one of Athenagoras, written between the years of Chriſt 177 and 180, and preſented to M. Antoninus and Commodus; one of Apollinaris, addreſſed to M. Antoninus about the year 176 or 177; one of Miltiades, about the year 180, addreſſed to the princes of this world; three books in defence of the Chriſtian religion, by Theophilus, written a little before his death, in the beginning of the reign of Commodus, A. D. 181, and addreſſed to Autolycus, a learned heathen; that of Apollonius before the Roman ſenate, A. D. 186 or 187; the apologetic of Tertullian, and the dialogue of Minucius Felix, called *Octavius*, written in the beginning of the third century.

We have two excellent treatiſes by the learned and ingenious Dr. Watſon, biſhop of Landaff, under the title of Apology: one, an "Apology for Chriſtianity," in a ſeries of letters addreſſed to the well-known hiſtorian, Mr. Gibbon, and printed in 1776; and another, "An Apology for the Bible," in a ſeries of letters addreſſed to Thomas Paine, author of "The Age of Reaſon," and printed in 1796. The name of the author will ſufficiently recommend theſe tracts in defence of our common faith.

APOLYSIS, from απολυω, *I releaſe*, in a general ſenſe, the ſolution or reſolution of any thing. Thus we read of the apolyſis of a diſeaſe, the apolyſis of a bandage, or the like.

APOLYSIS, in a more particular ſenſe, denotes the excluſion of any thing. Thus we read of the apolyſis of the *fœtus*, the fecundines, and the like.

APOMELI, in *Medicine*, a kind of decoction prepared of honey, or a honeycomb, mixed with vinegar, and boiled a ſhort time, till the qualities of both be united, and the acrimony of the vinegar allayed.

The *apomeli* is repreſented as a kind of medium between mulſe and oxymel. It was anciently of great uſe among the Greeks, as a detergent, promoter of ſtool, urine, &c.

APOMYOS DEUS, from απο, and μυια, *fly*, in the *Heathen Mythology*, a name under which Jupiter was worſhipped at Elis; and Hercules, as well as Jupiter, at the Olympic games. Theſe deities were ſupplicated under this name, to deſtroy or drive away the vaſt number of flies which always attended at the great ſacrifices; and in thoſe which accompanied the Olympic games, the firſt was always to the *Apomyos* or *Myiagrus Deus*, that he might drive the flies away from the reſt. The uſual ſacrifice was the bull.

APONEUROSIS, compounded of απο, *from*, and νευρον, *a nerve*, in *Anatomy*, ſignifies an expanded tendon. See the deſcription of the Aponeuroſis of the *muſculus obliquus externus abdominis*.

APONEUROTICUS MUSCULUS, a name given by Spigelius, and ſome others, to a muſcle of the thigh, called by Cowper and Winſlow, the *muſculus lati tendinis*, and *muſculus faſciæ latæ*. Winſlow has called it, with more propriety, the *muſculus vaginæ femoris*.

APONIA, from α, and πονος, *labour*, among *Phyſicians*, a ſtate of indolence, or the abſence of pain. In which ſenſe, the word amounts to the ſame with *anodynia*. Hence alſo aponia is uſed by ſome for medicines which do not excite pain.

APONIANA, in *Ancient Geography*, a name given by Hirtius (De bell. Afr. c. 2.), to an iſland near Sicily, oppoſite Lilybæum, and ſuppoſed by Cluvier to be the ſame with Œguſa.

APONO, PETER DE, in *Biography*, a celebrated philoſopher and phyſician, born at a village of that name near Padua, about the year 1250, went early to Conſtantinople to acquire a knowledge of the Greek language, and from thence to Paris, where he was inſtructed in mathematics and in medicine. He appears alſo to have viſited England

and Scotland. In 1302, he was invited to Padua, to fill the Professor's chair. He afterwards went to Bologna, and so great was his reputation for his skill in medicine, that he is said to have received fifty crowns for every visit he made out of the city. On being sent for to Pope Honorius the fourth, he stipulated to receive four hundred ducats a day while he continued at Rome. As he pretended to a knowledge of astrology, and thence to foretel the termination of the diseases for which he was consulted, he was accused of being a magician, and cited before the tribunal of the inquisition. On this charge, however, he was at that time acquitted, as appears by the following inscription placed over one of the gates of the palace, at the foot of his statue erected there in the year 1420:

> "Petrus Aponus Patavinus,
> Philosophiæ medicinæ qua ferentissimus,
> Ob idque Conciliatoris cognomen adeptus:
> Astrologiæ vero adeo peritus,
> Ut in magiæ suspicionem inciderit,
> Falsóque de hæresi postulatus, absolutus fuit."

But being again accused of the same crime, he died before the process was finished, aged 66 years. Not appearing, therefore, to answer the charges against him, he was condemned, and his body ordered to be taken up and committed to the flames. The officers not being able to find the body, his friends having removed and privately interred it, they burned him in effigy. Frederic, duke of Urbino, honoured him with a statue, which he placed among those of other illustrious persons in his castle.

While at Paris, he wrote, "Conciliator differentiarum philosophorum, et præcipue medicorum," which was so much esteemed as to acquire for him the title of "Conciliator." This book, which has passed through several editions, was first printed at Mantua, in 1472, in folio; in the same year was printed his book "De Venenis, eorumque remediis;" also in folio, in 1474, "La Fisionimie du Pierre de Apono;" at Padua in 8vo. in 1505, "Textus Mesue emendatus," Lugduni, 8vo. For the titles of various other works, and their different editions, see Eloy's Diction. Histor. de la Medicine. Gen. Dict.

APONOGETON, in *Botany*, Lin. supp. 32. Schreb. gen. 835. Thunb. nov. gen. 72. Juss. 19. Class, *dodecandria tetragynia*. Nat. order. *inundatæ: naiades*, Juss.

Gen. char.: *cal.* none, except a spathaceous scale surrounding the flower, simple, sessile, ovate, obtuse, entire, erect, smooth, coloured; *cor.* none; *stam.* filaments eleven to nineteen, in the upper flowers fewer, inserted between the spathe and the capsules, subulate, smooth, white, many times shorter than the spathe; *pist.* germ usually four; *styles* none; *stigmas* subulate, bent inwards; *per.* capsules four, seldom three or five, ovate, subulate, acute, gibbous on the outside, flat on the inner side, smooth, one-celled; *seeds* three in each capsule, attached to its base, sessile, obovate, very blunt, smooth, sub-compressed.

Ess. gen. char.: *cal.* an amentum; *cor.* none; *caps.* three-seeded.

Species 1. A. *monostachyon*, single-spiked aponogeton: spike simple; leaves cordate-oval; root bulbous; leaves very long, petioled, radical, entire, floating, spike hexangular: bractes instead of a corolla, two below each floret; stamens six, longer than the bractes. Observed by Koenig to be common in the fields in the East Indies that are flooded for rice. 2. A. *distachyon*, broad-leaved aponogeton: spike bifid; leaves linear oblong, floating; bractes entire; flowers many-stamened. Thunb. nov. gen. 4.; root bulbous; spike imbricated within; flowers white, fragrant, alternate, erect, with an ovate bracte: pistils three or four; stamens vary from six to twelve; it flowers almost all the year. Thunberg found it in brooks at the Cape of Good Hope, whence it was introduced here by Mr. F. Masson in 1788. 3. A. *angustifolium*, narrow-leaved aponogeton: spike bifid; leaves linear lanceolate, erect; bractes two-parted; flowers six-stamened. The stamens of this species are in the Supp. Plant. said to vary from six to twelve, whereby it has been confounded with the preceding plant. A native of the Cape of Good Hope, introduced by Mr. F. Masson, in 1788. It flowers during the greatest part of the year.

Propagation and culture: these plants are inhabitants of the green house or cape-stove, and may be increased by offsets from the bulbs. See Miller's Dict. by Martyn.

APONUS, in *Ancient Geography*, an hamlet near Patavium or Padua, and celebrated by Martial as the birth place of Livy, and on account of its baths: now ABANO.

APOPEMPTIC, from ἀποπέμπω, *I dismiss*, in the *Ancient Poetry*, a hymn addressed to a stranger on his departure from a place to his own country.

The ancients had certain holy days, wherein they took leave of the gods with apopemptic songs, as supposing them each returning to his own country.

APOPHASIS, from ἀποφημι, *I declare*, and *I deny*, in the *Civil Law*, an answer or rescript of the prince.

Among *Logicians*, the word is also used for a negation or denial.

APOPHASIS was also used for the account given of estates, at the exchange of them, for avoiding public employments. When any man would excuse himself from any troublesome and chargeable trust, by casting it on another richer than himself, the person produced had power to challenge him to make an exchange of estates, and thereby compel him to undergo the office he had before refused.

APOPHASIS, in *Rhetoric*, a figure whereby we really say or advise a thing, under a feigned show of passing over or dissuading it.

Quinctilian makes the apophasis a species of irony. Scaliger holds it the same with what is otherwise called *occupatio*.

APOPHLEGMATIZANTIA, (from ἀποφλεγματίζω, *pituita purgo*), MASTICATORIA, SALIVANTIA.—SIALAGOGUES. This term is applied to those remedies, by which a discharge of saliva is produced, or the evacuation of the saliva promoted. They are, properly speaking, evacuant, stimulating remedies, which, when they are chewed, or made to operate upon the internal parts of the mouth or throat, partly contribute to render the viscid fluid thinner, and partly produce a more copious flow of the saliva and other fluids, and their evacuation from the glands situated within the cavity of the mouth, about the palate, pharynx, larynx, uvula, and tonsils. To this class of remedies belong all those solid substances, which can be moved backwards and forwards in the mouth, without injury; as in consequence of the pressure which they give to the salivary glands, and in mastication, the discharge from those passages is increased: on this account such substances are chosen for this purpose as possess at the same time a degree of acrimony. As a security against the infection of contagious diseases, it has therefore always been recommended to chew cubebs, cardamom, cinnamon bark, juniper berries, wax, marjoram, sage, angelica root, and to spit out the saliva thus secreted. More stimulant remedies of this kind are, tobacco-smoke, the leaves of tobacco, mustard-seed, horse-radish, ginger, pepper, pimpinella, &c.

To the true sialagogues belong those powerfully resolvent medicines, which dissolve the mucous and acrid lymph to that

that degree, as to enable it to be ſeparated and diſcharged by the ſmalleſt veſſels of the glands:—to theſe belongs MERCURY.—However the uſe of ſialagogues cannot be recommended without diſtinction, as they are detrimental to debilitated conſtitutions, and thoſe that are much inclined to vomiting. They are prejudicial to ulcers within the cavity of the mouth, and are frequently fatal to emaciated and phthiſical conſtitutions.

APOPHORETA, from αποφερω, *I carry away*, in *Antiquity*, preſents made to the gueſts at a feaſt or other entertainments, which they carry away with them.

APOPHRADES, from αποφρας, *unfortunate*, derived again from απο, and φραζω, *I ſpeak*, in *Phyſic*, denote a ſort of unhappy days, wherein either no *criſis*, or an ill one, is to be expected.

APOPHTHEGM, from απο and φθεγγομαι, *I ſpeak*, a ſhort, ſententious, and inſtructive ſaying or maxim, delivered by a perſon of diſtinguiſhed character.

Such is that of Cyrus: "He is unworthy to be a magiſtrate, who is not better than his ſubjects." Or this: "He that will not take care of his own buſineſs, will be forced to take care of that of others." Or that of Artaxerxes Mnemon, when reduced to hunger by the loſs of his baggage: "How much pleaſure have I hitherto lived a ſtranger to!" Or that of Cato, "Homines nihil agendo diſcunt malè agere." Or, finally, that of Auguſtus, "feſtina lente." The apophthegms of Plutarch are well known.

APOPHYGE, in *Architecture*, that part of a column where it begins to ſpring out of its baſe, and ſhoot upwards.

The word in its original Greek ſignifies *flight*; whence the French alſo call it *eſcape*, *congé*, &c.; and we, ſometimes, the *ſpring* of the column.

The apophyge, in its original, was no more than the ring or ferril heretofore faſtened at the extremities of wooden pillars, to keep them from ſplitting; which afterwards was imitated in ſtone-work.

It is properly a large concave or arched member, ſerving either to connect two flat members together, or to join a flat member to another not flat.

In this ſenſe we may diſtinguiſh two apophyges, the upper and lower.

APOPHYGE, *upper*, is that part, or ſweep, whereby a large flat member of the upper part of an order is connected to the lower.

This is alſo called by the French *le congé d'enhaut*; and by the Italians, *il cavo di ſopra*.

APOPHYGE, *lower*, *apophygis inferior*, is a concave member, which connects two flat parts in the lower part of an order.

This the French call *le congé d'embas*; and the Italians, *il cavo di baſſo*, ſometimes alſo, *il vivo di baſſo*.

APOPHYSIS, in *Anatomy*, a protuberance of a bone; or a part eminent, and jutting out beyond the reſt. The word literally denotes a production outwards; formed from απο τε αποφυεσθαι, *to ariſe from*. It is the ſame with what we otherwiſe call proceſs, eminence, probole, projecture, protuberance, ecphyſis, head, and the like. *Apophyſes* differ from *epiphyſes*, as theſe latter are only appendages adhering or contiguous to a bone; whereas the former are productions or continuations of the bone itſelf, ſhooting out from it like branches from the trunk of a tree. For an account of the kinds of proceſſes or apophyſes, which are found in the ſkeleton, ſee SKELETON.

APOPHYSIS, or *Proceſſus mammillaris*, a name given to the olfactory nerves, when they lie on the cribriform lamella of the ethmoid bone.

APOPHYSIS *mammillaris*, or *maſtoidea*, is a proceſs in the petrous part of the TEMPORAL BONE.

APOPHYSIS *raviana*, denotes a large proceſs of the MALLEUS of the ear, formed to give attachment to muſcles.

APOPHYSES is alſo applied by Hippocrates to certain fleſhy excreſcences found in moles, and female *fatuſes* of ſeven months, as appearing rather proceſſes, and origins of members, than diſtinct members, ſuch as he ſays may be found in male *fœtuſes*.

APOPHYSES, in *Botany*, excreſcences from the receptacle of the *muſci*.

APOPLANESIS, from αποπλαναω, *I deceive*, in *Oratory*, a kind of fallacious defence, and ſlurring over, darkening, and concealing things, in order to blind the judges, or the audience.

APOPLANESIS, in a more particular ſenſe, denotes a ſort of confutation, wherein the ſpeaker promiſes to anſwer what the adverſary objects in another place, but which being too difficult to anſwer, is afterwards forgot and left to paſs unanſwered.

APOPLEPTIC, relating to an apoplexy. Thus we ſay, an apoleptic fit, an apoplectic water, &c.

APOPLECTIC *veins*, a name ſometimes given to the *jugulars*.

APOPLECTICA, *apoplectical medicines*, a name uſed by ſome for what we more properly call *antapoplectics*.

APOPLECTICAL *balſams* is a name given by ſome writers, to a ſort of ſweet ſcented balms, prepared of diſtilled oils, and uſed by way of perfume.

APOPLEXY, APOPLEXIA, in *Medicine*, a ſudden privation of all the ſenſes, and all the ſenſible motions of the body, excepting thoſe of the heart and lungs, attended with a great depravation or ſuſpenſion of the principal faculties of the mind.

The word comes from αποπλησσειν, to *ſtrike*, or *aſtoniſh*; this diſtemper ſtriking ſuddenly, and, as it were, like a flaſh of lightning.

Hippocrates diſtinguiſhes two kinds of apoplexies, the one *ſtrong*, the other *weak*; only differing in the greater or leſs difficulty of reſpiration and the circulation: in the former the pulſe and breath ſeem almoſt entirely ſtopped; in the latter there are conſiderable remains of them.

The more modern authors diſtinguiſh apoplexies from their *cauſes* (affecting the brain, or nervous ſyſtem in general), into *ſanguineous*, *ſerous*, *nervous*, *ſpaſmodic*, *ſymptomatic*, &c. Diſſections diſcover the *ſanguineous* only; unleſs HYDROCEPHALUS may be conſidered as producing caſes of *ſerous* apoplexy. The ſpeedy recovery of the patient, in a conſiderable number of inſtances, together with ſome other conſiderations, have induced medical writers to admit the other ſpecies. Whenever apoplexy is followed by paralyſis, it appears from diſſections, that it always is of the ſanguineous kind. For Dr. Cullen's other ſpecies, ſee HYDROCEPHALUS, CATALEPSIA, ASPHYXIA, &c.

The fit of apoplexy is uſually preceded by a violent pain in the head, a dimneſs and loſs of ſight or memory: ſometimes by an univerſal indolence. It is attended with a ſtertor and difficulty of breathing; ſometimes with a fever, rarely with a foaming at the mouth; frequently with a ſweat, hæmorrhoids, or diarrhœa.

With reſpect to the *proximate* cauſe, a multitude of the moſt accurate obſervations have made it appear, that this diſorder ariſes from any cauſe that is capable of preventing either totally, or in part, the influx of the nervous fluid, ſuppoſed to be ſecreted in the *cerebrum*, to the organs of ſenſe

and voluntary motion; and the reflux of the ſame fluid from the above mentioned organs to the common ſenſory in the brain; whilſt the progreſs, and perhaps the return of the fluid, ſupplied by the *cerebellum* to and from the heart and organs of reſpiration, is preſerved in a degree ſufficient to ſupport in ſome meaſure their functions.

All the remote, prediſpoſing, or occaſionally exciting cauſes, as obſerved and delivered by authors, may for the greater perſpicuity be reduced to claſſes; in the firſt of which may be reckoned,

1. The natural make of the body. Thus, when the head is naturally large, the neck ſhort, and as it ſometimes happens, conſiſting only of ſix *vertebræ*, whereas there ought to be ſeven; this ſtructure diſpoſes to apoplexy, as it favours the congeſtion of blood in the head. Thus alſo, if the body is corpulent, the capillary arteries will in general be ſubject to compreſſions, or the circulation in them will be more languid in proportion to that in the larger trunks; hence ariſe local congeſtions of blood; and the face and neck in particular are obſerved to be turgid, florid, or bloated.

2. To the ſecond claſs belong all thoſe cauſes which induce ſuch a change in the blood, lymph, and nervous fluid, as to render them incapable of circulating freely through their reſpective veſſels in the brain; till lately, this claſs of cauſes was conſidered as more generally applicable to pathology than any other. At preſent, the exiſtence of ſuch cauſes is more generally doubted than believed. So great, indeed, is the inſtability of Medical Theories at this time, that many phyſicians of great reſpectability have ſeriouſly recommended our return to profeſſed Empiriciſm. As this, however, is not likely to take place ſoon, we ſhall mention the cauſes which have been aſſigned by eminent Pathologiſts, and leave their adoption or rejection to the judgment of the public. Among theſe are—polypous or grumous concretions in the carotid or vertebral arteries, whether formed originally about the heart, or within the *cranium*; theſe are diſcovered by a palpitation of the heart, an unequal pulſe, a vertigo, and temporary loſs of ſight often recurring, and which are increaſed by motion or heat: an inflammatory ſizineſs of the blood, which may be known by an acute continual fever, an inflammatory pain in the head, eyes, &c. —a thick, glutinous, and ſluggiſh diſpoſition of the whole maſs of blood; whence old people, thoſe who are much ſubject to catarrhs, whoſe conſtitutions are cold and moiſt, and who are pale and leucophlegmatic, are very ſubject to apoplexies. It is not difficult to preſage an apoplexy from this cauſe, as it is generally preceded by an univerſal liſtleſſneſs and dulneſs of the ſenſes, unuſual flowneſs of ſpeech, tremors, ſtertors, *incubi* (night mares), frequent diſcharges of viſcid phlegm by vomit, vertigoes, ſhortneſs of breath on the leaſt motion, with a compreſſion of the cartilages of the noſe.

3. To the third claſs belongs whatever *compreſſes* the arteries themſelves, or the nervous fibrillæ of the brain, ſo as to prevent a free circulation of the fluids through them. People who are plethoric and bloated are much ſubject to this ſpecies of apoplexy; eſpecially if extraordinary motion or heat increaſe the velocity of the circulation. To ſuch, therefore, high feeding, ſpirituous liquors, acrid medicines, intenſe and long-continued thought, are pernicious. All humours extravaſated or effuſed within the cranium properly belong to this claſs; as alſo a too great velocity of the blood in the veſſels of the head, determined thither by ſome impediment to the circulation in the inferior parts, which may ariſe from an infinite number of cauſes. Hither alſo may be referred all compreſſions, from whatever cauſe, of the veins without the head, which convey the refluent blood from the contents of the cranium toward the heart; as alſo effuſions of blood, pus, ichor or lymph, which preſs externally on the *dura* or *pia mater*.

4. To the fourth claſs belong all thoſe cauſes, which by any means ſo diſſolve the texture or wear down the coats of the arteries, veins, or lymphedučts, belonging to the internal parts of the cerebrum, as to cauſe an extravaſation of their reſpective fluids, which then preſs upon and injure the medullary origin of the nerves of the cerebrum.

5. Some ſorts of poiſons, which are ſuddenly deleterious, may be ranked in the fifth claſs: but theſe may either be reduced to the ſecond, third, or fourth, or may be more properly ſaid to act on the nervous ſyſtem or the blood, than the brain. Among theſe are the fumes of mineral ſulphurs, of charcoal, or that *gas* which exhales from vegetable juices during fermentation.

The anatomical inſpection of bodies which have died of apoplexies, and the hiſtorical obſervation of ſuch circumſtances as occur in the treatment of theſe caſes, furniſh us with a knowledge of their cauſes: and a due reflection upon theſe naturally leads us to a diſtribution of them into the preceding claſſes, which are well adapted to the inveſtigation of the beſt methods of cure. The part affected in a perfect, violent, or what Hippocrates calls a *ſtrong apoplexy*, appears to be the entire ſenſorium commune, or what has been called the whole *brainular ſyſtem*; but in a *parapoplexia*, thoſe parts only of the common ſenſory which are more compreſſed than the reſt; whilſt the *cerebellum*, and its dependencies, remain in the beginning of the diſorder unaffected. Boerhaave.

As to the *prevention and cure* of apoplexy, no invariable rules can be laid down; for as the predilpoſing and exciting cauſes, together with the parts principally affected, are various, the method of relief muſt alſo vary; and muſt be attempted before the prediſpoſition grows inveterate, otherwiſe ſucceſs will be very precarious.

In general, however, to prevent an apoplexy, wine, hard labour, exceſs in eating, and ſleeping after dinner, are to be avoided: exerciſe is to be kept up, anxiety and chagrin to be reſtrained. To *cure* an apoplexy, the *indications* muſt be taken from the appearance and age of the patient; but more particularly from the remote and proximate cauſes. The perſon being placed and ſupported as nearly in the ſitting poſture as poſſible; and a free acceſs of freſh air ſecured; we muſt, during the fit, in the *ſanguineous* kind, employ copious evacuations of blood, ſerum, and fæces.

The jugulars or temporal arteries ſhould be opened as ſoon as a proper operator can be procured. In default of one, the vein of the arm or leg ſhould be tried; or cupping, or leeches applied to the occiput and back of the neck, ſo as to take away nearly a pint of blood. The head ſhould be ſhaved, and as ſoon as a ſinapiſm has inflamed the ſkin, an active bliſter muſt be applied to the whole occiput and back of the neck. Sinapiſms alſo ſhould be applied to the legs.

When theſe ſteps have been taken, the patient ſhould be laid on his ſide, with his head raiſed; and a ſtimulating clyſter with aloes and ſpirit of turpentine injected as ſoon as poſſible; if no urine is evacuated with the return of the clyſter, the catheter ſhould be introduced.

As ſoon as ſwallowing becomes practicable, ten or fifteen grains of calomel ſhould be got down, and repeated if neceſſary. If theſe means, duly employed, produce no relief in twenty-four or thirty-ſix hours; the patient's recovery will be very doubtful, if not impoſſible.

In the *ſerous* kind, that is, where the patient has not ſigns of fulneſs of blood, but on the contrary a poverty or defect

defect of that fluid, blifters and evacuations of the bowels conftitute the principal means of relief: bleeding, even with leeches, fhould be admitted with caution.

In the *nervous* or *fymptomatic* fpecies, the treatment will vary with the cauſe. When noxious gaſſes have been inhaled, or poiſon ſwallowed, the offending cauſe ſhould be removed, and its place ſupplied by ſalubrious air, or medicated food.

Dr. Flemmyng recommends trepanning for the cure of apoplexies. Med. Muſ. vol. ii. p. 300, &c.

Termination. The diſeaſe ſometimes degenerates into a *paralyſis*; and ſometimes only half the body is affected, in which caſe it is called ſimply a *hemiplegia*.

Apoplexy differs from *carus*, *lethargy*, and *coma*, as in thoſe three diſtempers the ſtupor is not ſo profound, nor is all ſenſation quite deſtroyed.

It differs from *ſyncope*, in that there is little or no ſenſible pulſe in this laſt; whereas in an apoplexy, the pulſe is often full, and perceptible almoſt till death.

It differs from *epilepſy*, becauſe all motion is not aboliſhed in that, as in this; and it differs from the *palſy*, inaſmuch as the palſy is not attended with any ſtupor, nor does it deprive the patient of ſenſe and perception.

APOPLEXY is alſo reckoned among the diſeaſes of hawks; being a diſtemper which ſeizes their heads, occaſioned by too much greaſe and blood, or their having ſtood too long expoſed to the heat of the ſun, or having taken too long flights in the heat of the day.

Horſes are alſo ſaid to be ſubject to apoplexies, occaſioned by want of exerciſe, or too plentiful feeding.

The diſtemper ſhews itſelf by a giddineſs, reeling, trembling, and ſometimes falling ſuddenly down without ſenſe or motion. The cure is by taking a large quantity of blood from the neck, and applying volatile ſpirits to the noſtrils.

APOPLISTÆ, from ἀπο, and ὅπλον, *arms*, in *Ancient Laws*, a ſort of officers in the country, appointed to diſarm all private perſons, or thoſe not entitled to have arms; for the prevention of miſchief and violence.

APOPOMPÆ, in *Antiquity*, certain days in which ſacrifices were offered to the gods called *pompæi*. Who theſe deities were, is doubtful.

APOPSYCHIA, from ἀποψύχω, *I expire*, is ſometimes underſtood of effluvia emitted from the ſun, moon, and other heavenly bodies; to which their influence on ſublunary things was aſcribed by aſtrologers.

APOQUENEMY *Creek*, in *Geography*, a creek of America, which falls into Delaware-bay from Middle-town, in Newcaſtle-county in Delaware, a mile and a half below Reedy iſland.

APORIA, from ἀπορέω, *I doubt*, in *Rhetoric*, denotes a ſtate of doubt or wavering, wherein the orator appears undetermined whether to ſay any thing or not: e. gr. "*Eloquar, an ſileam?* Shall I ſpeak out, or hold my tongue?"

The uneaſineſs ariſing from ſuch a diſorder of thought, and the heſitation produced by it, are naturally very moving. Of this kind is that of Cicero for Cluentius (c. i.): "I know not which way to turn myſelf. Shall I deny the ſcandal thrown upon him of bribing the judges? Can I ſay the people were not told of it? that it was not talked of in the court? mentioned in the Senate? Can I remove an opinion ſo deeply and long rooted in the minds of men? It is not in my power. You, judges, muſt ſupport his innocence, and reſcue him from this calamity." Orators ſometimes begin their diſcourſe with this figure; and as it expreſſes a diffidence of mind, and has an air of modeſty, it tends very much to conciliate the affections of the hearers. Livy gives us a very elegant example of this, in a ſpeech of Scipio Africanus to his ſoldiers, when he called them together after a ſedition: "I never thought I ſhould have been at a loſs in what manner to addreſs my army.—I am in doubt what or how to ſpeak to you, not knowing what name to give you. Shall I call you citizens, who have revolted from your country? Soldiers, who have diſowned the authority of your general, and violated your military oath? Enemies? I perceive the mien, the aſpect, and habit of citizens; but diſcern the actions, words, deſigns, and diſpoſitions of enemies." Livy, lib. xxviii. c. 27. tom. iv. p. 228. ed. Drakenb.

APORON, or APORIME, a problem difficult to reſolve, though it be not certain that the reſolution of it is impoſſible.

The word is derived from ἄπορος, which ſignifies ſomething very difficult and impracticable; being formed from the privative α and πορος, *paſſage*.

Such we conceive the quadrature of the circle; the duplicature of the cube; the triſection of an angle, &c.

When a queſtion was propoſed to any of the Greek philoſophers, eſpecially of the ſect of academiſts; if he could not give a ſolution, his anſwer was, ἀπορεω, q. d. "I cannot conceive it: I am not able to explain it."

This word is alſo uſed by ſome law-writers for an inexplicable ſpeech or diſcourſe.

APORRHOEA, APORRHOES, in *Philoſophy*, ſulphureous effluvia, or exhalations, emitted from the earth and ſubterraneous bodies.

The word is formed from ἀποῤῥέω, *defluo, to flow from*.

APORRHOEA, in *Phyſic*, is ſometimes particularly uſed for morbid or contagious *miaſmata*, or effluvia from unwholeſome bodies. The word is alſo uſed to denote a ſhedding or falling of the hair. See ALOPECIA.

APOSIOPESIS, from ἀποσιωπάω, *I am ſilent*, in *Rhetoric*, otherwiſe called *reticency*, and *ſuppreſſion*; a figure, by which a perſon really ſpeaks of a thing, at the ſame time that he makes a ſhow as if he would ſay nothing of it. See PRETERITION.

It is commonly uſed to denote the ſame with ELLIPSIS. Jul. Scaliger diſtinguiſhes them. The latter, according to him, being only the ſuppreſſion of a word; as "me, me: adſum qui feci;" the former, the omitting to relate ſome part of the action; as,

> "Dixerat, atque illam media inter talia ferro
> Collapſam adſpiciunt————————."

Where the poet does not mention how Dido killed herſelf. This figure is of uſe to keep up the grandeur and ſublimity of a diſcourſe.

This figure denotes different paſſions; as anger, which, by reaſon of its heat and vehemence, cauſes perſons to break off abruptly in their diſcourſe. Thus the old man in Terence, when he was jealous that his ſervant obſtructed his deſigns, uſes this imperfect but threatening expreſſion: And. act i. ſc. i. v. 137. "Whom if I find." And alſo Neptune, when deſcribed by Virgil as very angry, that the winds ſhould preſume to diſturb the ſea without his permiſſion, after he has called them to him to know the reaſon of it, threatens them in this abrupt manner: "Whom I—but firſt I'll lay the ſtorm." Æn. lib. i. v. 139.

Cicero, in writing to Atticus, applies it to expreſs grief; "I know nothing of Pompey, and believe he muſt be taken, if he is not got on ſhipboard: O incredible ſwiftneſs! But of our friend.—" Ad Fam. lib. vii. ep. 22. And in a letter to Caſſius, he uſes it to expreſs his fear: "Brutus could ſcarcely ſupport himſelf at Mutina: if he is ſafe, we have carried the day. But if—heaven avert the omen,"

omen," &c. His meaning is, "if Brutus should be defeated." Ad Fam. lib. xii. [illegible]

APOSCEPARNISMUS, a species of fracture of the skull or other bone, wherein a piece is taken clearly off, as if cut out with a hatchet; from [illegible], an ax, or *hatchet*.

APOSPASMA, from [illegible], *I tear off*, [illegible] denotes a solution of continuity in some org[illegible] as a membrane, ligament, or the like.

APOSPHACELISIS, from [illegible], *mortification*, &c. in the *Ancient Surgery*, denotes a mortification of a fleshy part, happening in cases of wounds and fractures, from too tight a ligature.

APOSPHRAGISMA, from [illegible] and [illegible], *I seal*, in *Antiquity*, the figure or impression of a seal.

It was forbid among the ancients to have the figure or image of God on their rings and seals. To this purpose the precepts of Pythagoras, [illegible]! But in process of time, this was little regarded; it was usual enough to have the figures of Egyptian and other deities, as well as of heroes, monsters, friends, ancestors, and even brutes, on their *[illegible]*, or ring-seals. Thus Cæsar had the image of Venus, Pollio of Alexander, Augustus of the *sphinx*, Pompey of a frog, Lentulus of his grandfather, &c.

APOSTASIS, from αφιστημι, *I depart*, &c. in *Physic*, usually signifies the same with abscess.

In which sense the word is used by Hippocrates and others, promiscuously with αποστημα, *apostem*.

Apostasis, in a more particular sense, denotes a departure or removal of the morbid matter, in the crisis or solution of a disease.

Apostasis is also used by Hippocrates for a fracture of a bone, wherein some part is entirely separated or broken off.

APOSTASY, a deserting or abandoning of the true religion.

The word is borrowed from the Latin *apostatare*, or *apostare*, to *despise*, or *violate*, any thing. Hence *apostatare leges* anciently signified to transgress the laws. *Qui leges apostabit terræ suæ reus sit apud regem.* LL. Edw. Confess. The Latin *apostatare*, again, comes from απο, *from*, and ιστημι, *I stand*.

Among the Romanists, apostasy also signifies the forsaking of a religious order, whereof a man had made profession, without a lawful dispensation.

The ancients distinguished three kinds of apostasy: the first, *à supererogatione*, is committed by a priest, or religious, who abandons his profession, and returns to his lay state; the second, *à mandatis Dei*, by a person of any condition, who abandons the commands of God, though he retains his faith; the third, *à fide*, by him who not only abandons his works, but also the faith.

There is this difference betwixt an *apostate* and a *heretic*; that the latter only abandons a part of the faith, whereas the former renounces the whole.

The primitive Christian church distinguished several kinds of apostasy. The first was that of those who relapsed from Christianity into Judaism: the second, that of those who blended Judaism and Christianity together; the third, that of those who so far complied with the Jews as to communicate with them in many of their unlawful practices, without making a formal profession of their religion: and the fourth, was that of those who, after having been Christians, voluntarily relapsed into Paganism. The perversion of a Christian to Judaism, Paganism, or other false religion, was punished by the emperors Constantius and Julian with confiscation of goods; to which the emperors Theodosius and Valentinian added capital punishment, in case of the apostate's perverting others to the same iniquity: a punishment, says Blackstone, too severe for any temporal laws to inflict upon any spiritual offence, and yet the zeal of our ancestors imported it into this country: for we find by Bracton, that in his time apostates were to be burnt to death. It is also said to have been anciently punishable, in England, by burning, and tearing to pieces by horses. Thus Fleta, lib. i. c. 37. § 2. "Apostatæ & sacrilegi, & hujusmodi, detractari debent & comburi." And, § 4. "Si inde convincantur, detracteatur, & suspendantur." Where Du Cange interprets, *detractari*, by *tirer à quatre chevaux*.

This punishment has long ago become obsolete, and the offence of apostasy was for a long time the object only of the ecclesiastical courts, which corrected the offender "pro salute animæ." Nevertheless, it was enacted by statute 9 and 10 Will. III c. 32., that if any person educated in, or having made profession of, the Christian religion, shall, by writing, printing, teaching, or advised speaking, deny the Christian religion to be true, or the holy scriptures to be of divine authority, he shall, upon the first offence, be rendered incapable to hold any office or place of trust; and, for the second, be rendered incapable of bringing any action, being guardian, executor, legatee, or purchaser of lands, and shall suffer three years imprisonment, without bail. To give room, however, for repentance, if, within four months after the first conviction, the delinquent will, in open court, publicly renounce his error, he is discharged for that once from all disabilities. Such, however, is the spirit of toleration which has prevailed in this country, that penal statutes in the province of religion, though they still exist, have long lain dormant, and find few advocates in modern times.

APOSTATA *capiendo*, a writ which anciently lay against one, who having entered and professed some order of religion, broke out again, and wandered through the country, contrary to the rules of the order.

APOSTATE, in a general sense, signifies a deserter from the true religion.

In which sense *apostate* amounts to much the same with lapsed, perverted, &c.

APOSTERIGMA, from απο and στηριζω, *I support*, in the *Ancient Physic*, denotes a rest or support for a diseased part, without binding.

Such are pillows, cushions, and the like.

The word seems also to have been used by Hippocrates for a stoppage, or obstruction of some vascular part.

A POSTERIORI. Demonstration *à posteriori*. See Demonstration.

APOSTHUME, or Apostem, Apostema, in *Surgery*, a preternatural tumor; called also abscess, and imposthume.

The word comes from αφιστημαι, *abscedo*, *I depart from one place and fix in another*, alluding to the manner wherein the tumor is usually formed of a translated humour.

Aposthume is particularly used for a disease of hawks, which occasions swellings in the head, arising from a redundancy of humours, and a preternatural heat of that part.

The aposthume discovers itself by a swelling of the eyes, a moisture issuing from the ears, and their wings extremely slothful.

APOSTIL, *apostilla*, in *Matters of Literature*, a marginal addition, or note to a book, passage, or the like.

APOSTLE, αποστολος, one of the twelve disciples of Jesus Christ, commissioned by him to preach his gospel, and propagate it to all the parts of the earth. The word originally signifies a person *delegated* or *sent*; from αποστελλω, *mitto*; in which sense it occurs in Herodotus, and other profane authors. Hence, in the New Testament, the term is applied

applied to divers ſorts of delegates; and to the twelve diſciples by way of eminence. They were limited to the number twelve, in alluſion to the twelve tribes of Iſrael. (See Mat. xix. 28 Luke, xxii. 30. Rev. xxi. 12. 14.; and compare Exod. xxiv. 4. Deut. i. 23. and Joſh. iv. 2, 3.;) accordingly care was taken, on the death of Judas, to chuſe another, to make up the number, Acts, i. 21, 22. 26. This ſeems to have been a token of reſpect to the Jews, previous to the offer of the Goſpel to them; whereas, when they had generally rejected it, two more, Paul and Barnabas, were added, without any regard to the number of twelve. Of the firſt ſelection and commiſſion of the twelve apoſtles, we have an account, Luke vi. 13, &c. Mat. x. 1, &c. Having choſen and conſtituted twelve perſons, under the name of Apoſtles, our bleſſed Lord determined that for ſome time they ſhould be continually with him, not only to attend upon his public miniſtry, but to enjoy the benefit of his private converſation, that he might furniſh them the better for the great work in which they were to be employed; and that, at length, after ſuitable preparation, he might, with greater advantage, ſend them abroad to preach his Goſpel, and thus make way for his own viſits to ſome more diſtant parts, where he had not yet been. And to enable them more effectually to do it, he endowed them with the power of working miracles, of curing diſeaſes, and caſting out dæmons; well knowing that ſuch endowments would command a regard, notwithſtanding the meanneſs of their origin and appearance. About the commencement of the third year of his miniſtry, according to the common account of its duration, he ſent them out two by two, or in pairs, that they might be agreeable companions and aſſiſtants to each other in their work; and he commanded them to reſtrict their teaching and ſervices to the people of Iſrael, and to avoid going to the Gentiles or to the Samaritans; to declare the approach of the kingdom of heaven, and the eſtabliſhment of the Goſpel diſpenſation; to exerciſe the miraculous powers with which they had been endowed gratuitouſly, and to depend for their ſubſiſtence on the providence of God, and on the donations of thoſe to whom they miniſtered. Their names were: Simon-Peter; Andrew, his brother; James the greater, the ſon of Zebedee; and John his brother, who was the beloved diſciple; Philip of Bethſaida; Bartholomew; Thomas, called Didymus, as having a twin-brother; Matthew or Levi, who had been a publican; James, the ſon of Alpheus, called James the leſs; Lebbeus, ſurnamed Thaddeus, and who was alſo called Judas or Jude, the brother of James; Simon, the Canaanite, ſo called, as ſome have thought, becauſe he was a native of Cana, or, as Dr. Hammond thinks, from the Hebrew קנא *kana*, ſignifying the ſame with Zelotes, or the Zealot, a name given to him on account of his having before profeſſed a diſtinguiſhing zeal for the law; and Judas Iſcariot, or a man of Carioth (Joſh. xv. 25.), who afterwards betrayed him, and then laid violent hands on himſelf. Of theſe four, *viz.* Simon, Andrew, James the greater, and John, were fiſhermen; two, *viz.* Matthew, and James, the ſon of Alpheus, were publicans; and the other ſix were probably fiſhermen, though their occupation is not diſtinctly ſpecified.

After the reſurrection of our Saviour, and not long before his aſcenſion, the place of Judas the traitor was ſupplied by Matthias, ſuppoſed by ſome to have been Nathaniel of Galilee, to whom our Lord had giving the diſtinguiſhing character of an "Iſraelite indeed, in whom there was no guile:" and the twelve apoſtles, whoſe number was now completed, received a new commiſſion, of a more extenſive nature than the firſt, to preach the Goſpel to all nations, and to be witneſſes of Chriſt, not only in Jeruſalem, in all Judea, and in Samaria, but unto the uttermoſt parts of the earth; and they were qualified for the execution of their office by a plenteous effuſion of miraculous powers and ſpiritual gifts, and particularly the gifts of tongues. In conſequence of this commiſſion, they preached firſt to the Jews, then to the Samaritans, and afterwards to the idolatrous Gentiles. Their ſignal ſucceſs at Jeruſalem, where they opened their commiſſion, alarmed the Jewiſh Sanhedrim, before which Peter and John were ſummoned, and from which they received a ſtrict charge never more to teach, publicly or privately, in the name of Jeſus of Nazareth. The noble reply, and ſubſequent conduct of the apoſtles, are well known. This court of the Jews was ſo awed and incenſed, as to plot the death of the twelve apoſtles, as the only effectual meaſure for preventing the farther ſpread of Chriſtianity. Gamaliel interpoſed, by his prudent and moderate counſel; and his ſpeech had ſo good an effect upon the Sanhedrim, that inſtead of putting the apoſtles to death, they ſcourged them, renewed their charge and threats, and then diſmiſſed them. The apoſtles, however, were not diſcouraged nor reſtrained; they counted it an honour to ſuffer ſuch indignities, in token of their affection to their maſter, and zeal in his cauſe; and they perſiſted in preaching daily in the courts of the temple, and in other places, that Jeſus of Nazareth was the promiſed and long-expected Meſſiah. Their doctrine ſpread, and the number of converts in Jeruſalem ſtill increaſed. During the violent perſecution that raged at Jeruſalem, ſoon after the martyrdom of St. Stephen, ſeveral of the leading men among the Chriſtians were diſperſed; ſome of them travelled through the regions of Judea and Samaria, and others to Damaſcus, Phœnicia, the iſland of Cyprus, and various parts of Syria; but the twelve apoſtles remained, with undaunted firmneſs, at Jeruſalem, avowing their attachment to the perſecuted intereſt of Chriſt, and conſulting how they might beſt provide for the unforeſeen emergencies of the church, and its infant and oppreſſed ſtate.

When the apoſtles, during their abode at Jeruſalem, heard that many of the Samaritans had embraced the Goſpel, Peter and John were deputed to confer upon them the gift of the Holy Spirit; for to the apoſtles belonged the prerogative of conferring upon others ſpiritual gifts and miraculous powers. In their return to Jeruſalem, from the city of Samaria, they preached the Goſpel in many Samaritan villages. The manner of its being ſent to Ethiopia, by the converſion of the eunuch who was chief treaſurer to Candace, queen of the country, is related in Acts, viii. 26. &c. After the Chriſtian religon had been planted in Jeruſalem, Judea, and Samaria, and ſent into Ethiopia, one of the uttermoſt parts of the earth (Acts, i. 8.); and after it had been preached about eight years to the Jews only; God, in his wiſe and merciful providence, diſpoſed things for the preaching of it among the Gentiles. With this view, about the year 41, the next tranſition was to the devout Gentiles within the borders of Paleſtine. As they had caſt off idolatry on the one hand, and on the other hand had not ſubmitted to the ceremonial part of the Jewiſh law, they were better diſpoſed and prepared for receiving the Goſpel. Cæſarea was the ſcene in which the apoſtle Peter was to open his commiſſion for this purpoſe; and Cornelius, one of the devout Gentiles, and a man diſtinguiſhed by his piety and charity, was a proper perſon to be ſelected as the firſt proſelyte to Chriſtianity. After Peter had laid the foundation of a Chriſtian church among the devout Gentiles,

other

other Chriſtians imitated his example, and a great number of perſons of this deſcription embraced the Chriſtian faith, more eſpecially at Antioch, where the diſciples, whom their enemies had hitherto called Galileans, Nazarenes, and by other names of reproach, and who, among themſelves, had been called diſciples, believers, the church, the ſaints, and brethren, were denominated, poſſibly not without a divine admonition, Chriſtians.

When Chriſtianity had been preached, for about eight years, among the Jews only, and for about three years more among the Jews and devout Gentiles, the next gradation of its progreſs was to the id latrous Gentiles, in the year of Chriſt 44, and the 4th year of the emperor Claudius. Barnabas and Saul were ſelected for this purpoſe, and conſtituted in an extraordinary manner apoſtles of the Gentiles, or uncircumciſion. Barnabas was probably an elder of the firſt rank; he had ſeen Chriſt in the fleſh, had been an eye-witneſs of his being alive again after his crucifixion, and had received the Holy Spirit on the day of Pentecoſt, as being one of the 120. Saul alſo, ſince his converſion, had preached as a ſuperior prophet, about ſeven years to the Jews only, and about two years more to the Jews and devout Gentiles. They had both been born in Gentile countries; and therefore may be ſuppoſed to have had more reſpect and affection for the Gentiles, than moſt of the Jews who were natives of Judæa. Saul had been converted, and had hitherto preached chiefly on Gentile ground; and he had joined with Barnabas in teaching devout Gentiles for a whole year, at Antioch in Syria; by all which previous ſteps they were regularly conducted to the laſt gradation, or the converſion of the idolatrous Gentiles. But it was neceſſary, in order to the being an apoſtle, to have ſeen our Lord Jeſus Chriſt alive after his crucifixion, for the apoſtles were in a peculiar manner the witneſſes of his reſurrection. Some have ſuppoſed that Saul ſaw the perſon of Jeſus, when he was converted, near the city of Damaſcus; but others, who conceive from attention to the hiſtory of this event, that this could not have been the caſe, as he was inſtantly ſtruck blind, are of opinion that the ſeaſon, when his apoſtolic qualification and commiſſion were completed, was that mentioned by himſelf (Acts, xxii. 17.), when he returned to Jeruſalem the ſecond time after his converſion; when he ſaw the Lord Jeſus Chriſt in perſon, and received the command to go quickly out of Jeruſalem, and was informed that he ſhould be ſent unto the Gentiles. See alſo, Acts, xxvi. 16—20., where he gives an account of the object of his commiſſion. He alſo received a variety of gifts and powers, which, ſuperadded to his own genius and learning, as well as fortitude and patience, eminently qualified him for the office of an apoſtle, and for that particular exerciſe of it which was aſſigned to him. St. Paul is frequently called the *Apoſtle*, by way of eminence; and the *Apoſtle of the Gentiles*, becauſe his miniſtry was chiefly employed for the converſion of the Gentiles, as that of St. Peter was for Jews, who is therefore ſtyled the *Apoſtle of the Circumciſion*.

The apoſtles having continued at Jeruſalem twelve years after the aſcenſion of Chriſt, as tradition reports according to his command, determined to diſperſe themſelves in different parts of the world. But what were the particular provinces aſſigned to each does not certainly appear from any authentic hiſtory. Socrates (Hiſt. Eccl. lib. i. c. 19.) ſays, that Thomas took Parthia for his lot; Matthew, Ethiopia; and Bartholomew, India. Euſebius (Hiſt. Eccl. lib. iii. *ad init.*) gives the following account: "Thomas, as we learn by tradition, had Parthia for his lot; Andrew, Scythia; John, Aſia; who having lived there a long time, died at Epheſus. Peter, as it ſeems, preached to the diſperſed Jews in Pontus and Galatia, Bithynia, Cappadocia, and Aſia: at length, coming to Rome, he was crucified with his head downward, as he had deſired. What need I to ſpeak of Paul, who fully preached the Goſpel of Chriſt, from Jeruſalem to Illyricum, and at laſt died a martyr at Rome, in the time of Nero." From this paſſage we may conclude, that at the beginning of the 4th century there were not any certain and well atteſted accounts of the places out of Judæa, in which any of the apoſtles of Chriſt preached; for if there had, Euſebius muſt have been acquainted with them.

The ſtories that are told concerning their arrival and exploits among the Gauls, the Engliſh, the Spaniards, the Germans, the Americans, the Chineſe, the Indians, and the Ruſſians, are too romantic in their nature, and of too recent a date, to be received by an impartial inquirer after truth. Theſe fables were for the moſt part forged after the time of Charlemagne, when moſt of the Chriſtian churches contended about the antiquity of their origin, with as much vehemence as the Arcadians, Egyptians, and Greeks, diſputed formerly about their ſuperiority and precedence.

It appears, however, that all of them did not die by martyrdom. Heraclion, the Valentinian, cited by Clemens Alexandrinus (Strom. lib. iv. p. 522), reckons among the apoſtles who did not ſuffer martyrdom, Matthew, Thomas, Philip, and Levi, probably meaning Lebbeus.

To the apoſtles belonged the peculiar and excluſive prerogative of writing doctrinal and preceptive books of authority in the Chriſtian church; and it ſufficiently appears that no epiſtles or other doctrinal writings of any perſon who was of a rank below that of an apoſtle, were received by Chriſtians as a part of their rule of faith. With reſpect to the writings of Mark and Luke, they are reckoned hiſtorical, not doctrinal or dogmatical: and Auguſtine ſays, that Mark and Luke wrote at a time when their writings might be approved not only by the church, but by apoſtles ſtill living. The credit of men, not apoſtles, though they were companions of apoſtles, was admitted no farther than as hiſtorians, or reporters of what they had ſeen, or of what they had heard from apoſtles, or eye-witneſſes, and miniſters of the word.

The ſeveral apoſtles are uſually repreſented with their reſpective badges or attributes: St. Peter with the keys; St. Paul, with a ſword; St. Andrew, with a croſs or ſaltier; St. James minor, with a fuller's pole; St. John, with a cup, and a winged ſerpent flying from it; St. Bartholomew, with a knife; St. Philip, with a long ſtaff, whoſe upper end is formed into a croſs; St. Thomas, with a lance; St. Matthew, with a hatchet; St. Matthias, with a battle-ax; St. James major, with a pilgrim's ſtaff, and a gourd bottle; St. Simon, with a ſaw; and St. Jude, with a club.

This appellation of Apoſtles was alſo given to the ordinary travelling miniſters of the church. Thus St. Paul, in the epiſtle to the Romans, xvi. 7. ſays, "Salute Andronicus and Junia, my kinſmen and fellow-priſoners, who are of note among the apoſtles." In this inferior ſenſe the appellation is applied by Clement of Alexandria, to Barnabas; and it is alleged that he was not an apoſtle in the higheſt ſenſe of the word, ſo as the twelve and Paul were apoſtles. Tertullian calls all the ſeventy diſciples, apoſtles; and Clement calls Barnabas apoſtolical only in another place, and ſays, that he was one of the ſeventy, and fellow-labourer of Paul. Theſe, ſays Dr. Lardner, are the higheſt characters which he really intends to give to Barnabas, and what he means when he ſtyles him apoſtle; therefore he need not be ſup-

poſed to aſcribe to Barnabas that large meaſure of inſpiration and high authority, which was peculiar to the apoſtles, ſtrictly and properly ſo called. In a ſimilar ſubordinate form St. Clement of Rome is called apoſtle. Timothy alſo is called by Salvian, apoſtle, meaning merely apoſtolical, or a companion and diſciple of apoſtles.

APOSTLE was likewiſe a title given to thoſe ſent by the churches to carry their alms to the poor of other churches. This uſage they borrowed from the ſynagogues, who called thoſe whom they ſent on this meſſage, by the ſame name; and the function or office itſelf αποστολη, *apoſtle*, q. d. *miſſion*. Thus St. Paul, writing to the Philippians, tells them, that Epaphroditus, their *apoſtle*, had miniſtered to his wants, ch. ii. 25. It is applied in like manner to thoſe perſons who firſt planted the Chriſtian faith in any place.

Thus Dionyſius of Corinth is called the *apoſtle of France*; Xavier, the *apoſtle of the Indies*, &c. In the Eaſt Indies the Jeſuit miſſionaries are alſo called *apoſtles*.

In ſome ages of the church, the pope was peculiarly denominated the *apoſtle*.

APOSTLE, is alſo uſed among the Jews, for a kind of officer anciently ſent into the ſeveral parts and provinces in their juriſdiction, by way of viſitor, or commiſſary; to ſee that the laws were duly obſerved, and to receive the monies collected for the reparation of the temple, and the tribute payable to the Romans.

The Theodoſian code, lib. xiv. *De Judæis*, calls thoſe *apoſtoli, qui ad exigendum aurum atque argentum a patriarcha certo tempore diriguntur*. Julian the Apoſtate remitted the Jews the *apoſtle*, αποστολη; that is, as he himſelf explains it, the tribute they had been accuſtomed to ſend him.

Theſe apoſtles were a degree below the officers of the ſynagogues called *patriarchs*, and received their commiſſions from them. Some authors obſerve, that St. Paul had borne this office; and that it is this he alludes to in the beginning of the Epiſtle to the Galatians: as if he had ſaid, Paul, no longer an apoſtle of the ſynagogue, nor ſent thereby to maintain the law of Moſes, but now an apoſtle and envoy of Jeſus Chriſt, &c. St. Jerom, though he does not believe that St. Paul had been an apoſtle of this kind, yet imagines that he alludes to it in the paſſage juſt cited.

APOSTLE, in the Greek *Liturgy*, is particularly uſed for a book containing the Epiſtles of St. Paul, printed in the order wherein they are to be read in churches, through the courſe of the year. Another book of the like kind containing the Goſpels, is called Ευαγγελιον, *Goſpel*.

The apoſtle, of late days, has alſo contained the other canonical Epiſtles, the Acts of the *Apoſtles*, and the Revelations. Hence it is alſo called *Acts of the Apoſtles*, Πραξ-αποστολος; that being the firſt book in it.

APOSTLE is alſo thought by many to have been the original name for biſhops, before the denomination *biſhop* was appropriated to their order. Thus Theodoret ſays expreſsly, the ſame perſons were anciently called promiſcuouſly both biſhops and preſbyters, whilſt thoſe who are now called biſhops were called *apoſtles*.

In the arſenal of Bremen, there are twelve pieces of cannon, called the *Twelve Apoſtles*; on a ſuppoſition that the whole world muſt be convinced, and acquieſce in the preaching of ſuch *apoſtles*.

APOSTLES' *Creed*. See CREED.

APOSTLES, in *Eccleſiaſtical Hiſtory*. See APOSTOLICI.

APOSTOLA THADEIA, in *Geography*, a cape on the eaſt coaſt of Siberia, at the weſt end of the Anadirſkoi gulf in the North Pacific Ocean. N. lat. 63°. E. long. 178° 14′.

APOSTOLÆUM, or APOSTOLIUM, in *Eccleſiaſtical Writers*, denotes a church dedicated to, and called by the name of an *apoſtle*.

Sozomen ſpeaks of the apoſtolæum of St. Peter at Rome, and the apoſtolæum of St. Peter and St. Paul a Quercus near Chalcedon.

In this ſenſe apoſtolæum ſtands diſtinguiſhed from *prophæteum*, *martyrium*, &c.

APOSTOLARE, APOSTOLICARE, *apoſtoliziug*, in ſome *Middle Age Writers*, denotes the being preferred to the dignity of POPE.

APOSTOLATE, in a general ſenſe, is uſed for miſſion. In this ſenſe, Olearius has a diſcourſe concerning the apoſtolate of Chriſt. Lip. 1681. 4to.

APOSTOLATE more properly denotes the dignity or office of an apoſtle of Chriſt: but it is alſo uſed in ancient writers for the office of a biſhop.

In this ſenſe, we meet with ſeveral letters, petitions, requeſts, &c. directed to biſhops under the title of your *apoſtolate*, or *apoſtolatus veſter*.

But as the title *apoſtolicus* had been appropriated to the pope, ſo that of *apoſtolate* became at length reſtrained to the ſole dignity of the popedom.

Every biſhop's ſee was anciently dignified with the title of *ſedes apoſtolica*, an apoſtolical ſee, which is now the peculiar denomination of the ſee of Rome.

APOSTOLI, in *Law*, denotes thoſe letters miſſive which are demanded in caſes of appeal.

APOSTOLIC, APOSTOLICAL, ſomething that relates to the apoſtles, or deſcends from them.

Thus we ſay, the *apoſtolical* age, *apoſtolical* doctrine, *apoſtolical* character, conſtitutions, traditions, &c.

APOSTOLIC, in the *Primitive Church*, was an appellation given to all ſuch churches as were founded by the *apoſtles*; and even to the biſhops of thoſe churches, as being the reputed ſucceſſors of the *apoſtles*.—Theſe were confined to four, *viz.* Rome, Alexandria, Antioch, and Jeruſalem.

In after-times, other churches aſſumed the ſame quality, on account, principally, of the conformity of their doctrine with that of the churches which were *apoſtolical* by foundation, and becauſe all biſhops held themſelves ſucceſſors of the apoſtles, or acted in their dioceſes with the authority of apoſtles.

The firſt time the term *apoſtolical* is attributed to biſhops, as ſuch, is in the letter of Clovis to the council of Orleans, held in 511; though that king does not there expreſsly denominate them *apoſtolical*, but *apoſtolica ſede digniſſimi*, highly worthy of the *apoſtolical* ſee. In 581, Guntram calls the biſhops, met at the council of Maſon, *apoſtolical* pontiffs, *apoſtolici pontifices*.

In progreſs of time, the biſhop of Rome growing in power above the reſt; and the three patriarchates of Alexandria, Antioch, and Jeruſalem, falling into the hands of the Saracens, the title *apoſtolical* was reſtrained to the pope, and his church alone. Though ſome of the popes, and St. Gregory the great, not contented to hold the title by this tenure, began at length to inſiſt that it belonged to them by another and peculiar right, as being the ſucceſſors of St. Peter. The council of Rheims, in 1049, declared that the pope was the ſole *apoſtolical* primate of the univerſal church.

And hence a great number of *apoſtolicals*; *apoſtolical* ſee, *apoſtolical* nuncio, *apoſtolical* notary, *apoſtolical* brief, *apoſtolical* chamber, *apoſtolical* vicar, &c.

APOSTOLIC *clerks*, ſee JESUATES.

APOSTOLICAL *canons*, and *conſtitutions*; ſee CANONS, and CONSTITUTIONS.

APOSTOLICAL *traditions*, ſee TRADITION.

APOSTOLICAL *Fathers* is an appellation uſually given to the writers of the firſt century, who employed their pens in the cauſe of Chriſtianity, and who had converſed with the apoſtles, or their diſciples. To this claſs are referred, Cle-

ment, Barnabas, Hermas, Ignatius, and Polycarp. We may obſerve, in general, that theſe apoſtolic fathers, and the other writers in favour of Chriſtianity, during the infancy of the church, were remarkable neither for their learning nor their eloquence. On the contrary, they expreſs the moſt pious and admirable ſentiments in the plaineſt ſtyle. This indeed is honourable rather than reproachful to the Chriſtian cauſe; ſince we ſee, from the converſion of a great part of mankind to the goſpel by the miniſtry of weak and unlearned men, that the progreſs of Chriſtianity is not to be attributed to human means, but to a divine power. Their teſtimony to the books of the New Teſtament is important; for in their writings they take all the notice of them that could be expected. From them ſucceeding writers received great part of that full and ſatisfactory evidence, which they appear to have had concerning the ſeveral books of the New Teſtament. Of theſe writers, Cotelerius, and after him Le Clerc, have publiſhed a collection in two volumes, accompanied with both their own annotations, and the remarks of other learned men.

APOSTOLICI, Apostoli, or Apostles, in *Eccleſiaſtical Hiſtory*, was a name aſſumed by three different ſects, on account of their pretending to imitate the manner and practice of the apoſtles. The firſt *Apoſtolici*, otherwiſe called *Apotactitæ*, and *Apotactical*, roſe out of the Encratitæ, and Cathari, in the third century. They made profeſſion of abſtaining from marriage, and the uſe of wine, fleſh, money, &c. See Apotactitæ.

Gerhard Sagarelli was the founder of the ſecond ſect; he obliged his followers to go about from place to place as the apoſtles did, to wander about cloathed in white, with long beards, diſhevelled hair, and bare heads, accompained with women, whom they called their ſpiritual ſiſters. They likewiſe renounced all kinds of property and poſſeſſions, inveighed againſt the growing corruption of the church of Rome, predicted its overthrow, and the eſtabliſhment of a purer church on its ruins. With this practice, they made little or no alteration in the doctrinal part of the public religion; but they principally aimed to introduce among Chriſtians, the ſimplicity of the primitive times, and more eſpecially the manner of life that was obſerved by the apoſtles. Sagarelli was burnt alive at Parma in the year 1300, and was afterwards ſucceeded by Dulcinus, a native of Novara, who added to the character of an apoſtle thoſe of a prophet and general, and carried on a bloody and dreadful war for the ſpace of more than two years againſt Raynerius, biſhop of Vercelli; he was at length defeated, and put to death in a barbarous manner, in the year 1307, together with Margaret, whom he had choſen for his ſpiritual ſiſter, according to the cuſtom of the ſect. Nevertheleſs this ſect ſubſiſted in France, Germany, and in other countries, till the beginning of the fifteenth century, when it was totally extirpated under the pontificate of Boniface IX.

The other branch of *Apoſtolici* were of the twelfth century. Theſe alſo condemned marriage, preferring celibacy, and calling themſelves the chaſte brethren and ſiſters; though each was allowed a ſpiritual ſiſter, with whom he lived in domeſtic relation; and on this account they have been charged with concubinage: they held it unlawful to take an oath; they ſet aſide the uſe of baptiſm; and in many things imitated the Manichees. Bernard wrote againſt this ſect of *Apoſtolici*.

APOSTOLICUM is a peculiar name given to a kind of ſong or hymn, anciently uſed in churches.

The Apoſtolicum is mentioned by Greg. Thaumaturgus as uſed in his time. Voſſius underſtands it as ſpoken of the apoſtles' creed. Suicer thinks this impoſſible, becauſe this creed was then unknown in the churches of the Eaſt.

APOSTOLIUS, Michael, in *Biography*, a learned Greek, flouriſhed in the fifteenth century, about the years 1450 and 1460; at the time when the empire of the Greeks founded by Conſtantine the Great was extinguiſhed under Conſtantine Palæologus, the laſt Chriſtian emperor. His diſtinguiſhed learning appears from many ſmall tracts written by him, and ſtill remaining in manuſcript in ſeveral libraries. When Conſtantinople, after a long ſiege, fell into the hands of the Turks, he wrote a funeral oration upon the emperor Conſtantine, who loſt his life on that occaſion. After the deſtruction of the eaſtern empire, he left Greece ſome time after the year 1453, and paſſed over into Italy; for he appears in 1462 to have lived at Viterbo. Diſſatisfied with the neglect he experienced, and with the dependent condition to which he was reduced, he wrote againſt ſeveral perſons of diſtinction amongſt the learned men who flouriſhed at that time; and having thus incurred the reſentment of Beſſarion, to whom he was indebted for ſupport, he was compelled by his poverty to retire to the iſland of Crete, where he maintained himſelf, in a very mean manner, by tranſcribing books and inſtructing children. His averſion to the Roman church induced him likewiſe to compoſe a tract againſt it, "Concerning the proceſſion of the Holy Ghoſt." His collection of proverbs, amounting to more than 2000 in Greek and Latin, illuſtrated with notes, was publiſhed in quarto by Pontinus at Leyden in 1619. His ſon Arſenius publiſhed at Rome a collection of Apophthegms, which was probably taken from the "Ιωνια" of Apoſtolius. Fabr. Bibl. Græc. l. v. c. 41. § 8. t. x. p. 222. Gen. Dict.

APOSTOLORUM Unguentum, the *apoſtles' ointment*, in *Pharmacy*, is a kind of detergent or cleanſing unguent, compoſed of twelve drugs, the number of the apoſtles; whence its name.

It was invented by Avicenna, and is otherwiſe called *unguentum veneris*. The principal ingredients are turpentine, reſin, wax, gum ammoniac, birth-wort roots, olibanum, bdellium, myrrh, and galbanum, opoponax, verdegris, litharge, oil of olives, and vinegar.

APOSTOOLIANS, in *Eccleſiaſtical Hiſtory*, a ſect of the Mennonites, which firſt ſprung up in the year 1664, and derived its name from Apoſtool, one of the Mennonite miniſters at Amſterdam. They concurred with them in doctrine, and admitted to their communion thoſe only who profeſſed to believe all their ſentiments which are contained in their public confeſſion of faith.

APOSTROPHE, or Address, in *Rhetoric*, a figure whereby the orator, in an extraordinary commotion, turns his diſcourſe from the audience, and directs it to ſome other perſon, preſent or abſent, living or dead, or to inanimate nature as endued with ſenſe and reaſon. The word is formed of απο, *ab*, *from*, and στρεφω, *verto*, *to turn*. By this figure the ſpeaker has an opportunity of uſing greater freedom than would perhaps be conſiſtent with decency, if he addreſſed the perſons themſelves; he can admoniſh, chide, or cenſure, without giving offence; nor is there any paſſion that may not be advantageouſly expreſſed by this figure.

Thus Cicero, in his oration for Milo, addreſſes himſelf to the great patriots who had ſhed their blood for the public; and calls them to the defence of his client. So the ſame orator, in his firſt *Catilinarian*, directs himſelf to Jupiter the protector of the city and empire, and beſeeches him to repel the parricide, &c.

The apoſtrophe is alſo frequently addreſſed to inanimates, as tombs, monuments, defuncts, &c. Cicero's apoſtrophe to Tubero, in his oration for Ligarius, is judged one of the fineſt paſſages in his works. In his oration for Balbus, he thus

thus calls upon dumb nature to witneſs to Pompey's virtues: "I invoke you, remote regions, moſt diſtant countries, you ſeas, havens, iſlands, and ſhores! For what coaſt, what land, what place is there, in which the marks of his courage, humanity, wiſdom, and prudence, are not extant?"

That apoſtrophe of Demoſthenes, wherein he addreſſes himſelf to the Greeks ſlain at the battle of Marathon, is alſo famous: cardinal Perron ſays, it has procured the orator as much glory as if he had raiſed them from the dead.

An appeal to heaven, or any part of inanimate nature, has a ſublimity and ſolemnity, which frequently occurs in the ſacred writings, "Hear, O heavens!" ſays Iſaiah, ch. i. 2. "and give ear, O earth! for the Lord hath ſpoken." In like manner, the prophet Jeremiah exclaims (ch. ii. 12), "Be aſtoniſhed, O ye heavens! at this."

APOSTROPHE, or *Apoſtrophus*, in *Grammar*, alſo denotes a note or character placed over a letter in lieu of a vowel, to denote that the vowel is cut off, and not to be pronounced: as *ev'n* for *even*; *th'angelic hoſt* for *the angelic*, &c.

The affectation of frequent *apoſtrophes*, ſo uſual among ſome Engliſh writers, is a great abuſe.

In proſe, apoſtrophes are indefenſible, and tend to vitiate the language; their uſe in poetry is to reduce a line to the proper meaſure.

APOSTROPHIA, in *Mythology*, a ſurname of Venus, under which her votaries applied to her to be preſerved from irregular deſires.

APOSYRMA, from αποσυρω, *I take off*, in *Surgery*, denotes a diſquamation or ſcaling of the ſkin. In which ſenſe the word amounts to much the ſame with ABRASION.

APOTACTITÆ, or APOTACTICI, formed from αποτασσω, or αποταττω, *to renounce*, in *Eccleſiaſtical Hiſtory*, an ancient ſect, who, affecting to follow the evangelical counſels of poverty, and the examples of the apoſtles and primitive Chriſtians, renounced all their effects and poſſeſſions.

It does not appear, that they gave into any errors during their firſt ſtate: ſome eccleſiaſtical writers aſſure us, they had divers holy virgins and martyrs, under the perſecution of Dioclefian, in the fourth century; but they afterwards fell into the opinions of the Encratitæ, and taught, that the renouncing of all riches was not only a matter of counſel and advice, but of precept and neceſſity. And hence the ſixth law in the Theodoſian code joins the *Apotactitæ* with the Eunomians and Arians.

APOTEICHISMUS, from αποτειχιζω, derived from απο, and τειχιζω, *I raiſe a wall*, or τειχος, in the *Ancient Military Art*, a kind of line or circumvallation drawn round a place, in order to beſiege it.

This was alſo called *periteichiſmus*.

The firſt thing the ancients went about, when they deſigned to lay cloſe ſiege to a place, was the apoteichiſmus; which ſometimes conſiſted of a double wall, or rampart, raiſed of earth; the innermoſt to prevent ſudden ſallies from the town; the outermoſt to keep off foreign enemies from coming to the relief of the beſieged. This anſwered to what we call lines of contravallation and circumvallation among the moderns.

APOTELESMA, from αποτελεω, *I perform*, in a general ſenſe, denotes an effect of ſome cauſe. It is alſo uſed for a prognoſtic, or natural prediction of an event.

In which ſenſe Scaliger ſpeaks of the apoteleſmata of Hippocrates. The anſwers of aſtrologers deduced from the conſideration of the ſtars are particularly called apoteliſms or apoteleſmata; which were the expreſſions they uſed to denote the effects of the ſtars and planets on ſublunary bodies; in which ſenſe apoteleſmata amount to the ſame with influences.

APOTELESMATICA, the ſcience of *apoteliſms*, or the art of foretelling future events, from the aſpects and configuration of the heavenly bodies.

In this ſenſe the word amounts to the ſame with what we otherwiſe call *judicial aſtrology*.

APOTHECARY, a perſon who profeſſes the practice of pharmacy, or that part of phyſic, which conſiſts in the preparation and compoſition of medicines.

The word is derived from αποθηκη, *ſhop*, the place where he makes up and expoſes his medicines to ſale.

The *apothecaries* in England are obliged to make up their medicines according to the formulas preſcribed in the College Diſpenſatory.

Their ſhops are ſubject to the viſitation of the cenſors of the College, who are empowered to deſtroy ſuch medicines as they think not good.

The company of apothecaries was incorporated by charter from James I. procured at the ſolicitation of Dr. Mayerne and Dr. Atkins; till that time they only made a part of the grocers' company; plums, ſugar, ſpice, Venice-treacle, mithridate, &c. were ſold in the ſame ſhop, and by the ſame perſon. The reaſon of ſeparating them was, that medicines might be better prepared, and in oppoſition to divers perſons who impoſed unwholeſome remedies on the people. Obſerv. on Caſe of Will. Roſe, ſect. 2.

In the year 1712, the 10th of queen Anne, an act paſſed for reviving and continuing ſeveral acts therein mentioned, one whereof was for exempting the apothecaries from ſerving the offices of conſtable and ſcavengers, and other pariſh and ward offices, and from ſerving upon juries; which act was made perpetual in the ninth year of George I.

They have a hall in Black-Friars, where there are two fine laboratories, out of which all the ſurgeons' cheſts are ſupplied with medicines for the royal Britiſh navy.

To his majeſty belong two *apothecaries*: the ſalary to the firſt, 320 *l.* to the ſecond, 275 *l.* To the houſhold belong alſo two.

The charitable diſpenſation of medicines by the Chineſe is well deſerving notice. They have a ſtone, which is ten cubits high, erected in the public ſquares of their cities; and on this ſtone are engraven the name of all ſorts of medicines, with the price of each; and when the poor ſtand in need of any relief from phyſic, they go to the treaſury, where they receive the price each medicine is rated at.

APOTHECARY, *apothecarius*, in *Writers of the Middle Age*, denotes a ſhop-keeper, or warehouſe-keeper.

APOTHECARIUS is alſo uſed to denote a ſtore-keeper, or officer appointed to have the direction of a magazine, GRANARY, &c.

In which ſenſe *apothecarii* is ſometimes rendered by *horrearii* and *rationarii*.

APOTHEOSIS, derived from απο and Θεος, *God*, in *Antiquity*, a heathen ceremony, whereby their emperors and great men were placed among the gods.

After the apotheoſis, which they alſo called *deification* and *conſecration*, temples, altars, and images were erected to the new deity; ſacrifices, &c. were offered, and colleges of prieſts inſtituted. Dio, 47. 56. 59. Suet. Aug. 5. Tib. 40. Paterc. 1. Ovid. Pont. 4.

Images were erected to them, with the attributes of divinity (Lucan 7. Dio, 53. Capitolin. Antonin.); and to demoliſh them was deemed treaſon (Venul. lib. vi. D. ad Leg. Jul. Mal.); and even the ſenate decreed that oaths ſhould be taken in their names (Dio, 44. 59, 60. Tac. Ann. 1.). Vide Kirchm. de Fun. Rom. 4. 14.

The Perſians, according to Herodotus (l. i. c. 131. l. viii. c. 143.), never conceived that their gods were deified men; and Jablonſki, in the prolegomena to his

"Panthcon Egyptiorum," maintains that it was a fundamental principle in the mythology of the Egyptians, not to deify any mortal. The Greeks, it is faid, were the firft who admitted this practice; and the heroes of the firft ages were of this defcription. Under the Cæfars, the Romans imitated the Greeks: at firft they contented themfelves with deifying Romulus, their founder; but having loft their liberty under Julius Cæfar, they allowed Auguftus, his fucceffor, to acknowledge him as a god, to build temples in honour of him, and to offer facrifices to him. Auguftus, at the age of twenty-eight years, was declared the tutelary god of all the cities of the empire. The example was followed by fucceeding emperors; fo that they elevated to the rank of gods, not only the moft ftupid, fuch as Claudius, but the moft wicked and abandoned: and the appellation "Divus" was affumed among their ordinary titles.

It was one of the doctrines of Pythagoras, which he had borrowed from the Chaldees, that virtuous perfons, after their death, were raifed into the order of gods. And hence the ancients deified all the inventors of things ufeful to mankind; and thofe who had done any important fervice to the commonwealth. Tiberius propofed to the Roman fenate the apotheofis of Jefus Chrift, as is related by Eufebius, Tertullian, and Chryfoftom. Juvenal, rallying the frequent apotheofes, introduces poor Atlas complaining that he was ready to fink under the burden of fo many new gods as were every day added to the heavens. Seneca ridicules the apotheofis of Claudius with admirable humour. Herodian, lib. iv. in fpeaking of the apotheofis of Servius, gives us a very curious defcription of the ceremonies ufed in the apotheofis of the Roman emperors. After the body of the deceafed emperor (faid he) had been burnt, with the ufual folemnities, they placed an image of wax, perfectly like him, but of a fickly afpect, on a large bed of ivory, covered with cloth of gold, in the veftibule of the palace. The greateft part of the day, the fenate fat ranged on the left fide of the bed, dreffed in robes of mourning; the ladies of the firft rank fitting on the right fide, in plain white robes, without any ornaments. This lafted for feven days fucceffively, during which the phyficians came from time to time to vifit the fick, always making their report that he grew worfe, till at length they publifhed that he was dead.

This done, the young fenators and Roman knights took the bed of ftate upon their fhoulders, carrying it through the Via Sacra, the Old Forum, where the magiftrates were ufed to divefl themfelves of their offices. There they fet it down between two kinds of amphitheatres, in the one whereof were the young men, and in the other the maidens, of the firft families of Rome, finging hymns fet to folemn airs, in praife of the deceafed. The hymns ended, the bed was carried out of the city into the Campus Martius, in the middle of which place was erected a kind of fquare pavilion, the infide whereof was full of combuftible matters, and the outfide hung with cloth of gold, and adorned with figures of ivory, and various paintings.

Over this edifice were feveral others, like the firft in form and decoration, but lefs; always diminifhing and growing flenderer towards the top. On the fecond of thefe was placed the bed of ftate; and a great quantity of aromatic perfumes, and odoriferous fruits and herbs were thrown all around; after which the knights made a proceffion or cavalcade in folemn meafures around the pile; feveral chariots alfo run round it, thofe who conducted them being clad in purple robes, and bearing the images of the greateft Roman emperors and generals.

This ceremony ended, the new emperor came to the *catafalca*, or pile, with a torch in his hand; and, at the fame time, fire was fet to it on all fides; the fpices and other combuftibles kindling all at once.

While this was doing, they let fly from the top of the building an eagle, which, mounting into the air with a firebrand, carried the foul of the dead emperor along with it into heaven, as the Romans believed; and thenceforward he was ranked among the gods. It is for this reafon, that the medals, wherein apotheofes are repreſented, have ufually an altar with fire upon it, or elfe an eagle taking its flight into the air, and fometimes two eagles.

There are feveral curious and celebrated monuments of antiquity under the denomination of apotheofes: the firft and principal is the apotheofis of Homer, faid to have been the work of Archelaus of Priena, a famous ancient fculptor, and difcovered, in 1668, in the Appian way near Albano, in a place formerly called *Ad Bovillas*, but now *Frattochia*, belonging to the prince of Colonna, where the emperor Claudius had a houfe of pleafure. This is now one of the principal ornaments of the palace of thofe princes at Rome. To decypher the figures upon this monument, has been the labour of feveral celebrated antiquarians, fuch as Kircher, Cuper, Spanheim, Heinfius, Gronovius, Wetftein, Schott, and Winkelman. The apotheofis of Homer has alfo been repreſented on a filver vafe, in the form of a mortar, and found at Herculaneum. The apotheofis of Romulus was publifhed at Florence, in 1716, and by Montfaucon, in the third volume of the Supplement to his Antiquities. This work was executed at the time when the arts declined, and was intended to be prefented in the Quirinal feafts, or in fome other games celebrated by horfe races in honour of Quirinus, and called Quirini Circenſes. The apotheofis of Julius Cæfar is exhibited on a gem in the mufeum of Brandenburg. Cæfar is mounted on a celeftial globe, and holding in his hand an helm and a large crown of laurel. The apotheofis of Auguftus is repreſented on a beautiful agate, which the emperor Baldwin II., when in 1244, he fought fuccour of the Chriftian princes, and particularly of St. Louis, is faid to have fold to the pious monarch, who depofited it in the mufæum of the holy chapel at Paris. See AGATE. The apotheofis of Germanicus is the fubject of a precious gem; that of Claudius is a baffo-relievo; that of Titus is exhibited in the arch of Titus at Rome; and that of the younger Fauftina, repreſented in baffo-relievo in the Capitol, is mentioned by Montfaucon in the fifth volume of his Supplement.

APOTHERAPIA, from *αποθεραπευω*, *I cure*, in *Phyfic*, properly denotes a complete or finifhed cure.

APOTHERAPIA is alfo ufed, in the *Gymnaſtic Art*, for the laft part of all regular exercife, viz. friction or unction with oil, before as well as after bathing.

The deſign of this was partly to cleanſe the ſkin from any filth or duft it might have contracted during the exercife, and partly to remove wearinefs.

APOTHERMUM, from *απο*, and *θερμος*, *hot*, in *Ancient Writers*, a ſharp kind of ſauce, like that prepared of muſtard, oil, and vinegar, or of vinegar alone.

APOTOME, in *Mathematics*, the difference of two incommenſurable quantities: ſuch is the difference between $\sqrt{2}$ and 1: and ſuch is the exceſs of the diagonal of a ſquare above its ſide.

The word is derived from *αποτεμνω*, *I cut off*.

Euclid (lib. x.) makes ſix ſorts of *apotomes*.

APOTOME *prima*, is when the greater number is a rational number, and the difference of the ſquares of both numbers is a ſquare number, e. g. $3-\sqrt{5}$.

APOTOME *ſecunda*, is where the leſſer number is a rational number, and the ſquare root of the difference of the ſquares of both numbers has a ratio expreſſible in numbers to the greater

greater number; ſuch is $\sqrt{18-4}$, ſince the difference of the ſquares 18 and 16 is 2, and $\sqrt{2}$ is to $\sqrt{18}$ as 1 to 3, becauſe $\sqrt{18}=3\sqrt{2}$.

Apotome *tertia*, is when both the numbers which are ſubſtracted from each other are irrational numbers, and the ſquare root of the difference of their ſquares has a ratio in numbers to the greater. This holds in $\sqrt{24}-\sqrt{18}$, for the difference of their ſquares 24 and 18 is 6, and $\sqrt{6}$ is to $\sqrt{24}$ as 1 is to 2, for $\sqrt{24}=2\sqrt{6}$.

Apotome *quarta*, is when the greater number is a rational number, and the ſquare root of the difference of the ſquares of both numbers has no ratio to it in numbers: ſuch is $4-\sqrt{3}$, for the difference of the ſquares 16 and 3 is 13, but the ſquare root of 13, *viz.* $\sqrt{13}$, has no numerical ratio to 4.

Apotome *quinta*, is when the leſſer number is a rational number, and the ſquare root of the difference of the ſquares of both numbers has no ratio in numbers to the greater number: ſuch is $\sqrt{6}-2$, for the difference of the ſquares 6 and 4 is 2, and $\sqrt{2}$ has to $\sqrt{6}$ no ratio in numbers.

Apotome *ſexta*, is where both numbers are irrational, and the ſquare root of the difference of their ſquares has no ratio in numbers to the greater: ſuch is the caſe in $\sqrt{6}-\sqrt{2}$, for the difference of the ſquares 6 and 2 is 4, and the root thereof 2 has to the $\sqrt{6}$ no ratio in numbers. Peter Ramus cenſures Euclid's doctrine of *apotomes*, and even all the reſt delivered in the tenth book concerning irrational lines.

Apotome, in *Muſic*, is the difference of the tone *major* and limma, expreſſed by $\frac{2187}{2048}$.

The Greeks thought that the greater tone could not be divided into two equal parts; for which reaſon they called the firſt part αποτομη, and the other λιμμα; in this imitating Pythagoras and Plato.

The *apotome* is by ſome authors, as Boethius, called *hemitonium majus;* and the *limma*, *hemitonium minus*. He alſo calls the difference of theſe two, *comma*. The interval of two ſounds expreſſed by $\frac{125}{128}$, was called by the ancients *apotome major*; and that expreſſed by $\frac{2025}{2048}$, *apotome minor*.

APOTOPOTO Bay, or *Round bay*, in *Geography*, lies on the S. W. coaſt of Otaha, one of the Society iſlands, near the iſland of Otaheite, in the S. Pacific Ocean.

APOTROPÆA, from αποτρεπω, *I avert*, in the *Ancient Poetry*, verſes compoſed for averting the wrath of incenſed deities: and the deities invoked for averting any threatened misfortune were called *Apotropæans:* they were alſo called *Alexiaci*, from αλεξω, *I drive away;* and *Averrunci*, from *averrunco*, which denotes the ſame.

APOZEM, derived from αποζεω, *fervefacio*, *I make hot*, in *Medicine*, a form of remedy, otherwiſe called a decoction; which ſee.

APPA, in *Ancient Geography*, a town of Arabia Felix, according to Ptolemy.

APPACK, or Appagh, in *Geography*, a town of Africa, in the country of Ardrah, on the ſlave coaſt.

APPANAGE, or Appenage. See Apanage.

APPARATOR. See Apparitor.

APPARATUS, from *apparo*, *I prepare*, properly ſignifies a formal preparation for ſome public and ſolemn action.

We ſay, the *apparatus* of a feaſt, coronation, &c. The prince made his entry with great apparatus and magnificence.

Apparatus is alſo uſed for the utenſils and appendages belonging to ſome more conſiderable machine; as the furniture or *apparatus* of an air-pump, microſcope, &c.

The term *apparatus* is uſed in *Chemiſtry*, either generally, to expreſs the whole of the inſtruments and veſſels in which or by whoſe means any proceſs is performed, or in a more limited ſenſe, it is applied to thoſe complicated inſtruments, for the moſt part of modern invention, in which a number of ſeparate parts are combined into one whole. Thus a retort, according to the former application of the term, is an article of chemical apparatus; a receiver is another article; and theſe two when combined form the retort and receiver, one of the ſimpleſt ſpecies of *diſtillatory apparatus*, according to the latter method of applying the term. Thus alſo the complicated arrangement of veſſels invented by Woulfe, is called Woulfe's apparatus, that executed by Nooth is called Nooth's apparatus. It might ſeem at firſt ſight that this was the proper place to introduce all that we ſhall have to ſay concerning chemical apparatus, but by ſo doing the article would be extended to an unuſual length; we have therefore adopted the method of deſcribing every general article under its proper name; of which the articles Alembic and Aludel, already printed, are examples; and the apparatus for particular experiments is deſcribed where the experiments themſelves are mentioned; thus under the article Alcohol will be found a deſcription of the apparatus invented by Lavoiſier for the combuſtion of that fluid. Certain kinds of apparatus have alſo a neceſſary connection with each other, either in ſimilarity of form, or of the uſes to which they are applied; there will be found therefore in the courſe of the work certain general articles, ſuch as Distillatory *apparatus*, Pneumatic *apparatus*, &c. where theſe topics will be diſcuſſed.

Apparatus, in *Surgery*, conſiſts of ſuch outward applications as are uſually termed Dressings, together with ſuch inſtrumental means as are requiſite for the performance of any ſurgical operation; e. g. bandages, lint, pledgets, tents, compreſſes, ointments, and various machines. Previous to the performance of any chirurgical operation, a ſurgeon ſhould always conſider what ſort of apparatus will be neceſſary; and he ſhould never, for the ſake of parade or oſtentation, bring together any inſtruments which may as well be diſpenſed with. Modern ſurgery has very wiſely laid aſide a number of uncouth, clumſy, and terrific inſtruments employed by our anceſtors, eſpecially the tools named cauterizing-irons (ſee Cautery), and the immenſe levers, &c. for reducing diſlocations or fractures. Whatever is indiſpenſably neceſſary in operations, ſhould be prepared before the time fixed for their performance; and it ought to be an invariable rule among ſurgeons, to prevent the patient from ſeeing his formidable apparatus, leſt he be thereby intimidated and diſcouraged at the very moment he moſt ſtands in need of reſolution: for inſtances are not wanting of patients actually dying from the effects of terror, without having undergone the intended operation.

The term *apparatus* is ſometimes uſed to diſtinguiſh the operation of Lithotomy or Cystotomy; thus we ſay, the greater apparatus, the leſſer apparatus, &c. See Stone, *cutting for the*.

Apparatus is alſo uſed as a title of ſeveral books compoſed in form of catalogues, bibliothecas, dictionaries, &c. for the eaſe and conveniency of ſtudy.

The apparatus to Cicero, is a kind of concordance or collection of Ciceronian phraſes, &c. The *apparatus ſacer* of Poſſevin, is a collection of all kinds of eccleſiaſtical authors, printed in 1611, in three volumes.—Gloſſaries, comments, &c. are alſo frequently called *apparatuſes*.

APPARENT, from *appareo*, *I appear*, that which is viſible to the eye, or evident to the underſtanding.

Apparent, in *Mathematics* and *Aſtronomy*, is uſed to ſignify things as they appear to us in contradiſtinction from real or true; and in this reſpect the apparent ſtate of things is often very different from their real ſtate; as in the caſe of diſtance, magnitude, &c.

APPARENT *Altitude, Conjunction, Diameter, Diſtance, Figure, Horizon, Magnitude, Motion, Place, Time*, &c. See the ſeveral ſubſtantives.

APPARENT, *Heir*, in *Law*. See HEIR.

APPARENT *Iſland*, in *Geography*, lies in Duſky bay, on the coaſt of New Zealand, and is placed by captain Cook on an arm, which captain Vancouver found to be divided into two branches, leaving that iſland a peninſula joined to the main land by a very high though narrow ridge of mountains; the perpendicular height and very extraordinary ſhape of the rocky part fronting the arm, render it a moſt ſingular and majeſtic promontory. As the entrance of theſe arms was called by Cook "Nobody knows what;" Vancouver, having particularly examined them, called them "Somebody knows what." Voyage round the World, vol. i. p. 63.

APPARITION, in *Aſtronomy*, denotes a ſtar's or other luminary's becoming viſible, which before was hid.

In which ſenſe the word ſtands oppoſed to OCCULTATION. Thus the heliacal riſing is rather an apparition than a proper riſing.

APPARITION, *circle of perpetual*. See CIRCLE *of perpetual apparition*.

APPARITION, in a general ſenſe, is the appearance or ſemblance of a thing.

APPARITION is alſo uſed to denote a ſpectre, or præternatural appearance of ſome ſpirit, or the like.

We read of apparitions of angels, genii, dæmons, fairies, witches, departed ſouls, &c. apparitions of God, of Chriſt, the Virgin, ſaints, prophets, and of the devil himſelf.

Among the moſt zealous advocates of the reality of apparitions and witchcraft, we may reckon Dr. Henry More, Baxter, and Glanvil. The latter, in particular, has attempted, in a treatiſe entitled, "Saduciſmus triumphatus," to prove the doctrine of apparitions, by arguments deduced from the nature of the ſoul, the teſtimony of ſcripture, and the evidence of fact; and he expreſsly aſſerts (Part II. p. 2.) that thoſe who deny and deride the exiſtence of apparitions and witchcraft, are prepared for the denial of ſpirits, a life to come, and all the other principles of religion. It is a ſtrong preſumption againſt the reality of apparitions, however anciently and generally the belief of them has prevailed, that they have been connected with ſome cauſes and circumſtances of terror, either real or apprehended; and theſe have previouſly diſpoſed the imagination for being impoſed upon and deluded. The darkneſs of the night, the gloom that has overſpread particular ſituations, the horror produced by the record of ſome diſaſtrous occurrence, ſuch as murder or the like, and a ſtate of mind naturally depreſſed and melancholy, and of courſe eaſily alarmed, have contributed to give riſe to many of thoſe ſtories, that have been credulouſly received and as obſtinately vindicated and ſedulouſly diſſeminated by the vulgar. The ancients alſo entertained ſome notions concerning the ſtate of the ſoul on its eſcape from the body, which favoured this opinion; and they were diſpoſed to ſeek the ſpirits of their deceaſed anceſtors near the habitations in which their bodies were depoſited. Hence they would be eaſily led into deception; and when they fancied that they actually ſaw their departed friends, they diſtinguiſhed the illuſions which were merely the creations of their own fancy, by the name of "ſhades." It ought alſo to be conſidered, that the relation and belief of apparitions have prevailed chiefly in times of ignorance, and amongſt thoſe who had the feweſt opportunities for inquiry and information. In fact, as the night has been the ſeaſon to which the appearance of ghoſts has been referred, the belief of their reality has gradually ſubſided in proportion to the degree in which knowledge has been diffuſed. It ought alſo to be conſidered, that apparitions are machines that on particular occaſions have been of good ſervice to generals, to miniſters of ſtate, to prieſts, and others; to ſay nothing of the very injudicious and culpable uſe that has been made of them by thoſe with whom the care of children, at a period when their imagination is eaſily impreſſed, has been entruſted. Upon the whole, it muſt be allowed, that many of the apparitions that are recorded by writers, or reported by tradition, are mere deluſions; others are fictions contrived merely to amuſe or to anſwer ſome purpoſe; and others have originated in dreams or deliquiums. There are ſeaſons of ſlumber when we are not ſenſible of being aſleep. On this principle, Hobbes (Treatiſe of human nature, part i. c. 2. Works, p. 102.) has endeavoured to account for the ſpectre that is ſaid to have appeared to Brutus. "We read," ſays he, "of Marcus Brutus (one that had his life given him by Julius Cæſar, and was alſo his favourite, and notwithſtanding murdered him), how at Philippi, the night before he gave battle to Auguſtus Cæſar, he ſaw a fearful apparition, which is commonly related by hiſtorians as a viſion; but conſidering the circumſtances, one may eaſily judge to have been a ſhort dream. For ſitting in his tent penſive and troubled with the horror of his raſh act, it was not hard for him, ſlumbering in the cold, to dream of that which moſt affrighted him; which fear, as by degrees it made him awake, ſo alſo it muſt needs make the apparition by degrees to vaniſh; and having no aſſurance that he ſlept, he could have no cauſe to think it a dream, or any thing but a viſion." The well-known ſtory told by Clarendon, of the apparition of the duke of Buckingham's father, has been ſolved in a ſimilar manner. There was no man in the kingdom ſo much the ſubject of converſation as the duke; and his character was ſo corrupt that he was very likely to be miſled by the enthuſiaſm of the times: Sir George Villiers is ſaid to have appeared to him at midnight; and hence it appears probable that the man was aſleep; and as he was terrified by the dream, it muſt have made a ſtrong impreſſion, and was likely to be repeated.

Mr. Andrew Baxter, in his "Eſſay on the phænomenon of dreaming," recurs to the principle "that our dreams are prompted by ſeparate immaterial beings," in order to account for apparitions. If the power of ſuch beings be unreſtrained, this author maintains, that it will equally poſſeſs the fancy with deluſive ſcenes, without waiting for the occaſion of ſleep to introduce them, and obtrude them forcibly upon the organ, amidſt the action of external objects. For it requires but a greater degree of the ſame power to make deluſory impreſſions upon the ſenſory, while real external objects are making true impreſſions upon it, than it would require to make the ſame impreſſions, while no other impreſſion from external objects is made upon it at the ſame time. "If our imaginations," ſays Dr. Tillotſon in one of his ſermons, "were let looſe upon us, we ſhould be always under the moſt dreadful terrors, and frighted to diſtraction with the appearance of our own fancy; and an over-ruling power reſtrains theſe effects:" i. e. as Mr. Baxter conceives, by reſtraining the power of inviſible beings, which would otherwiſe inceſſantly diſtreſs the ſoul with ſuch unpleaſing ſights. Upon this hypotheſis he thinks there is nothing inconſiſtent in thoſe relations of apparitions which we meet with in hiſtory, whether the facts be true or falſe; for theſe ſpirits may, upon ſome important occaſions, be licenſed ſo to affect the ſenſory, according to the exigency of the caſe, that the whole ſcene of viſion, which is then thought to have an exiſtence from without, may be the effect of impreſſions made on the brain only. Thus, for inſtance, that apparition mentioned before which was preſented to Brutus before he came

over from Aſia, and again the night before the battle of Philippi, the noiſe as of one entering into his tent which he heard, and the words ſpoken, "I am, O Brutus, thy evil genius, but thou ſhalt ſee me again near Philippi," might all be only inward repreſentations upon the ſenſory, and any other perſon preſent might neither have heard nor ſeen any thing. This, in our author's opinion, affords a better account of the appearance than that of Hobbes; who makes cold produce dreams and viſions of fear, without either reaſon or experience to ſupport his aſſertion. He makes Brutus to be ſleeping; but Plutarch tells us, that he had ſlept the former part of the night immediately after eating, and had riſen to digeſt ſomething in his own mind; ſo that, according to Hobbes's ſcheme, it was a waking viſion, and it occurred without any previous diſtemper either external or internal. The caſe of Dion, related by Plutarch, is alleged to the ſame purpoſe; for he was ſitting in the porch of his own houſe in a thoughtful and meditating attitude, when the ſpectre appeared to him; and this happened while the aſſaſſins were contriving his death, a little before he was cruelly murdered. No men in antiquity could be leſs liable to the ſuſpicion of weakneſs and credulity than Brutus and Dion; and therefore, according to Mr. Baxter, the terror they experienced muſt have proceeded from the power of ſome ſuperior being. Upon the whole he thinks that although Δεισιδαιμονια, or *a fear of ſpirits*, hath been much abuſed by vain or weak people, and carried to an extreme, perhaps by deſigning and crafty men, the moſt rigorous philoſophy will not juſtify its being entirely rejected. It is true, he adds, no evil can happen to us in God's world but by our own fault; but that ſubordinate beings are never permitted, or commiſſioned to be the miniſters of his will, is a hard point to be proved; and that direct atheiſm is better than this deiſidemony is horrid. See Eſſay on the phenomenon of dreaming, in the "Inquiry into the nature of the human ſoul," vol. ii. p. 111, &c.

The abbé de St. Pierre has a diſcourſe expreſsly on the phyſical method of ſolving or accounting for apparitions; he makes them the effect of feveriſh dreams, diſturbed imaginations, &c.

APPARITOR, or Apparator, a beadle in an univerſity, who carries the mace before the maſters, and the faculties.

Apparitor is alſo uſed in ſome ancient Engliſh laws, for a judge or juſtice.

Apparitor *comitatus*. There was formerly an officer called by this name, for which the ſheriffs of Buckinghamſhire had a conſiderable yearly allowance; and in the reign of queen Elizabeth there was an order of court for making that allowance. But the cuſtom and reaſon of it are now altered.

Apparitors alſo denote meſſengers who ſerved the proceſs of the ſpiritual court. Their duty is to cite the offenders to appear, to arreſt them, and to execute the ſentence or decree of the judges. See ſtat. 21 Hen. viii. c. 5.

Among the Romans, apparitors were the ſame with ſerjeants or tipſtaffs among us: or rather apparitor was a general term, and compriſed under it all the miniſters and attendants of the judges and magiſtrates, appointed to receive and execute their orders. And hence, they ſay, the name was derived, viz. from *apparere, to be preſent, to be in waiting*. Under the name *apparitores* were comprehended the *ſcribæ, accenſi, interpretes, præcones, viatores, lictores, ſtatores*, and even the *carnifices* or hangmen.

They were uſually choſen out of the freedmen of the magiſtrates, and their condition was held in ſo much contempt, that, as a mark of ignominy, the ſenate appointed a city that had revolted from them to furniſh them with apparitors.

There were alſo a kind of *apparitors of cohorts*, called *cohortales* or *conditionales*, as being attached to a cohort, and doomed to that condition. The apparitors of the prætors, *prætoriani*, were thoſe who attended the prætors, or governors of provinces; and who, on their maſters' birth-day, were always changed, and preferred to better poſts. Add, that the pontifices had alſo their apparitors, as appears from an inſcription of an ancient marble in the *Via Appia*:

APPARATORI
PONTIFICVM
PARMVLARIO.

APPAUMEE, in *Heraldry*. See Apaumee.

APPEAL, derived from the French verb neuter *appeller*, of the ſame ſignification, in *Law*, ſignifies the removal of a cauſe from an inferior court or judge to a ſuperior; or the having recourſe to a ſuperior judge to rectify what is amiſs in a ſentence paſſed by an inferior.

Appeals to Rome were firſt introduced into England in the reign of king Stephen; and though they were not ſtrictly regarded in the ſucceeding reigns, they continued till the time of king Henry the eighth, when they were finally aboliſhed by the 24 Hen. 8. c. 12. and 25 Hen. 8. c. 19. 21.: by which appealing to Rome from any of the king's courts, ſuing to Rome for any licence or diſpenſation, and obeying any proceſs from thence, are made liable to the pains of *premunire*.

Appeals lie from the archdeacon or his official to the court of arches, and from the arches to the archbiſhop, and from the biſhop or his commiſſary to the archbiſhop; and when the cauſe concerns the king, appeal may be brought in fifteen days from any of the ſaid courts to the prelates in convocation, ſt. 24 Hen. 8. c. 12.: and by the 25th Hen. 8. c. 29. for lack of juſtice in the archbiſhop's courts, the party may appeal to the king in chancery, where commiſſioners are named, and by reaſon of this appointment they are called *delegates*; and after the deciſion of this court, a commiſſion of review may be granted by the king as ſupreme head, to review the definitive ſentence given in appeal in the court of delegates.

Appeals lie from all the ordinary courts of juſtice, and alſo from the court of equity in chancery, to the houſe of lords, who judge *en dernier reſſort*; i. e. no *appeal* lies from them.

But appeals from a court of equity, and writs of error from a court of law, differ in theſe two particulars: 1. The former may be brought upon any interlocutory matter; the latter upon nothing but only a definitive judgment. 2. On writs of error the houſe of lords pronounces the judgment; on appeals it gives direction to the court below to rectify its own decree.

There are appeals from eccleſiaſtical juſtice to ſecular.

The firſt inſtance of this is that of Paulus Samoſatenus; who being condemned and depoſed by the ſecond council of Antioch, refuſed to ſurrender the epiſcopal houſe to Domnus, who had been elected his ſucceſſor, and appealed to the emperor.

Appeal is alſo uſed, in *Common Law*, in the ſame ſenſe with *accuſatio* among the *Civilians*. And when thus ſpoken of as a criminal proſecution, it is derived from the French verb active *appeller*, to *call upon, ſummon*, or *challenge one*, and denotes an accuſation by a private ſubject againſt another, for ſome heinous crime; demanding puniſhment on account of the particular injury ſuffered, rather than for the offence againſt the public. This method of proſecution is ſtill in force, but very little in uſe. This private proceſs, for the puniſhment of public crimes, had probably

probably its original in thoſe times, when a private pecuniary ſatisfaction, called a *weregild*, was conſtantly paid to the party injured, or his relations, to expiate enormous offences. This was a cuſtom derived to us, in common with other northern nations, from our anceſtors the ancient Germans: and we find in our Saxon laws, particularly thoſe of king Athelſtan, the ſeveral weregilds for homicide, eſtabliſhed in progreſſive order, from the death of the ceorl or peaſant, up to that of the king himſelf. And in the laws of king Henry I. we have an account of the other offences that were redeemable by weregild, as well as of thoſe that were not ſo redeemable. As therefore, during the continuance of this cuſtom, a proceſs was certainly given for recovering the weregild by the party to whom it was due; it ſeems that, when theſe offences by degrees grew no longer redeemable, the private proceſs was ſtill continued, in order to inſure the infliction of puniſhment upon the offender; though the party injured was allowed no pecuniary compenſation for the offence. It was alſo anciently permitted, that any ſubject might appeal another ſubject of high-treaſon, either in the courts of common law, or in parliament; or for treaſons committed beyond the ſeas, in the court of the high-conſtable and marſhal. The cognizance of appeals in the latter ſtill continues in force; and ſo late as 1631, there was a trial by battle awarded in the court of chivalry, in ſuch an appeal of treaſon; but that in the firſt was virtually aboliſhed by the ſtatutes 5 Edw. 3. c. 9, and 25 Edw. 3. c. 4.; and in the ſecond expreſsly by ſtatute 1 Hen. 4. c. 14. So that the only appeals now in force, for things done within the realm, are thoſe of felony and mayhem. Mr. Kyd, the ingenious editor of Comyns's Digeſt, obſerves, "that the appeal of treaſon does not appear to have been taken away by the ſtat. 1 Hen. 4. c. 14. or any other. But as no inſtance occurs of any ſuch appeal, before any court of common law, either ſince that ſtatute was made, or for many years before, the law relating to ſuch appeals ſeems to be wholly obſolete at this day."

Criminal appeals are either capital or not capital. Of the latter ſort, appeals *de pace*, *de plagis*, *de impriſonamento*, and of *mayhem*, are now become obſolete; having been long ſince converted into actions of treſpaſs. Capital appeals are either of treaſon or felony. The latter may be ſubdivided into *appeals of death*, or of *murder*, *appeals of larceny or robbery*, *appeals of rape*, and *appeals of arſon*, which laſt are now entirely obſolete. An *appeal of felony* may be brought for crimes committed either againſt the parties themſelves, or their relations. The crimes againſt the parties themſelves are *larceny*, *rape*, and *arſon*. And for theſe, as well as for mayhem, the perſons robbed, raviſhed, maimed, or whoſe houſes are burnt, may inſtitute this private proceſs. The only crime againſt one's relations, ſays judge Blackſtone, for which an appeal can be brought, is that of killing him; either by murder or manſlaughter: but Mr. Tomlins, in his edition of Jacob's Law Dictionary, obſerves, that this ſeems to be an unguarded aſſertion of the learned commentator, as an appeal is given to the huſband, next of kin, &c. by ſtat. in caſe of rape.

Appeal *of death*, is a vindictive action which the law gives to the wife for the death of her huſband, or to the heir male for the death of his anceſtor; which heirſhip was confined, by an ordinance of king Henry I. to the four neareſt degrees of blood. It is given to the wife on account of the loſs of her huſband; therefore if ſhe marries again, before or pending her appeal, it is loſt and gone: or if ſhe marries after judgment, ſhe ſhall not demand execution. The heir muſt alſo be heir male, and ſuch a one as was the next heir by the courſe of the common law at the time of the killing of the anceſtor. But this rule has three exceptions: 1. If the perſon killed leaves an innocent wife, ſhe only, and not the heir, ſhall have the appeal. 2. If there be no wife, and the heir be accuſed of the murder, the perſon, who next to him would have been heir male, ſhall bring the appeal. 3. If the wife kills her huſband, the heir may appeal her of the death. And by the ſtatute of Glouceſter, 6 Edw. 1. c. 9. all appeals of death muſt be ſued within a year and a day after the completion of the felony by the death of the party, which ſeems to be only declaratory of the old common law. The court muſt ſet forth the fact, and the length and the depth of the wound, the year, day, hour, place where done, and with what weapons; and that the party died in a year and a day; and by the above ſtatute, principal and acceſſaries before and after are to be joined in appeal; and this is to be obſerved, though the acceſſary is guilty in another country. 3 Hen. 7. c. 1. The caſe of other appeals than of murder, as of robbery, rape, &c. are not within this laſt ſtatute, and therefore *autrefoits acquit*, upon an indictment within the year, ſtands at common law, a good bar to an appeal of robbery, or any offence beſides murder or manſlaughter; and yet the judges at this day never forbear to proceed upon an indictment of robbery, rape, or other offence, though within the year, becauſe appeals of robbery eſpecially are very rare, and of little uſe, ſince the ſtatute of 21 Hen. 8. c. 11. gives reſtitution to the proſecutor as effectually as upon an appeal.

The ſeveral appeals above enumerated may be brought previous to any indictment: and if the appellee be acquitted thereon, he cannot be afterwards indicted for the ſame offence. But if the appellant does not proſecute his appeal, the appellee may be indicted. If a man be acquitted on an indictment for murder, or found guilty and pardoned by the king, ſtill he ought not (in ſtrictneſs) to go at large, but be impriſoned, or let to bail till the year and day be paſt, by virtue of the ſtatute 3 Hen. 7. c. 1. in order to be forthcoming to anſwer any appeal for the ſame felony, not having as yet been puniſhed for it; though if he has been found guilty of manſlaughter, on an indictment, and hath had the benefit of clergy, and ſuffered the judgment of the law, he cannot afterwards be appealed, for it is a maxim in law, "that *nemo bis punitur pro eodem delicto*." If the appellee be acquitted, the appealor (by virtue of the ſtatute of Weſtminſter 2. 13 Edw. 1. c. 12.), ſhall ſuffer one year's impriſonment, and pay a fine to the king, beſides reſtitution of damages to the party for the impriſonment and infamy which he has ſuſtained: and if the appellee be incapable of making reſtitution, his abettors ſhall do it for him, and alſo be liable to impriſonment. This proviſion proved a great diſcouragement to appeals, ſo that thenceforward they ceaſed to be in common uſe. If the appellee be found guilty, he ſhall ſuffer the ſame judgment as if he had been convicted by indictment; but with this remarkable difference, that, on an indictment, the king may pardon and remit the execution; but on an appeal, which is at the ſuit of a private ſubject, to make an atonement for the private wrong, the king can no more pardon it, than he can remit the damages recovered on an action of battery. And the ancient uſage was, ſo late as Henry the fourth's time, that all the relations of the ſlain ſhould drag the appellee to the place of execution. However, the puniſhment of the offender may be remitted and diſcharged by the concurrence of all parties intereſted; and as the king of his pardon may fruſtrate an indictment, ſo the appellant by his releaſe may diſcharge an appeal. A peer in appeal of murder, ſhall not be tried by his peers, but by a common jury; though he ſhall upon an indictment for murder. Where appeal of death is brought, the defendant cannot

cannot juſtify *ſe defendendo*; but muſt plead not guilty, and the jury are to find the ſpecial matter.

An appeal is proſecuted two ways, either by *writ*, or by *bill*.

Appeal by *writ* is, when a writ is purchaſed out of chancery, by one for another, to the intent that he may appeal a third perſon of ſome felony committed by him, finding pledges that he ſhall do it.

Appeal by *bill*, is where a man of himſelf gives up his accuſation in writing, offering to undergo the burden of appealing the perſon therein named. The appeal of death may be brought by bill before the juſtices in the King's Bench; before juſtices of gaol-delivery, and commiſſioners of oyer and terminer, &c. or before the ſheriff and coroner in the county-court; but the ſheriff and coroner have only power to take and enter the appeal and count, for it muſt be removed by certiorari into B. R

In appeal by original, principals and acceſſaries are generally charged alike without diſtinction, till the plaintiff counts; but it is otherwiſe in appeals by bill. There is but one appeal againſt the principal and acceſſary: if the principal is acquitted, it ſhall acquit the acceſſary: and both ſhall have damages againſt the appellant on a falſe appeal, or the acceſſary may bring a writ of conſpiracy. If the defendant in appeal is attaint or acquit, or the plaintiff nonſuit after appearance, which is peremptory, no other appeal lies. If an indictment and an appeal be depending at the ſame time, againſt the ſame perſon, the appeal ſhall be tried firſt, if the appellant be ready; otherwiſe the king would deſtroy the ſuit of the party.

Appeal of *Mayhem* is the accuſation of one that hath maimed another; but this being generally no felony, it is in a manner merely an action of treſpaſs, and nothing is recovered by it but damages. Bracton calls this *appellum de plagis & maihemio*, and has a whole chapter upon it. In this appeal, the defendant pleads that the plaintiff had brought an action of treſpaſs againſt him for the ſame wounding, and had recovered, and damages given, &c.; and this was a good plea in bar of the appeal, becauſe in both actions damages only are to be recovered. In king John's time, there is recorded an appeal againſt a Jew, *qui fecit cmentulari quendam nepotem ſuum*.

Appeal of *rape* lies where a rape is committed on the body of a woman. A feme covert without her huſband may bring appeal of rape; and ſtatute 6 R. 2. c. 6. gives power where a woman is raviſhed, and afterwards conſents to it, for a huſband, or a father, or next of kin, there being no huſband, to bring this appeal: alſo the criminal in ſuch caſe may be attainted at the ſuit of the king. If a woman be raviſhed by her next of kin, and conſents to him, and has neither huſband nor father, the next of kin to him ſhall have the appeal; for he has diſabled himſelf by the rape, whereby he becomes a felon. If there be no huſband nor father, the appeal is given to the heir, whether male or female. The ſtatute of Weſtm. 1. c. 13. which reduced the crime of rape to a treſpaſs, enacts that appeal of rape ſhall be brought within forty days; but by ſtatute Weſtm. 2. c. 34. which makes this offence felony, no time is limited for the proſecution, ſo that it may be brought in any reaſonable time. It is to be commenced in the county where the rape was committed. It is held, that though formerly the defendant might have his clergy, it is taken away by the ſtatute 18 Eliz. c. 17. See further on this ſubject, 2 Hawk. P. C. c. 23. §. 58—73.

Appeal of *robbery* or *larceny* is a remedy given by the common law, whereby a perſon robbed of his goods may obtain reſtitution of them. If a man robbed make freſh purſuit after, and apprehend and proſecute the felon, he may bring appeal of robbery at any time afterwards. By ſtatute 21 Hen. 8. c. 11. reſtitution of ſtolen goods may be had on indictments after attainder, as on appeals; and appeals of robbery, as well as of mayhem and rape, are now much out of uſe. By the expreſs proviſion of ſtatute 4 & 5 W. & M. c. 3. an accomplice convicting two others guilty of robbery, ſhall have the king's pardon; and this ſhall be a good bar to an appeal of robbery. Blackſt. Com. vol. iv. Jacob's Law Dictionary by Tomlins, tit. *Appeal*.

APPEARANCE, the exterior ſurface of a thing; or that which firſt ſtrikes the ſenſe, or the imagination.

The Academics maintain, that the ſenſible qualities of bodies are only *appearances*; and the like doctrine is held by ſome later philoſophers.

Our errors ariſe chiefly from a too haſty and precipitate aſſent of the will, which acquieſces too eaſily in the appearance of truth.

Appearance, in *Law*, is the defendant's engaging to anſwer a cauſe or action entered againſt him in ſome court of judicature; and it is done by filing common or ſpecial bail, when he is ſerved with copy of, or arreſted on any proceſs out of the courts at Weſtminſter, and there can be no appearance in the court of B. R. or king's bench, but by ſpecial or common bail. There are four ways for defendants to appear to actions; viz. in perſon, or by attorney, by perſons of full age; and by guardians or next friend, by infants. It is now the common courſe for the plaintiff or defendant, in all kinds of actions where there may be an attorney, to appear by attorney, and put in his warrant without any writ from the king for that purpoſe, as was formerly the caſe by common law. And, therefore, generally, in all actions real, perſonal, and mixt, the demandant or plaintiff, tenant or defendant, may appear by attorney. But in all caſes where the party ſtands in contempt, the court will not admit him to appear by attorney, but oblige him to appear in perſon. In all caſes where proceſs iſſues forth to take the party's body, if a common appearance only, and not ſpecial bail is required, there every ſuch party may appear in court in his proper perſon, and file common bail. In a capital criminal caſe, the party muſt always appear in perſon, and cannot plead by attorney; alſo in criminal offences, where an act of parliament requires that the party ſhould appear in perſon; and likewiſe in appeal or on attachment. On an indictment, information or action, for any crime whatſoever under the degree of capital, the defendant may, by the favour of the court, appear by attorney; and this he may do as well before plea pleaded, as in the proceeding after, till conviction. Attornies ſubſcribing warrants to appear, are liable to attachment, upon non-appearance: and where an attorney promiſes to appear for his client, the court will compel him to appear and put in common bail in ſuch time as is uſual by the courſe of the court; and that although the attorney ſay he hath no warrant for appearance: nor ſhall repealing a warrant of attorney to delay proceedings excuſe the attorney for his not appearing, who may be compelled by the court. The defendant's attorney is to file his warrant the ſame term he appears, and the plaintiff the term he declares, under penalties by ſtat. 4 & 5 Ann. c. 16. An attorney is not compellable to appear for any one, unleſs he take his fee or back the warrant; after which the court will compel him to appear.

In actions by original, appearances muſt be entered with the filazer of the county; and if by bill, they ſhall be entered with the prothonotary; and by ſtatute 5 Geo. 2. c. 27. where defendant is ſerved with a copy of the proceſs, appearances and common bail are to be entered and filed by him within eight days after the return of the proceſs; and if de-

fendant does not appear, plaintiff may, on affidavit of the ſervice of proceſs, enter a common appearance for defendant, and proceed upon it; ſtatute 12 Geo. 1. c. 29. And by ſtat. 25 Geo. 3. c. 80. § 22. a common appearance may be filed by plaintiff, without entering or filing a record, a memorandum or minute for defendant. Jacob's Law Dict. by Tomlins.

Appearance *Day* of *Term*. See Term.

Appearance, in *Perſpective*, is the repreſentation or projection of a figure, body, or like object, upon the perſpective plane.

The appearance of an objective right line is always a right line. See Perspective. The appearance of an opake body and a luminary being given, to find the appearance of the ſhadow, ſee Shadow.

Appearance *of a ſtar or planet*. See Apparition.

Appearances, in *Aſtronomy*, &c. are more uſually called *phenomena* and *phaſes*.

In *Optics*, we uſe the term *direct appearance* for the view or ſight of any object by direct rays, without either refraction or reflection.

Appearances, *to ſave*, is to diſcharge one's duty ſeemingly, or acquit one's ſelf of the formalities and externals thereof; ſo as to ſave the character, and avoid giving ſcandal or offence.

Appearances, in *Phyſiology*. See Phasmata.

APPEASING Remedies, in *Medicine*, are thoſe which aſſuage the pain in a diſeaſe, and give the patient ſome reſt or reſpite; and at the ſame time contribute to the cure. Theſe amount to the ſame with what we otherwiſe call Paregorics, Anodynes, &c.

APPELDOORN, in *Geography*, a town of the united Netherlands, in the duchy of Gueldres, $4\frac{1}{2}$ leagues N. W. of Zutphen.

APPELLANT, in *Law*, denotes a perſon who brings an Appeal.

Appellants, in *Eccleſiaſtical Hiſtory*, is a denomination diſtinguiſhing thoſe among the French clergy who refuſed to ſubſcribe the conſtitution or bull *unigenitus*, iſſued by Clement XI. in 1713, and appealed from it, either to the pope better informed, or a general council.

APPELLATION ſignifies the name by which any thing is known or diſtinguiſhed. See Name.

APPELLATIVE, formed of *appellare, to name a thing*, in *Grammar*, denotes a common name which ſtands for a whole rank of beings, whether general or ſpecial, in contradiſtinction to proper names, which belong only to individuals, e. g. fiſh, man, horſe, tree, &c. are appellatives; and ſo are trout, eel, lobſter; for they all agree to many individuals, and ſome to many ſpecies: but Peter, Gabriel, Bucephalus, are proper names. See Name.

APPELLEE, in *Common Law*, ſignifies the perſon againſt whom an appeal is brought. See Appeal, and Approvement.

In the civil law, *appellee*, *appellatus*, properly belongs only to the judge before whom an appeal is brought.

APPENAGE. See Apanage.

APPENDANT, from *appendo*, *I hang by*, in *Law*, is underſtood of ſuch things as by preſcription have belonged, appertained, and been joined, to ſome other principal thing.

Thus an hoſpital may be appendant to a manor; a common of fiſhing, to a freehold; a ſeat in a church, to a houſe; or the like. As appendants are ever by preſcription, they are thus diſtinguiſhed from appurtenances, which may be created in ſom ecaſes at this day. See Appurtenance.

Appendant, *Advowſon*. See Advowson.

Appendant, *Common*. See Common.

APPENDICULA, or Appendix *vermiformis*, in *Anatomy*, an appendage to the inteſtinum cæcum, or caput coli. See the deſcription of the Intestines.

Appendiculæ *Aſteriarum*, *wires of aſteriæ*, a name given by the writers on *Natural Hiſtory* to certain ſmall branches which are placed in a circular order at different diſtances upon the column of the aſteriæ.

APPENDICULATUS, *Appendage*, in *Botany*, a term moſtly uſed to expreſs an additional ſmall leaf.

APPENDIX, or Appendage, in *Anatomy*, is a part in ſome meaſure diſtinct yet connected to another. Thus, the Fallopian trumpets, ovaries, &c. are called the Appendices Uteri.

Appendix is more particularly uſed in the ſame ſenſe with Epiphysis.

Appendix, or Appendage, a thing neceſſary to, or dependant on another.

The term is chiefly uſed in matters of literature, for an additional diſcourſe, placed at the end of any piece, or writing, to explain or proſecute ſomething there left deficient, or to draw concluſions from it. In which ſenſe the word coincides with Supplement.

APPENSA, from *ad*, and *pendo*, *I hang to*, or Appended *remedies*, ſuch as are outwardly applied, by hanging about the neck.

Such are divers amulets, necklaces, phylacteries, &c.

APPENZELL, in *Geography*, a town of Swiſſerland, and principal place of a canton to which it gives name. N. lat. 47°. 17′. E. long. 9°. 20′. It is ſuppoſed to have derived its name from the Latin, "Abbatis cella," and to have been originally only a religious houſe belonging to the abbey of St. Gal.

Appenzell, the thirteenth canton of Swiſſerland, ſurrounded by the Rhinthal and the lands belonging to the abbey of St. Gal, is about ten leagues from eaſt to weſt, and from ſix to ſeven broad. The whole country is hilly and mountainous. It is divided into twelve communities; ſix of which are Proteſtants, and ſix Roman Catholics. The country formerly belonged to the abbé of St. Gal; but the inhabitants, wearied with exactions and oppreſſions, aſſerted their liberty againſt the troops of the abbot and the Auſtrians ſent to ſuccour them, and ſealed it with their blood. In the year 1513, it was admitted into the Helvetic league, and conſtituted the thirteenth canton. The population is eſtimated at 51,000, 13,000 being catholics, and 38,000 proteſtants; which is a large number in a country of not more than ſixty ſquare leagues, and compoſed for the moſt part of glaciers, inacceſſible rocks and precipices. It yields, however, good paſturage; and, in ſome parts of it, the manufactures have of late been much encouraged. This canton is popularly divided into Innerooden, or the interior part; and Auſſerooden, which comprehends the tracts ſituate near the borders. In the former part, paſturage is the principal employment; and whatever reſpects the feeding the cattle, the management of dairies, and the making of cheeſe, is carried to a high degree of perfection among theſe mountaineers. The rich and poor are cow-keepers; but the poor, having little or no graſs land, employ agents through the canton to inform them where hay may be obtained; and the *ſenn*, or cow-keeper, bargains for it, and drives his cattle, when they return from graſs, to the places where the hay is to be had. The perſon who ſells his hay, furniſhes the ſenn not only with ſtabling for his beaſts, but boards and lodges him and his whole family. In return, the ſenn, beſides paying the ſtipulated price for the hay, allows to his hoſt as much milk, whey, and ziegee (a kind of lean cheeſe), as may be uſed in the houſe, and leaves him alſo the manure of his cows. In the middle of April,

when nature revives, the ſenn again iſſues forth with his herd to the meadows and fertile Alps, which he rents for the ſummer: ſo that the life of theſe people is a conſtant migration, and they enjoy with it health, content, and cheerfulneſs. The original breed of cattle in this canton is of a black and brown caſt; but the ſenns, preferring a motley herd, compoſe it of black, brown, and ſome bay cows: to produce which ſet a black cow with a white belly and a ſtripe of the ſame colour along the back is required. The animals are curried, dreſſed, and tended with the utmoſt care; and thus they have an appearance of ſleekneſs, cleanlineſs, and health, ſuperior perhaps to that of any other cattle in the world. The mountaineer, it is ſaid, lives with his cows in a conſtant exchange of reciprocal acts of gratitude; the latter affording him almoſt whatever he wants; and the ſenn, in return, providing for and cheriſhing them, ſometimes more than his own children. The fine cattle, which are the pride of the cow-keeper who inhabits the Alps, are adorned with large bells ſuſpended from broad thongs; and every ſenn has an harmonious ſet of at leaſt two or three bells. The whole peal, including the thongs, will ſometimes be worth between 140 and 150 guilders; while the whole apparel of the ſenn himſelf, when beſt attired, does not amount to the price of 20 guilders. Theſe ornaments, however, are only worn on particular occaſions; as in the ſpring, when the cows are driven up the Alps, or removed from one paſture to another; or when, in winter, they travel to the different farms, where the owner has contracted for the hay. The ſenn, arrayed in his beſt garb, leads the proceſſion, ſinging the ranz des vaches, conſiſting of ſimple tones moſtly formed within the throat, and without articulate ſounds or words; three or four fine goats follow, then comes the handſomeſt cow with the great bells, and then two others with ſmaller bells; theſe are ſucceeded by the reſt of the cattle; and in the rear is the bull, with a one-legged milking-ſtool hanging on his horns; and the proceſſion is cloſed by a ſledge in which are the implements of the dairy. The cows themſelves, as well as the keeper, ſeem to be pleaſed with their ornaments; and if the leading cow is deprived of her honours, ſhe manifeſts her grief by lowing inceſſantly, abſtaining from food, and becoming lean; and ſhe purſues her rival, who has obtained the badge of ſuperiority, with vengeance, butting, wounding, and perſecuting her in the moſt furious manner. The cows, when diſperſed on the Alps, are brought together by the voice of the ſenn, who allures them to him by ſinging the ranz des vaches. Of the urine of the cattle, the farmers of Appenzell make ſalt-petre by a very ſimple proceſs. Under their ſtables, which are built on ſloping ground, ſo that one ſide of the edifice reſts on the hill and the other is elevated by means of two ſtrong poſts which ſupport it two or three feet above ground, are pits filled with ſandy ſoil. The animal water continually oozes through the planks of the floor; and, having drenched the ſoil contained in the pit for two or three years, the pit is emptied, and the ſaltpetre is collected and refined in the uſual manner.

Among the various modes of induſtry in Innerooden, that of feeding ſnails is one of the moſt ſingular. In the garden grounds along the river Sitter, ſuch numbers of ſnails are kept during the ſummer ſeaſon, that the ſound cauſed by the motion of their denticulated jaws, while they are eating, is diſtinctly heard at ſeveral paces from the ſpot. Young ſnails are collected in the adjacent parts, placed in theſe gardens, and ſupplied (till, on the approach of winter, they incloſe themſelves), with leaves of lettuce, colewort, cabbage, and other vegetables, by which they grow and fatten to a ſurpriſing degree. Some time before Lent, the owners pack up the cloſed ſnails in caſks, and carry them for ſale to the convents of Suabia, Bavaria, and Auſtria, and even as far as Vienna, where they are purchaſed as delicacies. By this traffic ſome have acquired a handſome fortune.

The food of the inhabitants is exceedingly ſimple, conſiſting chiefly of milk, cheeſe, whey, oatmeal, and potatoes. Bread is not in common uſe, except among the rich. Their dreſs is equally plain: and as there is leſs diſparity of fortunes among them than in almoſt every other part of Europe, a great uniformity prevails in diet, dreſs, and manners; and this conſtitutes the main ſupport of their civil and political equality. Some travellers, who have obſerved crowds of beggars in this canton, have been led to draw erroneous inferences concerning the proſperity of the people; but the fact is, that hoſts of beggars, attracted by the charitable diſpoſition of the Appenzellers, flock thither from Suabia, and other neighbouring provinces of Germany. The mountaineers of Appenzell are undiſturbed and content, free from the oppreſſion of arbitrary power and the exactions of taxes, and ſolely occupied with their cows and the Alps on which they graze. The government of this republic confines itſelf to merely granting protection, and providing for the ſecurity of perſons as well as of property. The people have no deſire of knowledge; and are ſo ignorant, that the majority of the inhabitants of Innerooden cannot read and write; and of courſe they have no ſchools, or ſuch as are in the moſt deplorable ſtate. This ignorance is neceſſarily attended with groſs and wretched ſuperſtition. Parents, whoſe children are taken ill, ſeldom ſeek medical aſſiſtance, but have maſſes read for the purpoſe of obtaining from heaven their ſpeedy diſſolution. On the loſs of a ſtill-born child they are inconſolable, under an apprehenſion that for want of baptiſm it is gone to hell; but, on the death of other children, tears are ſcarcely ever ſhed; on the contrary, the parents are joyful, and their friends ſay to them by way of congratulation, "now you have an angel in heaven." The puniſhment inflicted on incontinence is not very ſevere; the tranſgreſſing parties only paying a fine of five guilders each, provided that both be unmarried; but if any female commits the ſame fault three times, ſhe is ſentenced to be publicly whipped. Yet popular opinion requires, that he who violates a virgin ſhall make her his lawful wife; and if they are not joined in marriage, both of them, eſpecially the raviſher, are branded with indelible ſhame. The girl, in ſuch a caſe, is prohibited from wearing the badge of virginity, which is a metal pin ſtuck into the braided hair, and is obliged to cover her head with a black or brown hood. The male offender is virtually diveſted of thoſe privileges which belong in common to all citizens; an humiliation than which there is none more grievous in democratical ſtates; for the man ſo ſtigmatized is civilly dead in his own country, having loſt what is moſt dear to him, the advantages of a freeman. The preceding remarks pertain chiefly to Innerooden, the inhabitants of which are Roman Catholics: but in Auſſerooden, and the outer parts of the canton of Appenzell, the reformed religion has been eſtabliſhed ſince the middle of the ſixteenth century. From that period, the manufacture of linen, muſlin, and cotton cloth has conſtituted the chief branch of induſtry among the reformed Appenzellers. The manufacturers of Appenzell have now attained to ſuch a degree of ſkill, as to be able to ſpin out of half an ounce of flax, a thread meaſuring from 9 to 10,000 feet in length; whence their cambrics are in great demand on the continent. The Appenzellers, apprized of the improvements of the manufactories in Ireland and Scotland, and dreading to loſe their trade, have lately begun to introduce machines for ſpinning and carding

wool, invented by an inhabitant of Rehetobel. Paſturage, in this diſtrict, has of courſe decreaſed; the large paſture grounds being divided into ſmall meadows, each ſufficient only for two or three cows. The people of Appenzell are induſtrious and perſevering, in common with other Swiſs; but their diſtinguiſhing feature is quickneſs of apprehenſion. They accordingly manifeſt particular ingenuity in inventing, imitating, and improving machines, as well as other branches of mechanics, without any aſſiſtance from inſtruction or books. Beſides ſome exceedingly ſkilful weavers, ſeveral among them have acquired reputation by the manufacture of watches, clocks, and fire-engines. The wooden bridges of Ulrick Grubenmann, a native of the village of Teaſen, are very generally known on the continent. This ingenious mechanic, it is ſaid, offered to build an arched wooden bridge acroſs the river of Derry in Ireland, which is 620 feet wide; but his plan was rejected.

See Schilderung du Gebirgsvolker des Schweitz, &c or A Deſcription of the Tribes which inhabit the mountainous parts of Switzerland, by John Gottfried, M. D. vol. i. containing the canton of Appenzell; 8vo. Leipzig, 1798.

APPERCEPTION, or Adperception, is uſed by Leibnitz and his followers, for an attribute of the mind, conſidered as conſcious of, or reflecting on its own perceptions: in which ſenſe the word amounts to the ſame with what Des Cartes and others call consciousness.

APPERWACK, or Capperwack River, in *Geography*, lies about E. S. E. from the iſland and city of Cayenne, on the coaſt of Guiana, in South America. An iſland extends acroſs the entrance, which is ſurrounded by a ſand bank, and off the river is a cluſter of rocks called the Conſtables.

APPETITE, Appetitus, Appetency, formed of *ad*, *to*, and *peto*, *I crave*, in *Phyſiology*, a deſire of enjoying ſomething that is apprehended to be neceſſary or conducive to happineſs. When this inclination towards any object conſidered as good, is guided by reaſon, and reſults from reflection on the real value of the object, it is called *rational*; but when it proceeds from the mere impulſe of the ſenſes, without any diſtinct apprehenſion of the value of the object, it is denominated *ſenſitive*.

Appetite is reſtrained, by Hutcheſon, to ſuch of our deſires as have a previous painful and uneaſy ſituation, antecedently to any opinion of good in the object; nay ſo as that the object is often chiefly eſteemed good only for its allaying this pain or uneaſineſs, or if it give alſo a poſitive pleaſure, yet the uneaſy ſenſation is previous to, and independent of this opinion of good in it. By another ingenious writer (ſee Elem. Crit. vol. i. p. 44.), appetites are repreſented as paſſions directed to general objects, in contradiſtinction to paſſions directed to particular objects, which retain their proper name. Thus we ſay an *appetite* for fame, for glory, for conqueſt, for riches; but we ſay the *paſſion* of love, of gratitude, of envy, &c. Appetite may be alſo diſtinguiſhed from paſſion, ſince the latter has no exiſtence till a proper object be preſented: whereas the former exiſts firſt, and then is directed to an object.

Some have erroneouſly aſcribed the appetites ſolely to the corporeal ſyſtem or animal part of man; but this mode of repreſenting them muſt appear to be a miſtake on a cloſe inveſtigation; ſince, however the generality of moral writers may be inclined to regard the groſſer appetites as having their ſeat in the body, and thence term them ſenſual and carnal, they never reproach the more refined ſpecies of corporeal enjoyments with theſe degrading epithets; nor do they accuſe a man of being ſenſually diſpoſed, if he loves muſic, or receives delight from the contemplation of the beauties of nature. Dr. Reid (Eſſays on the active Powers of Man, Eſſ. iii. p. 122, &c.), limits the term *appetite* to a particular claſs of deſires, which belong to the animal principles of action, and which are diſtinguiſhed by the following properties. Every appetite is accompanied with an uneaſy ſenſation proper to it, which is ſtrong or weak in proportion to the deſire we have of the object. Moreover, appetites are not conſtant, but periodical, being fated by their objects for a time, and returning after certain periods. He adds, thoſe that are chiefly obſervable in man, as well as in moſt other animals, are hunger, thirſt, and luſt. The ends for which our natural appetites are given, are too evident to eſcape the obſervation of any man of the leaſt reflection: two of thoſe above enumerated are intended for the preſervation of the individual, and the third for the continuance of the ſpecies. To act merely from appetite is neither good nor ill in a moral view: it is neither an object of praiſe nor of blame; and the perſon who yields to its impulſe, when there is no reaſon to the contrary, acts agreeably to his nature. Appetites, conſidered in themſelves, are neither ſocial principles nor ſelfiſh. They cannot be called ſocial, becauſe they imply no concern for the good of others; nor can they juſtly be called ſelfiſh, though they be commonly referred to that claſs. To this purpoſe, Dr. Reid obſerves, that appetite draws us to a certain object without regard to its being good for us, or ill; nay, in ſome caſes, ſelf-love is ſacrificed to appetite. But it may be replied, that the impulſe of appetite ſuppoſes the previous apprehenſion of good; though this apprehenſion, and the appetite that reſults from it, may be miſguided and perverted. Beſides the appetites which nature hath given to us for uſeful and neceſſary purpoſes, we may create appetites which nature never gave. As it is therefore beſt to preſerve our appetites in that tone and degree of ſtrength which nature gives them, ſo we ought to beware of acquiring appetites which nature never gave; theſe are always uſeleſs, and often very hurtful. It ſhould alſo be conſidered, that although there be neither virtue nor vice in acting from natural appetite, yet there may be much of either in the management of our appetites; and the power of ſelf-government is neceſſary for their reſtraint and regulation.

Appetite, in *Medicine*, is more particularly uſed to denote a natural periodical call or deſire to eat and drink, occaſioned by a certain uneaſy and painful ſenſation, and with a view of repairing what had been waſted by the ſeveral excretions of the body. A loſs or proſtration of appetite is called Anorexia. The defect of appetite is of two kinds, and is uſually divided, by medical writers, under two names, the *anorexia* and *nauſea*.

The anorexia is a too great abſtinence from food, which ſometimes has its origin from depravation of the ſtomach, ſometimes from other cauſes more remote.

The nauſea is defined to be a plenary abſtinence from foods, being a complaint of the ſame nature and origin with the anorexia, but differing in degree.

The ſigns are very obvious ſo far as a diſtaſte to food, which is common to both; but there is this difference, that in an anorexia the patients uſually eat ſomething, though without appetite, and are troubled always with a pain and uneaſineſs of the ſtomach after it; but in the nauſea there is a greater diſreliſh of food of all kinds, and frequent ſtraining to vomit. Men of idle lives, and ſuch as drink too freely of ſtrong liquors, are ſubject to *idiopathic* defects of appetite, from actual injuries in the ſtomach; others labouring under the different diſeaſes before mentioned, are as often ſubject to the *ſymptomatic*. People of a ſanguine habit, when afflicted with a loſs of appetite, always find great relief in acids of the milder kind; and thoſe of a leucophlegmatic

leucophlegmatic habit are often cured by taking ſmall doſes of *elixir proprietatis* every day before dinner. Some perſons are very fond of external applications to the ſtomach in thoſe caſes, but theſe are rarely to be found of any great ſervice. The beſt of them is a plaſter of *tacamahaca*, with oil of maſtic.

A prepoſterous appetency of things not proper for food is called PICA; and an immoderate appetite is called BULIMIA, or *fames canina*. Some, however, diſtinguiſh between the *βυλιμια*, and *canine appetite*; making it the diſtinguiſhing character of the latter, that it is attended with a hentery or other cœliacal flux.

APPETITE *exceſſive*. See OREXIS.

Dr. Cullen, in his arrangement of diſeaſes, makes two diſtinct ſections of erroneous and deficient appetites under the order of *dyſorexiæ*: to the former he refers *bulimia*, *polydipſia*, *pica*, *ſatyriaſis*, *nymphomania* or *furor uterinus*, and *noſtalgia*; to the latter, *anorexia*, *adipſia*, and *anaphrodiſia*.

APPIA, or APIA, in *Ancient Geography*, a town of Aſia, in Phrygia.

APPIADES, in *Mythology*, five divinities ſo called becauſe their temples were at Rome near the fountains of Appius, viz. Venus, Pallas, Veſta, Concord, and Peace.

APPIAN, in *Biography*, a Greek hiſtorian, was a native of Alexandria, and lived under the reigns of Trajan, Adrian, and Antoninus Pius, in the former part of the ſecond century. In the time of Trajan, he ſettled at Rome, and gained ſuch reputation as an advocate, that he was choſen one of the procurators of the emperor, and had the government of a province aſſigned to him. In the preface to his hiſtory, he informs us, that he wrote about the 900th year of Rome, and therefore this preface muſt have been written about the year of Chriſt 147, or 148. His Roman Hiſtory was compriſed in 24 books, and compiled, not in the chronological order of Dionyſius Halicarnaſſenſis and of Polybius, nor in the biographical method of Plutarch, nor in a continued ſeries like that of Livy, but in the order of the countries in which the events that are related by him happened, as Italy, Gaul, Sicily, Spain, Africa, Greece, Syria, Parthia, Egypt, and Arabia. He is charged with many errors by Bodin, Sidonius, and Scaliger; though the former allows, that he is the only hiſtorian, who gives a juſt and clear account of the Roman provinces, cities, and armies, and a lively deſcription of the Roman empire. La Mothe le Vayer thinks that the principal ground of complaint againſt him, is his undue partiality to the Romans, ſo that he repreſents the right as well as the advantage to be always on their ſide, to the prejudice of all other nations, and even of his own country. He is alſo charged with having borrowed many paſſages from Polybius, Plutarch, and other authors, without acknowledgment; inſomuch that Scaliger reproachfully calls him "alienorum laborum fucum," a drone who robs the induſtrious bees of their labour. Photius, however, is of opinion, that he wrote with the utmoſt regard to truth, and that he has ſhewn a more accurate and extenſive acquaintance with military affairs than any of the hiſtorians: while we read him, he ſays, we cannot but imagine that we ſee the battles which he deſcribes. But his chief talent, according to this author, is diſplayed in his orations, in which he moves the paſſions as he thinks proper, either in animating the reſolution of the ſoldiers, or repreſſing the impetuoſity of thoſe who were too precipitate. His ſtyle is plain and ſimple, without any thing turgid or ſuperfluous. In his preface he has given a general deſcription of the Roman empire. Of the nine firſt books of his "Hiſtory," ſome fragments remain, which are preſerved in Urſinus's "Excerpta de legationibus," publiſhed in Greek, at Antwerp, with notes, in 1582, 4to.; and ſome of them are extant in the "Excerptæ Peireſcianæ," publiſhed by Valeſius, with a Latin verſion and notes, at Paris, in 1634, 4to.; of the fourth book on the war with the Gauls, only an epitome remains; the ſixth and ſeventh books, on the affairs of Spain, and the war with Hannibal, were firſt publiſhed, in 8vo. by H. Stephens, at Paris, in 1557; the eighth, on the affairs of Libya; the eleventh and twelfth, on thoſe of Syria and Parthia; five books on the Civil Wars; and fragments of the twenty-third, on the affairs of Illyria; are extant. A Latin verſion of ſeveral parts of Appian, by Petrus Candidus, was printed at Rome, in 1472, and at Venice, in 1477 and 1492, in folio. An edition of Appian was publiſhed, in Greek, by Charles Stephens, with various readings, at Paris, in 1551, in folio; another, in Greek and Latin, was publiſhed by Henry Stephens, at Geneva, in 1592, in folio; an improved edition, by Tollius, was publiſhed at Amſterdam, in 1670, in two volumes, 8vo. Appian, Hiſt. Præf. Fabr. Bibl. Græc. l. iv. c. 12. § 1—4. t. iii. p. 391—396. Gen. Dict.

APPIAN *Aquæduct*, was ſo called from Appius Claudius, who was cenſor of Rome in the 442d year of that city. This aquæduct began ſeven miles from Rome, and after having run a great way under ground, diſcharged part of its waters between the gates Capena and Trigemina, and conveyed the reſt quite to the Campus Martius; and thus the whole city was plentifully ſupplied. It was dug under ground, and laid very deep, ſays Frontinus (De Aquæductibus), either becauſe the art of levelling was not then brought to perfection, or becauſe the Roman territory was too much expoſed to the incurſion of its enemies, who might have deſtroyed the ſtately arches, and intercepted the water. This water was for many ages called "Aqua Appia." The principal fountain under this denomination, was placed in the forum of Cæſar, below the temple of Venus Appiades; and by a verſe of Ovid it appears to have formed a jet of water:

"Appias expreſſis aera pulſat aquis."

APPIAN *Way*, a great Roman highway, conſtructed by Appius Claudius, cenſor of Rome, in the 442d year of that city. It commenced at the gate Capena, now called St. Sebaſtian's, and paſſing over the mountain called St. Angeli, croſſes the plain of Valdranus, the *Palus Pompina*, and ends at Capua, which was the limit of the Roman empire.

The Appian way, called by Statius (Sylv. i. 12.), "the queen of roads," extended about 140 miles, and was wide enough for two chariots to go abreaſt without inconvenience. The ſtones which Appius employed in this work, were brought from a great diſtance, and were as hard as flints. They were previouſly ſquared and ſmoothed by ſkilful workmen, and then joined together without any cement; ſo that they appeared for ſeveral miles like a ſingle ſtone. In the beginning of Auguſtus's reign, this road reached to Brunduſium, that is, 238 miles farther; but it is not certain, who was the manager of this additional work. It is generally aſcribed to Cæſar. Dr. Burnet, in his Letters, ſays, that in many places, it is ſtill as entire as when it was firſt made. On each ſide of it was a deep ditch for receiving off and conveying away the water.

Caius Gracchus placed the ſmall columns called *termini*, which marked the miles.

The new *Appian way* was conſtructed by Caracalla, from his baths to the gate Capena, where it joined the other.

APPIANI, GIUSEPPE, in *Biography*, an exquiſite Italian finger, with a contralto voice, born at Milan, and always mentioned with rapture by ſome of our friends who heard him at Rome when he was very young; they likewiſe ſpoke of him as an excellent actor. He was in the

ſervice

ſervice of the empreſs queen, when he died at Ceuſſa, near Bologna, in 1742, at only 23 years of age, extremely regretted. He had ſtudied under Porpora, with the celebrated Salimbene. His ſtyle was naturally pathetic and touching, and his *adagio*, conſequently, extremely admired.

APPIANO, in *Geography*, a town of Italy in the duchy of Milan, 20 miles N. N. W. from Milan.

APPIARIA, in *Ancient Geography*, a town of Europe, in Lower Mæſia, on the right bank of the Danube, there called Iſter. It was ſituated between Durroſtorus on the eaſt, and Nicopolis ad Iſtrum on the weſt.

APPIDEMISCHKAN, in *Geography*, a town of Pruſſia, nine miles ſouth-eaſt from Gumbinnen.

APPII Forum, in *Ancient Geography*, *Borgo Longo*, a ſmall town of Italy, in Latium, in the country of the Volſci. It was ſituated upon the Appian way, between Sueſſa Pometia to the north-weſt, and Terracina at ſome diſtance to the ſouth-eaſt. It is mentioned in the Acts, ch. xxviii. 15. and by Horace in his account of his journey to Brunduſium:

" ——inde forum Appii
Diſſertum nautis, cauponibus atque malignis."
" To Forum Appii thence we ſteer, a place
Stuff'd with rank boatmen, and with vintners baſe."
Francis.

On the ruins of this ancient little town is ſituated an abbey called Foſſa Nuova.

APPLANA, in *Entomology*, a ſmall ſpecies of Phalæna, of the *Tortrix* family, that inhabits Kiel and other parts of Europe. The wings are depreſſed, brown, with three white dots in the centre. Gmelin. Obſ. This is the Fabrician character in the ſpecies Inſectorum, where it is arranged in the ſection *Pyralis*, t. 2. 288.; and it is alſo *Phalæna punctata* of Clerk. Icon.

APPLAUSE, properly ſignifies an approbation of ſomething, witneſſed by clapping of hands; and in this reſpect it differs from acclamation, which was articulate, and performed with the voice. The word comes from the verb *plaudere*, *to clap the hands*.

The ancient way of applauding by clapping of hands is ſcarcely retained any where but in theatres. Among the Romans there were three different ſpecies of applauſe denominated from the different noiſes made in them, viz. *lomlus*, *imbrices*, and *teſtæ*; the firſt a confuſed din, made either by the hands or the mouth; the ſecond and third by beating on a ſort of ſounding veſſels placed in the theatres for this purpoſe.

Perſons were inſtructed to give applauſe with ſkill; and there were even maſters who profeſſed to teach the art. The proficients in this way let themſelves out for hire to the vain-glorious among the poets, actors, &c. and were properly diſpoſed to ſupport a loud applauſe. Theſe they called *laudicoeni*.

At the end of the play, a loud peal of applauſe was expected, and even aſked of the audience, either by the chorus or the perſon who ſpoke laſt. The formula was, *ſpectatores plaudite*, or *valete & plaudite*.

The *plauſores*, or applauders, were divided into *chori*, and diſpoſed in theatres oppoſite to each other, like the choriſters in cathedrals; ſo that there was a kind of concert of applauſes.

Seneca (Nat. Quæſt. ii. 28.) has deſcribed the different modes of applauding with the hands: "Averſæ inter ſe manus colliſæ non plaudunt, ſed palma cum palmâ collata, plauſum facit. Et plurimum intereſt utrum cavæ concutiantur, an planæ et extentæ." The people ſtood up to applaud in the theatres: thus Propertius (iii. 16.);

" Stantiaque in plauſum tota theatra juvent."

Of the awkward applauſes of the uninſtructed ruſtics, who did not underſtand the art of applauding, and who diſturbed the general harmony by their diſcordant ſounds, Tacitus ſpeaks; (Annal. xvi. 5.), "cum manibus neſciis fatticerent, turbarent ignaros."

APPLE-TREE, *Malus*, in *Botany*, a general name applied to a cultivated orchard-tree, which produces the fruit known by the name of apple. In the ſyſtem of Linnæus, it is conſidered as a ſpecies of the genus *pyrus*, of which there are three: the *wild-apple* or *crab*, which has a very ſour fruit; the *Virginian wild crab*, which produces a ſweet-ſcented flower; and the *dwarf-apple*, frequently known by the name of *Paradiſe-apple*. See Pyrus Malus.

Trees of this ſort are produced in an artificial manner, by means of ingrafting the ſcions or ſhoots of ſuch apple-trees as are valuable for their fruit, on ſtocks that have been raiſed from the ſeeds of crabs. Thus a ſcion of an apple-tree, inſerted into a crab ſtock, occaſions the crab-tree from that time to produce *apples* of nearly the ſame kind and quality with thoſe from which the ſcion was taken. Mr. Ray, indeed, thinks, that the fruit of theſe trees always follows the nature of the ſcions.

In the nurſeries, three ſorts of ſtocks are commonly uſed to graft apples upon: firſt, *free ſtocks*, which are raiſed indifferently from the kernels of all ſorts of apples, and which by ſome are alſo termed *crab-ſtocks*, as all thoſe trees which are produced from the ſeeds before they are grafted, are termed *crabs*, without any diſtinction. Such ſtocks ſhould, however, be preferred, as are raiſed from the kernels of crabs, where they can be procured. Several old writers are of this opinion. Auſten, who wrote more than an hundred years ago, ſays the ſtock which he accounts beſt for *apple-grafts* is the *crab*, which is better than *ſweeter apples* to graft on, becauſe it is uſually free from canker, and will become a large tree, and, he conceives, laſt longer than ſtocks of *ſweeter apples*, and make fruits more ſtrong and hardy to endure froſts. It is well known, however, that by frequent grafting ſome ſorts of apples upon free ſtocks, the fruits have been rendered larger, but leſs firm, and of ſhorter duration.

The ſecond ſort of ſtock is the *Dutch creeper*; theſe ſtocks are deſigned to ſtint the growth of trees, and keep them within compaſs for dwarfs or eſpaliers. The third ſort is the *Paradiſe apple*, which is a very low ſhrub, conſequently only proper for trees which are kept in pots by way of curioſity, as they do not continue long. See Ingrafting of Fruit Trees.

Trees of the apple kind are found in general to thrive well when planted on ſtrong deep loamy ſoils, or ſuch clayey ones as, by having a portion of gravel in their compoſition, are rendered not retentive of moiſture. Mr. Knight, in his treatiſe on the Culture of the Apple and Pear, remarks, that a preference has been given to ſoils of oppoſite kinds, by planters of different ages. Thoſe of the laſt century uniformly contended, he ſays, in favour of a light ſandy loam, and on that their fineſt cyder fruits were grown; but at preſent a ſoil of a diametrically oppoſite quality, a ſtrong red clay, is generally preferred. Much of the ſoil which is called clay, in the diſtrict where he reſides, is, however, he obſerves, properly argillaceous marle; and ſome of it contains a large portion of calcareous earth, and effervеſces ſtrongly with acids. He has found this ſoil to form the ſubſtratum of ſome orchards much celebrated for producing fruit of the firſt quality. It appears, he thinks, to have the effect of mitigating the harſhneſs of rough auſtere fruits; and that as the trees grow with great luxuriance in it, it is perhaps, of all ſoils, the beſt calculated to anſwer the wiſhes of the planter; but that the ſtrongeſt and moſt highly

flavoured

flavoured liquor, which has hitherto been obtained from the apple, is produced by a ſoil which differs from any of thoſe that have been mentioned—the ſhallow loam on a limeſtone baſis, ſuch as is met with in the forreſt of Dean.

It is added, that in regard to ſituation, the apple-tree ſucceeds beſt in thoſe which are neither high nor remarkably low. In the former, its bloſſoms are frequently liable to be injured by cold winds, and in the latter by ſpring-froſts, particularly when the trees are planted in the loweſt part of a confined valley. A ſouth or ſouth-eaſt aſpect is generally preferred, on account of the turbulence of the weſt, and the coldneſs of north winds; but orchards ſucceed well in all: and where the violence of the weſt wind is broken by an intervening riſe of ground, a ſouth-weſt aſpect will, he thinks, be found equal to any. Apple-trees are generally the moſt productive of fruit when they are ſituated near the fold-yard, and the ground, in conſequence, much trod and manured by the cattle in the winter ſeaſon. The ſoil in which old apple-trees have grown, is, however, eſteemed very unfavourable to young ones.

When from contiguity to the houſe, an orchard is planted in this kind of ground, the pear and apple ſhould be made to ſucceed each other, as has been judiciouſly recommended by the author of the Rural Economy of Glouceſterſhire. The land intended to be planted with apple-trees ſhould be well prepared the year before, by thoroughly digging or ploughing; and if dung, in the form of compoſt with mould, be laid on, it will be of great utility. In chuſing the trees, ſuch as are but of two years growth from the graft, are, in general, to be preferred, and they ſhould have ſtrong ſtraight ſtems. When the trees are planted, they ſhould alſo be ſtaked, to prevent their being ſhaken by the wind. For the manner of planting apple-trees, &c. ſee Orchard.

In directing the choice of fruit-trees, for particular ſituations, great attention ſhould be paid to ſelect ſuch as are proper for the peculiar views of the planter, and ſufficiently early to ripen well in them. The apple-tree being naturally very full of branches, frequently requires the operation of pruning; and when properly executed, great advantages will be found to ariſe from it. Mr. Knight thinks, in this buſineſs, the pruner ſhould confine himſelf almoſt entirely to the extremities of the bearing branch, which are always too full of wood, and leave the internal part of the trees nearly as he finds it. Large branches ſhould rarely or never be amputated.

In the garden culture of the apple, where the trees are retained as *dwarfs* or *eſpaliers*, the more vigorouſly growing kinds are often rendered unproductive by the exceſſive, though neceſſary, uſe of the pruning knife. The above writer has always ſucceeded, he ſays, in making trees of this kind fruitful, by digging them up, and replacing them with ſome freſh earth in the ſame ſituation. The too great luxuriance of growth is, he thinks, thus checked, and a diſpoſition to bear in conſequence brought on. See Pruning of Fruit-trees.

Apple-trees ſometimes begin bearing at the age of two or three years; but when they are ſix or ſeven, they are for the moſt part found to produce the moſt abundantly.

The bloſſoms of apple-trees are liable to be injured or deſtroyed by various cauſes; as ſevere cold, a hazy ſtate of the atmoſphere, froſts, and inſects of various kinds. And Mr. Knight has remarked, that they alſo fail frequently from want of impregnation, when the weather is unuſually hot and dry, or when cold winds prevail, as he has often obſerved the *farina* to wither and die on the *antheræ* in ſuch ſeaſons. In theſe caſes, thoſe trees have been found to eſcape the beſt, that were moderately full of wood, and conſequently capable of affording the bloſſoms the moſt protection.

Apple, a well-known orchard fruit, cultivated for the purpoſes of the table as well as for the liquor which is prepared from its juice. The varieties of this valuable fruit are extremely numerous. Mr. Forſyth, in his treatiſe on the Culture and Management of Fruit-trees, mentions eight different ſorts, as having been introduced from France; among which the *French rennet*, the *rennet griſe*, and the *violet apple*, are moſt eſteemed in this country; and about thirty-ſix ſorts of our own growth, which may be conſidered as valuable. But the varieties of this fruit will be treated of more fully under the article Pyrus Malus.

In reſpect to the method of preſerving apples for uſe during the winter ſeaſon, it has been recommended to let them remain upon the trees until perfectly ripe, and then to gather them by the hand in dry weather, laying them in heaps for a few weeks, in order that they may undergo a ſlight degree of ſweating. They ſhould then be carefully looked over, and all ſuch as are in any way ſoft or decayed, be removed, the ſound fruit being wiped dry, and packed in any kind of large jars that have been previouſly made clean and dry; the mouths or openings being cloſely ſecured, in order to exclude the air as much as poſſible from them. In this way apples are ſaid to keep ſound a great length of time, the fleſh or pulp remaining perfectly firm and plump, which is not the caſe when they are conſtantly expoſed to the action of the open air. But they may be kept perfectly well without this trouble, by being cloſely packed in large hampers, baſkets, or bins, and placed in cloſe dry ſituations.

The ſort of apples that are in general held in moſt eſteem for the table are the following, which ſtand in the order of their ripening: the *white juncating*, the *margaret apple*, the *ſummer pearmain*, the *ſummer greening*, the *embroidered apple*, the *golden rennet*, the *ſummer white calville*, the *ſummer red calville*, the *ſilver pippin*, the *aromatic pippin*, the *la reinette griſe*, the *la haute bonte*, the *royal ruſſeting*, the *wheeler's ruſſet*, the *ſharp's ruſſet*, the *ſpine apple*, the *golden pippin*, the *nonpareil*, and *l'api* or *pomme d'api*.

But for kitchen uſe; the *codling*, the *ſummer marygold*, the *ſummer red pearmain*, the *Holland pippin*, the *Kentiſh pippin*, the *courpendu*, the *Loan's pearmain*, the *French rennet*, the *French pippin*, the *royal ruſſet*, the *monſtrous rennet*, the *winter pearmain*, the *pomone violette*, the *Spencer's pippin*, the *ſtone pippin*, and the *oaken pippin*.

And for the purpoſes of cyder; the *ſtire apple*, the *hagloe crab*, the *golden pippin*, the *old red ſtreak*, and the *woodcock*, were the favourite old cyder fruits; but moſt of them are now, according to Mr. Marſhall, on the decline. The *muſt* and the *coccagee* are, however, ſtill in high eſtimation, eſpecially the latter. Mr. Crocker, in his tract on the Art of making Cyder, obſerves, that in the diſtricts of Hereford and Worceſter, the following are conſidered as the beſt liquor fruits: the *Bennet apple*, *Captain Nurſe's kernel*, *Elton's yellow*, *Normandy apple*, and the *yellow* or *foreſt ſtyre*. And that in the county of Somerſet; the *Jerſey*, the *white four*, the *margill*, *vallis apple*, *barn's-door*, *crab red-ſtreak*, *Du-ann*, *Jack Every*, *coccagee*, *Clark's primo*, *Buckland*, *Pit crab*, *Slater's pearmain*, *Slater's No.* 19, *Slater's No.* 20, *Slater's No.* 21, *Caſtle pippin*, *ſaw-pit*, and the *pomme apis*, are ſuppoſed moſt valuable. But that in Devonſhire, the moſt eſteemed fruits are; the *Seaverton red-ſtreak*, the *ſweet broady*, the *lemon bitter ſweet*, *joſey*, *Orcheton pippin*, *wine-apple*, *marygold ſpice-apple*, *Ludbrook red-ſtreak*, *green Corniſh*, the *butter-box*, *red Corniſh*, *broad noſed pippin*,

eat's

cat's head, brandy apple, Pine's red-ſtreak, winter red, ſweet pomme roi, and the *Bickley red ſtreak.*

The beſt and moſt proper ſorts of apples to be cultivated in a ſmall garden are, according to Mr. Forſyth, the *jenetting, golden pippin, nonſuch, Rilſtone pippin, nonpareil, Queen's apple, ſkyhouſe, golden rennet, aromatic pippin, grey kadington, ſcarlet pearmain, lemon pippin, pomme gee,* and the *French crab,* with *ruſſetings* and *codlings* for the purpoſe of baking.

It has been ingeniouſly ſuggeſted by Mr. Knight, in his treatiſe on the Apple and Pear, that the juice of theſe fruits might be uſed with great advantage in long voyages. He has frequently, he ſays, reduced it by boiling, to the conſiſtence of a weak jelly; and that in this ſtate it has remained ſeveral years without the ſlighteſt apparent change, though it has been intentionally expoſed to much variation of temperature. A large quantity of the inſpiſſated juice would, he further obſerves, occupy but a very ſmall ſpace; and the addition of a few pounds of it to a hogſhead of water would probably, at any time, form a liquor a good deal ſimilar to cyder or perry: it might alſo, he thinks, be uſed to ſupply the place of *rob* of *lemons* and *oranges,* and might be obtained at a much lower price.

It has been obſerved by Dr. Grew, in his Anatomy of Vegetables, that the apple is formed of four diſtinct parts, conſiſting of the *cuticle* or *pill,* the *parenchyma,* the *branchery,* and the *core;* that the *pill* or *ſkin* is only a dilatation of the outermoſt ſkin or rind of the bark of the branch on which it grew; and that the *parenchyma* or *pulp,* though tender and delicious to the taſte, is only a dilatation of the *alburnum,* or inner part of the bark of the ſame part. This is evident, he thinks, not only from the viſible continuation of the bark, from the one through the pedicle or ſtalk to the other; but alſo from the ſtructure common to both. And that the branchery, or veſſels, are only ramifications of the woody part of the branch diſperſed through all the parts of the *parenchyma,* the greater branches being made to communicate with each other by the medium of the ſmaller ones; and the *core* proceeds originally, he ſuppoſes, from the pith of the branch, the ſap of which finding room enough in the *parenchyma,* to diffuſe itſelf, quits the pith, which, in conſequence, hardens into core.

Apple is alſo a name given to divers fruits, bearing ſome reſemblance in figure, rotundity, and the like, to the orchard apple.

Apple, *Adam's.* See Citrus, and *Pomum* Adami.

Apple, *Alligator.* See Annona.

Apple, *bitter,* a name ſometimes given to the fruit of the Colocynthis. See Cucumis.

Apple, *blad.* See Cactus.

Apple, *cuſtard.* See Annona.

Apple, *dwarf.* See Dwarf-*trees.*

Apple-*fly,* in *Natural Hiſtory,* the name given by authors to a ſmall green fly found ſometimes within an apple, and hatched of a worm or maggot, very frequently found infeſting that fruit.

Apple, *love.* See Solanum.

Apple, *mad.* See Solanum.

Apple, *male balſam.* See Momordica.

Apple, *marchaſite,* ſo called by Dr. Grew on account of its figure, as being round, except on one ſide, where it falls in, and has a ſtalk like a young apple. Muſ. Reg. Soc. P. iii. § 2. cap. 3.

Among the ancient ornaments of churches we read of *golden* apples, *poma aurea;* by which it ſhould ſeem, we are to underſtand the globular parts of candleſticks. Du-Cange.

Some ancient cuſtomaries alſo ſpeak of apples of wax, *poma de cera.*

Apple, *May.* See Podophyllum.

Apples, *oak,* are a kind of excreſcences or exudations of the nutritious juice of that tree, joined with ſome degree of putrefaction.

The like are ſometimes alſo found on willows.

Apple *of the eye.* See Pupil.

Apple, *pine.* See Bromelia.

Apple, *prickle,* is remarkable for the ſeveral tuffocks or bunches of thorns with which it is armed all round; each bunch conſiſting of ſix or eight thorns, ſome erect, others couched a little, and crooked outwards, of ſeveral lengths, from one inch to above two.

Apple, *purple.* See Annona.

Apple, *ſoap.* See Sapindus.

Apple, *ſour.* See Annona.

Apple, *ſtar.* See Chrysophyllum.

Apple, *ſugar* and *ſweet.* See Annona.

Apple, *thorn.* See Datura.

Apple, *water.* See Annona.

Apple, *Iſland,* in *Geography,* a ſmall uninhabited iſland of north America, in the river St. Lawrence, in Canada, on the ſouth ſide of the river, between Baſque and Green Iſlands. It is ſurrounded by rocks, and the navigation is dangerous.

APPLEBY, a corporate and borough town, the county-town of Weſtmoreland, where the aſſizes are held, and which ſends two members to parliament, is ſituated on the banks of the river Eden. It was formerly a conſiderable town, and had many privileges; but it has long ago ſunk into decay, and now conſiſts only of mean houſes in one broad ſtreet, which has an eaſy aſcent from north to ſouth, and at the end of it the caſtle, almoſt ſurrounded by the river. It has two churches, a town-hall, a county gaol, a free grammar ſchool; and an hoſpital for a governeſs and twelve widows, founded, in 1651, by a daughter of lord Clifford. It is governed by a mayor, twelve aldermen, a common council, two ſerjeants at mace, &c. It is diſtant about 32 miles from Carliſle, and 270 from London. Its market is on Saturday, and it is the beſt corn-market in theſe northern parts. N. lat. 54° 38′. W. long. 3°. 32′.

APPLECROSS, a village of Scotland, ſeated on a bay to which it gives name, on the weſt coaſt of the county of Roſs, 52 miles weſt of Dingwall.

APPLEDORE, a ſea-port town of England, in the county of Devon, in Barnſtable bay, where the Danes landed under Hubba, in the time of Alfred. The harbour divides into two branches; that to the eaſt goes up to Barnſtable, diſtant from it 10 miles weſt, and the other to Biddeford.

Appledore, a town of England, in the county of Kent, on the river Rother, 9 miles W. from New Romney, and 63 E. S. E. from London.

APPLE-TOWN, an Indian village on the eaſt ſide of Seneca-lake, in New York, between the townſhips of Ovid on the South, and Romulus on the North.

APPLICATE, Applicata, *Ordinate* Applicate, in *Geometry,* is a right line drawn acroſs a curve, ſo as to be biſected by the diameter thereof.

Applicate is the ſame with what we otherwiſe and more uſually call Ordinate.

Applicate *number.* See Concrete.

APPLICATION, the act of *applying* one thing to another by cauſing them to approach or bringing them nearer together. Thus a longer line or ſpace is meaſured by the application of a leſs, as a foot or yard by an inch, &c.:

and motion is determined by ſucceſſive application of any thing to different parts of ſpace.

Application is ſometimes alſo uſed, both in *Arithmetic* and *Geometry*, for the operation of diviſion, or for that which correſponds to it in Geometry. Thus 20 applied to, or divided by 4, i. e. $\frac{20}{4}$, gives 5. And a rectangle *ab* applied to a line *c*, gives the fourth proportional $\frac{ab}{c}$, or another line, as *d*, which with the given line *c* will contain a rectangle $cd=ab$.

Application, in *Geometry*, denotes the act of placing one figure upon another in order to determine their equality or inequality. In this way Euclid, and other geometricians, have demonſtrated ſome of the primary and fundamental propoſitions in elementary Geometry. Thus it is proved, that two triangles, having two ſides of the one equal reſpectively to two ſides of the other, and the two included angles equal, are equal in all reſpects; and two triangles having one ſide and the adjacent angles of the one reſpectively equal to one ſide, and the adjacent angles of the other, are alſo in the ſame mode of application ſhewn to be equal. Thus alſo it is demonſtrated, that a diameter divides the circle into two equal parts; and that the diagonal divides a ſquare or parallelogram into two equal parts. The term is alſo uſed to ſignify the adaptation of one quantity to another, in order to their being compared; the areas of which are the ſame, but their figures different. Thus Euclid ſhews how, on a right line given, to apply a parallelogram that ſhall be equal to a right-lined figure given. See alſo l. vi. pr. 28. &c.

Application of one ſcience to another, ſignifies the uſe that is made of the principles of the one for augmenting and perfecting the other. As there is a connection between all the arts and ſciences, one of them may be made ſubſervient to the illuſtration and improvement of the other: and to this purpoſe algebra has been applied to geometry, and geometry to algebra, and both to mechanics, aſtronomy, geography, navigation, &c.

Application of *Algebra*, or *Analyſis*, to *Geometry*. After the diſcovery of algebra and analyſis, it was natural to apply theſe ſciences to geometry, ſince lines, ſurfaces and ſolids, which are the objects of geometry, are commenſurable, and capable of being compared with one another, and conſequently of having their relations and proportions aſſigned. The application of algebra to geometry is of two kinds: that which regards the plane or common geometry, and that which reſpects the higher geometry, or the nature of curve lines.

The *firſt* of theſe is concerned in the algebraical ſolution of geometrical problems, and the inveſtigations of theorems in geometrical figures, by means of algebraical inveſtigations or demonſtrations. Inſtances of this kind of application occur in the works of the moſt early writers in algebra, as Diophantus, Lucas de Burgo, Cardan, Tartalea, &c. and may be found in thoſe of authors of more modern date even to our own times. Some of the beſt precepts and exerciſes relating to this kind of application may be ſeen in Sir Iſaac Newton's "Univerſal Arithmetic," and in Mr. Thomas Simpſon's "Algebra" and "Select Exerciſes." This method of reſolving geometrical problems is, in many caſes, more direct and eaſy, than that of the geometrical analyſis; but the latter method by ſyntheſis, or conſtruction and demonſtration, is the moſt elegant. The algebraical ſolution ſucceeds beſt in ſuch problems as reſpect the ſides and other lines in geometrical figures; and thoſe geometrical problems in which angles are concerned are beſt reſolved by the geometrical analyſis. See other remarks on this method of ſolution in Newton's treatiſe above mentioned. The ſolution of problems in this way depends upon a previous acquaintance with the method of expreſſing geometrical magnitudes, as well as their mutal poſitions and relations, by algebraical notation: *e. g.* a line, whether known or unknown, is repreſented by a ſingle letter: a rectangle may be denoted by the product of the two letters expreſſing its ſides; and a rectangular parallelepipedon by the product of three letters, two of which repreſent its rectangular baſe, and the third its height. The oppoſite poſition of ſtraight lines may be expreſſed by the ſigns + and −; and ſegments of lines may be denoted by letters with theſe ſigns prefixed, as circumſtances require. In order to expreſs the poſitions of geometrical figures, which it will be more difficult to do, becauſe they are infinitely various, it will be neceſſary to have recourſe to proportions or equations, which expreſs certain relations that depend upon their poſitions: and the poſitions of figures may again be deduced from the equations that expreſs the relations of their parts. Thus, an angle may be expreſſed by the ratio of its ſine to the radius; a right angle in a triangle, by making the ſum of the ſquares of the two ſides equal to the ſquare of the hypothenuſe; the poſition of points may be aſcertained by perpendiculars let fall from them on lines given in poſition; the poſition of lines by the angles which they make with given lines, or by perpendiculars drawn to them from given points; the ſimilarity of triangles by an equation deduced from the proportionality of their ſides, &c. But it is not poſſible to give general rules for all the particular caſes that occur. As the geometrical propoſition muſt firſt be expreſſed in the algebraic manner, the reſult, when the operation is completed, muſt be expreſſed geometrically. All theorems, in which the proportions of magnitudes only are employed, and all thoſe that expreſs the relations of the ſegments of a ſtraight line, of their ſquares, rectangles, cubes, and parallelepipeds, are eaſily demonſtrated in the algebraical method. From the firſt propoſition of the ſecond book of Euclid, the nine following may be derived with eaſe in this manner; and they may be conſidered as appropriate examples of this moſt obvious application of algebra to geometry. Moreover, the algebraical demonſtrations of the 12th and 13th propoſitions of the ſecond book require only the 47th of the firſt book; and the 35th and 36th of the third book require only the third of the third book and 47th of the firſt.

In the ſolution of problems, the following general obſervations will be of uſe. When any geometrical problem is propoſed for algebraic reſolution, you are, in the firſt place, to deſcribe a figure that ſhall repreſent the parts or conditions of the problem, and regard that figure as the true one; then, having conſidered the nature of the problem, you are to prepare the figure for a ſolution, if it be neceſſary, by producing and drawing ſuch lines, as appear moſt conducive to that purpoſe. When this has been done, let the unknown line or lines that ſeem to be the moſt eaſily found, and any of the known ones that are requiſite, be denoted by proper ſymbols; then proceed to the operation, by obſerving the relation which the ſeveral parts have to each other. As no general rule can be given for the drawing of lines and ſelecting the moſt proper quantities to ſubſtitute for them, ſo as always to bring out the moſt ſimple concluſions, becauſe different problems require different methods of ſolution; it will be beſt, in order to gain experience in this matter, to attempt the ſolution of the ſame problem by ſeveral ways, and then to apply that which ſucceeds beſt to other caſes of the ſame kind, when they afterwards occur. The following general directions will be of uſe.

1. In preparing the figure, by drawing lines, let them be either parallel or perpendicular to other lines in the figure,

or ſo as to form ſimilar triangles; and if an angle be given, let the perpendicular be oppoſite to that angle, and alſo fall from the end of a given line, if poſſible.

2. In ſelecting proper quantities for ſubſtitution, let thoſe be choſen, whether required or not, which lie neareſt the known or given parts of the figure, and by means of which the next adjacent parts may be expreſſed, without the intervention of ſurds, by addition and ſubtraction only. Thus, if the problem were to find the perpendicular of a plane triangle, from the three ſides given, it will be much better to ſubſtitute for one of the ſegments of the baſe than for the perpendicular, though it be the quantity required; becauſe the whole baſe being given, the other ſegment will be given, or expreſſed, by ſubtraction only, and to the final equation come out a ſimple one; from whence the ſegments being known, the perpendicular is eaſily found by common arithmetic; whereas if the perpendicular were firſt ſought, both the ſegments would be ſurd quantities, and the final equation a quadratic one.

3. Where in any problem, there are two lines or quantities alike related to other parts of the figure or problem, the beſt way is to make uſe of neither of them, but to ſubſtitute for their ſum, their rectangle, or the ſum of their alternate quotients, or for ſome line or lines in the figure, to which they have both the ſame relation.

4. If the area, or the perimeter of a figure be given, or ſuch parts of it as have but a remote relation to the parts required, it will ſometimes be of uſe to aſſume another figure ſimilar to the propoſed one, of which one ſide is unity, or ſome other known quantity; from whence the other parts of this figure, by the known proportions of the homologous ſides, or parts, may be found, and an equation obtained.

Prob. I. "The baſe b, and the ſum of the hypothenuſe and perpendicular a, of a right-angled triangle ABC (*Plate* II. *Geometry*, *fig.* 28.) being given, to find the perpendicular." Let the perpendicular BC be denoted by x; then the hypothenuſe will be expreſſed by $a-x$; but (by Euc. 47. 1.) $AB^2 + BC^2 = AC^2$, i. e. $b^2 + x^2 = a^2 - 2ax + x^2$; whence $x = \frac{a^2-b^2}{2a}$ = the perpendicular required.

Prob. II. "The diagonal, and the perimeter of a rectangle, ABCD (*fig.* 29.) being given, to find the ſides." Put the diagonal $BD=a$, half the perimeter, $DA+AB$, $=b$, and $AB=x$; then will $AD=b-x$: and therefore, AB^2+AD^2 being $=BD^2$, we have $x^2+b^2-2bx+x^2=a^2$; which ſolved gives $x=\frac{\sqrt{2a^2-b^2}+b}{2}$.

Prob. III. "The area of a right-angled triangle ABC (*fig.* 30.), and the ſides of a rectangle EBDF inſcribed therein, being given; to find the ſides of the triangle." Put $DF=a$, $DE=b$, $BC=x$, and the given area $ABC=d$; then, by ſimilar triangles, we ſhall have $x-b$ (CF): a (DF) :: x (BC): $AB=\frac{ax}{x-b}$. Conſequently $\frac{ax}{x-b}\times\frac{x}{2}=d$, and therefore $ax^2 = 2dx - 2bd$, or $x^2 - \frac{2dx}{a} = -\frac{2bd}{a}$: which, ſolved, gives $x=\frac{d}{a}+\sqrt{\frac{dd}{aa}-\frac{2bd}{aa}}$; whence AB and AC will likewiſe be known.

Prob. IV. "Having the area of a rectangle DEFG (*fig.* 31.) inſcribed in a given triangle ABC, to determine the ſides of the rectangle." Let CI be perpendicular to AB, cutting DG in H; and let $CI=a$, $AB=b$, $DG=x$, and the given area $=cc$; then it will be, as $b:x::a:\frac{ax}{b}=CH$; which, taken from CI, leaves $a-\frac{ax}{b}=IH$; and this, multiplied by x, gives $ax-\frac{ax^2}{b}=cc=$ the area of the rectangle; whence we have $abx-ax^2=bcc$, $x^2-bx=-\frac{bcc}{a}$, $x-\frac{b}{2}=\pm\sqrt{\frac{bb}{4}-\frac{bcc}{a}}$, and $x=\frac{b}{2}\pm\sqrt{\frac{bb}{4}-\frac{bcc}{a}}$.

Prob. V. "To inſcribe a ſquare in a given triangle." Let ABC (*fig.* 32.) be the given triangle; and ſuppoſe DEFG to be the required ſquare; and draw the perpendicular BP of the triangle, which will be given together with the ſides. Then, the triangles BAC, BEF, being ſimilar, the notation may be as follows; viz. the baſe $AC=b$, the perpendicular $BP=p$, and the ſide of the ſquare DE or $EF=x$. Hence $BQ=BP-ED=p-x$; conſequently, by ſimilar triangles, BP : AC :: BQ : EF, i. e. $p:b::p-x:x$; whence $px=bp-bx$; or $bx+px=bp$, and $x=\frac{bp}{b+p}$ the ſide of the ſquare ſought, or a fourth proportional to the baſe and perpendicular, and the ſum of the two, making this ſum the firſt term; or $AC+BP:BP::AC:EF$.

Prob. VI. "The hypothenuſe AC of a right-angled triangle ABC (*fig.* 33.) and the ſide of the inſcribed ſquare BEDF, being given; to determine the other two ſides of the triangle." Let DE, or $DF=a$, $AC=b$, $AB=x$, and $BC=y$; then it will be, as $x:y::x-a$ (AF) : a (FD); whence we have $ax=yx-ya$, and conſequently $xy=ax+ay$. Moreover, $xx+yy=bb$; to which equation let the double of the former be added, and there ariſes $x^2+2xy+y^2=b^2+2ax+2ay$; that is, $x+y)^2=b^2+2a\times x+y$, or $x+y)^2-2a\times x+y=b^2$; whence, by conſidering $x+y$ as one quantity, and completing the ſquare, we have $x+y)^2-2a\times x+y+a^2=b^2+a^2$; whence $x+y-a=\sqrt{b^2+a^2}$, and $x+y=\sqrt{a^2+b^2}+a$, which put $=c$, and by ſubſtituting $c-x$ inſtead of its equal y in the equation $xy=ax+ay$, there will ariſe $cx-x^2=ac$; whence x will be found $=\frac{1}{2}c+\sqrt{\frac{1}{4}cc-ac}$, and $y=\frac{1}{2}c-\sqrt{\frac{1}{4}cc-ac}$.

Hence it appears that c, or its equal $\sqrt{aa+bb}+a$, cannot be leſs than $4a$, and therefore b^2 not leſs than $8a^2$, becauſe the quantity $\frac{1}{4}cc-ac$, under the radical ſign, would be negative, and its ſquare root impoſſible; and all ſquares, whether their roots be poſitive or negative, are poſitive; ſo that there cannot ariſe any ſuch quantities as negative ſquares, unleſs the conditions of the problem under conſideration are inconſiſtent and impoſſible. See Simpſon's Algebra, ſect. 18, paſſim.

The *ſecond* branch of the application of algebra to geometry, or that which reſpects the higher geometry, or the nature and properties of curve lines, was introduced by Des Cartes. In this department the nature of the curve is expreſſed or denoted by an algebraic equation, which is thus formed. A line is conceived to be drawn, as the diameter or ſome other principal line of the curve, and upon this line, at any indefinite points, are erected perpendiculars, which are called ordinates, and the parts of the firſt line cut off by them are called abſciſſes. Calling the abſciſs x, and its correſponding ordinate y, the known nature of the curve, or the mutual relations of other lines in it, will afford an equation involving in it x and y, and other given quantities. And as x and y are common to every point in the primary line, the equation, derived in this manner, will belong to every poſition or value of the abſciſs and ordinate, and may be properly conſidered as expreſſing the nature of the curve in all points of it; and is uſually called the equation of the curve.

Hence

Hence every particular curve will appear to have an appropriate equation, differing from that of every other; either as to the number of the terms, the powers of the unknown quantities x and y, or the ſigns of the co-efficients of the terms of the equation. Thus the circle, the ellipſe, the parabola, the hyperbola, and other curves, have their peculiar and diſtinguiſhing equations. The geometry of curve lines has been much extended and improved by means of theſe algebraic equations; for thus, all the properties of ſuch equations, and their roots are transferred to the curve lines whoſe abſciſſes and ordinates have ſimilar properties, and conſequently the known properties of curves are transferred to the equations that repreſent them. See CURVES.

APPLICATION of *Geometry* to *Algebra*. The higher geometry, or that of curve lines, is uſefully applied to the purpoſe of inveſtigating the nature and roots of equations; and alſo the values of thoſe roots by the conſtruction of ſuch lines. Beſides, common geometry is alſo applicable to algebra in ſome caſes with advantage. A familiar inſtance will be ſufficient to evince the truth of this obſervation. If it were required to ſquare the binomial $a+b$; a ſquare (*Plate* II. *Geometry*, *fig.* 34.) may be formed, whoſe ſide is equal to $a+b$; and then drawing two lines parallel to the ſides from the points of diviſion, it will immediately appear that the ſquare of the compound quantity $a+b$ is equal to the ſquares of both the parts, together with two rectangles under the two parts, i. e. $\overline{a+b}^2 = a^2+b^2+2ab$, which is alſo deduced from a geometrical conſtruction. Hence it alſo appears, that if a be equal to b, the ſquare on the whole line will be equal to four times the ſquare upon the half of that line. In this manner the Arabians, and the early European writers on algebra, deduced and demonſtrated the common rule for reſolving compound quadratic equations. And by a ſimilar method, Tartalea and Cardan derived and demonſtrated all the rules for the reſolution of cubic equations, uſing cubes and parallelepipedons inſtead of ſquares and rectangles.

APPLICATION of *Algebra* and *Geometry* to *Mechanics*. This is founded on the ſame principles as the application of algebra to geometry. It principally conſiſts in repreſenting by equations the curves deſcribed by bodies in motion, and in determining the equation between the ſpaces which the bodies deſcribe, when actuated by any forces; and the times employed in deſcribing theſe ſpaces, &c. The article ACCELERATION exhibits an inſtance of this kind of application; as the altitudes of triangles repreſent the times, the baſes, the velocities, and the areas, the ſpaces deſcribed by bodies in accelerated motion. In ſhort, as velocities, times, forces, ſpaces, &c. may be repreſented by lines and geometrical figures; and as theſe are capable of algebraic notations and operations, it is evident how the principles and properties of both algebra and geometry may be applied to mechanics, and indeed to all the other branches of the mixt mathematics.

APPLICATION of *Mechanics* to *Geometry*, conſiſts chiefly in the uſe that is ſometimes made of the centre of gravity of figures for determining the contents of ſolids deſcribed by thoſe figures. See CENTROBARYC *Method*.

APPLICATION of *Geometry* and *Aſtronomy* to *Geography*, principally conſiſts in the three following articles; viz. in determining by geometrical and aſtronomical operations, the figure of the terreſtrial globe; in finding the poſitions of places by their obſerved latitude and longitude; and in determining, by geometrical operations, the poſitions of places that are not very remote from one another. Aſtronomy and geography are alſo of great uſe in navigation.

APPLICATION of *Geometry* and *Algebra* to *Phyſics*, or *Natural Philoſophy*. For this application we are indebted to ſir Iſaac Newton, whoſe philoſophy may therefore be called the geometrical or mathematical philoſophy; and upon this application are founded all the phyſico-mathematical ſciences. Hence a ſingle obſervation or experiment will often produce a whole ſcience. Having aſcertained by experience, that the rays of light, by reflection, make the angle of incidence equal to that of reflection, we hence deduce the whole ſcience of Catoptrics, which thus becomes purely geometrical, ſince it is reduced to the compariſon of angles and lines given in poſition. The caſe is alſo the ſame in many other ſciences.

APPLICATION of *one thing to another*, is employed generally in ſubjects of *art* or *ſcience*, to denote the uſe that is made of the former for underſtanding or perfecting the latter; thus the application of the cycloid to pendulums ſignifies the uſe that is made of the cycloid for improving the doctrine and uſe of pendulums. See CYCLOID and PENDULUM.

APPLICATION is alſo uſed, in ſubjects of literature, &c. for the adjuſting, accommodating, or making a thing quadrate to another. Thus we ſay, the application of a fable, &c.

APPLICATION, in *Theology*, is particularly uſed, by ſome divines, for the act whereby our Saviour transfers, or makes over to us, what he had earned or purchaſed by his holy life and death. Accordingly it is by this application of the merits of Chriſt, that we are to be juſtified and entitled to grace and glory. The ſacraments are the ordinary means, or inſtruments, whereby this application is effected.

APPLY, among *Mathematicians*, ſometimes ſignifies to transfer a line given into a circle moſt commonly, or into any other figure; ſo that its ends may be in the perimeter of the figure.

APPLY denotes alſo as much as *divide*, eſpecially among Latin writers: who as as they ſay *duc* AB *in* CB, draw AB into CB, when they would have AB multiplied by CB; or rather when they would have a right-angled parallelogram made of thoſe lines; ſo they ſay, *applica* AB *ad* CB, *apply* AB to CB, when they would have CB divided by AB; which is thus expreſſed $\frac{CB}{AB}$. Or, it is uſed when the area of a figure, and one dimenſion are given, and the other is to be found: as the area ab applied to the line c, is $\frac{ab}{c}$.

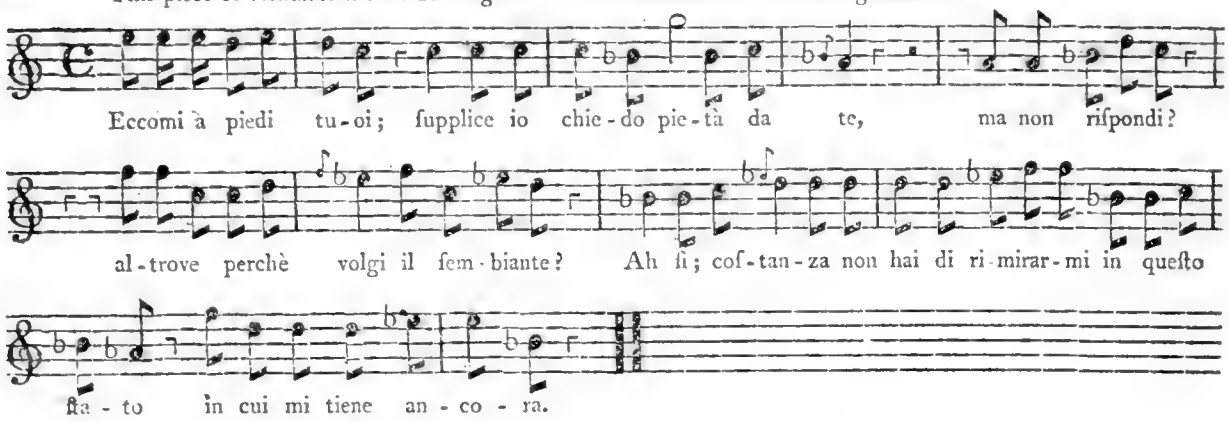
APPOGGIATURA, in *Muſic*, is a ſmall additional note of embelliſhment added to a melody, which is not ſuppoſed to occupy any portion of the time, a bar appearing complete without it; but the time which is given to this little note, is taken out of the great note which it precedes. As to the length of theſe diminutive notes, the beſt rule that can be given for them is, that in common time they ſhould be half the length of the great note, for which only the other half remains; and in triple time they rob the ſubſequent note of two-thirds of its length. So that the appoggiatura to a ſemibreve is a minim, to a minim a crotchet, to a crotchet a quaver, &c.

It has been well obſerved by M. Framery, in the Encyclopedie Methodique, that the appoggiatura gives a tender expreſſion to the melody, that would injure marches and movements of ſpirit, which require energy and ſtrong accents.

Appoggiaturas below the principal note, are more tender and affecting than thoſe above; which are, however, more graceful and intereſting. In recitative, though no appoggiaturas are ever written; they are as much underſtood and expected, as dots to the letter *i*.

Fragment of recitative, from Sacchini's opera of Creſo.

This piece of *recitative* ſhould be ſung as if it were written in the following manner:



M. Framery ſays, that the appoggiatura is the only embelliſhment in recitative. But Pacchierotti and Marcheſi (perhaps ſince his article was written) have introduced graces in recitative, particularly before a cloſe, which all the Italian ſingers and their imitators, who can execute them, have followed. See RECITATIVE.

The term appoggiatura is derived from appoggiare, to lean on. And as theſe little notes generally occur on the accented parts of a bar, more force is given to them by good performers, than to the principal note which they precede. In pathetic ſtrains, the ſoul of the melody may be ſaid to reſide in the appoggiaturas.

APPOINTEE, a name formerly given to a foot ſoldier in the French army, &c. who for his long ſervice and bravery receives pay above private ſentinels.

Till the year 1670, they had alſo captains and lieutenants under the appellation of appointees, who, without reſiding in the regiment, received their pay. See ANSPESSADES.

APPOINTEE, in *Heraldry*, is when two or more things are placed touching each other at the points or ends.

APPOINTMENT, a penſion or ſalary given by great lords and princes to perſons of worth and parts, in order to retain them in their ſervice. This term was chiefly uſed among the French in the time of their monarchy.

Appointments differ from wages, in that the latter are fixed and ordinary, being paid by the ordinary treaſurers; whereas appointments are annual gratifications granted by *brevet* for a time uncertain, and are paid out of the privy purſe.

APPOINTMENT, in *Law*, is uſed in contradiſtinction to a bequeſt. Thus, by conſtruction of the ſtatute 43 Eliz. c. 4. it is held, that a deviſe to a corporation for a charitable uſe is valid, as operating in the nature of an *appointment* rather than of a *bequeſt*. It is alſo held, that the ſtatute of Elizabeth, which favours appointments to charities, ſuperſedes and repeals all former ſtatutes, and ſupplies all defects of aſſurances; and therefore, not only a deviſe to a corporation, but a deviſe by a copyhold tenant without ſurrendering to the uſe of his will, and a deviſe (nay even a ſettlement) by tenant in tail without either fine or recovery, if made

made to a charitable uſe, are good by way of appointment. Blackſt. Com. b. ii. vol. ii. p. 376.

APPOMATOX, in *Geography*, is the name of a ſouthern branch of James river in Virginia.

APPORTIONMENT, Apportionamentum, in *Law*, a dividing of a rent into two or more parts, or portions, according as the land whence it iſſues is divided among two, or more proprietors.

Thus if a man, having a rent-ſervice iſſuing out of land, purchaſe a part of the land; the rent ſhall be apportioned, according to the value of the land.—So if a man let lands for years, reſerving rent, and a ſtranger afterward recover part of the land; the rent ſhall be apportioned.

But a rent-charge cannot be apportioned, nor things that are entire; as if one hold land by ſervice, to pay to his lord yearly at ſuch a feaſt a horſe, &c.; there, if the lord purchaſe a part of the land, this ſervice is totally extinct; becauſe ſuch things cannot be divided without hurt to the whole. But if part of the land, out of which a rent-charge iſſues, deſcends to the grantee of the rent, this ſhall be apportioned.

On partition of lands out of which a rent is iſſuing, the rent ſhall be apportioned. The ſtatute 11 Geo. ii. c. 19. § 15. has in certain caſes altered the law as to apportioning of rents in point of time; it being thereby enacted, "that if any tenant for life ſhall happen to die before, or on the day on which any rent was reſerved or made payable, upon any demiſe or leaſe of any lands, tenements, or hereditaments, which determined on the death of any ſuch tenant for life, the executors or adminiſtrators of ſuch tenant for life, ſhall and may, in an action on the caſe, recover of and from ſuch under-tenant or under-tenants of ſuch lands, &c. if ſuch tenant for life die on the day on which the ſame was made payable, the whole; or if before ſuch day, then a proportion of ſuch rent, according to the time ſuch tenant for life lived, of the laſt year, or quarter of a year, or other time in which the ſaid rent was gowing due as aforeſaid, making all juſt allowances, or a proportionable part thereof reſpectively." Before this ſtatute, the rent, by the death of a tenant for life, was loſt; but the legiſlature having thus interpoſed in favour of tenants for life, the proviſions of the ſtatute have, by an equitable conſtruction, been extended to tenants in tail. However, the dividends of money directed to be laid out in lands, and in the mean time to be inveſted in government ſecurities, and the intereſt and dividends to be applied as the rents and profits would in caſe it were laid out in land, were held not to be apportionable, though tenant for life died in the middle of the half year. But where the money is laid out in mortgage, till a purchaſe could be made, the intereſt is apportionable. This diſtinction, however, may be referred to intereſt on a mortgage, being in fact due from day to day, and ſo not properly an apportionment; whereas the dividends accruing from the public funds are made payable on certain days, and therefore not apportionable. Upon this principle the Maſter of the Rolls decreed an apportionment of maintenance-money, it being for the daily ſubſiſtence of the infant; and the principle extending to a ſeparate maintenance for a feme covert, ſuch apportionment has, in ſuch caſes, been allowed at law.

A man purchaſes part of the land where he hath common appendant, the common ſhall be apportioned: of common appurtenant it is otherwiſe; and if by the act of the party, the common is extinct. Common appendant and appurtenant may be apportioned on alienation of part of the land to which it is appendant or appurtenant. Danv. Abr. 505. 507. Co. Litt. 144. 148, 149. Amb. Rep. 502. 2 P. Wms. 176. 501. 8 Rep. 79. Wood's Inſt. 199.

APPOSAL *of ſheriffs*, is the charging of them with money received on their account in the exchequer, 22 and 23 Car. II. c. 22.

APPOSER ſignifies an examiner. In the court of exchequer, there is an officer called the foreign *apoſer*.

In the office of confirmation, in the firſt liturgy of Edw. VI. the rubric directs the biſhop, or ſuch as he ſhall appoint, to appoſe a child; and a biſhop's examining chaplain was anciently called his *poſer*.

APPOSITION, from *ad*, *to*, and *pono*, *I put*, the act of putting or applying one thing to another.

Apposition is uſed in *Phyſics*, in ſpeaking of bodies which derive their growth from the adjunction or union of neighbouring bodies.

Apposition, in *Grammar*, denotes the putting two or more ſubſtantives together in the ſame caſe, and without any copulative conjunction between them.

Thus, Flanders, bloody theatre, horrible ſcene of war; love, enemy of human quiet; peace, parent of riches, ſource of faction, &c.

APPRAISER, from *ad*, *to*, and *pretium*, *value*, one who rates, or ſets a value upon goods, &c. He muſt be a ſkilful and honeſt perſon. It is not a buſineſs of itſelf, but is practiſed by brokers of houſehold furniture, to which ſet of men the word is chiefly applied. Yet upholſterers and other brokers are employed, or even any perſon or perſons who are ſuppoſed to be ſkilled in the commodities to be appraiſed or valued. They are employed in caſes of death, executions brought in upon goods, or of ſtock to be turned over from one perſon to another, or divided between copartners; and are called *ſworn appraiſers*, from their taking an oath to do juſtice between party and party. If they value the goods too high, they ſhall be obliged to take them at the price appraiſed, ſtatute 11 Edw. I.

They ſometimes appraiſe on behalf of both ſides, each party agreeing to have the ſame appraiſer or appraiſers; ſometimes in oppoſition, each part chuſing one or more of a ſide; and ſometimes by commiſſion or deputation of truſtees, maſters in chancery, &c.

APPRECIATION, in *Muſic*, is the judging accurately of things within the power of our ſenſes and perception. Our organ of hearing is unable to judge of ſounds beyond a certain degree of gravity and acuteneſs. The octave below double C, the loweſt note of the additional keys in the baſe of piano-fortes, is extremely difficult to tune; and the additional high notes ſeem more the production of wood than wire. However, the great mathematician, Euler, gives the extent of eight octaves to human perception; from the higheſt appreciable ſound to the loweſt: but, ſays Rouſſeau, theſe extremes of the ſcale not being very agreeable, we ſeldom, in practice, exceed five octaves, which the common compaſs of keyed-inſtruments furniſhes. There is likewiſe a degree of force or loudneſs, which we cannot appreciate. The ſound of a great bell, for inſtance, gives no diſtinct and certain tone, but a confuſion of harmonies, which we cannot diſtinguiſh in the belfrey, from the fundamental. We muſt diminiſh the force by diſtance, ere we are ſure what the real ſound is. It is the ſame with a wind inſtrument overblown, and a voice that is forced beyond its natural power; ſo that thoſe who try to ſing loud, with a feeble voice, are always out of tune. With reſpect to noiſe, we can never reduce it to any fixed tone; and it is that which conſtitutes the difference between ſound and noiſe. See Bruit.

The abbé Feyter, taking up the ſubject, ſays, "Euler probably determined the compaſs of appreciable ſounds, from

from the following circumſtances: The largeſt pipe in a 32 feet organ, is an octave below the *bordunn*, or double-baſe ſtop, and two octaves below double C in the open diapaſon of an organ. Now from the loweſt C to the higheſt, on a piano-forte or harpſichord, there is an interval of four octaves; and if we add two octaves to the bottom, and two to the top, for the low and high ſtops of an organ, we ſhall have the eight octaves in queſtion. In order to complete the demonſtration, we muſt have found by experiment, that a pipe leſs than two inches will not ſpeak: for the moſt acute C in the 15th has only that length; but though birds, and the ſerinetto or bird-pipe, do produce more acute ſounds, as we are unable to find their uniſon, we know not what they are.

APPREHENSION, in *Logic*, denotes the ſimple attention of the mind to an object preſented either to our ſenſe, or our imagination, without paſſing a judgment, or making any inference.

The word literally denotes the action of the hand, whereby it takes hold of, and graſps any thing: being formed of *ad*, and *prehendo*, *I catch*.

It is by that operation of the underſtanding, which is called ſimple apprehenſion, that we acquire thoſe notions or ideas, which are the materials of all our knowledge. According to Dr. Reid, it is ſynonymous with conception; and like other ſimple operations of the mind, it cannot be logically defined. For his account of this operation of the mind, ſee CONCEPTION.

APPREHENSION is likewiſe uſed to expreſs an inadequate and imperfect idea: and thus it is applied to our knowledge of God, in contradiſtinction to comprehenſion.

APPREHENSION, in *Law*, ſignifies the ſeizing a criminal, in order to bring him to juſtice. See ARREST.

APPRENDRE, in our *Ancient Law-Books*, a fee or profit to be taken or received. Statute 2 & 3 Edw. VI. c. 8.

APPRENTICE, from *apprendre*, *to learn*, one who is bound by covenant to ſerve a tradeſman or artificer a certain time, uſually ſeven years, upon condition of the maſter's inſtructing him in his art or myſtery.

Apprentices may likewiſe be bound to huſbandmen, or even to gentlemen of fortune and clergymen; who, as well as tradeſmen, are compellable to take the children of the poor under a penalty of 10l. (ſtat. 8 & 9 Will. III. c. 30. § 5.); and the church-wardens and overſeers, with the conſent of two juſtices, may bind them till the age of twenty-one years. ſtat. 43 Eliz. c. 2. 18 Geo. III. c. 47. And by ſtatute 5 Eliz. c. 4. §. 35. the juſtices may compel certain perſons under age to be bound as apprentices, and on refuſal may commit them.

Apprentices may be diſcharged on reaſonable cauſe, either at their own requeſt or that of their maſters, at the quarter ſeſſions, or by one juſtice, with appeal to the ſeſſions (5 Eliz. c. 4.), who may, by the equity of the ſtatute, if they think it reaſonable, direct reſtitution of a rateable ſhare of the money given with the apprentice; and pariſh-apprentices may be diſcharged in the ſame manner, by two juſtices, 20 Geo. II. c. 19. But if any, whoſe premium has been leſs than ten pounds, run away from their maſters, they are compellable to ſerve out the time of abſence, or give ſatisfaction for it, at any period within ſeven years after expiration of the original contract, 6 Geo. III. c. 26. Apprentices gain a ſettlement in that pariſh where they laſt ſerved forty days, 13 & 14 Car. II. c. 12. And by the 5th of Elizabeth, c. 4 they have an excluſive right to exerciſe the trade in which they have been inſtructed, in any part of England. However, the reſolutions of the courts have in general rather confined than extended the reſtrictions of this ſtatute.

No trades are held to be within the ſtatute, but ſuch as were in being at the making of it. For trading in a country village, apprenticeſhips are not requiſite; and following the trade ſeven years, without any effectual proſecution (either as a maſter or a ſervant), is ſufficient without an actual apprenticeſhip. See Blackſtone's Com. vol. i. p. 426, &c.

By the common law, infants, or perſons under the age of 21 years, cannot bind themſelves apprentices, in ſuch a manner as to entitle their maſters to an action of covenant, or other action againſt *them* for departing from their ſervice, or other breaches of their indentures; which makes it neceſſary, according to the uſual practice, to get ſome of their friends to be bound for the faithful diſcharge of their offices, according to the terms agreed on. If an apprentice miſbehaves himſelf, the maſter may correct him in his ſervice, or complain to a juſtice of peace, to have him puniſhed according to the ſtatute 5 Eliz. c. 4. If any one entices an apprentice from his maſter's ſervice, or harbours him after notice, the maſter may maintain a ſpecial action on the caſe againſt the perſon ſo doing. By the cuſtom of London, an infant unmarried, and above the age of fourteen, may bind himſelf apprentice to a freeman of London, by indenture with proper covenants, which covenants, by the ſaid cuſtom, ſhall be as binding as if he were of full age. By the ſtat. 5 Eliz. c. 4. § 25. an apprentice muſt be bound by deed indented; and this muſt be complied with for all purpoſes except for obtaining a ſettlement. Indentures muſt alſo be enrolled in all towns corporate. 5 Eliz. c. 5. and 5 Geo. II. c. 46.; and in London, by the cuſtom, in the Chamberlain's office there. In London, if the indentures be not enrolled before the Chamberlain within a year, upon a petition to the Mayor and Aldermen, &c. a *ſcire facias* ſhall iſſue to the maſter, to ſhew cauſe why not enrolled; and if it was through the maſter's default, the apprentice may ſue out his indentures and be diſcharged: otherwiſe, if through the fault of the apprentice, as if he would not come to preſent himſelf before the Chamberlain, &c. for it cannot be enrolled unleſs the apprentice be in court and acknowledge it. Indentures are likewiſe to be ſtamped, and are chargeable with ſeveral duties by act of parliament.

With regard to the aſſigning of apprentices, it hath been held that an apprentice is not aſſignable. He cannot be bound nor diſcharged without deed. But though an apprentice is not aſſignable, yet ſuch aſſignment amounts to a contract between the two maſters, that the child ſhould ſerve the latter. By the cuſtom of the city of London, an apprentice may be turned over from one maſter to another; and if the maſter refuſe to make him free at the end of the term, the Chamberlain may make him free; but, in other corporations, there muſt be a mandamus to the mayor, &c. to make him free in ſuch caſe. It ſeems agreed, that if a man be bound to inſtruct an apprentice in a trade for ſeven years, and the maſter dies, the condition is diſpenſed with, being a thing perſonal; but if he be further bound to find him meat, drink, cloathing, and other neceſſaries; here the death of the maſter doth not diſpenſe with the condition, but his executors ſhall be bound to perform it as far as they have aſſets. But if a perſon is bound apprentice by a juſtice of the peace, and the maſter dies before the expiration of the term, the juſtices have no power to oblige his executor, by their order, to receive ſuch apprentice and maintain him. It is ſaid, however, that the executor or adminiſtrator may bind him to another maſter for the remaining part of his time. In this caſe of the maſter's dying, it is ſaid that by

the cuſtom of London, the executor muſt put the apprentice to another maſter of the ſame trade. By the cuſtom of the city of London, a freeman may turn away his apprentice for gaming: though, if a maſter turn away an apprentice on account of negligence, &c. equity may decree him to refund part of the money given with him. Jacob's Law Dict. by Tomlins, Art. *Apprentice*.

In France, the ſons of tradeſmen, living in their fathers' houſe till ſeventeen years of age, were reputed to have ſerved an apprenticeſhip. In that country the times of ſerving are different in the different profeſſions, from three years to eight. After ſerving out an apprenticeſhip, the perſon becomes what they call an *aſpirant*, or candidate for maſterſhip, and is to be examined by proper officers as to his ſkill and proficiency, and alſo to exhibit a *chef d'œuvre* or maſterpiece in the art he has been bred to, before he be ſuffered to ſet up to practiſe for himſelf. And the cuſtom of France, in regard to apprentices, is not unworthy the imitation of other nations.

Anciently, benchers in the inns of court were called *apprentices of the law*, in Latin *apprenticii juris nobiliores*; as appears by Mr. Selden's note on Forteſcue; and ſo the learned Plowden ſtyles himſelf. See BENCHER.

Sir Henry Finch, in his *Nomotechnia*, writes himſelf, *apprentice de ley*: ſir Edward Coke, in his Inſt. ſays *apprenticii legis*, in pleading, are called *homines conſiliarii, & in lege periti*; and in another place, apprentices, and other counſellors of law.

APPRENTICESHIP denotes the ſervitude of an apprentice, or the duration of his indenture. The ingenious Dr. Smith, in his well-known and admirable work on "The Nature and Cauſes of the Wealth of Nations," has introduced ſeveral important and uſeful obſervations on this ſubject. The competition in ſeveral employments is reſtrained to a ſmaller number, than would otherwiſe be diſpoſed to enter into them, partly by the limitation of the number of apprentices, which attends the excluſive privilege of incorporated trades, and partly by the long term of apprenticeſhip, which increaſes the expence of education. Seven years ſeem formerly to have been, all over Europe, the uſual term eſtabliſhed for the duration of apprenticeſhips in the greater number of incorporated trades. Such incorporations were anciently called univerſities, which is the proper Latin name for any incorporation whatever. The univerſity of ſmiths, the univerſity of tailors, &c. are expreſſions commonly occurring in the old charters of ancient towns. When thoſe particular incorporations, which are now peculiarly called univerſities, were firſt eſtabliſhed, the term of years during which it was neceſſary to ſtudy, in order to obtain the degree of Maſter of Arts, appears evidently to have been copied from the term of apprenticeſhip in common trades, of which the incorporations were much more ancient. As to have wrought ſeven years under a maſter properly qualified, was neceſſary to entitle any perſon to become a maſter, and to have himſelf apprentices, in a common trade; ſo to have ſtudied ſeven years under a maſter properly qualified, was neceſſary to entitle him to become a maſter, teacher, or doctor (words anciently ſynonymous) in the liberal arts, and to have ſcholars or apprentices (words likewiſe originally ſynonymous) to ſtudy under him. By the 5th of Elizabeth, commonly called the *ſtatute of apprenticeſhip*, it was enacted, that no perſon ſhould for the future exerciſe any trade, craft, or myſtery, at that time exerciſed in England, unleſs he had previouſly ſerved to it an apprenticeſhip of ſeven years at leaſt; and thus, what before had been the bye-law of many particular corporations, became in England the general and public law of all trades carried on in market towns. To country villages the term of ſeven years' apprenticeſhip doth not extend; but the limitation of this ſtatute to trades exerciſed before it was paſſed has given occaſion to ſeveral diſtinctions, which, conſidered as rules of police, appear as fooliſh as can well be imagined. A coach-maker, for inſtance, has no right to make, or employ journeymen for making, coach wheels; but he muſt buy them of a maſter wheel-wright, this latter trade having been exerciſed in England before the 5th of Elizabeth. But a wheel-wright, though he has never ſerved an apprenticeſhip to a coach-maker, may, by himſelf or journeymen, make coaches, becauſe this trade, being of a later origin, is not within the ſtatute. Thus alſo the manufactures of Manchester, Birmingham, and Wolverhampton are, many of them, upon this account, not within the ſtatute, not having been exerciſed in England before the 5th Elizabeth. The regulations of apprenticeſhip in Ireland are upon a different footing, and ſomewhat leſs illiberal than in England. Prohibitions ſimilar to thoſe of the ſtatute 5 Eliz. obtain in all corporate towns, by authority of bye-laws of the ſeveral corporations: but theſe prohibitions extend only to natives of Ireland; for by a regulation made by the lord lieutenant and privy council, having in this inſtance, by 17 & 18 Car. II. the force of a law, all foreigners and aliens, as well perſons of other religious perſuaſions as proteſtants, who are merchants, traders, artificers, &c. ſhall, upon coming to reſide in any city, walled town, or corporation, and paying twenty ſhillings by way of fine to the chief magiſtrate and common council, or other perſons authorized to admit freemen, be admitted to the freedom of that city, &c. and to the freedom of guilds of their reſpective trades, with the full enjoyment of all privileges of buying, ſelling, working, &c.; and any magiſtrate, refuſing to admit foreigners ſo applying, ſhall be diſfranchiſed. In Scotland, there is no general law which regulates univerſally the duration of apprenticeſhips. The term is different in different corporations: where it is long, a part of it may generally be redeemed by paying a ſmall fine. In moſt towns too, a very ſmall fine is ſufficient to purchaſe the freedom of any corporation. The weavers of linen and hempen cloth, the principal manufactures of the country, as well as all other artificers ſubſervient to them, wheel-makers, reel-makers, &c. may exerciſe their trades in any town corporate without paying any fine. In all towns corporate all perſons are free to ſell butchers' meat upon any lawful day of the week. Three years are, in Scotland, a common term of apprenticeſhip, in ſome very nice trades; and, in general, there is no country in Europe in which corporation laws are ſo little oppreſſive. In France, the duration of apprenticeſhips is different in different towns and in different trades. In Paris, five years are the term required in a great number; and before any perſon can be qualified to exerciſe the trade, as a maſter, he muſt, in many of them, ſerve five years more as a journeyman. During this latter time, he is called the companion of his maſter, and the term itſelf is called his companionſhip. The inſtitution of long apprenticeſhips, ſays Dr. Smith, can give no ſecurity that inſufficient workmanſhip ſhall not frequently be expoſed to ſale: nor has it any tendency to form young people to induſtry. Apprenticeſhips were altogether unknown to the ancients: the Roman law is perfectly ſilent with regard to them. There is no Greek or Latin word which expreſſes the idea we now annex to the word Apprentice. Long apprenticeſhips are altogether unneceſſary. The arts, which are much ſuperior to common trades, ſuch as thoſe of making clocks and watches, contain no ſuch myſtery as to require a long courſe of inſtruction. In the common mechanic trades, the

the leſſons of a few days might certainly be ſufficient. The dexterity of hand, indeed, even in common trades, cannot be acquired without much practice and experience. But a young man would practiſe with much more diligence and attention, if, from the beginning, he wrought as a journeyman, being paid in proportion to the little work which he could execute, and paying, in his turn, for the materials which he might ſometimes ſpoil through awkwardneſs and inexperience. His education would generally in this way be more effectual, and always leſs tedious and expenſive. The maſter, indeed, would be a loſer; he would loſe all the wages of the apprentice, which he now ſaves for ſeven years together. In the end, perhaps, the apprentice himſelf would be a loſer: in a trade ſo eaſily learnt he would have more competitors; and his wages, when he came to be a complete workman, would be much leſs than at preſent. The ſame increaſe of competition would reduce the profits of the maſters, as well as the wages of the workmen: the trades, the crafts, the myſteries would all be loſers; but the public would be a gainer, the work of all artificers coming in this way much cheaper to market. Smith's Nature and Cauſes of the Wealth of Nations, vol. i. p. 183—191. Iriſh Tranſ. vol. iv. pt. ii. part 59, &c.

APPRISING, in *Scots Law*, the name of the action by which a creditor formerly carried off the eſtate of his debtor for payment. It was thus called, becauſe the ſheriff, when no purchaſer of the heritable rights could be found, *appriſed*, or taxed the value of the lands by an inqueſt, ſo as to make over to the creditor lands to the value of the debt. By the act 1672, appriſings were ſuperſeded, and adjudications were ſubſtituted in their place. See ADJUDICATION.

APPROACH, *curve of equable, acceſſus equabilis*, was firſt propoſed by M. Leibnitz, and has given the analyſts ſome trouble. The curve is of ſuch a nature, that a body deſcending in it by the ſole power of gravity approaches the horizon equally in equal times.—This curve has been found by Bernouilli, Varignon, Maupertuis, and others, to be the ſecond cubical parabola ſo placed as that its point of regreſſion or vertex is uppermoſt, and the deſcending body muſt commence its motion in it with a certain determinate velocity. M. Varignon rendered the queſtion general, by inveſtigating the curve which a body might deſcribe in vacuo, ſo as to approach towards a given point through equal ſpaces in equal times, according to any law of gravity. Maupertuis alſo reſolved the ſame problem, in the caſe of a body deſcending in a medium, the reſiſtance of which is proportioned to the ſquare of the velocity. Vide Hiſt. Acad. R. Sciences, an. 1699. p. 82. Idem, an. 1730. p. 129. Mem. p. 333.

APPROACH, in *Gardening*, is uſed in ſpeaking of the method of inarching or INOCULATING, which is called GRAFTING by *approach*.

Some phyſicians alſo ſpeak of a method of curing diſeaſes by touching or *approach*. See APPROXIMATION.

APPROACHES, in *Fortification*, the ſeveral works made by the beſiegers for advancing or getting nearer to a fortreſs, or place beſieged. Such are trenches, mines, ſaps, lodgments, batteries, galleries, epaulements, &c.

APPROACHES, or *Lines of Approach*, are particularly uſed for trenches dug in the ground, and their earth thrown up on the ſide next the place beſieged; under ſhelter or defence whereof the beſiegers may approach, without loſs, to the parapet of the covered way, and plant guns, &c. wherewith to cannonade the place.

The lines of approach are to be connected by PARALLELS, or lines of communication.

The beſieged frequently make COUNTER-*approaches*, to interrupt and defeat the enemies' approaches.

The ancients made their approaches towards the place beſieged much after the ſame manner as the moderns. M. de Folard ſhews, that they had their trenches, their ſaps, parallels, &c. which, though uſually held of modern invention, appear to have been practiſed long before by the Greeks, Romans, Aſiatics, &c. Vide Polyb. t. ii. p. 161.

APPROACHES, *Method of*, in *Mathematics*, a name given by Dr. Wallis, in his Algebra, to a method of reſolving certain problems relating to ſquare numbers, &c., by firſt aſſigning certain limits to the quantities required, and then approaching nearer and nearer till a coincidence is obtained. In this ſenſe, the double rule of falſe poſition may be conſidered as a method of approaches. See APPROXIMATION.

APPROACH, in *Fowling*, expreſſes the devices made uſe of to get within ſhot of ſhy birds. There are many contrivances practiſed for this purpoſe: a very common one is by means of circular pieces of wood or hoops ſurrounded with boughs, not unlike a chimney-ſweeper's or milkmaid's garland, within which the fowler conceals himſelf with his gun, and ſteals on the birds, who are completely deceived, imagining the machine a tree, and its approach effected by their own motion towards it: it is therefore neceſſary that the fowler's approach ſhould be very ſlow, and his motions very uniform; for any ruffle or ſhake would alarm the birds, and put them to flight. This mode is ſucceſsfully practiſed on water-fowl when they are feeding on marſhy grounds or baſking on the ſides of the water. But when theſe birds confine themſelves principally to the middle of wide rivers, or in moors and lakes, this leafy covering muſt be placed in a boat; or a tall ſcreen made of ſtraw is ſometimes ſet upright in it, behind which the ſportſman remains concealed, and either gently paddles himſelf near the birds, or permits the boat to drift towards them.

In moonlight nights when water-fowls come on ſhore to feed, they are approached by the fowler, concealing himſelf behind a horſe, who is made to move gently towards the birds, and this practice has given riſe to an artificial figure called a ſtalking-horſe, behind which the ſportſman endeavours to gain on the fowls; but this is a leſs certain method, as they are fearful even of horſes, cows, and ſheep, as well as of man.

In deep ſnows, birds are approached by concealing every part of the perſon in a white dreſs; and even the gun muſt be clothed likewiſe. By this means hares, partridges, and moor-game are killed in abundance: but this device is not held fair in ſporting language, becauſe theſe are leſs wary animals, and, moreover, becauſe there are regular methods in conſtant practice to entrap them. When buſtards were plentiful on Saliſbury plain, it was uſual to hunt and approach them in a kind of covered cart with loopholes through which the fowler could ſee and take aim at them; but cultivation and increaſed population have nearly deſtroyed theſe birds in England.

APPROBATION, a ſtate or diſpoſition of the mind wherein we put a value upon, or become pleaſed with, ſome perſon or thing. Moraliſts are divided on the principle of approbation, or the motive which determines us to approve and diſapprove. The Epicureans will have it to be only *ſelf-intereſt*; according to them, that which determines any agent to approve his own action, is its apparent tendency to his private happineſs; and even the appprobation of another's action flows from no other cauſe but an opinion of its tendency to the happineſs of the approver, either immediately or remotely. Thoſe, who incline to this ſyſtem,

reaſon thus: having experienced, in ſome inſtances, a particular conduct to be beneficial to ourſelves, or obſerved that it would be ſo, a ſentiment of approbation riſes up in our minds, which ſentiment afterwards accompanies the idea, or the mention of the ſame conduct, although the private advantage which firſt excited it no longer exiſt. Others reſolve approbation into a moral ſenſe, or a principle of benevolence, by which we are determined to approve every kind affection, either in ourſelves or others, and all publicly uſeful actions, which we imagine to flow from ſuch affection, without any view to our own private happineſs.

Dr. Adam Smith thinks it needleſs to introduce any new power of perception, in order to account for the principle of approbation; and apprehends that ſympathy is ſufficient to account for all the effects aſcribed to this peculiar faculty. This ſyſtem places virtue in utility; and accounts for the pleaſure with which the ſpectator ſurveys the utility of any quality from ſympathy with the happineſs of thoſe who are affected by it. This ſympathy, he obſerves, is different both from that by which we enter into the motives of the agent, and from that by which we go along with the gratitude of the perſons who are benefited by his actions; and he ſays, it is the ſame principle with that by which we approve of a well-contrived machine.

Dr. Smith does not reject entirely from his ſyſtem that principle of utility, the perception of which in any action or character conſtitutes, according to Mr. Hume, the ſentiment of moral approbation. That no qualities of the mind are approved of as virtuous, but ſuch as are uſeful or agreeable, either to the perſon himſelf or to others, he admits to be a propoſition that holds univerſally; and he alſo admits, that the ſentiment of approbation with which we regard virtue, is enlivened by the perception of this utility, or, as he explains the fact, by our ſympathy with the happineſs of thoſe to whom the utility extends. Nevertheleſs he inſiſts, that it is not the view of this utility which is either the firſt or principal ſource of moral approbation. To ſum up the whole of his doctrine in a few words: when we approve of any character or action, the ſentiments which we feel are derived from four different ſources. Firſt, we ſympathize with the motives of the agent; ſecondly, we enter into the gratitude of thoſe who receive the benefit of his actions; thirdly, we obſerve that his conduct has been agreeable to the general rules by which theſe two ſympathies generally act; and, laſtly, when we conſider ſuch actions as making a part of a ſyſtem of behaviour which tends to promote the happineſs either of the individual or of ſociety, they appear to derive a beauty from this utility, not unlike that which we aſcribe to a well-contrived machine. Theſe different ſentiments, he thinks, exhauſt completely, in every inſtance that can be ſuppoſed, the compounded ſentiment of moral approbation. "After deducting," ſays he, "in any one particular caſe, all that muſt be acknowledged to proceed from ſome one or other of theſe four principles, I ſhould be glad to know what remains; and I ſhall freely allow this overplus to be aſcribed to a moral ſenſe, or to any other peculiar faculty, provided any body will aſcertain preciſely what this overplus is."

When we approve of good actions, and diſapprove of bad, this approbation and diſapprobation, when we analyſe it, ſays Dr. Reid, "Eſſays on the active Powers of Man," (ch. vii. p. 244.) appears to include not only a moral judgment of the action, but ſome affection, favourable or unfavourable, towards the agent, and ſome feeling in ourſelves. Dr. Ferguſon, in "Principles of Moral and Political Science," agrees in the main with Lord Shafteſbury, Dr. Hutcheſon, Dr. Reid, and Buffier, in regarding moral approbation as a ſpecific ſentiment, incapable of reſolution into any other ſentiment or principle.

According to Dr. Clarke and others, reaſon or the underſtanding, the ſame faculty by which we diſtinguiſh between truth and falſehood, enables us to diſtinguiſh between what is fit and unfit, amiable and odious, both in actions and affections; and they argue, that ſuch are the natures of certain actions, that when perceived as they are by a reaſonable being, there muſt reſult in him certain emotions and affections. An excellent writer adds, that in contemplating the actions and affections of moral agents, we have both a perception of the underſtanding and a feeling of the heart; and the latter, or the effects in us accompanying our moral perceptions, are deducible from two ſprings. They partly depend on the poſitive conſtitution of our natures; but the moſt ſteady and univerſal ground of them is the eſſential congruity between the object and the faculty. Hutcheſon's Inquiry, &c. tract iv. ſect. vi. and Eſſ. on Paſſ. p. 207. Smith's Theory of Mor. Sent. Parts iv. and vi. Cudworth's Immut. Mor. b. i. Price's Review, &c. ch. ii. Paley's Philoſophy, vol. i. p. 14.

Approbation, in *Civil Law*. It is a maxim among civilians, *approbare dicitur qui non improbat. He is judged to approve who does not diſapprove.*

By the civil law, a mere approbation of a crime after commiſſion does not make a perſon guilty; but an approbation attended with fact is equivalent to a command.

Approbation is more particularly uſed in ſpeaking of recommendations of books given by perſons qualified or authorized to judge of them.

Thoſe appointed to grant licences and imprimaturs, frequently expreſs their approbation of books.

Books were formerly ſubjected to a licenſer in England, ſee 13th Car. II. c. 33. which act is long ſince expired; and being incompatible with the noble principles of the revolution, has never ſince, and we hope never will be revived.

APPROPRIARE *ad honorem*, in *Law*, ſignifies to bring a manor within the extent and liberty of ſuch an honour.

Appropriare *communam*, ſignifies to diſcommon, i. e. to ſeparate and incloſe any parcel of land, which before was open common.

APPROPRIATE, Appropriated, in *Philoſophy*, is underſtood of ſomething which is indeed common to ſeveral; yet, in ſome reſpects, is peculiarly attributed to one.

APPROPRIATION, in *Law*, denotes the annexing of an eccleſiaſtical benefice to the proper and perpetual uſe of ſome religious houſe, biſhopric, college, or ſpiritual perſon, to enjoy for ever; in the ſame way as *impropriation* is the annexing of a benefice to the uſe of a lay perſon or corporation; that which is an appropriation in the hands of religious perſons being uſually called an impropriation in the hands of the laity. It is computed, that there are in England 3845 impropriations.

This contrivance ſeems to have ſprung from the intereſted policy of the monaſtic orders, who begged and bought, for maſſes and obits, and ſometimes even for money, all the advowſons within their reach, and then appropriated the benefices to their own corporation. But, in order to complete ſuch appropriation effectually, the king's licence and the biſhop's conſent muſt firſt be obtained; becauſe both the king and the biſhop might ſome time or other have an intereſt, by lapſe, in the preſentation to the benefice, which can never happen if it be appropriated to the uſe of a corporation, which never dies. The conſent of the patron is alſo neceſſarily implied, becauſe the appropriation can be originally made to none but to ſuch ſpiritual corporation as

is alſo the patron of the church; the whole being, indeed, nothing elſe but an allowance for the patrons to retain the tithes and glebe in their own hands, without preſenting any clerk, they themſelves undertaking to provide for the ſervice of the church. When the appropriation is thus made, the appropriators and their ſucceſſors are perpetual parſons of the church, and muſt ſue and be ſued, in all matters concerning the rights of the church, by the name of parſons. This appropriation may be ſevered, and the church become diſappropriate, two ways: as firſt, if the patron or appropriator preſent a clerk who is inſtituted and inducted to the parſonage; for the incumbent ſo inſtituted and inducted is, to all intents and purpoſes, complete parſon; and the appropriation, being once ſevered, can never be re-united again, unleſs by a repetition of the ſame ſolemnities. And when the clerk ſo preſented is diſtinct from the vicar, the rectory then veſted in him becomes what is called a *ſine-cure;* becauſe he hath no cure of ſouls, having under him a vicar to whom that cure is committed. Alſo, if the corporation which has the appropriation is diſſolved, the parſonage becomes diſappropriate at common law; becauſe the perpetuity of perſon is gone, which is neceſſary to ſupport the appropriation.

In this manner may appropriations be made at this day; and thus were moſt, if not all, of the appropriations at preſent exiſting originally made; being annexed to biſhoprics, prebends, religious houſes, nay even to nunneries, and certain military orders, all of which were ſpiritual corporations. At the diſſolution of the monaſteries by ſtatutes 27 Henry VIII. c. 28. and 31 Henry VIII. c. 13. the appropriations of the ſeveral parſonages, which belonged to thoſe religious houſes, amounting to more than one-third of all the pariſhes in England, would have been, by the rules of the common law, diſappropriated; if a clauſe in thoſe ſtatutes had not intervened, by which they were given to the king in as ample a manner as they were before held by the abbots, &c. The alien priories had, in former reigns, been diſſolved and given to the crown. From theſe two ſources have ſprung all the lay appropriations or ſecular parſonages in the kingdom; they having been afterwards granted out from time to time by the crown. Blackſtone's Com. vol. i. p. 384, &c.

APPROUAGE, or Approuak, in *Geography*, a river of South America, in the country of Guiana, which diſcharges itſelf into the ſea; N. lat. 4° 20'. W. long. 52° 46'.

Approuage, or *Approuak*, a town of South America, in Guiana, ſituate at the mouth of the river of the ſame name.

APPROVEMENT, Approveamentum, or Approviamentum, is ſometimes uſed in *Ancient Law Writers*, for an improvement, or riſe of the value and worth of a thing.

Thus *to approve, approbare*, is to make the beſt benefit of a thing, by increaſing the rent, &c. *Cum omnibus approviamentis, et aliis pertinentiis ſuis, &c.*

Hence, in ſome ancient ſtatutes, bailiffs of lords in their franchiſes are called their approvers. A bailiff is not to think it below him to *approve, approbare*, his maſter's goods; but of his barley to make malt, of his wool to make cloth, &c.

Approvement is more particularly uſed where a man hath common in the lord's waſte, and the lord incloſeth part of the waſte for himſelf, leaving ſufficient common, with egreſs and regreſs, for the commoner. Reg. Jud. 8, 9. This incloſure, when juſtifiable, is called in law approvement, an ancient expreſſion ſignifying the ſame as improvement. Accordingly, it is provided by the ſtatute of Merton, 20 Hen. III. c. 4. that the lord may approve, or incloſe, and convert to the uſes of huſbandry, which is a melioration or improvement, any waſte grounds, woods, or paſtures, in which his tenants have common appendant to their eſtates, provided he leaves ſufficient common to his tenants, according to the proportion of their land.

APPROVER, in our *Laws*, one who, being indicted for treaſon or felony, and arraigned for the ſame, doth confeſs the fact before plea pleaded, and appeals or accuſes others his accomplices of the ſame crime, in order to obtain his pardon; and this confeſſion is called *approvement*.

He is called an approver, or prover, *probator*, becauſe he muſt prove what he hath alleged in his appeal. This proof was anciently either by battle, or by the country, at the choice of the appellee: and the form of this accuſation may be found in Cromp. Juſt. 250. See alſo Bracton, lib. iii. Staundf. Pl. Cor. 52.

If the appellee were vanquiſhed, or found guilty, he muſt ſuffer the judgment of the law, and the approver have his pardon *ex delicto juſtitiæ*. On the other hand, if the appellee were conqueror, or acquitted by the jury, the approver muſt receive judgment to be hanged, upon his own confeſſion of the indictment; for the condition of his pardon has failed, viz. the conviction of ſome other perſon, and therefore his conviction remains abſolute. It is purely in the diſcretion of the court to permit the approver thus to appeal, or not; and, in fact, this courſe of admitting approvements hath been long diſuſed. But we have, in caſes of burglary and robbery on the highway, what ſeems to amount to the ſame by ſtatute; it being ordained, that where perſons charged with ſuch crimes out of priſon, diſcover two others concerned in the crime, they ſhall have a pardon, &c. ſtat. 5 Anne, c. 31. Blackſt. Com. vol. iv. p. 329.

Approvers of the king, are thoſe who have the letting of the king's demeſnes in ſmall manors, &c. ſtat. 51 Hen. III. ſt. 5.

In the ſtatute of the 1ſt of Ed. III. c. 8. ſheriffs are called the king's approvers.

Approver is particularly uſed, in *Ancient Law Writers*, for a bailiff or land-ſteward, appointed to have the care of a manor, franchiſe, or the like, and improve and make the moſt of it for the benefit of his maſter.

In this ſenſe, the word is alſo written *appruare*.

APPROXIMATION, from *ad*, and *proximus, near to*, in *Arithmetic* and *Algebra*, a continual approach ſtill nearer and nearer to a root or quantity ſought, without a poſſibility of ever arriving at it exactly.

Methods of continual approximation for the ſquare roots and cube roots of numbers have been employed by Algebraiſts and Arithmeticians, from Lucas de Burgo, and perhaps a much earlier period, to the preſent time. For the roots of higher powers, and of all ſimple equations, and alſo for the roots of all compound equations whatever, we have various approximations by Wallis, Raphſon, Halley, and later writers, eſpecially Newton, De Lagny, &c. all of them forming ſeries infinitely converging, or approaching ſtill nearer to the quantity required, according to the nature of the ſeries.

It is evident, that if a number propoſed be not a true ſquare, it is in vain to hope for a juſt quadratic root thereof, explicable by rational numbers, whether integers or fractions; whence, in ſuch caſes, we muſt content ourſelves with approximations, ſomewhat near the truth, without pretending to accuracy: and ſo for the cubic root, of what is not a perfect cube, and the like for ſuperior powers.

This the ancients were aware of, and accordingly they had their methods of approximation; which, though ſcarcely applied by them beyond the quadratic, or perhaps the cubic root,

root, are yet equally applicable, by due adjuſtments, to the ſuperior powers alſo, as is ſhewn by Dr. Wallis, in the Philoſoph. Tranſact. N° 215. or Ph. Tr. Ab. vol. i. p. 98

The rule of double poſition furniſhes an eaſy and general method of approximation. See POSITION.

For the roots of pure powers, many rules are given by writers on this ſubject; but the following, diſcovered by Dr. Hutton, and publiſhed in the firſt volume of his "Mathematical Tracts," is peculiarly recommended by its convenience for practice.

Let N be any number, the root r of which is to be extracted, and let n be the neareſt root firſt found by trial: then $\frac{r+1.N+r-1.n^r}{r-1.N+r+1.n^r} \times n$ will be equal to the required root of N very nearly; or expreſſing this theorem in a proportion, we ſhall have the following rule: $\overline{r-1} \times N + \overline{r+1} \times n^r : \overline{r+1} \times N + \overline{r-1} \times n^r :: n$: the required root, very nearly. In order to find a root ſtill nearer, ſubſtitute the laſt value of the root ſought for n, and repeat the operation, as often as may be thought neceſſary. This theorem includes all the rational formulæ of Halley and De Lagny. E.G. Let it be required to double the cube, or to find the cube root of the number 2. In this caſe $r=3$, $r+1=4$, and $r-1=2$: and the general theorem will be $\frac{4N+2n^3}{2N+4n^3} \times n$, or $\frac{2N+n^3}{N+2n^3} \times n = N^{\frac{1}{3}}$, or the cube root of N: or the proportion will be $N+2n^3 : 2N+n^3 :: n$: the root ſought nearly. Hence N being $= 2$, the neareſt root $n = 1$, and its cube n^3 alſo $=1$: conſequently $N+2n^3 = 2+2 = 4$, and $2N+n^3 = 4+1=5$; therefore $4 : 5 :: 1 : \frac{5}{4} = 1\frac{1}{4} = 1.25$, the reſult of the firſt approximation. Again, taking $n=\frac{5}{4}$, and conſequently $n^3 = \frac{125}{64}$, we ſhall have $N+2n^3 = 2+\frac{250}{64} = \frac{378}{64}$, and $2N+n^3 = 4+\frac{125}{64} = \frac{381}{64}$; and therefore the proportion will be $\frac{378}{64} : \frac{381}{64}$; i. e. $378 : 381$ or $126 : 127 :: \frac{5}{4} : \frac{635}{504} = 1.25992$, &c. the cube root of 2, true in all the figures: and by again taking $\frac{635}{504}$ for a new value of n, and repeating the proceſs, many more figures may be found, and the reſult more nearly obtained.

Another method of approximating to the ſquare root or cube root of any number, that is not a perfect ſquare or cube, is as follows: Firſt of all ſuppoſe two ſucceſſive ſquare or cube numbers, one greater and the other leſs than the given number, and whoſe ſquare or cube roots differ from one another by unity. Then for the ſquare root, it is evident that the given ſquare number may be repreſented by $m^2 \pm n$; m^2 being greater or leſs than the given number, and n being the part which is to be added in the former caſe and ſubtracted in the ſecond, in order to obtain the ſaid number. Then, $\sqrt{m^2 \pm n} = \overline{m^2 \pm n}^{\frac{1}{2}} = m \pm \frac{n}{2m} - \frac{n^2}{8m^3} \pm \frac{n^3}{16m^5}$, &c. will be the ſquare root required. This ſeries will always converge, becauſe m and n are ſuppoſed to be integral numbers, and $\frac{n}{m}$ not to exceed unity: e. g. let the non-quadratic number be 150, and the neareſt ſquare numbers being 144 and 169, and their ſquare roots 12 and 13, and 150 being nearer to 144 than to 169, $m^2 = 144$ and $n = 6$; and the formula $m^2 \pm n$ will be $144+6$: conſequently $\sqrt{144+6} = 12+\frac{6}{24} - \frac{36}{8 \times 1728} + \frac{216}{16.248832}$ &c. Of this converging ſeries it will be ſufficient to take the three firſt terms for the required ſquare root of 150: i. e. $12 + \frac{1}{4} - \frac{1}{384} = 12 + \frac{95}{384} = 12.247395$ for the approximated root. The proceſs is the ſame for the cube root, biquadratic root, &c.: e. g. let a number, which is an imperfect cube, be repreſented by $m^3 \pm n$, m being the next greateſt or next leaſt cube to the number given, and n the part to be added or ſubtracted, ſo as to give the propoſed number. Then $\sqrt[3]{m^3 \pm n} = \overline{m^3 \pm n}^{\frac{1}{3}} = m \pm \frac{n}{3m^2} - \frac{n^2}{9m^5} \pm \frac{58n^3}{81m^8} - \frac{10n^4}{243m^{11}}$ &c. will be the cube root ſought. The reader converſant with ſubjects of this nature, will eaſily ſupply an example.

To extract the roots of equations by APPROXIMATION. Stevinus and Vieta propoſed methods for obtaining the roots of equations by approximation; and their methods were improved and purſued by Oughtred and others. However they required a different proceſs for every degree of equation, and of courſe were very tedious as well as imperfect. Sir Iſaac Newton introduced general methods for inveſtigating and expreſſing radical quantities by means of approximating, infinite ſeries, and alſo the roots of all ſorts of compound equations whatever, which methods are eaſy and expeditious. For the approximation of roots he purſued the following method: he firſt found by trial the value of the root, either greater or leſs, but nearly equal to it; then aſſuming another letter to denote the unknown difference between this and the true value, he ſubſtituted in the equation, inſtead of the unknown letter or root of the equation, the ſum or difference of the approximate root and the ſaid aſſumed letter; and thus he obtained a new equation, having only the aſſumed ſmall difference for its root or unknown letter; and then found by a certain method which he purſued, from this equation, a near value of this ſmall aſſumed quantity. He then aſſumed another letter for the ſmall difference between this laſt value and the true one, and ſubſtituted the ſum or difference of theſe into the laſt equation, whence aroſe a third equation, involving the ſecond aſſumed quantity, whoſe near value he found as before. Proceeding thus as far as he thought proper, he connected together by their proper ſigns all the near values that had been found, and thus formed a ſeries approaching ſtill nearer and nearer to the true value of the root of the firſt or propoſed equation. The approximate values of the ſeveral ſmall aſſumed differences may be found in different ways. Newton's method was as follows: as the quantity ſought is ſmall, its higher powers decreaſe more and more, and therefore no great error will reſult from neglecting them; accordingly Newton neglected all the terms having in them the ſecond and higher powers, leaving only the firſt power and the abſolute known term; from which ſimple equation he always found the value of the aſſumed unknown letter nearly, in a very ſimple and eaſy manner. Halley's method of doing the ſame thing, was to neglect all the terms above the ſecond power, and then to find the root of the remaining quadratic equation; which would give a nearer value of the aſſumed letter than Newton's method, but by a more troubleſome and leſs expeditious proceſs. Raphſon has propoſed another method, little different from that of Newton, thus: having found a near value of the firſt aſſumed ſmall quantity or difference, he corrected by this the firſt approximation to the root of the propoſed equation; and then, aſſuming another letter for the next, or ſmaller difference, he introduced it into the original equation in the ſame manner as before;

and thus he proceeded from one correction to another, employing always the firſt propoſed equation to find them, inſtead of the ſucceſſive near equations uſed by Newton.

E. G. Let it be required to find the root of the equation $x^3-5x=31$ or $x^3-5x-31=0$: here the root x is evidently equal to 8 nearly: and therefore for x take $8+z$, and ſubſtitute $8+z$ for x in the given equation, and the terms will be as follow:

$$\begin{array}{rl} x^3 = & 64+16z+z^2 \\ -5x = & -40-5z \\ -31 = & -31 \\ \hline \text{the ſum is } & -7+11z+z^2=0. \end{array}$$

Then, rejecting z^2, we have $-7+11z=0$, and $z=\frac{7}{11}=.6363$, &c. or $=.6$ nearly. Next aſſume $z=.6+y$, then

$$\begin{array}{rl} z^2 = & .36+1.2y+y^2 \\ 11z = & 6.6+11y \\ -7 = & -7 \\ \hline \text{the ſum } & -.04+12.2y+y^2=0, \end{array}$$

and rejecting y^2, $12.2y=.04$, and $y=\frac{.04}{12.2}=.003278$ nearly. Aſſume $y=.003278-v$, then

$$\begin{array}{rl} y^2 = & .00001074\,5284-.006556\,v+v^2 \\ 12.2y = & .039991\,6-12.2\,v \\ -.04 = & -.04 \\ \hline \text{the ſum } & .00000\,2345284-12.206556\,v+v^2=0, \end{array}$$

and $v=\frac{.00000\,2345284}{12.206556}=.000000192133$.

Hence, collecting all the aſſumed differences, with their appropriate ſigns, we ſhall have $x=8+z+y-v=1+.6+.003278-.000000192133=8.600327807867$ the required root of the equation propoſed, according to the method of Newton.

Raphſon's proceſs is as follows: aſſume $x=8+z$, then

$$\begin{array}{rl} x^3 = & 64+16z+z^2 \\ -5x = & -40-5z \\ -31 = & -31 \\ \hline \text{the ſum } & -7+11z+z^2=0; \end{array}$$

hence $z=\frac{7}{11}=.6$ nearly. Aſſume $x=8.6+y$; then

$$\begin{array}{rl} x^2 = & 73.96+17.2y+y^2 \\ -5x = & -43-5y \\ -31 = & -31 \\ \hline \text{the ſum } & -.04+12.2y+y^2=0; \end{array}$$

hence $y=\frac{.04}{12.2}=.003278$ nearly; and $x=8.6+y=8.603278$ nearly. Aſſume $x=8.603278-v$; then

$$\begin{array}{rl} x^2 = & 74.016392345284-17.206556\,v+v^2 \\ 5x = & -43.016390+5\,v \\ -31 = & -31 \\ \hline \text{the ſum } & .00000\,2345284-12.206556\,v+v^2=0; \end{array}$$

hence $v=.000000192133$; conſequently $x=8.600327807867$ as before.

For the cubic equation e. g. $y^3-2y-5=0$, Newton proceeds thus:

y is nearly $=2$; aſſume therefore $y=2+p$; then,

$$\begin{array}{rl} y^3 = & 8+12p+6p^2+p^3 \\ -2y = & -4-2p \\ -5 = & -5 \\ \hline \text{the ſum } & -1+10p+6p^2+p^3=0; \end{array}$$

hence $p=\frac{1}{10}=.1$ nearly. Aſſume $p=.1+q$; then,

$$\begin{array}{rl} p^3 = & 0.001+0.03q+0.3q^2+q^3 \\ +6p^2 = & 0.06+1.2q+6q^2 \\ +10p = & 1+10q \\ -1 = & -1 \\ \hline \text{the ſum } & 0.061+11.23q+6.3q^2+q^3=0; \end{array}$$

hence $q=-0.0054$ nearly.

Aſſume $q=-0.0054+r$; then,

$$\begin{array}{rl} q^2 = & +0.00002\,91600-0.000087\,48r, \text{ &c.} \\ +6.3q^2 = & +0.00183708-0.06804r, \text{ &c.} \\ +11.23q = & -0.060642+11.23r \\ +0.061 = & +0.061 \\ \hline \text{the ſum will be } & +0.00054\,1550536+11.162047\,48r; \end{array}$$

hence $r=-0.00004\,8517$, &c. Conſequently,

$$\begin{aligned} y &= 2+p+q+r \\ &= 2+0.1-0.0054-0.00004\,8517 \\ &= 2.09455\,1483, \text{ the root of the equation, } y^3-2y=5. \end{aligned}$$

In the ſame manner Newton performs the approximation for the roots of literal equations, that is, equations having literal coefficients; thus, the root of this equation,

$y^3+axy+a^2y-x^3-2a^3=0$, is

$$y=a-\frac{x}{4}+\frac{x^2}{64a}+\frac{131x^3}{512a^2}+\frac{509x^4}{16,384a^3}, \text{ &c.}$$

Vid. De Analyſi per Æquationes infinitas, cap. iv. § 1 and 2. apud Oper. Newtoni, t. i. p. 270, &c. Geometria Analytica, cap. ii. ibid. t. i. p. 394, &c. Ed. Horſley. Raphſoni Analyſis Æquationum Univerſalis. Phil. Tranſ. Abr. v. i. p. 81, &c. Saunderſon's Algebra, vol. i. p. 722, &c. See a memoir on this method of the reſolution of equations by the marquis de Courtivron, in the Mem. de l'Academie for 1744. For M. de la Grange's method of approximation for all the roots of a determinate numeral equation, ſee Mem. of Berlin, tom. xxiii. and xxiv.

Other particular methods of approximation, applicable to various purpoſes, have been given by many other perſons: as for inſtance, methods of approximating, by ſeries, to the roots of cubic equations belonging to the irreducible caſe, by Nicole, in the Memoires de l'Academie above cited; by M. Clairaut, in his "Algebra"; and by Dr. Hutton, in vol. i. of his "Tracts." Beſides, the methods of infinite ſeries by Wallis, Newton, Gregory, Mercator, Maclaurin, &c. may be conſidered as approximations in quadratures, and other branches of the mathematics, many inſtances of which may be ſeen in Wallis's Algebra, the Philoſophical Tranſactions, and other books on the ſubject. To this head may be alſo referred the methods of exhauſtions of the ancients, by which Archimedes and others have approximated to the quadrature and rectification of the circle, &c. which was performed by continually biſecting the ſides of polygons, both inſcribed in a circle, and circumſcribed about it; by which means the ſums of the ſides of the ſimilar polygons approach continually nearer and nearer to each other, and the circumference of the circle is nearly a mean between the two ſums. See EQUATION.

APPROXIMATION, in *Medicine*, denotes a magnetical kind of cure or method of tranſplanting a diſeaſe into ſome other ſubject, whether animate or vegetable, by bringing it in immediate contact with the patient.

APPROXIMATION, in *Surgery*, APPROPINQUATIO, ENGYSOMA, ENGISOMA OSSIUM CRANII. Fr. *Approximation des os du crane;* Germ. *Die Uebereinander ſchieburg der Hirnſchalknochen.* This term is applied to thoſe wounds of the head, in which, the ſcull being fractured, one or more of the ſplinters are forced under the ſound part of the bone, ſo as to occaſion a compreſſion of the dura mater. In the delivery of a child, this occurrence with the bones of the cranium, one lapping over the other, is a natural circumſtance.

APPUI, in the *Manege*, q. d. reſt or ſtay upon the hand, is the reciprocal effort between the horſe's mouth and the bridle-hand; or the ſenſe of the action of the bridle on the hand of the horſeman.

A juſt appui of the hand, is the nice bearing up or ſtay of the bridle; ſo that the horſe, being awed by the ſenſibility and tenderneſs of his mouth, dares not reſt too much upon

upon the bit-mouth, nor check or beat upon the hand to withſtand it.

A dull appui, is when a horſe has a good mouth, but his tongue is ſo thick that the bit cannot work, or bear upon the bars; the tongue not being ſo ſenſible as the bars: though the like effect is ſometimes owing to the thickneſs of his lips. A horſe is ſaid to have no appui, when he dreads the bit-mouth, is too apprehenſive of the hand, and cannot bear the bit. He is ſaid to have too much appui, when he reſts, or throws himſelf too much, or too hardily, upon the bit. Horſes deſigned for the army ought to have a full appui upon the hand. See HAND.

APPULSE, from *ad*, and *pulſo*, *I act on*, in a general ſenſe, a thing's being brought to, or in contact with another.

Articulation is either by appulſe, i. e. when one of the moveable organs touches and reſts on ſome of thoſe which are immoveable; or without appulſe, only by inclination of the moveable organ to the immoveable.

APPULSE *of cattle*, *appulſus pecoris*, in the *Civil Law*, the right of driving them to water.

APPULSE, in *Aſtronomy*, the approach of any planet to a conjunction with the ſun, or a ſtar; ſo that they may be ſeen within the ſame field of the teleſcope: or, as ſome authors have defined it, the actual contact of two luminaries.

The appulſes of the planets to the fixed ſtars have always been of great uſe to aſtronomers, in order to fix the places of the former. The ancients wanting an eaſy method of comparing the planets with the ecliptic, which is not viſible, had ſcarce any other way of fixing their ſituations, but by obſerving their track among the fixed ſtars, and remarking their appulſes to ſome of thoſe viſible points. Hiſt. Acad. Scienc. an. 1710, p. 417.

Dr. Halley has publiſhed a method of determining the places of the planets, by obſerving their near appulſes to the fixed ſtars. Phil. Tranſ. N° 369. See alſo Phil. Tranſ. N° 76. p. 361. and Mem. Acad. Scienc. for 1708, where Flamſteed and de la Hire have given obſervations of the moon's appulſes to the Pleiades.

For diſcovering the longitude at ſea, obſervations of the appulſes of the moon to the fixed ſtars afford an excellent method. See LONGITUDE.

Of all the celeſtial obſervations hitherto made, none are capable of ſo perfect an exactneſs, as the near appulſes of the moon and planets to the fixed ſtars; for though the places of the ſtars have not as yet attained their ultimate preciſion, yet ſuch obſervations are ever good, the places of the planets being thereby aſcertained in proportion to the correctneſs of any catalogues that may be made hereafter. But the ordinary number of ſtars, with which the planets may be thus compared, being ſmall, the opportunities of obſerving are conſequently rare; whence appears the great uſe of a full catalogue of all the teleſcopical ſtars within the zodiac, viz. that thereby opportunities of obſerving appulſes may be more frequent. Since the royal obſervatory at Greenwich was put under Dr. Halley's care, he endeavoured to put himſelf in a condition to ſupply the many and great vacancies to be met with in the preſent zodiac; and for the ſervice of aſtronomy, publiſhed a map or planiſphere of the ſtarry zodiac; wherein are accurately laid down all the ſtars to which the moon's appulſe has ever been obſerved in any part of the world. Phil. Tranſ. Abr. vol. vi. p. 170.

His ſucceſſors in that department, and particularly the preſent aſtronomer royal, Dr. Maſkelyne, have contributed, in a very high degree, to the facility and uſe of ſuch obſervations. See *Nautical* ALMANAC, and LONGITUDE.

APPURTENANCES, or APPERTINANCES, in *Common Law*, ſignify things belonging to ſome other as their principal. The word is formed of *ad*, *to*, and *pertinere*, *belong*.

Appurtenances may either be things corporeal, as [illegible] belonging to a chief manor, and common of paſture &c.; or incorporeal, as liberties and ſervices of [illegible]. See APPENDANT, and COMMON.

APREMONT, in *Geography*, a town of France, in the department of Vendée, and chief place of a canton, in the diſtrict of Sables d'Olonne, 5 leagues N. of Sables d'Olonne, and 2½ S. E. of Challans.

APRES, a fictitious or heraldic animal, drawn as a bull with a ſhort tail, like that of a bear; it is borne as the ſiniſter ſupporter to the arms of the company of Muſcovy merchants.

APRES-LÈS-VEYNE, in *Geography*, a town of France, in the department of the Higher Alps, and chief place of a canton in the diſtrict of Gap. The place contains 897, and the canton 5,300 inhabibants: the territory includes 245 kiliometres and 9 communes.

APREY, a town of France, in the department of the Upper Marne, and chief place of a canton in the diſtrict of Langres, 8 miles S. W. of Langres.

APRI, in *Natural Hiſtory*, a ſpecies of TAENIA that infeſts the liver of the boar. *Goeze Eingew.*—Gmelin.

APRI, is alſo the ſpecific name of another kind of *vermes* that inhabits the inteſtines of the boar; it is of the TRICHOCEPHALUS genus, and is thus deſcribed. Tail furniſhed on each ſide with crenated ſcales. *Goeze Eingew.* This is of the ſame ſize as T. hominis, which infeſts the human body.

APRI, a third kind of *vermes*, alſo belonging to the ASCARIS genus. It is found in the lungs of the boar; is viviparous, brittle, tapering to a point at each end; ſlender as a fine thread, and an inch in length.

APRICARIUS, in *Ornithology*, a ſpecies of CHARADRIUS, about the ſize of the golden plover, that inhabits the northern parts of Europe; as Sweden, Denmark, Iceland, and Greenland; and feeds on worms, and the buds of the black-berried heath in the latter. The fleſh is delicious.

The ſpecific character is, the chin and abdomen black; body brown, dotted with white and yellow; legs cinereous. Linn. To which may be added, the length of the bill is one inch, its colour black; the eyes large, irides brown, eyelids black; at the baſe of the upper mandible, the feathers black; forehead, between the eyes, white, a line of which is continued over each eye, down the ſides of the neck, and unites on the breaſt in the form of a tranſverſe bar. The vent is ſpotted with white; ſecondaries, quills, and tail, barred with black and brown; legs black.—The male is diſtinguiſhed by having a black patch on the temples.

This is pluvialis aurea freti Hudſonis of Briſſon; pluvier doré à gorge noire of Buffon; ſpotted plover of Edwards; and alwargrim plover, Arct. Zool. & Lath. Gen. Syn.

APRICOT, in *Botany*. See PRUNUS.

APRICOT, in *Gardening*, a general name applied to a fruit-tree of the plum kind. This tree, we are told by different writers on gardening, came originally from Armenia, whence it takes the name of *Armeniaca*. It was introduced into this country, according to Mr. Forſyth, in 1562. The ſame writer alſo remarks, that though the apricot will not take upon the cherry-ſtock, it will ſucceed upon all ſorts of plums, except the Bruſſels. The following ſelection of apricots is recommended as the moſt ſuitable for a ſmall garden. The *Maſculine*, the *Roman*, the *Orange*, the *Breda*, and the *Moor Park*. The moſt proper time for planting trees of this ſort, the above author obſerves, is in autumn, as ſoon as the leaf begins to fall; ſuch trees being choſen for this purpoſe as have the ſtrongeſt and cleaneſt ſtems, and if ſuch as have been headed down, and are of

two or three years growth, they will bear and fill the walls much ſooner than thoſe which have not been ſo treated. He thinks they ſhould only have one ſtem; or if they have two, one of them ſhould be cut off; for by planting thoſe with two ſtems, the middle of the tree is apt to be left naked, and of courſe one-third of the wall remains uncovered by the branches. The writer, however, ſeems fully aware, that it is the practice of many to make choice of trees with the ſmalleſt ſtems; but theſe, he thinks, always produce weaker ſhoots than ſuch as he has recommended. The *Breda* is ſuppoſed the beſt and the richeſt flavoured for a ſtandard, although the *Bruſſels* is frequently preferred; but Mr. Forſyth would by no means recommend planting more than three trees of each ſort in a garden, as ſtandards; as it is not one year in ten, he ſays, that a tolerable crop is produced from them. He thinks the *Breda*, the *Bruſſels*, and the *Moor Park*, ſhould always be planted on an eaſt or weſt aſpect. A few trees for an early ſupply may be planted on a ſouth aſpect, according to the ſize of the garden, and the demand there may be for the ſupply of the family; but a weſt aſpect is far preferable for the general crop. Thoſe who wiſh for a late ſupply, may alſo have ſome trees planted on an eaſt aſpect.

In planting the trees, it is recommended, where the borders are new, that they ſhould be made two feet and a half or three feet deep of good, light freſh loam; and that in old borders, where the earth has been injured by the roots of the former trees, it will be neceſſary to take out the old mould at leaſt three feet deep and four feet wide, filling up the hole with freſh loam, taking care to plant the trees about eight inches higher than the level of the old border, to allow for the ſinking of the earth, and that they may not afterwards be too deep in the ground. But the propagation, culture, and management of apricot trees, will be more fully treated of under the article PRUNUS.

The produce of the apricot tree is highly valuable as a ſummer fruit, for different purpoſes; while green and young, for tarts, pies, &c.; when ripe, it is a fine table fruit, provided it be gathered before it become ſoft and mealy; and when preſerved in ſugar, is an excellent ſweetmeat.

APRIES, in *Biography* and *Ancient Hiſtory*, ſucceeded his father Pſammis or Pſammutis, as king of Egypt, in the year before Chriſt 594, and is ſuppoſed to have been the Pharaoh-Hophra of Jeremiah, ch. xxxvii. 5.; and Ezekiel, xvii. 15. Herodotus (l. iv. c. 161.) and Diodorus (l. i. p. 62.) give him the character of a martial prince; and ſpeak of ſucceſsful wars which he carried on againſt the Tyrians, Sidonians, and Cypriots. Having taken Sidon by ſtorm, and made himſelf maſter of the iſle of Cyprus, he returned with immenſe ſpoil into Egypt. In the firſt year of his reign, he entered into a league with Zedekiah king of Judah, againſt the king of Babylon; and about two years after, attempted to relieve Jeruſalem, which was cloſely beſieged by Nebuchadnezzar; but as the Babylonians approached, he and his Egyptian army fled, and left the Jews to the mercileſs rage of their enemies. Towards the latter end of his reign, the Libyans applied to him for ſuccour againſt the Cyrenæans, a Greek colony of Africa, by whom they were invaded; but the powerful army which he ſent to their relief, being defeated with great ſlaughter, a diſcontent, which terminated in a civil war, took place among his own ſubjects. Amaſis, who was employed to quell the tumult, betrayed Apries, and was proclaimed king. In a battle near Memphis, Apries was vanquiſhed and made priſoner, and after ſome time was ſtrangled; having reigned, according to Herodotus, 25 years, but 22 according to Diodorus. Anc. Un. Hiſt. v. i. p. 312.

APRIGLIANO, in *Geography*, a town of Italy, in the kingdom of Naples, and province of Calabria Citra, 7 miles S. E. of Coſenza.

APRIL, the fourth month of the YEAR, according to the common computation; but the ſecond, reckoning from the vernal equinox.

The word is derived from *Aprilis*, of *aperio*, *I open*; becauſe the earth, in this month, begins to open her boſom for the production of vegetables; or, as others ſay, from Ἀφροδίτη, the Greek appellation of Venus.

In this month the ſun travels through parts of the ſigns Aries and Taurus.

APRILE GUISEPPE, in *Biography*. See TENDUCCI, and CANTARE.

APRILINA, in *Entomology*, a ſpecies of PHALÆNA, in the *Noctua* family, deſcribed by Linnæus, and Fabricius. Both authors, it muſt indeed be remarked, have made great confuſion between this and another ſpecies of the ſame family; viz. RUNICA: and Entomologiſts have been under conſiderable doubts reſpecting the identity of either. Theſe are natives of Great Britain, and as ſuch fully noticed by Mr. Donovan, in his "Natural Hiſtory of Britiſh Inſects;" from which it appears that the Linnæan ſpecies named *Aprilina*, is the ſame as Fabricius calls *Runica*; and, on the contrary, the *Runica* of Linnæus is the *Aprilina* of Fabricius: to reconcile the difficulties ariſing from this confuſion, the two inſects are thus defined.

Phalæna Aprilina: thorax creſted; wings deflexed, green; a black mark and tranſverſe band; and a ſingle row of black triangular dots near the apex. Vol. x. p. 57.

Phalæna Runica: thorax creſted; firſt wings greeniſh, with black marks; and a row of triangular dots behind. Vol. x. p. 75.

And it is further obſerved, that the two black ſemicircles on the thorax, and double row of triangular ſpots at the ends of the poſterior wings, are mentioned as peculiarities of the ſpecies *Runica*, by ſome writers; the latter is, however, liable to conſiderable variations, the ſpots being in general crowded in a confuſed ſeries, and forming an irregularly interrupted line. It may be eaſily diſtinguiſhed from the *Phalæna Aprilina*, by its ſuperior ſize; the colours are leſs vivid, and it is deſtitute of the broad tranſverſe bar, which is conſpicuous on the upper wings of *Phalæna Aprilina*. Vide Don. Brit. Inſ.

APRILIS, or PRILIS *Lacus*, in *Ancient Geography*, *Lago de Caſtiglione*, a lake of Italy, belonging to Etruria, to the weſt of Ruſellæ.

APRIO, in *Geography*, a town of European Turkey, in the province of Romania, the ſee of a Greek archbiſhop; ſituate on the Lariſſa, between Trajanapolis and Rhodoſto. It was anciently called *Theodoſiopolis*, from its being a favourite reſidence of Theodoſius the great; and afterwards *Apris* or *Apro*.

A PRIORI *Demonſtration*. See DEMONSTRATION.

APRON, in *Naval Architecture*, is a piece of curved timber fixed behind the lower part of the ſtern, immediately above the foremoſt end of the keel.

APRON is alſo a name given to a platform or flooring of plank, raiſed at the entrance of a dock, againſt which the dock gates are ſhut.

APRON, in *Gunnery*, a piece of lead which caps or covers the vent or touch-hole of a cannon.

APROS, in *Ancient Geography*, a river of Gaul, in the country of the Oxybians; ſuppoſed by M. D'Anville to be the preſent *Loup*.

APROSIO, ANGELICO, in *Biography*, a learned Auguſtine monk, was born at Ventimiglia in Genoa, in 1607. In Genoa he taught philoſophy for five years, and he afterwards ſettled at Venice, where he lectured on polite literature.

rature. Of the library of the Auguſtines, founded by him in his native place, he publiſhed a catalogue, under the title of "Bibliotheça Aproſiana," printed at Bologna, in 1673, 12mo.; which contains an account of his own life, and of various authors. He wrote many ſatirical or humorous pieces under fictitious names. He died about the year 1682. Gen. Dict. Nouv. Dict. Hiſtor.

APRUSA, in *Ancient Geography*, a river of Italy, placed by Pliny in Umbria, and ſuppoſed by Hardouin to be the preſent *Aveſa*.

APRUSTUM, Aprigliano, a town of Italy, in Brutium, ſouth-eaſt of Conſentia; and ſuppoſed by Hardouin to be the *Abuſteron* of Ptolemy.

APRUTIUM, a town of Italy, now *Teramo*.

APSALUS, a town placed by Ptolemy in Macedonia.

APSINES, in *Biography*, a ſophiſt and rhetorician of Athens, was born at Gadara of Phœnicia, and flouriſhed about the year 236. Philoſtratus was his friend, and celebrates his accuracy as a writer, in the laſt book of his ſophiſts. His remains are to be found in Manutius's Collection of Rhetoricians, publiſhed at Venice in 1608. fol. Fabr. Bib. Græc. l. iv. c. 31. § 16.

APSINTHII, in *Ancient Geography*, people who inhabited the ſouthern part of Thrace, towards the coaſts, eaſt of the river Melas, and weſt of the Hebrus. They took their name from the river Apſinthus, which traverſed their country.

APSIS, or Absis, ſignifies the bowed or arched roof of a houſe, room, or oven, &c. as alſo the ring or compaſs of a wheel.

Apsis, in *Eccleſiaſtical Writers*, denotes an inner part in the ancient churches, wherein the clergy ſat, and where the altar was placed. It is ſuppoſed to have been thus called, becauſe covered with an arch or vault of its own, by the Greeks called ἁψις, and by the Latins *abſis*. Iſidore, with leſs probability, imagines it ſo called, as being the moſt luminous part; from ἁπτειν, *to give light*.

Apſis, in this ſenſe, amounts to the ſame with what is otherwiſe called *choir*, *concha*, *camera*, and *preſbyterium*; and ſtands oppoſite to the *nave* or body of the church.

Apsis is more particularly uſed for the biſhop's ſeat, or throne, in ancient churches. This was more peculiarly called *apſis gradata*, becauſe raiſed on ſteps above the ordinary ſtalls. It was alſo denominated *exedra*, and in later times *tribune*.

Apsis is alſo uſed for the reliquary, or caſe, wherein the relics of ſaints were anciently kept. It took the name apſis from its being round, or arched at the top; or perhaps from the place where it was kept. The apſis was commonly placed on the altar; it was uſually of wood, ſometimes alſo of gold and ſilver, with ſculptures, &c.

Apsis, in *Aſtronomy*, is applied to either of the two points in the orbits of planets, wherein they are at the greateſt, and the leaſt diſtance from the ſun, or earth. The apſis at the greateſt diſtance is called the *higher* or *ſumma apſis*; that at the leaſt diſtance, the *lower*, *apſis ima*, or *infima*. The two *apſides* are alſo called *auges*. The higher apſis is more particularly denominated the *aphelion*, or *apogee*; the lower, the *perihelion* or *perigee*. The diameter which joins theſe two points is called the *line of the apſides*, and this paſſes through the centre of the orbit of the planet, and the centre of the earth or ſun. In the modern aſtronomy, this line makes the longer or tranſverſe axis of the elliptical orbit of the planet. Such is the line AQ (*Plate* I. *Aſtron. fig.* 9.) drawn from the aphelion A to the perihelion Q. The eccentricity is reckoned in the line of the apſides; being the diſtance between the centre of the orbit of the planet C, and the centre of the ſun or earth, S, according as the Copernican or the Ptolemaic ſyſtem is followed.

Theſe definitions ſuppoſe that the lines of the greateſt and leaſt diſtances form one and the ſame right line; but this is not always preciſely the caſe; as they ſometimes make an angle with each other, which is greater or leſs than 180 degrees; and the difference from 180° meaſures the motion of the line of the apſides. When this angle is leſs than 180°, the motion of the apſides is ſaid to be contrary to the order of the ſigns; and when it exceeds 180°, the motion is according to the order of the ſigns. Aſtronomers have propoſed various methods for eſtimating the motion of the apſides, ſeveral of which are recited and explained in the "Aſtronomy" of Keil and that of Monnier. Newton, in his "Principia," has given an excellent method for determining the motion of the apſides of a planet, occaſioned by the attraction of another, on the ſuppoſition that the planetary orbit is little different from a circle. He ſhews, that, if the ſun be immoveable, and all the planets gravitate towards him, in the inverſe ratio of the ſquares of their diſtances, the motion of the apſides will be nothing; or the lines above mentioned will make an angle with each other of 180°, or form one ſtraight line. But, on account of the mutual gravitation of the planets towards one another, their gravitation towards the ſun is not preciſely in that ratio, and conſequently their apſides are not always exactly in a right line with the ſun: and Newton has given a very elegant method of determining the motion of the apſides, on the ſuppoſition that we know the force which is thus added to the gravitation of the planet towards the ſun, and that this additional force is always directed towards the ſun, which is not preciſely the caſe. For the motion of the apſides, ſee Aphelion, Apogee, and Planet.

Kepler diſcovered, from obſervation, that the velocities of the planets in their apſides, are inverſely as their diſtances from the ſun; whence it follows, that they deſcribe, in theſe points, equal areas about the ſun in equal times. And although he could not prove, from obſervation, that the ſame was true in every point of the orbit, yet he had no doubt that this was the caſe. He therefore applied this principle to find the equation of the orbit, and, finding that his calculations agreed with obſervations, he concluded it was true in general, "that the planets deſcribe about the ſun equal areas in equal times." This diſcovery was, perhaps, the foundation of the "Principia," as it probably might ſuggeſt to ſir Iſaac Newton the idea that the propoſition was true in general, which he afterwards proved it to be.

APSORRUS, or Apsarus, in *Ancient Geography*, a river in the diſtrict of Colchis, which fell into the Euxine ſea, to the eaſt of Athenæ.

Apsorrus was alſo the name of a town in Aſia, on the coaſt of the Euxine ſea.

APSUS, now *Crevaſta*, a river of Europe, in Macedonia, which roſe in mount Tomarus, and ran into the Adriatic ſea, at ſome diſtance to the ſouth of Dyrrachium. This river watered a valley, which the ancients compared to that of Tempé. The Roman and Macedonian armies encamped on the banks of this river, in the war againſt Philip.

APSYCHIA, from α, privative, and ψυχη, *ſoul*, in *Medicine*, a ſwooning or fainting away, called alſo *lypopſychia* and *apopſychia*.

APSYCTOS, from α, and ψυχω, *I cool*, a word uſed by the ancients, as the name of a ſtone found in Arcadia, and of the colour of iron, the quality of which they ſay was, that when once heated red-hot, it would never grow cold again.

We have ſome ſtones indeed in England, that when once heated, will retain a warmth for a long time, but all the other accounts ſeem groundleſs; our warming-ſtone, uſed in Cornwall and Yorkſhire to lay at the feet of people's beds, will retain warmth eight or ten hours; and there is a ſort of red

ſtone.

ſtone cut out of the ſalt mountains near Cordova, and formed into broad tiles called *ruggiolas* by the Italians, which being once well heated, will retain a ſenſible warmth twenty-four hours; but theſe do not all come up to the qualities of this imaginary ſtone of the ancients, the accounts of which muſt be fabulous.

APSYNTHUS, in *Ancient Geography*, a town of Thrace, the ſame, according to Stephan. Byz. with Ænus, ſituate at the mouth of the Hebrus.

APSYRTIDES, the name of four iſlands of the Adriatic ſea, at the entrance of the gulf of Flano.

APSYRTUS, in the *Materia Medica* of the ancients, a name given to the common *marrubium*, or horehound; a plant at that time, as well as now, eſteemed very good in coughs, and other complaints of the breaſt.

APT, in *Geography*, a town of France, and principal place of a diſtrict in the department of Vaucluſe; the ſee of a biſhop, ſuffragan of Aix, before the revolution; the cathedral is ſaid to be the oldeſt in France, and a council was held here in 1365. It is ſituated on the river Calavon, 9 leagues E. of Avignon, and 7 N. of Aix. N. lat. 43° 52'. E. long. 5° 56'.

APTA Julia, in *Ancient Geography*, called alſo *Civitas Aptenſium*, a town of Gallia Narbonenſis; now Apt.

APTENODYTES, in *Ornithology*, a genus of the order anseres. The bill is ſtraight, rather compreſſed, and ſharp along the edges; the upper mandible is obliquely ſulcated lengthwiſe; feet palmated, ſhackled; wings fin-ſhaped, and without quill feathers.—Gmelin, &c. This is the genus Pinguin of Dr. Latham's ſynopſis; his character of it is more copious, and is as follows: bill ſtrong, ſtraight, more or leſs bending towards the point, furrowed on the ſides; noſtrils linear, placed in furrows; tongue covered with ſtrong ſpines, pointing backwards; wings ſmall, more like fins, covered with no longer feathers than the reſt of the body, uſeleſs in flight; body clothed with thick ſhort feathers, having broad ſhafts, and placed as compactly as ſcales; legs ſhort and thick, placed very near the vent; toes four, all placed forwards, the interior looſe, the reſt webbed; tail very ſtiff, conſiſting of broad ſhafts ſcarcely webbed.

"This genus of birds," adds Dr. Latham, "ſeems to hold the ſame place in the ſouthern parts of the world as the awks do in the northern, and are by no means to be confounded the one with the other, however authors may differ in opinion in reſpect to this matter. The pinguin is ſeen only in the temperate and frigid zones, on that ſide of the equator which it frequents; and the ſame is obſerved of the awk in oppoſite latitudes; and neither of the genera has yet been obſerved within the tropics. The awk has true wings and quills, though ſmall; the pinguin, mere fins only, inſtead of wings. This laſt has four toes on each foot; but the former only three. The pinguin, while ſwimming, ſinks quite above the breaſt, the head and neck appearing only out of the water; rowing itſelf along with its finny wings, as with oars; while the awk, in common with moſt other birds, ſwims on the ſurface. Several other circumſtances, peculiar to each, might be mentioned, if theſe were inſufficient to characteriſe this genus.

"The bodies of the pinguin tribe are commonly ſo well and cloſely covered with feathers, that no wet can penetrate; and as they are in general exceſſively fat, theſe circumſtances united ſecure them from cold. They have often been found above ſeven hundred leagues from land; and frequently on the mountains of ice, on which they ſeem to aſcend without difficulty, as the ſoles of their feet are very rough, and ſuited to the purpoſe." Gen. Syn. vol. iii. p. 2.

The birds called by Buffon and ſome others pengouin or pinguin, belong to the Alca genus of Gmelin.—The laſt author deſcribes the following ſpecies of the Aptenodytes genus; chryſocome, patachonica, papua, antarctica, magellanica, demerſa, cataractes, torquata, minor, chiloenſis, and chilenſis.

APTERA, from α and πτερον, *wing*, in *Entomology*, the ſeventh and laſt order of inſects in the Linnæan ſyſtem. The definition of the order is ſimply this: aptera, wings none; and the genera are divided into the three following ſections:

* Legs ſix; head diſtinct from the thorax: comprehending the leptura, podura, termes, pediculus, and pulex, genera.

** Legs from eight to fourteen, incluſive; head and thorax united: comprehending the acarus, hydrachnæ, aranea, phalangium, scorpio, monoculus, and oniscus, genera.

*** Legs numerous; head diſtinct from the thorax: comprehending the two laſt genera, scolopendra, and julus.

It muſt, however, be obſerved, that this arrangement, though preferable to that of Fabricius in ſome reſpects, is not entirely free from objection; for there are abundant inſtances of apterous inſects that can only be referred to the other claſſes, unleſs we ſeparate the two ſexes of many individual ſpecies, as we ſhall have occaſion to notice in the articles Formica, Mutilla, and others hereafter. Brunniche, in his ſyſtem of entomology, has arranged every inſect wanting wings, under his apterous order, without regarding thoſe in which one ſex has wings, and the other is deſtitute of them. Thus, for example, the apterous aphis, the female coccus, the neuters of ants, and the apterous mutillæ, are ſeparate from their own ſpecies, and arranged amongſt inſects that have no affinity with them; and, to complete the diſorder and confuſion, the pupa of the grylli, creatures in a ſtate yet imperfect, is included with the apterous order alſo.

No inſect can be referred to the apterous order in the Linnæan ſyſtem, unleſs both ſexes, when arrived at their laſt ſtate of being, are deſtitute of wings: although the term *apterous* is uſed in a general manner, by entomologiſts, to ſignify any inſect without wings, when complete, whether it be the females of thoſe winged males that belong to the other orders, or not; and even for coleopterous and hemipterous inſects that have a hard ſhelly covering or elytra, and have no wings under them. It is often uſed, by Linnæus himſelf, in this manner, as the following examples fully prove.

Aptera, a ſpecies of Blatta; it is apterous, brown, and punctured; poſterior margins of the abdominal ſegments, and legs livid; wings (wing-caſes) ferruginous; ſhanks ſpinous. Linn. and Gmel.

Aptera, a ſpecies of Cicada; apterous and black; wing-caſes abbreviated; ſhanks and antennæ pale. Linn. & Gmel.

Aptera, in *Ancient Geography*, a town of Lycia.

Aptera, or *Apteria*, was alſo a town of the iſle of Crete, ſituate in the weſtern part to the north-weſt of Cydonia, and having for its port Ciſſamos or Kiſſamos. Near this town, according to Stephan. Byz., the Sirens challenged the Muſes to a muſical conteſt, but having been vanquiſhed, they plucked off their wings, and leaped into the ſea, whence fable reports its name; but Euſebius, in his Chronicon, ſays, that it was ſo called from one Apteras, king of Crete, the ſuppoſed founder of it. Here was alſo a temple or chapel dedicated to Venus Urania. This town is now called *Atteria* or *Paleocaſtro*.

APTERUS, in *Entomology*, the ſpecific name of an inſect in the Ptinus genus, deſcribed by Linnæus. The head is brown, and caniculated in front; wing-caſes, legs, and antennæ rufous; thighs clavated; ſhank ciliated. Leſk. p. 7. n. 130.

APTERUS, is likewiſe the name of a ſpecies of HISTER, of a fulvous colour, and without wings. It is a native of Italy, and deſcribed by Scopoli (ent. carn.). Gmelin.

APTERUS, is a name alſo given to one of the curculiones, CURCULIO APTERUS: thorax ſpinous, impreſſed with a cruciform mark; wing-caſes dotted with ferruginous brown. Fabr. Obſ. The beak is ſhort, legs unarmed, body black, and punctured on the belly. It is the CURCULIO CRUCIATUS of Degeer, is of a large ſize, and inhabits the Cape of Good Hope.

APTERUS is, laſtly, a ſpecies of CIMEX found in Europe. It is variegated with red and black; elytra red with two black ſpots: no wings. Fab. and Gmel.

AP-THANES, an ancient term for the higher nobility in Scotland. See THANE,

APTITUDE, from *aptus, fit*, the natural diſpoſition any thing hath to ſerve for ſuch or ſuch a purpoſe. Thus oil hath an *aptitude* to burn, and water to extinguiſh fire.

APTITUDE, or APTNESS, is often uſed in ſpeaking of the talents of the mind, for a promptitude or diſpoſition to learn things with eaſe and expedition.

In which ſenſe aptneſs amounts to the ſame with what the Greeks call ευμαθια, and the Latins *bona indoles*, and we ſometimes *docility*.

Charlton divides aptneſs into three parts, viz. *acuteneſs*, *ſagacity*, and *memory*.

APTOTE, derived from α priv. and πτωσις, *caſus*, in *Grammar*, a noun indeclinable, or which is without any variation or caſe.—Such are the words *fas*, *nefas*, &c.

APULEIUS, LUCIUS, in *Biography*, a Platonic philoſopher, was born of a reſpectable family at Madaura in Africa, and lived in the 2d century, under the Antonines. He proſecuted his ſtudies at Carthage, Athens, and Rome; at which latter place he acquired the knowledge of the Latin tongue without a maſter: and of theſe ſtudies he gives the following curious account. "Our firſt cup of knowledge, which we receive from the hand of the teacher of letters, removes entire ignorance; the ſecond furniſhes us with the learning of the grammarian; the third arms us with the eloquence of the rhetorician; and as much as this is drunk by moſt perſons: but at Athens I drank other cups from the deceitful fountain of poetry, from the clear ſtream of geometry, from the ſweet waters of muſic, from the rough current of dialectics, and from the nectareous but inexhauſtible deep of univerſal philoſophy." In the early period of life he ſpent his patrimony, which was conſiderable, in acts of liberality to his inſtructors and to the indigent, and in his travels, which he undertook for the acquiſition of knowledge, and chiefly for gaining information concerning the religious opinions and ceremonies of different countries. With this view he obtained admiſſion into their ſeveral myſteries; being initiated, in Greece, into ſeveral ſolemn rites; and devoting himſelf, at Carthage, to the worſhip of Æſculapius, their tutelary divinity, and performing the honourable office of Antiſtes, or chief conductor of the ceremonies, in the college of his prieſts. Upon his return to Rome, his patrimony was ſo completely exhauſted, that he is ſaid to have pawned his clothes in order to defray the expence of the inaugural ceremonies of his introduction into the fraternity of Oſiris. In order to gain a ſubſiſtence, he aſſumed the profeſſion of a pleader, from the exerciſe of which he derived conſiderable profit; but with a view of more ſpeedily repairing his fortune, he married Pudentilla, a rich widow of Oea, whoſe principal attraction was her wealth. This connection involved him in a law-ſuit with the brother of her former huſband, who charged him with employing magical incantations to gain her affection: but he found no difficulty in proving to the ſatisfaction of his judges, that the only witchcraft by which he accompliſhed his purpoſe were the attractions of his perſon. The apology which he delivered on this occaſion is ſtill extant, and is much admired. In conſequence of this unfounded accuſation, and without any other evidence, Apuleius was ranked among the profeſſors of magic; and after his death miracles were aſcribed to him, which were placed in competition with thoſe of Jeſus Chriſt. Accordingly Lactantius, in the beginning of the 4th century, expreſſes his ſurpriſe that the author whom he confutes, had omitted Apuleius, of whom many wonderful things were reported: and Auguſtine, in the fifth century, was requeſted by Marcellinus to exert his utmoſt efforts in refuting thoſe who falſely aſſerted that Chriſt did nothing more than was done by other men, and who produced their Apollonius, Apuleius, and other maſters of the magical art, whoſe miracles they maintained to have been greater than his. Apuleius ſeems, indeed, to have been no mean proficient in thoſe arts of impoſture, which he had learned from prieſts of different countries; but the idle report above-mentioned was the only ground of the opinion circulated after his deceaſe, that he poſſeſſed or exerciſed miraculous powers. This opinion, probably, originated in an abſurd miſapprehenſion of his fable of the "Golden Aſs," for true hiſtory. The work is a ſatirical romance, in which a Mileſian fable, on the metamorphoſis of Lucius into an aſs, invented by Lucius of Patras, and abridged from him by Lucian, is enlarged and embelliſhed. Although there be no ſufficient evidence that Apuleius pretended to work miracles, and for inſtituting any compariſon between him and Jeſus Chriſt, yet it is not improbable that in ſome paſſages of the fable of the golden aſs, he intended to ridicule the Chriſtians; and biſhop Warburton was, perhaps, right in his conjecture, founded on a paſſage in Apuleius's Apology, that Æmilianus, the brother of Pudentilla's firſt huſband, who proſecuted him for magic, was a Chriſtian. But there ſeems to be no ſufficient ground for the ſuppoſition of this learned writer (ſee Div. Leg. b. iv. § 4.), that the deſign of the fable of the golden aſs was "to recommend the Pagan religion as the only cure for all vice in general." The author himſelf calls it a Mileſian tale, and a Greek fable; and the ancients always ſo underſtood it. Moſheim and Lardner have examined the hypotheſis of Dr. Warburton, and urged againſt it objections that are unanſwerable. The true character of this work ſeems to be that which Barthius and Bayle have given it, viz. "that it is a perpetual ſatire on magical deluſions, the tricks of prieſts, and the crimes of adulterers, thieves and robbers, committed with impunity." This work was publiſhed with large notes by Beraldus, at Venice, in 1504, folio; reprinted at Paris, in 1510, folio, and in 1536, 8vo. The beautiful Epiſode to it, intitled, "The Loves of Cupid and Pſyche," has been repeatedly tranſlated into various languages. The Apology, or "Oratio de Magia," was publiſhed ſeparately by Caſaubon, in 1594, 4to.; and at Leyden, in 1608, 8vo.; and by Pricæus with notes, &c. at Paris, in 1635, 4to. In philoſophy, Apuleius wrote a treatiſe, "De habitudine doctrinarum et nativitate Platonis Philoſophi," in 3 books: the firſt on the ſpeculative doctrines of Plato; the ſecond on his morals; and the third on his logic. He alſo wrote a Latin tranſlation of Ariſtotle's treatiſe, "De Mundo;" an oration "De Deo Socratis," diſcuſſing the queſtion concerning his dæmon; and a work intitled, "Florida," which, though rather rhetorical than philoſophical, ſerves in many particulars to illuſtrate the hiſtory of philoſophy. Another botanical work, intitled, "De Herbis, ſive de nominibus ac virtutibus Herbarum," has been aſcribed to Apuleius;

but Johnſon, the tranſlator of Gerard, ſuppoſed it to be a tranſlation of a Greek writer of the 8th century. Fabricius, however, thinks that this is an improbable conjecture. The firſt edition of the works of Apuleius was printed at Rome under the care of Cardinal Beſſarion, in 1469, folio; they have ſince paſſed through various other editions, as thoſe of H. Stephens, in 1585, 8vo.; of Elmenhorſt, at Frankfort, in 1621, 8vo.; of Scriverius, at Leyden, in 1624, 12mo.; "Variorum" edition, at Gouda in Holland, in 1650, 8vo.; and another, "In Uſum Delphini," 2 vols. 4to. at Paris, in 1688. Apuleius by his writings ought to be claſſed among the wits rather than the philoſophers of his age. His writings, the view of Plato's doctrines excepted, are too florid and ſportive, and in many parts too looſe and wanton, to comport with the gravity of philoſophy. Fabr. Bib. Latin. lib. iii. c. 2. tom. ii. p. 17. Gen. Dict. Gardner's Works, vol. vii. p. 459—465. Brucker's Hiſt. Phil. by Enfield, vol. ii. p. 53.

APULIA, now PUGLIA, in *Ancient Geography*, denoted that large diſtrict of Magna Græcia in Italy, which extended along the Adriatic ſea from the river Frento or Fronto to the north-weſt, as far as the cape Japygium to the ſouth-eaſt, and comprehended Daunia, Peucetia, and Meſſapia. Its boundaries were, on the north and eaſt, the Adriatic ſea; on the ſouth, Sinus Tarentinus, or the gulf of Tarentum, and part of Lucania; and on the weſt, Samnium. The principal mountains were, Garganus to the north, and Vultur to the ſouth: its chief rivers were, Fronto, Auſidus, Cerbalus, and Bradanus; and its principal cities were, Teanum, Apulum, Sipontum, Arpi, Luceria, Aſculum, Venuſia, Acherontia, Canuſium, Butuntum, and Barium; and Meſſapia, eaſtwards, Brunduſium, and Hydruntum; and in the gulf, Tarentum and Callipolis. M. Freret ſuppoſes that the Apulians were a party of the Liburni, of Illyrian origin, who penetrated into Italy about the 6th century before Chriſt, and eſtabliſhed themſelves between the Alps and the river Atheſis, whence they proceeded to that part which the Romans called Apulia and Japygia.

APULO-BAMA, in *Geography*, a juriſdiction of South America, conſiſting of miſſions belonging to the Franciſcans, ſubject to the biſhop of Cuſco, 60 leagues from that city, in the empire of Peru, and comprehending ſeven towns of converted Indians.

APULUS, in *Entomology*, a ſpecies of SPHINX that inhabits Surinam. The wings are indented; anterior pair fulvous, with two golden-coloured ſpots; poſterior wings white, antennæ feathered. Fabricius and Gmelin.

APURIMA, or APURIMAC, in *Geography*, a very rapid river of South America, riſing near the town of Arequipa in Peru, on the weſt of the Great Lake Titicaca, S. lat. 16° 30', and running into the Ucayal. The Apurimac, in the map of La Cruz, appears to be the original and proper river of the Amazons, and forms the remoteſt branch of the Ucayal, which muſt be regarded as the ancient or genuine Maranon.

APURWACA, or PIRAGUA, a river of South America, in Guiana, which is one of the moſt conſiderable rivers in the country.

APUS, *Avis Indica*, in *Aſtronomy*, a conſtellation of the ſouthern hemiſphere, placed near the pole, between the Triangulum Auſtrale and the Chameleon, ſuppoſed to repreſent the bird of paradiſe.

The apus is ſuppoſed to be one of thoſe birds called *apodes*, as having no feet.

The ſtars contained in this conſtellation, according to Sharp's catalogue, annexed to the Britiſh, are eleven; in Bayer's charts, twelve; but more numerous in La Caille's catalogue. The principal ſtar is of the 5th magnitude; and in 1750, its right aſcenſion was 214° 32' 45", and its ſouthern declination 77° 57' 6".

APUS, in *Entomology*, a ſpecies of MONOCULUS. The antennæ triſid, and the tail biſid. Fab. Spec. Inſ. The ſhell is rather compreſſed, retuſe in front, truncated behind, and tail terminating in two briſtles. Linn. Syſt. Nat. Found in ſtagnant waters.

The ſynonymous terms for this creature are numerous. It is the binoculus cauda biſeta of Geoffroy; binoculus (paluſtris) oculis ſuperis, teſta poſtice truncata, cauda biſeta of Muſ. Zool. Dan.; limulus paluſtris, Mull. Entom.; & apus cancriformis, Scæff.

APUS, in *Ornithology*, the ſpecies of HIRUNDO, well known by the name of ſwift or black martin. The colour is black; throat white; all the toes placed forwards, Linn. This is *hirundo apus* of Aldrovandus, &c.; martinet noir of Buffon; and alſo grand martinet of the ſame author.

The length of this bird is eight inches; the wings remarkably long, and meaſuring from tip to tip, when expanded, no leſs than eighteen inches; the legs and claws black. The female is rather ſmaller than the male; the plumage inclines more to brown; and the white on the throat is leſs diſtinct.

This bird arrives in England later and departs ſooner than either of the other ſwallows, from whence it is ſuppoſed to take a longer journey than the others. It has only one brood in the year; ſo that the young ones have time to gain ſtrength enough to accompany the parent birds in their diſtant excurſions. They inhabit the whole of the European continent, and have been alſo noticed at the Cape of Good Hope, and Carolina in North America. Swifts are almoſt conſtantly on the wing; they fly higher and with more rapidity than the ſwallows, and never aſſociate with them. They ſeldom alight, and if by accident they ſhould fall upon the ground, raiſe themſelves up again with great difficulty. They are ſaid to avoid heat as well as cold, and therefore remain in their holes in the daytime, and fly chiefly in the morning and evening in ſearch of prey; their neſts are built in elevated places, ſuch as lofty ſteeples and high towers; the neſt is compoſed of a variety of materials, as dry graſs, moſs, hemp, ſhreds of ſilk, linen, gauze, feathers, and other light ſubſtances. They lay five white eggs, which are rather of a longiſh form; the young are hatched about the latter end of May, begin to fly about the middle of June, and ſhortly after the neſts are abandoned. Swifts begin to aſſemble, previouſly to their departure, early in July; their numbers daily increaſe, and large bodies of them appear together; they ſoar higher in the air, with ſhriller cries, and continue at times to aſſemble together in greater numbers till the beginning or middle of Auguſt, when they leave the iſland of Britain altogether.

APUTASY, in *Botany*, a name given by the people of Guinea to a tree, a decóction of which is in great uſe among them for waſhing the mouth to cure the ſcurvy in the gums, and preſerve the teeth. Phil. Tranſ. N° 237.

APYCNI, in the *Ancient Muſic*, was uſed for ſuch chords or ſounds of the ſcale, as could never enter the ſpiſſum. They were fixed, or ſtabiles.

APYCNON, from α and πυκνος, *non ſpiſſimum, rarum*, in the *Ancient Muſic*, was applied to thoſe two conjunct intervals of a tetrachord, which taken together were greater than the third.

This happened only in the two diatonic genera.

APYRENOS, in *Botany*, properly ſignifies without kernels.

APYREXY, formed of the privative α, and πυρ, *ignis, heat*, in *Medicine*, the intermiſſion of a fever, or ague.

APYROI, in *Antiquity*, a denomination given to ALTARS whereon ſacrifice was offered without fire.

In which ſenſe, the word ſtands contradiſtinguiſhed from *empyroi*.

APYROMETALLUM, in *Metallurgy*, a name by which ſome authors have called gold, from its reſiſting the force of fire.

APYROUS, in *Chemiſtry*, is a word applied to denote that property in ſome bodies, by which they reſiſt the moſt violent fire, without any ſenſible alteration.

AQUA, in *Natural Hiſtory*, *Phyſics*, *Chemiſtry*, *Medicine*, WATER, &c. which ſee.

The word is Latin, and ſuppoſed to be compounded of *a* and *qua*, q. d. *from which*; alluding to the opinion that water is the baſis, or matter of all bodies.

AQUA *fortis*. The workers in metals, &c. diſtinguiſh two kinds of aqua fortis, the double and ſingle, or prima and ſecunda: the former of theſe is common NITROUS *acid*, the latter is nitrous acid diluted with an equal bulk of water.

AQUA *marina*, AQUA *marine*, in *Mineralogy*. See BERYL.

AQUA *regia*, or AQUA *regalis*. This is a combination in various proportions of nitric and muriatic acids. It was formerly known by the name aqua regia, from its being at that time the only acid capable of diſſolving gold. In the new nomenclature it has attained the appellation of NITRO-MURIATIC *acid*.

AQUA *ſecunda*. This is nothing elſe but aqua fortis diluted with much pure water. It is employed in ſeveral arts, to clean the ſurface of metals and of certain ſtones, and for various other purpoſes.

AQUA *ſulphurata*, *ſulphur water*, formerly called *gas ſulphuris* by Van Helmont, is at preſent known by the name of liquid SULPHUREOUS *acid*.

AQUA *vitæ*, water of life, *eau de vie* of the French, *uſquebaugh* of the Iriſh, *whiſky* of the Scotch, is a name familiarly applied to native diſtilled ſpirits. Hence grape wine being the material from which the common ſpirits are moſtly procured on the continent, the French eau de vie, the Italian acqua vite, the German brandwein, are ſtrictly ſynonymous, and correſpond to the Engliſh word *brandy*. But fermented barley, rye, &c. being the material made uſe of in Scotland, Ireland, Holland and England, the terms uſquebaugh, whiſky, and Hollands, are more properly ſynonymous with the Engliſh MALT *ſpirits*.

AQUA, in *Pharmacy*, is a term prefixed to a variety of liquid preparations, in which water is the principal liquid vehicle. Theſe are of two kinds, one the *diſtilled waters*, conſiſting of water impregnated with the medicinal virtue of various vegetables, through the medium of diſtillation; and the other kind is ſimply a ſolution of various ſaline ſubſtances, in known proportions of water, to enſure a greater accuracy in preſcription.

We ſhall briefly notice the ſeveral aqueous preparations which are either actually in uſe, or have acquired a certain celebrity.

Aqua diſtillata, Pharm. Lond. *Aqua deſtillata*, Ph. Edin. Simple diſtilled water. To prepare this, any quantity of ſpring water is to be diſtilled in clean veſſels. The firſt portions are to be rejected, and the proceſs continued, till about two thirds are diſtilled off, which are to be kept for uſe in clean glaſs veſſels.

No other water but diſtilled is allowed by the college to be uſed in the aqueous preparations. It is particularly requiſite in ſome of the ſaline ſolutions, as, for inſtance, in that of ſugar of lead, which is perfectly clear with diſtilled water, but milky with pump or river water.

Aquæ diſtillatæ, P. Lond. *Aquæ ſtillatitiæ*, P. Edin. *The diſtilled waters of Pharmacy*.

The general rule for preparing theſe waters is to put the plants, or parts of plants employed, into a tinned copper ſtill, to cover them with water, and to diſtil it off with a gentle heat, as long as the liquor retains ſufficient flavour of the plant. The proceſs muſt be ſtopped before all the water is evaporated, otherwiſe the plant would be burned, and would give a diſagreeable burnt taſte to the liquor. See the articles DISTILLATION, SPIRITS DISTILLED, and OILS ESSENTIAL.

The number of plants ſubmitted to diſtillation by former pharmaceutical chemiſts, is almoſt endleſs; and in the older pharmacopœias, we find numerous compound waters made of ingredients, many of which are either inert in themſelves, or whoſe virtue is not capable of uniting with water through the medium of diſtillation. Of this kind are the daiſy, bugloſs, water-creſs, &c. which have been preſcribed for diſtillation; but in the preſent pharmacopœias, all theſe uſeleſs materials are omitted, and thoſe only are retained that will give ſome ſenſible flavour or ſmell to water diſtilled of them.

The following are retained at preſent. *Aqua anethi*, (diſtilled water of dill)—*cinnamoni*, (of true cinnamon)—*faniculi*, (of fennel)—*menthæ piperitidis*, (of peppermint)—*menthæ ſativæ*, (of ſpearmint)—*pimento*, (of allſpice)—*pulegii*, (of pennyroyal)—*roſæ*, (of roſe leaves)—*corticis limonum*, (of lemon peel)—*corticis aurantiorum hiſpalenſium*, (of Seville orange peel)—*caſſiæ ligneæ*, (of caſſia cinnamon.)

About a pound of the dry barks and ſeeds, and a pound and a half of the freſh plants, are ſufficient for a gallon of the diſtilled waters; but three or four pints of water more muſt be employed to prevent burning, and to allow of that quantity to be diſtilled off.

It ſhould be remembered that the term *diſtilled water* is now ſtrictly confined to thoſe preparations in which no other liquid than water is employed to extract the virtue of the plant; but formerly it was extended to thoſe that were prepared with a mixture of ardent ſpirit and water, or even with pure ſpirit. Thus the *aqua lavendulæ*, (lavender water) is a *ſpirituous water*, prepared by diſtilling a mixture of ſpirits of wine and water from the lavender.

A few of the moſt celebrated diſtilled waters or ſpirituous waters, may be mentioned.

Aqua epidemica, *plague water*, is prepared by diſtilling the roots of maſterwort (*imperatoria*), the ſeeds of angelica and elder flowers, in French brandy.

Aqua Reginæ Hungariæ, *Hungary Water*.

The genuine Hungary water is a pure ſpirit diſtilled from the roſemary, and ſtrongly ſcented with the rich perfume of this aromatic plant. The French is reckoned the beſt.

Aqua odorifera, *honey water*, *eau de miel*.

This is a compound aromatic ſpirit, prepared by diſtilling ſpirit of wine with honey, coriander ſeeds, vanilloes, cloves, nutmegs, lemon-peel, ſtorax, benzoin, to which are added ſpirituous roſe-water, and orange-flower water.

Aqua Vulneraria, *Arquebuſade Water*, is a diſtilled ſpirit prepared from a great variety of aromatic plants, ſuch as thyme, origanum, balm, lavender, roſemary, &c.

The reader will find the recipes for the above-mentioned waters, and a great number of others (many of which are now obſolete) in *Beaumé's Elemens de Pharmacie*.

The medicinal virtues of the diſtilled aromatic waters and ſpirits have, perhaps, been much over-rated, and numerous diſtinctions between them with regard to their effects, have been made, without much foundation.

All of them are cordial and ſtimulating, and as ſuch have

conſiderable efficacy in ſudden faintings, ſickneſs, and languor; but the difference of effect between the ſimple aromatic waters and the ſpirituous waters is ſo great, that much of the virtue of the latter is to be aſcribed to the ardent ſpirit. They are largely uſed in medicine; and from their agreeable flavour and fragrancy, they will conceal the nauſeous taſte and ſmell of many of the moſt unpalatable drugs. The conſumption of the fragrant aromatic ſpirits is perhaps ſtill greater, as perfumes for the toilet; and the flavoured ſpirits, more than all, as drams and cordials.

The other kinds of *waters* in pharmacy are ſimple ſolutions of various ſalts, as we have already mentioned. The following are retained in the London and Edinburgh pharmacopœias.

Aqua aluminis compoſita (formerly *Aqua aluminis Bateana*), is a ſolution of half an ounce of alum, and half an ounce of vitriolated zinc, in two pints of water.

Aqua cupri ammoniati (formerly *Aqua ſapphirina*, or *aqua cæleſtis*), is prepared by mixing one dram of muriated ammonia with a pint of lime water, and ſuffering them to ſtand in a copper veſſel till the ſolution has acquired that beautiful blue colour by which it is diſtinguiſhed. The ſame effect takes place in glaſs veſſels, if ſome thin pieces of copper are added. This preparation is a very weak ſolution of copper in the cauſtic ammonia, which is ſeparated from the ſal ammoniac by means of the lime water. It is uſed as a gentle eſcharotic in ſurgery, and it alſo forms a conſpicuous ornament to the druggiſt's ſhop. See Copper.

Aqua lithargyri acetati compoſita, is a mixture of two drams of the aqua lithargyri (or Goulard's extract), with two pints of diſtilled water, and two drams of proof ſpirit of wine.

Aqua zinci vitriolati cum camphora, is a ſolution of half an ounce of vitriolated zinc, in two pints of diſtilled water, to which half an ounce of camphorated ſpirit is added, and the whole filtered, to ſeparate moſt of the camphor which is precipitated by the mixture. Enough of the camphor remains to give its ſtrong ſmell to the ſolution.

Aqua ammoniæ and *aqua ammoniæ puræ*. See Ammoniacal *preparations*.

Aqua ammoniæ acetatæ. See Acetite *of Ammonia*.

Aqua kali preparati (formerly *lixivium tartari*), is a ſaturated ſolution of carbonat of potaſh in water, made by the ſpontaneous deliqueſcence of this alkaline ſalt, when kept for ſome time in a moiſt place.

Aqua kali puri (formerly *lixivium ſaponarium*), is a ſolution of potaſh made cauſtic by means of lime. See Potash.

Aqua calcis, lime water. See Lime.

Aqua phagedænica, a preparation often uſed in ſurgery, is a ſolution of half a dram of corroſive ſublimate of mercury, in one pint of lime water. The lime water here decompoſes the mercurial ſalt, and makes a turbid brick-coloured liquor, of great efficacy as an eſcharotic in foul wounds or obſtinate ulcers.

Aquæ Minerales. See Waters Mineral.

Aqua, or *Agua*, in *Geography*, a province of Africa in Guinea, on the Gold Coaſt, bounded on the ſouth by Fantin, on the north-eaſt by Dinkira, and on the weſt by the river of Chama, or St. John.

Aqua *Auguſta*, in *Ancient Geography*, called likewiſe *Alſietina*, from the lake of that name, about 14 miles from Rome, near the Claudian way, was a ſtream of water brought to the city, and entering it at the porta Eſquilina, now the gate of St. Laurence. It was not fit to drink, and ſerved merely to water gardens, and to ſupply the Naumachiæ.

Aqua *crabra*, in *Ancient Geography*, a river which paſſed by the villa of Cicero at Tuſculum, ſuppoſed by Cluver and M. D'Anville to be that which is now called Maranna: but the abbé Chauppy is of opinion that theſe were different rivers.

Aqua *Julia*, a river about 12 miles from Rome, in the Via Latina, brought by Agrippa to Rome during his ædileſhip, A. U. C. 721. Its ſource was called *Caput Juliæ*, and it is now known by the name of *Caſo d'Aqua*. It enters the city near the Eſquiline gate, and had its name, according to Frontinus, from one Julius, who diſcovered the ſpring that ſupplies it.

Aqua *Marcia*, a ſtream of water which was conveyed through a conſiderable diſtance under ground, near the Tiber. This was alſo called *Auſulia*, and is ſaid to have been firſt brought to Rome by the prætor Q. Marcius, from a ſpring near the Valerian way, upwards of 30 miles diſtant from the city, which it enters near the Eſquiline gate. This was, and ſtill is, reckoned the beſt water for drinking in Rome.

Aqua *Paulina*. See Aquæduct.

Aqua *Tepula*, a river formed by the union of ſeveral ſtreams, which had its ſource about ten miles from Rome, in the Via Latina, and was conveyed thither by Agrippa; now known by the name of *Peſori*, near Frascati.

Aqua *Virginea*, a ſtream of water; ſo called, from a country girl's ſhewing the ſpring to ſome ſoldiers who were ready to periſh with thirſt; which enters Rome at the gate Pinciana, and was brought thither by Agrippa, A. U. C. 735. At preſent it iſſues from the fountain in the Piazza di Spagna, which repreſents a ſhip, and from that of Trevi, ſo called from the Trivium, where three ſtreets meet.

Aqua Viva, a place in Etruria, north of Rome.

Aquæ, a ſmall place in Brutium, near the ſea; north-eaſt of Scylla.

Aquæ, baths of mineral waters in Mauritania Cæſarienſis; mentioned by Ptolemy, and placed by Antonin in his Itinerary, 25 Roman miles from Cæſarea. The city was once a Roman colony and epiſcopal ſee.

Aquæ *Cazalegas*, a ſmall ancient town ſituate in Hiſpania Tarragonenſis.

Aquæ, a ſmall place of Italy, in Picenum, ſouth-weſt of Aſculum.

Aquæ *Albenſes*, a town of Africa in Bizacium; alſo a town of Africa, in Mauritania Setiſſenſis, which had been an epiſcopal ſee.

Aquæ *Angitiæ*, a ſmall place of Italy, in Brutium, upon the weſtern coaſt.

Aquæ *Apollinares*, a place of Italy, in Etruria, between Tarquinii on the north-weſt, and Cære to the ſouth-eaſt.

Aquæ *Auguſtæ*, or *Tarbellicæ*, a city of Gaul, in Novempopulana, and capital of the Tarbelli. It is now *Acqs*, or *Dax*. See Acqs.

Aquæ *Billicus*, *Vaſſerbilich*, a town of Gaul, belonging to the Sunuci; and placed by Martin ſouth-eaſt of Orolaunum, and weſt of Auguſta Treverorum.

Aquæ *Bilbilitanorum*, *Banoſde Athama*, a famous place of Hiſpania Tarragonenſis, between Bilbilis to the eaſt, and Anacum to the weſt.

Aquæ *Bormonis*, *Bourbon-l'Archambaut*, a place of Gaul, belonging to the Bituriges Cubi, in Aquitania prima, between Tinconcium to the north-weſt, and Sitillia, belonging to the Boii, to the eaſt.

Aquæ *Borvonis*, *Bourbonne les Bains*, a place of Gaul, belonging to the Sequani, between Andometurum, or Lingones, to the weſt, and Dittatium to the eaſt.

Aquæ *Calentes*, a place of Gaul, belonging to the Averni, ſituate ſouthwards.

Aquæ *Calidæ*, *Bagni di Ballicano*, baths of Italy, three miles from Phiſcon.—Alſo, a town of Africa, in Numidia Propria,

Propria, wholly deſtroyed:—alſo, *Aiguee-Perſe*, a place of Gaul:—alſo, Bath in Somerſetſhire:—alſo, *Calidæ Cilinorum*, a town of Hiſpania Tarragonenſis, north of Barcino, belonging to the Laletani:—alſo, *Calidæ* or *Tibilitanæ*, in Africa, about ten leagues ſouth-weſt of Hippo Regius, now called *Hamam*, or the baths, lying to the eaſt of the Hamam-Meſkouteen, on the north ſide of the river Seibouſe, in the diſtrict of the Bookalwan, of the province of Conſtantina:—alſo, *Calidæ Colonia*, now the *Hamam* or the baths of Mereega, in the African province of Tiemſan, eight miles eaſt-north-eaſt of Maliana, between the river Sheliff and the ſea; the largeſt and moſt frequented of theſe (ſays Shaw, Travels, &c. p. 30), is a baſon of 12 feet ſquare, and four deep; and the water, which bubbles up with a degree of heat ſcarce tolerable, after it has filled this ciſtern, paſſes on to a much ſmaller one, which is made uſe of by the Jews, who are not permitted to bathe in company, or in the ſame place, with the Mahometans; reſorted to by a great concourſe of people in the ſpring, the ſeaſon of theſe waters, which are accounted very efficacious for curing the jaundice, rheumatic pains, and ſome of the moſt inveterate diſtempers: near this bath are the ruins of an old Roman town, and tombs and coffins of ſtone, ſaid to be of an unuſual ſize.—*Calidæ, Vichi*, a place of Gaul, ſouth of Vorogium, and north-eaſt of Auguſtonometum, or Averni.

Aquæ *Ceretanæ*, a place of Etruria, north-weſt of Cære.

Aquæ *Cilenorum*, a place of Spain, ſouth-eaſt of the river Iria Flavia.

Aquæ *Convenarum, Capbern* according to M. D'Anville, ſouth-eaſt of Turba and north-weſt of Lugdunum, or Convenæ. Some authors have aſſigned its ſituation to that of the preſent Bagneres; but this does not correſpond to the meaſures given in the Itineraries.—*Convenarum*, or *Oneſiorum*, *Cominge*, a town of Gallia Narbonnenſis.

Aquæ *Cumanæ*, baths near Cumas in Italy.

Aquæ *Cutiliæ*, *Pozzo Ratignano*, a lake of Italy, in the country of the Sabines. Pliny, Seneca, and Varro report, that in this lake there was a moving iſland, and the latter ſays, that it was the centre of Italy. Veſpanian uſed theſe waters every ſummer, and died in this place. By ſome they are called *Aquæ Sabinæ*; and by Strabo, *Aquæ Cotiſcoliæ*.

Aquæ *Duræ*, *Alcala del Rio*, a place of Spain, in Bætica.

Aquæ *Flaviæ*, *Chiaves*, a town of Hiſpania citerior, belonging to the Callaici, and ſituate to the north-eaſt, in the interior part of the country. Trajan built a bridge on the river now called Tamaga, the ruins of which indicate its former grandeur.

Aquæ *Helvetiæ*, *Baden*, a town of Gaul, belonging to the northern Helvetii, between Vindoniſſa to the weſt and Vitodurum to the eaſt.

Aquæ *Letinatæ*, *Sardara*, a town in the iſland of Sardinia.

Aquæ *Leæ*, a town of Spain, at the mouth of the Mincius.

Aquæ *Merom*, ſuppoſed to be the lake called by Joſephus Samachonitis, in Upper Galilee, into which the river Jordan falls before it arrives at the ſea of Geneſareth. Here Jabin, king of Hazor, encamped, when he was defeated by Joſhua. See Joſh. ch. xi. 5.

Aquæ *Neapolitanæ*, a town of the iſland of Sardinia.

Aquæ *Neræ*, or *Neri*, *Neris*, a place of Gaul, belonging to the Bituriges Cubi, and ſituate between Mediolanum to the north-eaſt, and Cantilia to the ſouth-eaſt.

Aquæ *Niſinetii*, or *Nilinei*, *Bouron-Lamy*, a place of Gaul, belonging to the Ædui, ſouth-eaſt of Decetia, and weſt of Telonnum.

Aquæ *Onoſiæ*. See Aquensis *Vicus*.

Aquæ *Origines*, a place of Spain in the country of the Callaici, upon the Minius, north-eaſt of Tyde.

Aquæ *Pannoniæ*, baths of Auſtria, now called *Baden*.

Aquæ *Paſſaris*, a place of Italy, in Etruria.

Aquæ *Patavinæ*, baths in the territory of Venice, near Padua, called *Fontes Aponi* by Livy and Martial, now *Bagni d'Abano*.

Aquæ *Piſanæ*, a ſmall place of Etruria, north-eaſt of Piſa.

Aquæ *Populoniæ*, a ſmall place of Etruria, between Salebro to the ſouth-eaſt, and Manliana to the north-weſt.

Aquæ *Querquernæ*, a place of Spain, belonging to the Callaici, between Aquæ Origines and Nometobriga.

Aquæ *Quintianæ*, a place of Spain, in the country of the Callaici, ſouth-eaſt of Lucus Auguſti.

Aquæ *Regiæ*, a town of Africa, ſituate ſome miles ſouth of Tunzo; the ruins of which ſtill remain.

Aquæ *Regiæ*, baths of Epirus, near Acroceraunia.

Aquæ *Salviæ*, a famous place in Italy, three miles from Rome. It was the ſee of a biſhop, ſuffragan to the archbiſhop of Carthage.
